This Dwarfe kind hath a few small stalkes with fine cut leaves longer then the last, and but thinly or sparingly set thereon, somewhat resembling Sow-Fennell but seldome exceeding fifteene leaves on a stalke: from among which leaves riseth up a short thicke stalke not a foote high, branched from the bottome upwards with the like leaves on them, but seldome exceeding nine on the stalke, broadest below and of the smell and taste of Carrots; the toppe of each branch and stalke is furnished with many small umbells of white flowers without any seed at all, unto which succeede small seede like Parsley: the roote is small and short, browne and rugged on the outside, and white and spongie within having a bush of haires at the head: *Clusius* calleth this *Selinum montanum pumilum*, but *Bauhinus* referreth it to the wilde Carrots and calleth it *Daucus montanus multifido folio Selini semine*.

1. *Daucus Creticus verus Dioscoridis.*
The true Dauke of *Candy*.

2. *Daucus Alpinus Creticæ simil.*
Mountaine lea leafed Dauke.

5. *Daucus Selinoides major.* The greater Parsley leafed Dauke.

The greater of these Daukes which hath large stalks of somewhat broad pale greene leaves longer then Fennell and with divisions of the same fashion and manner next the ground, both somewhat bigge stalkes almost a foote high with the like leaves at the joynts but shorter, and at the toppes spokie rundles of white flowers which turne into long crested seede bigger then ordinary Fennell seede, and of a yellow browne colour: the roote somewhat great or thicke long and white, with a bush of haires at the head as many other [illegible] have, and of a hot and sharpe taste as the seede is also. There is another sort hereof as *Lobel* to his [illegible] saith, somewhat lesse then the former but else agreeing therewith in all parts, which hee found [illegible] *Narbonam.*

Minor.

6. *Daucus Selinoides maximus.* The greatest Parsley leafed Dauke.

This greatest kinde called by *Clusius Seseli alterum Pannonicum* yet passeth the figure of the last in that it is sometimes as great as ones arme, or being young of the bignesse of ones thumbe, parted into [illegible] the bottome, and covered with a rugged blacke barke of a clammy taste at the first, but sharpe after [illegible] fing spitting, having at the toppe many hairy heads, from whence spring lundry very large and grow winged leaves, much divided and dented about the edges somewhat like the last but larger, of a faire greene colour somewhat shining on the upper side and of a grayish ash colour underneath: among which riseth up a long [illegible] fled stalke of a fingers thicknesse, with some joynts and leaves at them, and with branches also [illegible] them, at the tops whereof stand small umbells of whitish flowers, and somewhat larger but like to the [illegible] Both these two last sorts may well be referred to the second *Daucus* of *Dioscorides*, whose leaves are [illegible] or Parsley before any other.

7. *Daucus tertius Dioscoridis Bello.* Coriander leafed Dauke.

This Dauke which *Honorius Bellus* saith groweth in *Candy*, and is referred by him to the third *Daucus* of *Dioscorides*, and both leafe and roote eaten by the *Candiots* as a familiar Sallet herbe, hath many stalkes of leaves somewhat like to *Coriander* but fatter and thicker, the stalkes are neare two foote high with great and swollen joynts (and therefore called by some *Seseli nodosum*, but by *Bauhine Tragus Cherius nodosus*) and smaller leaves at them, at the tops whereof grow yellow umbells of flowers, but white with [illegible] also bigger seede then Fennell: the roote is great, thicke and short, perishing yearely, the whole being [illegible]

8. *Daucus montanus Apii folio flore luteo.* Mountaine Dauke with yellow flowers.

This yellow flowred Dauke hath a crested smooth stalke branching forth into sundry parts, having leaves like unto Smallage but shorter and not dented at all about the edges, set on both sides at the creasing stalke, the flowers are small that grow at the toppes and yellow.

9. *Daucus pratensis Apii folio Bauhini.* Meadow Dauke of *Bauhine*.

The roores of this Dauke are long and reddish on the outside smelling and tasting like Carrots, very [illegible]

8. *Daucus montanus Apii folio minor.*
Mountaine Dauke with yellow flowers.

11. *Daucus [illegible]*
The French wilde [illegible]

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

at the toppes, from whence rise stalkes with many winged leaves on both sides, cut in on the edges and dented also round about, somewhat like unto the last, but much smaller and of a wan greene colour, betweene which riseth a slender stalke a foot high or scarcely higher, with few joynts and leaves, parted into long segments with umbells of white flowers at the toppes of them, which turne into double long seeds smelling well.

10. *Daucus Hispanicus.* *Spanish* Daucke.

This Spanish Daucke hath a tuncke long roote, parted into thicke long strings hairy at the head, from whence rise great winged stalkes of leaves, parted into divers other winged of dented leaves set one against another on a middle rybbe, of a fullen greene colour, among which riseth one or two stalkes as high as a man being somewhat reddish, creeked and jointed with the like leaves as them, but lesser comming forth diversly, and bearing large umbells of reddish flowers, after which come flat and somewhat thonne seed vessels. This came to me by the name of *Daucus Hispanicus*, but doth very well answer the *Daucus Athenis* of Bauhine with his *Prodromus* in every part which hee saith doth well agree unto the *Apium palustre* of *Dodonæus*, and the *Pastinaca Plinij* of *Lobel*, but that it giveth milke when the stalk is cut and that this riseth much higher then that the smell and taste of this is wholly like unto a Carrot.

11. *Daucus secundus Dalechampij.*
The French wilde or fielde Daucke.

This kinde of fielde Daucke hath a long round white roote, like unto a small long Carrot, sweet and somewhat hairy at the head, with long slender stalkes of winged leaves rising from it, which are whole and somewhat thicke, not gathered or cut in on the edges but dented, resembling Parsnep leaves but much smaller, seaven for the most part set together one against another somewhat close, and the odde one at the end, the stalke is a cubit high or higher, with finer leaves at the joynts then grow below

9. *Daucus Athenis.* Grene headed Daucke.

10. *Daucus Hispanicus.* Spanish Daucke.

16. *Daucus Austriacus.* Daucke of Germany.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

with store of white flowers in umbells, and small long seede after them, somewhat sweete in smell and hote in taste.

13. *Daucus sertus Dalechampij.* Another French wilde Dauke.

This other French wild Dauke hath a whitish yellow roote short and slender with haires at the head, stalkes of leaves that grow next thereunto are somewhat broad like unto the lower leaves of *Cumin* sa those grow higher on the stalkes are smaller and smaller, being as small as Fennell at the highest, the flowers white and the seede somewhat long like in taste unto Dill or Cumin that is sharpe.

13. *Daucus pratensis Dalechampij.* Wilde Dauke with water Milfoile leaves.

This fine leafed Dauke hath divers long stalkes of moist ing leaves set many together at spaces one right another, very like unto the water Yarrow or Milfoile, being soft and of a fresh greene colour: the stalke hath few joynts and fine long leaves like Fennell set at them with branches rising from thence, likewise bearing umbells of flowers which are reddish at the beginning and white when they are open, somewhat small and sharpe but well smelling.

14. *Daucus Proserpinæ vel Coriandri folio sive Bunium Dalechampij.* Rockie wilde Dauke.

The wilde Dauke that groweth in rough and rockie or stony places riseth up from a small white couched and smelling roote, hairy at the head with sundry long stalkes of leaves so nearely resembling Parsley that many are deceived at the first sight until they better heede it, the stalke is square, tall and of a fingers thicknesse with haires, leaves thereon like the finer leaves of Coriander and umbells of flowers like Dill, the seede is smaller then hartwane seede or a good kind.

15. *Daucus stellatus.* Starre headed Dauke.

This Dauke hath sundry leaves at the ground are somewhat like unto Parsley, but smelling well like to *Candy* Dauke and rising hot: the stalke hath sundry branches set with the like leaves at them, and yellow starry bells of flowers which are succeeded by small seede vessells, having five small leaves like thornes under them representing little starres five or six small threds rising from the bottome to the toppes making every seed bee like a Comet, each standing separate by it selfe on its owne foodstalke, smelling sweet and somewhat strong: the roote is thicke and long like unto a Parsley or Parsnep roote, and eaten familiarly by the Natives either raw or boyled, and held good to provoke Vrine, womens courses and Venery.

16. *Daucus alsatica.* Dauke of *Germany*.

This *Germane* Dauke hath a thicke root somewhat long, with sundry great strings thereat, and at the head many haires from whence come divers large winged leaves made of many parts, set one against another from one or two reddish stalkes, seldome more doe rise to a mans height, divided into many branches and ever this set with the like but smaller leaves at the joynts, and at the toppes stand large umbells of yellowish flowers and somewhat flat seede succeeding them.

The Place and Time.

The two first sorts grow not onely in *Candy* but in many places and countries, the shorter, thicker set and more hoary leaves in the warmer, and the longer, thinner set and lesse hoary in the colder countries of *Germany, England* and *Savoy*; most of the rest are declared in their titles or descriptions: many of them flower and seede somewhat earlier then others, yet all before the end of Autumne.

The Names.

The Greekes call it σέλινον, and the Latines also *Daucus, Daucum* and *Daucum. Dioscorides* made three sorts thereof, the first he named *Creticus*, the second *Selinoides* that is with leaves like Parsley, and the third with leaves like *Coriander*, which seven all sorts hath caused many learned men to suppose divers herbes to be the same which are since found much differing, and yet the certainetie of the two last is not fully allowed, for that some doe fully question those are held to be the truth. For as for the first it is in these times and to hath beene for a good while in *Italy, France, Germany, &c.* well knowne and onely used now a dayes in all the compositions wherein *Daucus* is appointed to be put: whereas formerly the common wilde Carrot (which is in most things like the manured, except the roote which is more hard and woodie, and more physicall and not edible as is the manured) was all in stead of the true *Candy* kinde: but to come to the declaration of these here set downe. The first is now well knowne to be the true *Daucus Creticus* of *Dioscorides*, as *Lobel, Matthiolus, Gesner* and others have observed and so set it downe: the second also is acknowledged to be so like the first, that the climate and soyle maketh the difference as I have said before, and so say *Gesner, Camerarius, Lobel* and others: the third and fourth are shewed in their descriptions to whom they belong and how they called them: the fifth diversly named: for *Tragus* and *Matthiolus* call it *Dioscorides* his second *Daucus*, and *Dodonæus* the other kinde of *Libanotis* or *Daucoides* and *Theophrastus Camerarius, Cæsius* and *Fuchsius* to be *Selinis Peloponnesia*. *Lobel* calleth it *Saxifragia Cretica*, and *Matthiolus* as I have given the figure of this for his *Selinis montanum alterum*, whose description doth expresse the next set here set downe, which *Bauhinus* in his *Pinax* entituleth *Daucus montanus Apuliæ*, but I have for the nearer resemblance unto the former *Selinoides* called it *montanus* because it is greater and the seventh is expresse to be from *Gemarius Bellus* of *Candy*, as it is set downe in his first epistle to *Lobel*: and *Pona* in his *Italian Baldus* in the same words: the eighth and ninth are remembred only by *Dodonæus* in his *Pemptades*, the foure next unto them are expressed by their titles as descriptions as they are fit for them: the fourteenth is as I said in the title called *Bunium Dalechampij* by *Lugdunensis* whose *Pastinaca* calleth as it is in the title also *Daucus petræolini vel coriandri folio*: but concerning this *Bunium* I will set downe something thereof here as I promised before in the Chapter of *Bulbocastanum*, that is to shew you that the *Bunium Dalechampij* is referred by *Bauhinus* to the kindes of *Daucus*, the description and figure thereof are very like unto sweete chervile thereunto: but yet I must withall give you my opinion thereof which is, that I thinke that the same forced them yielding freely of it selfe to take upon it this title, the composure of the description being wholly applyed to every part of *Dioscorides* his description moving that doubt in me: or I would learne of him gate either from the accurate judgement or sincerity of so learned an Herbarist as *Dalechampius* was. The *Italians* call it *Dauco* and *Carota*, the *Italians* and all other nations doe for the most part follow the Latine as neere as their Dialect will permit, or else follow the *French Cerui Sauuage* as some doe with us, to call them wilde Carots, or rather as is more fit Dauke according to the Latine, because there is another herbe more properly called wilde Carrot.

The Virtues.

Although the herbe of the true Daucke is by the watery moisture therein lesse effectuall then the seede, as *Galen* saith, which hath that power full heate therein that it is a principall medicine to helpe the strangurie, to provoke moneth and procure easie travell, to expell the dead birth and helpe the suffocation of the mother, yet the herbe is of a temperate qualitie, and will helpe to digest humors by exhaling them by the pores, if it bee applyed thereunto yet nothing like the seedes, which is powerfull to discusse griping paines, torments and wounds in the body or bowells, and especially profitable for those that are bitten by the *Phalangium* or deadly Spider, and the rootes as well as it shall resist any other venemous beast, or any other venom, or poyson or pestilence being drunke with wines the same also put into pultesses doth ease tumors and swellings in any part, being mixed with hony it helpeth old and inveterate Coughes.

Chap. XIIII.

Pastinaca tenuifolia. Carrots.

Having shewed you in the last Chapter all the sorts of *Daucus* which some for want of a more proper name have called wilde Carrots, I will in this shew you all the rest whether tame or wilde that so they may stand together.

1. *Pastinaca tenuifolia sativa lutea.* Common yellow Carrots.

The common Carrots I might well have spared to describe here, having shewed you all the sorts of them in my former booke, but seeing I am to speake of some wilde sorts which are like unto the manured, it shall not be impertinent to set them forth againe that to the wilde sort may bee knowne wherein they differ. This is well knowne to have divers large spread leaves made of many thin cut deepe greene leaves divided into many parts, among which riseth a round stalke three or foure foote high bearing large tufts or umbells of white flowers which doe close together and spread not much, and turne into small whitish rough or hairy seede holding one to another, the roote is somewhat great and yellow, big above and small pointed below, without any fangs or twines of a pleasant sweete taste, and therefore wholly spent for foode. There are other sorts as I have shewed in my former booke, whereunto I referre them that are desirous to know, but I have kept this garden yellow kinde by sowing it selfe sometimes the roote to become white.

2. *Pastinaca tenuifolia sylvestris.* Wilde Carrots.

The wild groweth in a manner altogether like the tame but that the leaves are somewhat whiter and rougher & more deepely cut, the stalkes likewise which beare large spokie tufts of white flowers, with a deepe purple spot in the middle whole are contracted together when the seede beginneth to ripen that the middle part being hollow and low, and the outer stalkes rising high maketh the whole umbell shew like unto a birds nest, as I shewed before in the Chapter of strange Corn ills the *Gingidium verum* useth to doe, the roote is small long and hard, unfit for meate, being somewhat sharpe and biting, although *Dioscorides* seemeth to say it was used to be eaten.

Pastinaca sylvestris altera tenuifolia atropurpurea.
Common red Carrots.

3. *Pastinaca sylvestris Apula Columnæ.*
Wilde Carrots of *Naples.*

The Neapolitane Carrot is so like in leaves and stalkes unto the last that they can hardly be distinguished one from the other before they in flower or seede. for although the whole winged leafe seemeth to be lesse and the parts fewer, yet therein is small difference: but being in flower the umbells are larger, the flowers darke purple, with a reddish yellow spot in the middle, and the seede (wherein lyeth the chiefest difference) long and small with a little white hairinesse upon them, and not rough as Carrots, being more like to the tame *Daucus*, but of a reddish colour being greene and fresh, and of a bitter and little aromaticke taste: the roote is somewhat long, white, hard, sweet and wholesome.

4. *Pastinaca echinophora Apula.*
Prickly wilde Carrots of *Naples.*

The stalke of this kinde of Parsnep or white Carrot is of a finger thicknesse and a cubits length, squill alike, like unto the prickly sea holly roote, somewhat yellow on the outside and white within, the barke being thicke and of substance, with small pith of a taste somewhat sharpe and sweete, not unpleasant, especially the younger rootes, the leaves that grow on the ground are like unto those of ordinary Carrots, but altogether so large and broad, but are finely cut, there is no difference betweene it and the Sea kinde, of a whitish green colour, with some hairinesse: the stalke is thicke and full of joints and leaves which tend a little downewards and have their divisions, being smaller, lesse divided, harder and sharper then on up to the toppes, where the umbells of flowers stand, which have six thicke sharpe pointed leaves at the bottome of them, the middle umbell first

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

1. Pastinaca sativa latifolia. Common yellow Carrots.

2. Pastinaca sylvestris flore albo. Wilde Carrots.

flowring, and the reft of the ſide afterwards: after they are paſte the ſeede appeareth which is of an oval forme long and round, hard and ſtaked, with ſix lines pointed at the toppes and yellowiſh, whoſe huſke is brownish, and of an aromaticall ſavour. This ſaith *Columna* differeth from the wilde *Paſtinaca* in the large ſpreading and manifold fine diviſions of the leaves, and in the pleaſanter taſte and gratefull of the roote, reſembling rather a Parſnep although their ſeedes are alike.

3. *Paſtinaca ſylveſtris hirſuta caule.* Wilde Carrots with hairy ſtalkes.

The roote of this Carrot is white and often a foote long, ſometime ſingle and ſometimes divided into two or three parts, very like both in ſent and taſte to a Parſley roote, but hotter in the mouth for a long time, from whence ſpringeth up a ſtalke a foote and a halfe high as thicke as ones little finger at the bottome, being ſomewhat round but creſted or cornered very plainly, exceeding hairy and full of joynts, whereat grow large creſted leaves of winged leaves compaſſing the ſtalke at the bottome, a foote in length, divided into ſundry leaves, and ſo againe into other ſmaller parts very rough and hairy alſo, and of a yellowiſh greene colour, ſmall leaves which leaves and the ſtalkes at the joynts, come forth other creſted ſtalkes and the like leaves as theſe but leſſer, and doe very well reſemble the leaves of our garden Carrots but larger and ſoft if one handle them but rough both on the backe and edge being gently touched: from every one almoſt of theſe joynts both of the ſtalke and branches ariſeth a certaine long huſke, conſiſting of ſix ſmall long leaves cloſe ſet together in which it openeth the ſelfe forth a ſmall tuft or cloſe umbell of white flowers, and ſometimes yellowiſh, ſomewhat ſweet, after which doe follow ſomewhat round ſeede, two alwayes joyned together and very prickly on the backſide, the inner ſide being flat and more yellow then Carrot ſeede, elſe ſomewhat like.

The Place and *Time*.

The firſt kindes are alwayes ſowen in Gardens or in the fields choſen out for that purpoſe, the other grow the firſt plentifully in our owne Land by the fields ſide and in untilled places: the laſt in the like places in Italy, the reſt in *Naples* and doe all flower and ſeede in the end of Summer.

The Names.

Staphylinus in Greeke derived (as is moſt likely) from σταφυλη the grape which it is almoſt like when it is ripe, for the one ſort hereof doth reſemble and not from σταφις the ſtalke of Bryonie as ſome imagine. Both the tame and wilde ſorts of *Paſtinaca* in Latine as *Dioſcorides* the wilde in the text called *Staphylinus* ſimply ſo taken for the wilde Carrot it muſt not be not joyned with it as we ſpeake the name which in Latine ſignifieth to take the name *a poſtendo cum corpus alat*, is now a dayes divided into *ſativa* is into *latifolia* which is the Parſnep whereof I ſhall ſpeake hereafter, and into *tenuifolia* which is called alſo *Carota* by divers from the *Italians* who doe ſo call it, but *Dodonæus* thinketh the word to be the *Germane Carrot* which is *ſtrum rubrum* but I doe not ſo thinke, and *Daucus* ſince as it is thought *Attus*, whereof yet there is ſome doubt whether the word ſhould not be *auctus* which is yellow, as the copies rather then *auratus* which is blacke as it is but in few. *Cato* alſo ſeemeth to call it *Carota*

an addition of wilde & Peßinaca, that others might know he did distinguish it from the true Daucus, but hereupon hath the Apothecaries shops beyond the seas, and with us, the first wilde sort was usually in former times taken for Daucus, and so vsed, and the vse continueth with many to this day; and Dioscorides the with that Staphylinus bear-rath a white spot in the middle of the white umbell, whereby it may be knowne to differ much from any Daucus which doth not so, besides that he speaketh of them in severall Chapters. The first is the Peßinaca sativa, or tame Parsnep by most Authors, yet some following the Greeke name, call it Staphylinus primus & sativus, according to the colour of the roote yellow or red, as Tragus and some others, and Matthiolus, Lobel, and Tabernamontanus, Siser alterum, or Cicuta, as Guilandinus, Cæsalpinus, Camerarius and Lobel's Cameracum saith Camerarius: some do not much amisse that take the roote of the red and yellow Carrot for the true Daucus to be eaten raw: the second is called Peßinaca sylvestris by Matthiolus and others, and Staphylinus secundus Dioscoridis by Dodonæus and Lobel, Peßinaca erratica by Lugdunensis, Cordus and Tabernamontanus, Staphylinus sylvestris by Tragus and Cæsalpinus, and Daucus agrestis by Galen in lib. de alimentis; Daucus vulgaris, and sylvestris by Camerarius and Lobel: the third is called by Columna Peßinaca sylvestris Daucoides Apula: the fourth is by some also called, as it is in the title: the last is the Daucus nanus of Thalius, that is to say herniaria caule, and may be the Daucus angustifolius of Cordus in historia, although he findeth some defects and differences therein from his. The Italians call it Carota, and by some Peßinaca: the Spaniards Candonia, as they call the Parsnepp: the French also Peßinades, but they adde jaunes to distinguish it from the Parsnepp, and the wilde kinde Peßinades sauvages (the Germanes Gael Ruben, and Mohren, and the wild Carrot Vogelneß as the Dutch doe, and the low dutch Geel poetsen, and geel wortelen; and we in English wilde Carrot.

The Vertues.

The manured or garden kinde is somewhat windie with the sweetnesse, and therefore in the nourishing thereof body lost, but doth not expell winde as some have thought, for so it should worke contrary effects which is not found herein: the wilde kinde indeede, is more physicall, and besides that it breaketh winde, and stitches in the sides, it prouoketh urine and womens courses, and helpeth to breake and expell the stone: the seede also of the tame worketh the like effects, and is good for the dropsie, and those whose bellyes are swollen with winde, helpeth the cholicke and the stone in the kidneyes, and the rising of the mother being taken in wine, or boyled in wine and taken, and helpeth conception: Dioscorides saith, that it is so powerfull to helpe the bitings or stings of venemous creatures, that if it be taken before hand their bitings shall not hurt them; the leaves also he saith, and Galen doth the like, being applied with honey to running vlcers or sores doth cleanse them.

Chap. XV.

Seseli. Hart-wort.

Because there are many sorts of Seseli, much differing in forme one from another, some having fine leaves like Fennell, others like Hemlockes, or other herbes they might peradventure seeme for to some to be referred to the severall Orders here appointed, but I thinke it better to place them all together.

1. Seseli Massiliense Fœniculi folio, quod Dioscoridis censetur.
The true Seseli or Hart-wort of Marseilles, as it is thought.

The true Seseli Massiliense Dioscoridis, as it is taken by the most iudicious Herbarists of our times hath a very long white slender roote like vnto Fennell, but smelling better, and tasting hotter and sharper, having but few leaves thinly set on the stalkes, thicker and shorter, and harder than Fennell leaves, turning downewards, of a grayish or ash colour, as all the rest of the plant is (especially in the hotter countries, for in some places they are thicker or longer or shorter than in others, as Lobel saith it is obserued) the middle stalke riseth two foote high, bowing to and fro sometimes, hauing many branches from the bottome with the like leaues on them, and each bearing umbells of white (some wholly and seldome purplish) flowers, after which come small long seede more like to Annisseede than Fennell, somewhat pleasant in taste, yet sharpe and hot.

1. Seseli Massiliense folio Fœniculaceo Dioscoridis censetur.
The true Seseli or Hart-wort of Dioscorides as it is thought.

2. Seseli Massiliense alterum.
Another Hart-wort of Marseilles.

Thurcher's Seseli Massiliense hath likewise Fennell-like leaues, but thicker and shorter divided, greene and hard set with white points, whose winged stalkes are larger and more spread than Fennel's the middle stalke two cubits or more high, of a fingers thickenesse, crested, jointed, and branched into divers other slender parts, each of them carrying umbells of white flowers on their toppes which turne into flat seede, not much vnlike to Angelica seede, and bigger than Dill, long pale, and very aromaticall, the roote is thicke, long and white, with diuers strings and fibres thereat hanging sparely.

3. *Seseli pratense Montpelienſium.* Medow Hart-wort of *Montpelier.*

The roote of this Hart-wort is blacke without and white within, parted into many ſtrings with fibres at them creeping well, from whence riſeth a ſtalke two or three foote high, with divers large ſpread ſtalkes of winged leaves very finely cut into many parts, each being like unto Fennell, but larger, harſher, and of a darke greene colour, ſet at the joynts, and branching forth towards the toppes, bearing umbells of white flowers, and after them ſeede ſmall, long, and ſomewhat flat ſeede, larger and blacker than Fennell, and neare unto *Meum Spig.* in forme, of little ſent, and a ſmall ſharpe taſte.

4. *Seſeli pratenſe noſtras.* Our *Engliſh* greene Saxifrage.

The likeneſſe of this our *Engliſh* greene Saxifrage unto the laſt *Seſeli* deſcribed, hath made me joyne it next thereunto, although I might have put into the Claſſis of the Saxifrages, but that being an umbelliferous, I would place it among the ſame Tribe or Family, which hath ſtalkes riſing nothing ſo high, ſomewhat creſted, and thereon ſtalkes of winged fine cut leaves, but nothing ſo largely ſpread, yet ſomewhat like them in greeneneſſe, harſhneſſe and forme, or ſomewhat leſſe; the umbells of flowers are ſmaller, paler, or ſomewhat tending to a yellow with whitenеſſe, and the ſeede after them like unto common Fennell ſeede, both for forme and greatneſſe, but of a browner colour and ſmall taſte.

5. *Seſeli pratenſe tenuifolium.* Medow Hart-wort of *Germany.*

The *Germane* Hart-wort hath a round creſted or ſtraked ſtalke above two cubits high, with divers joynts and leaves at them, very like for the forme and diviſions unto the wild Carrot leaves, but ſmooth, and not rough, and of a deepe greene colour, branching forth into ſundry parts, bearing umbells of whitiſh yellow flowers, after which follow long ſtrait long ſeede ſomewhat like Fennell and Carraway, or betweene them both, and ſomewhat greater: the roote is as thicke as ones finger, and very long, blacke without, and white within, of a ſharpe and ſomewhat bitter taſte.

6. *Seſeli paluſtre laſerpitium.* Milkie Marſh Hart-wort.

The ſolke Hart-wort riſeth up with a round ſtemme or ſtalke three cubits high, with joynts and long ſtalkes of wel ſpread leaves ſet at them, the diviſions whereof are very ſmall, and much cut in, almoſt like to thoſe of Carraways, or betweene them and Fennell, at the toppe of the ſtalkes it breaketh forth into branches, and they beare ſmall umbells of white flowers, after which follow thinne, flat, and winged ſeede: the roote is long and browne on the outſide, of an unpleaſant taſte, with no ſmall heate joyned therewith, which inflameth the throate, but being planted in a Garden, it looſeth much of the evill taſte of the burning qualitie becomming more milder: the whole plant, or any part thereof being broken, there iſſueth from it a certaine milke, as many other umbelliferous plants doe.

7. *Seſeli Creticum majus.* The greater Hart-wort of *Candy.*

The greater *Candy* kinde hath tough and hairy round ſtalkes, about two or three foote high, ſet with long ſtalkes of winged leaves, much reſembling Parſneppe leaves, both in forme and greatneſſe, yet ſomewhat longer and narrower, dented about the edges, and pointed at the ends, being rough and hairy likewiſe, and turning themſelves a little backward to the ſtalke, towards the toppes of the ſtalkes they branch forth and have ſmaller leaves ſet at the joynts than grow below, bearing umbells of purpliſh white flowers, whereon after they are paſſed, grow flat whitiſh round ſeede, circled about, as it were, with a border, and cut in round about it alſo with round dents, of little or no ſmell or taſte: the roote is white, ſomewhat long and woodily after it hath ſeeded, and periſheth, riſing from the ſowing of its owne ſeede againe plentifully.

8. *Tordilium ſive Seſeli Creticum minus.* The leſſer Hart-wort of *Candy.*

The leſſer *Candy* Hart-wort hath ſuch like ſtalkes of winged leaves, but ſmaller, ſlender, and ſhorter, ſomewhat hairy and whitiſh: the ſtalkes are leſſer and lower, fuller of branches, bearing paler purpliſh flowers in umbells and ſeede after them, of the ſame faſhion, but ſomewhat ſharper and quicker, as the herbe is alſo, and therefore more accepted and uſed as a ſallet herbe with the *Italians* and others: the roote is as unprofitable and periſheth as the laſt.

9. *Seſeli Creticum majus luteum.* Great *Candy* Hart-wort with yellow flowers.

This Hart-wort groweth very like the firſt greater kinde, having the like leaves on the ſtalkes, but ſomewhat ſlender and ſhorter, a little ſharpe in taſte, and not above two or three couples together, ſet on the like ſtalkes, and manner of branches, and bearing umbells of yellow flowers like Dill, without any leaves under them as the other have: after which follow ſuch like whitiſh flat buckler-like ſeedes ringed and dented about the edges like them, but larger and broader, and divided in the middle with a brownish ſtroke or line, making the ſeede ſeeme like two ſeedes of *Thlaſpi* or Treakle-Muſtard ſeede: this flowered and ſeeded at *Naples* in *May*, as *Columna* ſaith, and is rare yet in gardens, and not wilde.

10. *Seſeli Creticum minimum.* The ſmalleſt Hart-wort of *Candy.*

This ſmall kinde is very like unto the leſſer *Candy* ſort that is eaten in ſallets, but with leaves like the lower leaved Coriander, ſoft but a little hairy: the firſt leaves being of an inch and a halfe long, and an inch broad, and dented about the edges with round dents: the ſecond leafe is of two inches long, the third hath a longer ſtalke, with two leaves ſet thereon, ſmaller and rounder than the other, about halfe an inch broad, and a bigger leafe at the end, yet ſmaller and longer than the firſt leafe, the next are leſſer and longer, the ſtalke is naked of leaves, being ſmall, hard, hairy and ſtraked, and carrying diſtake umbells of white flowers, with yellow ſeede in the middle, and under ſet with long hairy leaves, the outer flowers being larger than the inner, thereby reſembling the umbell reſembleth that of the wilde Carrot, after which come ſuch like ſeede as the former have but ſomewhat greater, the middle part being of a darker colour, before they are ripe they looke of a purpliſh greene colour, but white when they are full ripe, of an aromaticall taſte, ſomewhat bitter, and ſomewhat ſweete in the end: the roote is ſmall, white, hard, and a little bearing in taſte. *Columna* ſaith, that the *Cunila ſive Satureia ſylveſtris* of *Lobel* is like unto this plant, if the figure be not imperfect.

11. *Seſeli montanum latifolium glaberrimum.* Mountaine Hart-wort with ſmooth Hemlocke-like leaves.

The mountaine Hart-wort hath large ſpread leaves, divided into many ſmaller parts, ſomewhat like unto the leaves of *Seſeli Pannonici*: the ſtalke is hollow, and riſeth a cubit and a halfe high, dented into branches

having small smooth long leaves, more finely divided at the joynts, and larger umbells of white flowers at the toppe, which turne into yellowish crested seede, two joyned together of an aromatike and hot taste.

13. *Seseli montanum Cicuta folio subhirsutum.* Hairy mountaine Hemlocke Hart-wort.

This other Hemlocke Hart-wort from a thicke roote, sendeth forth broad Hemlocke-like leaves, or like to the greater sweete Chervill, of a darke greene colour, and somewhat rough and hairy, especially the foote stalkes of the leaves, in the middle of whom riseth up a thicke hollow, crested, hairy and joynted stalke, about two foote high, divided into severall branches, with few leaves thereon but lesser: at the toppe whereof standeth a large umbell of white flowers, which are succeeded by long, sharpe pointed seede, two joyned together.

14. *Seseli Peloponesiacum vera officinarum.* The most usuall received *Seseli* or Hart-wort of *Peloponesus*.

This true Hart-wort hath a great roote, blackish on the outside, and white within, growing thicke into the ground like *Ferula* or *Thapsia*, somewhat sweete in smell and hot in taste, the stalke riseth two foot high or better, as thicke as ones finger, with divers large spread leaves at the bottome as great as Hemlocke, but crumpled, rough and hairy, the stalke and branches beare large tufts or umbells of yellow flowers, which after yeeld broad flat winged seede, of a pale yellow colour, somewhat like unto Angelica, but greater, and nothing so thicke, of a very sweete scent as the Seseli *Aethiopicum* hath. This, saith *Lobel*, the cheefest learned and most judicious Herbarist of *Europe*, acknowledged upon due consideration thereof, to be the true *Seseli Peloponense* of *Dioscorides*, although formerly they tooke it to be a kinde of Thapsia, but saith he, the true Thapsia is much differing, both in forme and colour from this, so that none there doubteth of the truth thereof.

15. *Seseli Aethiopicum frutex.* Shrubbe Hart-wort of *Ethiopia*.

This Hart-wort of *Ethiopia* to keepe his fellowes company for name sake is fitted to be placed here, although in time and everliving: the roote forth sundry woodily rough stems, covered with a blackish barke, divided into many branches two or three cubits long, beset with many faire, large, thicke and hard, smooth and pale greene leaves, growing long, and somewhat like unto Woodbind leaves, but not so broad, smooth on the edges, and not indented or cut at all, on the toppes of the branches stand small tufts of yellow flowers, which afterwards beare long small and long seede, bigger and larger than sweete Fennell seede: the root is great and woody, having divers smaller roots growne with divers strings from it, abiding many yeares, if it be defended from the colde: the whole plant smelleth very sweete, and the seede best, being of an aromatike taste somewhat biter and sharpe withall; which commendeth it by *Dioscorides* for the best of the *Seseleos*, and beyond the *Massiliense*.

16. *Seseli creticum radosum.* Great joynted Hart-wort of *Candy*.

This rough plant riseth up with some five or six hard round, and rough, or rather prickly stalkes, about two foote high, whose joynts are great and bunched out like knees, with a rough large winged leafe, or two at each of them, one of more, and others of five parts, and every of them also divided into severall parts, of a sad or dead greene colour drawing towards yellow: the seed tufts, the stalke is rough and crested, and the sundry branches hereof do carry their tufts or umbels of flowers: which turne into great, long, and round, rough seede: the roote is composed of many leader, long, white woodily strings, perishing yearely.

The Place and Time.

All of these *Seseles* grow about *Montpelier*, and in *Narbon* in *France*, yet some in *Germany*, other in *Italy* and *Candy*.

Candy, and some in our owne country; and although some of them be entituled of *Candy*, yet that is no reason that kinde which *Dioscorides* doth so call, as likewise that of *Peloponesus* in *Greece*, and that of *Marsilia*, and most of them doe beare ripe seede with us before the end of Summer, if care be had in the ordering and keeping of them.

The Names.

Sesel in *Greeke*, is likewise called *Seseli* in Latine, and of some *Siler*. The first is taken by *Lobel* to be the *Seseli Massiliensium* of *Dioscorides*, because there is not about *Montpelier* & *Monspelier*, any other herbe that answereth so nicely unto the description thereof by *Dioscorides*, as this doth, and *Clusius* also confirmeth the same, as is before declared. *Lobel* saith also that formerly it was called by the students, and others there, *Foeniculum tortuosum*, because the stalke groweth seldome upright but crooked: the second is the other *Seseli Massiliense* of *Lobel*, which he calleth *Ferula aut Daucus Cretico facie*, & the *Seseli Massiliense* of *Matthiolus*, against whom *Lobel* contendeth affirming that it grew on the hills by *Trent*, where he saith, it is not to be found, nor yet on *Baldus*, which is more fruitfull in rare plants than they are, and but onely to be found about *Montpelier*, and at the foote of Mount *Baldus* in *Italy*, which is in the way from *Rome* to *Sienna*. *Camerarius* calleth it *Seseli Massiliense secundum*, and saith *Lucas Ghinus* affirmed to have seene twentie sorts of herbes called all by that name. *Gesner in horto Scetmensi* and others, doe meane this kinde that they call *Massiliense*: the third *Lobel* also calleth *Seseli primum Massiliensium*, which *Gesner in horto* thinketh is the *Ligusticum* of *Matthiolus*, *Dodonæus* calleth it *Siler montanum tertium*, *Bauhinus* thinketh it may be the *Selaris Plinij lib. 26. c. 8.* and withall saith it is the *Pastinaca nigra* of *Cordus* in his history, which in my judgement differeth much from it, for that of *Cordus* hath divided leaves like wilde Carrots, and this like Fennell, that hath yellowish flowers, this white, and the seede likewise seemeth to be more sharpe, which is not found in this, although growing in a hotter climate. *Tabernemontanus* calleth it *Hippomarathrum*: the fourth *Lobel* calleth *Sazifraga Anglorum facie Seseli pratensis Massiliensium*, for although it be somewhat like to it, yet it is not the same as he there sheweth: the fift is called by *Bauhinus Seseli pratense tertium sive Daucoides pratensis tenuifolium* described in his *Prodromus*, as though none had expressed it before, whereas it is the very same *Pastinaca nigra* of *Cordus* spoken of before, as any that will compare them together shall easily finde: the sixt *Camerarius in horto* described, but *Bauhinus* in *Prodromo* giveth the figure of it, which none had done before: the seventh is called *Tordylium sive Seseli Creticum majus* by *Lobel* and *Lugdunenses*, and *Seseli Creticum majus* by *Camerarius*; *Cæsalpinus* saith, that in *Italy* it is called *Pimpinella Romana altera prima facie*: the eight is the *Tordilion Nicandri*, and *Tordylion Dioscoridis* by *Anguillara*, *Tordylion* and *Tordilion* by *Durantes Turner*, and others, and *Seseli Creticum* by *Lobel*, *Dodonæus* and others; *Cæsalpinus* and *Columna* saith, this is commonly called in *Italy Pimpinella Romana*, and familiarly eaten as a sallet herbe, and *Bellonius* saith, that this is the *Lactuca*, that is *Caucalis* which is used in *Candy* and *Greece*, as *Honorius Belon.* the web in his tail Pastie to *Clusius*: the ninth is set forth by *Columna*, by the name of *Tordylion majus alterum latifolium*: and the tenth is *Tordylium minimum Apulum alterum* by him also: the eleventh is thought by *Bauhinus* to be the *Ligusticum alterum* of *Lobel* and *Lugdunenses*, *Ligusticum secundum herbariorum* of *Tabernemontanus*, but I thinke it doth better agree unto the next, and is the *Seseli primum montanum* of *Clusius*, called by *Bauhinus Seseli montanum folio Millefolij glabrum*, and thinketh it may be the *Seseli Peloponesiacum* of *Dioscorides*: the twelfth is set forth by *Bauhinus* as it is in the title: the thirteenth is the true *Seseli Peloponesi folio Cicutæ Dioscoridis*, as *Lobel* saith, and so taken by the learned at *Montpelier*, as I shewed before, and thereof it thought he so set it forth with them as though his *Peloponesi* it placed with the Thapsia: the fourteenth is also taken at *Montpelier* for the true *Seseli Thapsia Dioscoridis*, as *Lobel* saith, all other authours acknowledge the verity thereof, only *Matthiolus* maketh a doubt whether his *Seseli Æthiopicum* (which is an herbe and no shrubbe, and well knowne now to be the *Ethiopis Theophrasti*) or this *Æthiopicum*, which he calleth *alterum* should be the truer, for that as he saith they both resemble it very well, but *Lobel* taxeth him too bitterly for it: the last hath his name in his title as I received it, and is not the *Daucus Creticus nodosus* before.

The Vertues.

The true *Seseli Massiliense* is commended by *Dioscorides* to helpe the straungury, and the straightnesse of breath, as also the suffocations of the mother, provoketh their courses, and expelleth the dead child, helpeth also the falling sicknesse, old coughes, and all other inward griefes, either the roote or the seede being taken in wine: the seede drunke in wine doth helpe digestion, expelleth winde and the paines in the bowells: it helpeth those that have taken cold in their journey, if they drinke it in wine with some pepper: it is given to Goates and other cattle to facilitate the delivery of their young. *Pliny* saith that women use it before their delivery of child (being taught by Hindes that eate *Seseli*'s to speede their delivery, as *Aristotle* did declare it) to helpe them at that time. *Galen* sheweth that the rootes of *Seseli*, speaking in generall of them all, are so powerfull in heating that they provoke urine, and are of thinne parts, that they helpe the falling sicknesse, &c. the other *Seseli* that *Dioscorides*, have the same facultie and operation: the *Candy Seseli* is good to provoke urine, if it be stopped or ordered, and womens courses also: the juyce taken with the seede in wine for seven dayes together helpeth the paines of the kidneyes, and driveth forth the stone engendered therein: the roote being taken with honey is good to breake the flegme in coughes, and to cause it easily to be spit forth. *Paulus Ægineta* saith, that *Tragium* taketh away bruises, and the blacke and blew spots that come by strookes or otherwise if one part of *Tragium* be put to two parts thereof, and laid to with honey. Our *English Seseli* or Sealrage is well approved and much used by country people, either the juyce or the decoction or the distilled water of the seede to be drunke in wine, to helpe to breake and expell the stone, to provoke urine, and to expell wind, and that both old or young, and is much given to sucking children for the wind, as women call it, which is winde in their guts and stomackes. The *Ethiopian Seseli* is preferred for the singular vertues therein, beyond all the other kindes of *Seseli*, and therefore most in use of all other to be used in medicines especially those two notable great compositions *Mithridatium* and *Theriaca Andromachi*, and *Lobel* sheweth that he gathered about *Montpelier* a whole basket full that he sent thereof to *Venice* and other places sufficient for them to use in the said compositions: the rest are little or not at all used to any physicall purpose.

Chap.

Chap. XVI.

Ligustico vero similis sive Siler montanum. Libstricke or Sermountaine of *Liguria*.

OF this *Ligusticum* I have two sorts to bring to your consideration both of them in face neare corresponding one another, and first of that which is held to be truest.

1. *Siler montanum vulgo Sistios.* The true Libstricke or Sermountaine of *Liguria*.

The true Sermountaine of *Liguria* riseth up with a round joynted stalke two or three foote high bearing both at the bottome and at the joynts large spread winged leaves, divided into many fine dry and small leaves whose small footestalkes beare usually two leaves and sometimes foure, set one against another, and ever at wayes at the end, each being much broader and thicker then Sow-Fennell leaves, almost equall to Hellebor, of a small sweete taste if they bee a little rubbed, and spreading at the toppes into a few branches bearing very large umbells of white flowers and after them long, thicke, full browne yellow seede larger by halfe then Cumin seede, two alwayes joyned together, striped on both sides and winged, with yellow thicke veines at the edges, and of a quicke sharpe hot taste and taste: the roote is long great and whitish on the outside, of a hot sharpe taste and taste likewise abiding long.

2. *Siler montanum angustifolium.* Narrow leafed Sermountaine.

The stalke of this Sermountaine is small about a cubit high divided into branches, which beare small umbells of white flowers: the leaves are few separated into many thinne small leaves like unto Sow-Fennell but much thorter and thicke towards and at the toppes more finely cut like haires.

The Place and Time.

The first is found plentifully growing on the *Appenine* hills in *Liguria*, whose chiefe Citie is *Genua*; and the other in *Austria* and doe seldome beare ripe seede with us unlesse in a warme kindly season.

The Names.

It is supposed by the most judicious writers of these times that it is the true *Agreste* of *Dioscorides* or *Asbrotis* of *Galen* by changing one letter, and tooke the name from *Liguria* the Country where the best and most store groweth and there they call it *Siler montanum*, in Latine it is also called *Ligusticum* but not *Levisticum*, which is our Lovage much differing from this as may soone be discerned: but this is also be same that *Adamantius* calleth *Ligusticum*, and after him *Lugdunensis*, *Cæsius Dioscorides* and others. *Tragus*, *Lobel*, *Dodonæus* and *Clusius* call it *Siler montanum* as was used in the Apothecaries Shoppes, and *Sesselis* also, because in former times they knew none of the true *Sesselis*, but as *Lobel* saith this ercour was tollerable, because they tooke a seede that had more sharpenesse and was of more efficacie then *Seselis*, although as *Gesner* saith it is like none of the *Sesselis*. *Cæsalpinus* calleth it *Siler montanum* and *Peloponnense*. *Pliny* sheweth that *Siler* tooke the name from *Sila* whereby

1. *Siler montanum vulgo Sistios.*
The true Libstricke or Sermountaine of *Liguria*

2. *Siler montanum angustifolium.*
Narrow leafed Sermountaine.

they used the seede for *Seseli*: and anciently they used to call *Seseli* by the name of *Sili* and *Selis*: *Pliny* saith that *Crateuas* used to call it *Cunila bubula*, and some *Romanes*: the last is remembred onely by *Apuleius* in his *Herbs*, and set downe in his *Prohemes*, I have called it in *English* Libisticke, or Set mountaine, as the fittest to expresse it.

The Vertues.

This Libisticke or Set mountaine is of a warming and digesting qualitie both roote and seede, and helpeth ward gripings and paines, swellings and winde, especially in the stomack, it provoketh urine also and womens courses being drunke or the roote outwardly applyed, and is used against the bitings of venemous beasts and serpents, and therefore is put both into Mithridate and Treakle, and for the propertie to breake winde is used among other things tending to the same purpose: the *Ligurians* among whom it groweth use the seede familiarly in their meats, to season and relish them as others doe with pepper.

CHAP. XVII.

Carum, Caraway.

ALthough with most writers there hath beene but one kind of Caraway formerly remembred, yet because there are two other herbes that nearely resemble it, I will put them together.

1. *Carum vulgare*. Ordinary Carawayes.

The ordinary Caraway is well knowne to beare divers stalkes of fine cut leaves lying on the ground, somewhat like to the leaves of Carrots, but not bushing so thicke, of a little quicke taste in them, from among which riseth up a square stalke, not so high as the Carrot, at whose joynts are set the like leaves but smaller and finer and at the toppe small open tufts or umbells of white flowers which turne into small blackish seed lesser than the Annis seede, and of a quicker and hotter taste, the roote is whitish small and long, somewhat like unto a Parsnep, but with a more wrinkled barke and much lesse, of a little hot taste and quicke, and stronger then a Parsnep, and abideth after seedetime.

1. *Carum vulgare*. Ordinary Caraway.

2. *Carum Alpinum*. Mountaine Caraway.

This mountaine Caraway is a small plant and smooth, shooting forth from a long blackish aromaticall roote sundry long stalkes with leaves on them like unto the former Caraway, but the devided leaves are somewhat broader and of a pale greene colour, from among which riseth one or two slender stalkes halfe a foote high, from the middle upwards bare or without leaves and thence spreading five or six small sprigges to forme an umbell, each of them bearing at the toppe a few small flowers in a tuft as it were together, of a reddish yellow colour.

2. *Carum pratense*. Medow Caraway.

The Medow Caraway groweth greater and higher then the ordinary kinde, with leaves somewhat like also unto it but larger, the spokie umbells of white flowers are likewise larger, and the seede like unto Cumin seede but much larger: the roote is small and slender of a sent somewhat strange or like unto Danke, of an hot and sharpe taste yet not so much as the seede.

The Place and *Time*.

The first groweth as *Tragus* saith in *Germany* in many places in the fields, and by the way sides, it is usually sowen with us in Gardens: the second was found on the *Pyrenian* hills, and the last in the fields and medowes of *Germany*, as *Tragus* saith also: they flower in *June* or *July* and seede quickly after.

The Names,

κάρον in Greeke is *Carui*, and *Carum* in Latine or *Carui*, as it is in the Apothecaries shoppes, *Symeon Sethi* calleth it *Carnabadion*, and tooke the name as *Dioscorides* saith from the Countrey of *Caria*, from whence it was first brought. All Authors doe generally call the first *Carui* or *Carum* and some *Carcum* and some *Carenum* as it is in shoppes, *Bauhinus* calleth it according to his owne country use *Carum pratense*: the second *Bauhinus* hath onely expressed in his *Pinax* and described in his *Theatre*: the third *Tragus* calleth *Cyminum equinum* after the high *Dutch* name as they call it there *Roßkimmel*: *Bauhinus* referreth to the *Panicularia aruensis alterius Lonicri* and *Hippomarathrum* of others, as if it were a Fennell: the first sette calleth it onely *Carui folia*. The *Arabians* call it *Karuia*, *Karauia* or *Carui*, the *Italians Caro*, the *Spanyards Caraua*, and *Alcaraua*, the *French Carui*, the *Germanes Wilt kummel* that is, *grasse Cumin*, and the *Almaines Matthiolus*, the *Dutch Carue*, or *Smicker seen*, and we in *English* Caraway.

The Vertues.

Caraway seedes are hot and dry as *Galen* saith, almost in the third degree, and have withall a moderate binding qualitie, whereby it breaketh winde and provoketh urine, and that not the seede onely but the herbe also and the roote thereof is better foode then of the Parsnep, and is pleasant and comfortable to the stomacke [illegible]

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

The feede is conducing to all the cold griefes both of the head and ſtomacke, the bowels or mother, as alſo the cholicke, and helpeth to sharpen the eye ſight: the powder of the feede put into a poultis taketh away the ſpots of blew veines or bruiſes, the feede is muchuſed in Bread, Cakes, &c. to give a reliſh and warmeth them as of a ſpice, and is ſo wholeſome to eate with fruit to breake the windineſſe of them: the herbe and flowers of the feede bruiſed and fryed layd hot in a bagge or double cloth to the lower part of the belly eaſeth the paines of the winde Cholicke.

Chap. XVIII.

Anisum. Anile.

Anile is a ſmall low herbe ſeldome a yard high, having the lower leaves broader then thoſe above few upon the ſtalkes, ſeldome divided, but dented on the fore part, of a whitiſh greene colour, and of a good ſweet taſte and ſmell, the ſtalk is roundler and not ſpread into branches having at the toppe, where the white umbells of flowers doe ſtand, which afterwards give ſmall round whiteiſh ſeede very ſweete, yea more then any umbelliferous ſeede and pleaſant taſte, and ſmell yet ſomewhat quicke withall: the roote is ſmall and periſheth every yeare, and is to be new ſowen in the ſpring.

The Place and Time.

It is every where ſowen even in the Eaſt Countries as in Aſia, or the where, and not knowne where it is naturall, but is very fruitfull and plentifull in hot countries, being ſowen and gathered within three or foure moneths at the moſt.

The Names.

It is called in Greeke ἄνισον γραῦς ἀλλοτρίου τοῦ γόνου, ἐμβάλλουσα καὶ ὑποβαλλομένη, ἢ ἀνίσημι ἐστὶν ἀπὸ τοῦ ἀνίσου καὶ ἀνωμάλου, καὶ ἀνίσους φλεγμονὰς ἐμποιοῦντος ἢ ἀνίσους τοὺς ἐντέρους ἔχοντος: it is generally called *Anisum* of all authors, and almoſt by all nations according to their dialect, onely the Spaniards call it *Matahalna* and *yerva dolce*.

The Vertues.

Galen hath erred very much in relating the temperature of Anile ſeede, ſaying it is hot and dry in the third degree, and burning withall, by reaſon of the ſharpeneſſe and bitterneſſe: when as it is well knowne it hath no ſuch acrimonie therein that it ſhould come neare to any burning nature: for the ſweetneſſe doth ſo temper the ſharpeneſſe therein that it doth not exceede the ſecond degree in heate nor the firſt in drineſſe: but the chymicall oyle drawen from the ſeed exceedeth much theſe degrees, the ſpirits being extracted muſt needs be the more fierce: The ſeede being often taken helpeth a ſtinking breath and to breake winds in any part of the body, bee it the head, ſtomacke, guttes, bowelle or mother, and to provoke Vrine and ſtirre up the mothers ſeate: they helpe Nurſes to ſtore of milke to their children, to eaſe the ſeedes conſired falling and lothſomneſſe, and is very good alſo for teeming women or ſuch as they helpe thoſe that are ſhort winded, or have ſymptomes of Conſumption, to take the decoction of Hyſſop, Figs & Licorice, &c. they helpe alſo to expectorate matter in them that have a Cough or ſtraightneſſe in the breſt, and is very conducible to the ſtomacke, and being boyled in wine and taken it helpeth the obſtructions of the Liver aſſuredly, and the Dropſie that commeth of the ſame alſo it openeth the liuer and helpeth digeſtion: the chymicall oyle taken in broth or in wine and a ſmall drop or two at the moſt for a time doth wonderfully helpe the giddineſſe of the head, the ſtraightneſſe of breath in the breſt and ſtomacke, or the crudities and belchings therein, the much deſire to caſt, and the riſing of the mother, as alſo all other griefes and paines inwardly that riſe of cold or windineſſe: Anile either greene or dry put to their eyes that have any hurtfull thing fallen into them it will ſoone draw it forth and helpeth them quickly: the venome of any hurt by the bitings of venemous creatures, and healeth them quickly: the ſame boyled in oyle of Roſes and dropped warme into the eares eaſeth the paines and noyſe in them: the ſame and Time mixed together, and the fumes thereof taken being caſt on quicke coales, to the head that the vertues may penetrate the better, will ſoone eaſe the continuall head ach: The *Italians* have a ſaying, *Qui vult vivere in mundo vita plantis & aniſo, non ſarcas moleſtatibus malicadus*; that is to ſay, he that hath the ſeede of Anile in his hand ſhall not be troubled with the Falling ſickneſſe: but although this may ſeeme to be the caſe, yet I doe not adviſe to grievous a ſickeneſſe, yet aſſuredly the diſtilled water of the herbe or more effectually of the oyle, or I would ſay and uſe rather the Quinteſſence thereof made as I ſhall ſhew you preſently is very much good for thoſe that are frantricke or diſtempered in their braines, eſpecially if alſo there be an outward uſe with the herbe or ſeede and other conducible things to the forehead and temples: the ſame is alſo effectuall for old folkes as well as young children that have the Falling ſickneſſe, or are troubled with

with Spasmes and Convulsions. The Quintessence is made in this manner, having infused the herbe small (what quantitie every one please) for 24. houres in good spirit of wine, let it stand as long in digestion never then let it bee pressed forth and distilled or vapoured gently in glasse, the residence in the bottome will come to the thicknesse of thinne hony, keepe it for your use as afore said.

Chap. XIX.

Ammi. Bishops weede.

Although we have not the true *Ammi* of *Dioscorides* and the ancients in all the Christian world, neither growing or to be seene with any Apothecarie or Druggist, yet wee have two or three kinds that learned men have called by that name which we will here set forth unto you.

1. *Ammi vulgatius.* Common Bishops weede.

Common Bishops weede riseth up with a round straight stalke, sometimes a little crooked, usually three or foure foote high be set with divers small long and somewhat broad leaves, in some places, and dented about the edges, growing on both sides of the long footestalke one against another, of a darke greene colour, somewhat like unto Skirret leaves, having sundry branches on them, and at the tops tunbells of white flowers which turne into small round and browne seede, little bigger then Parsley seed, not so bigge as Annseede, of a quicke hot taste, the roote is white and fibrous perishing every yeare when hath seeded, and riseth usually of it owne sowing againe.

2. *Ammi Creticum.* Bishops weede of *Candy.*

This *Ammi* sendeth forth divers slender stalkes of fine cut leaves, somewhat like unto those of wilde Carrot smelling somewhat quicke, from which rise slender stalkes with some joynts, and the like leaves to the joynts and at the tops umbells of white flowers, which turne into small seede like unto Smallage, of a sweet hot and quicke taste: the roote is somewhat great and browne on the outside, with sundry fibres darse.

3. *Ammi parvum folijs Fœniculi.* Small Bishops weede.

This small *Ammi* hath rising from a small roote two or three small and slender stalkes, about a foote high branched towards the toppes, and set with divers very fine small leaves finer then Fennell, bearing small umbells of white flowers, and very small blackish seede after them like to Parsley seede, somewhat pleasant but sharpe with a little quicke withall: the roote is small and white, perishing after seede time.

The Place and *Time.*

The first is found growing wilde in many places in *England* and *Wales* also; as by the hedge side of the corne field beyond *Greene hithe* on the way as you goe to *Gravesend*, &c. the second hath beene sent from *Crete*, and

1. *Ammi vulgatius.*
Common Bishops weede.

2. *Ammi Creticum.*

a Ammi perenne foliis tenuissimis.
Small bishops weede.

...seeds, from *Anguillara* on ... in Italy; the last was brought from *Alexandria* ... groweth in *Arabia*, and do all flower & ... well with us, if the yeare prove kindely, or ...

The Names.

It is called in Greeke ἄμμι and ἄμμις, *Ammi* and *Ammis* in Latine also, *Ameos* and *Ameos* in shoppes, and is ... of the true in most shoppes: the hill is called *Ammi vulgare* or *vulgatius* by all authors, yet *Tabermontanus* ... it *Ammi alterum*, and some tooke it to be ... as *Dodonæus* saith, and some to be *Bunium* ... as *Lobel* doubteth: but as I said in the ... the true name in *Dioscorides* is not knowne; although *Dioscorides* doth not describe it, as in many ... their were commonly well knowne in his time ... and the like, yet from some notes thereof from him, ... *Pliny*, and from *Galen*, it is plainely described ... the seede, to be much smaller and whiter than ... seede smelling like *Origanum*, and therefore was ... *Origanum Æthiopicum*, and *Hippocrates* called it *Regium* from the excellencie; yet as both *Dioscorides* and *Pliny* doe some oppose it in their times, taking the *Ammi* ... a different nature wholly, because it is smaller and ... than Cumin, but yet saith *Pliny* the use of this seede ... Egypt, both in their bread and meate, is like unto that of ... *Sisymbrium*. Now none of these seeds, ... of any other that have seene the wood for *Ammi*, or used ... the apothecaries, have the smell of *Origanum*, or can be ... with Cumin: I have onely once seene a seede ... frankincent of the *East Indies*, and obtruded for ... *Ammi*, which smell was strong, somewhat neare to ... but the other notes and markes agreed not with ... was larger, and browner also than Cumin seede, ... sowed in my Garden, but sprang not, and therefore can say no more thereof: the second is the *Ammi* of ... *Matthiolus*, *Castor*, *Lugdunensis* & ... who all call it *Ammi Matthioli* and *Camerarius* ... all, as both one; *Lobel* calleth it *Ammi Creticum aromaticum*: the last is called *Ammi alterum parvum* ... and as he saith divers suppose it may rather be taken for *Sysan* than *Ammi*. *Ammi verum* by *Gesner*, *Ammi peregrinum* by *Lobel* and *Ammium primum Alexandrinum* by *Tabermontanus*. The *Arabians* call *Ammi* ... *Nanarbe* and *Nanarce*, the *Italians* and all other Nations *Ammi* or neare thereupon, but we Bishops ... I meane these Nations here expressed; peradventure the true *Ammi* may be the *Cuminum Sylvestre* before let ... and would be better considered.

The Vertues.

The true *Ammi* is commended by *Dioscorides* and *Galen*, being of an heating and drying property in the third ... and of thinne parts, a little bitter in taste, and sharpe withall, whereby it discusseth humours, provoketh ... of womens courses, dissolveth windy, tough paines and torments in the bowells being taken in wine; ... stayeth the biting of serpents: it is used to good effect in those medicines that are given to hinder ... and hasten the operation of *Cathartikes* upon the *vitious* parts which they chiefly affect: being mixed with honey ... and applied to ... blacke and blew markes or spots by bowes and bruises, it doth take them away, and being drunke ... or outwardly applied, it abateth an high colour, and maketh it pale, and the fumes thereof taken with Rosin or ... with Rosewater cleanseth the mother. *Dodonæus* doth much commend the common but here hath set downe, that is ... to the vertues expected of the true *Ammi*: The *Egyptian* or *Arabian* seede is said to be very powerfull to ... venery, for which purpose the *Egyptians* doe much use it.

Chap. XX.

Apium sylvestre sive Ammum Germanicum. Small wilde Parsley of *Germany*.

... the resemblance of this herbe, with the last in the last Chapter, I thinke good to ioyne it next ... this growing with a tall slender stalke scarce able to stand upright without helpe, thinely ... with winged leaves on the branches, the lower leaves being largest, and divers being set on a ... like of both sides, each whereof is as small almost as the former *Ammi* leafe, some whereof will be ... three inches more or lesse, and some not one inch all, but all of them dented about the edges, at the toppes ... small tufts of white flowers, which turne into small blackish seede, lesser than Parsley, but of a ... and quicker smell: the roote groweth downe much, and spreadeth every way, whereby it ... fast on the ground, and abideth long.

a Sisarum odoratum. Sweete wilde Parsley.

... I have intituled *odoratum* to distinguish it from the former sort called *Sisum*, although peradventure ... be the right *Sisum* of *Dioscorides*: it beareth a single stalke about two cubits high, with long Fennell-like

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

1. *Seseli vulgare sive Anonum Germanicum.*
Small wilde Parsley of *Germany*.

2. *Seseli montanum.*
Sweete wilde Parsley.

like leaves at the joynts, which smell sweete betweene Dill and Fennell: the umbells are small thin set and white, and the seede small blacke well smelling, but bitterish, somewhat like Smallage: the roote is long, white, and slender: some have taken this to be *Seseli Massiliense*, but erroniously.

The Place and Time.

This was formerly taken to be a forraine plant, the seede being to be had in the Apothecaries shoppes onely in *Germany*, but afterwards divers found it wilde with them, as *Gesner in hortis* sheweth, and we have done the like with us, growing neere hedges by moist ditches almost every where, and floweth in *July*, the seede being ripe quickly after.

The Names.

Dioscorides calleth it in Greeke Σίσων, and so doth *Galen* & *Simon* also, but *Hippocrates Simon*, and *Pliny* doth write like, so that *Sison* and *Simon* be both but one plant, as *Cordus* also doth acknowledge: *Tragus*, *Gesner*, and other *German* Writers doe testifie, that the seede hereof was called in the Apothecaries shoppes of their country, *Anonum*, and used in the stead thereof, so great ignorance was spread over the face of the world for many yeares, that not onely the knowledge of herbes, but of good literature was in a manner buried, or at least neglected and lost: and therefore it is still called by many *Anonum Germanicum*. *Fuchsius* calleth it *Petroselinum Macedonicum*, as *Dodonæus* maintaineth it, taking it to be the cruell was extant before others in the Chapter next going before: I shewed you that he liked of their judgement that called the *Ammi prostratum* to be *Sesel*, and now knowe this to be the true *Sison*, and called so by *Tragus*, *Camerarius* and *Lugdunensis*, he would make it to be *Dodonæus* Parsley, but surely this cannot be referred to any of the *Selinum*, the comparing thereof, as well as the things contradicting it; *Alpinus* hath onely mentioned the other.

The Vertues.

The properties given to *Sison* are all found to be effectuall in this plant, that it is good against the diseases of the spleene and stitches in the sides, against the strangury and difficulty of making water, and womens courses when they are stopped: it likewise helpeth digestion, and is therefore used as Pepper in broths, meates, and sawces.

CHAP. XXI.

Cerefolium. Chervill.

OF the Chervills, there is both tame and wilde, which shall be here declared, but I have also thought good to make a kinde thereof, which although it doe in some sort resemble, yet I thinke it good to make a severall chapter, and to speake of it, and the other kindes thereof in the next Chapter.

1. *Cerefolium sativum.* Garden Chervill.

This garden Chervill at the first doth somewhat resemble Parsley, but after it is more like unto the leaves of Hemlocke, very much jagged, and ragged resembling Hemlockes, being a little hairy, and of a whitish green colour, it sometimes growing reddish in Summer with the stalkes alse: it sendeth forth slender

1. *Cerefolium sativum.*
Garden Chervill.

2. *Cerefolium sylvestre.*
Wilde Chervill.

bearing white flowers in spoked tufts which turne into long and round seede pointed at the ends, and blackish when they are ripe, of a sweete taste but of no smell when as the herbe it selfe smelleth reasonable well: the roote is small and long and perisheth every yeare being to be sowen a new in the spring for seede, and after *July* for Autume salleds.

2. *Cerefolium sylvestre.* Wilde Chervill.

The wilde Chervill groweth two or three foote high with yellow stalkes and joynts set with broader and more leaves devided into sundry parts, nicked about the edges, and of a darker greene colour, which likewise grow also with the stalkes, at the toppes whereof stand small white tufts of flowers, and afterwards smaller and longer seede: the roote is white and hard and as I suppose endureth long: this hath little or no sent.

The Place and Time

The first is sowen in Gardens to serve as a saller herbe: the other groweth wilde in their Vineyards and Orchards round about, and in many of the medowes of our owne Land, and by the hedge sides as also on heathes: they flower and seede early and thereupon are sowen againe in the end of Sommer.

The Names.

Columella calleth the first *Chærephyllum* and is likely to be the *Cerefolium* of *Pliny* which he saith the Greekes call *Paronyca*, but because he is so briefe nothing certaine can be affirmed, some also take it to be the [illegible] of Theophrastus lib. 7. c. 8. which *Gesner* translateth *Bubonium*, all authors doe call it *Cerefolium* or *Chærefolium*, *Dodonæus Tragoselinum* and *Cesalpinus* thinke it may bee *Orcoselinum* which it cannot bee; *Tragus*, *Matthiolus*, *Fuchsius* and others also leaning to that opinion, *Fuchsius* and *Lobel* take it to be a kind of *Gentiana*; the *Italians* call it *Cerefoglio*, the *French du Cerfueil*, the *Germans Kerffel* and *Korbelkraut*, the *Dutch Kervell*, and wee Chervill.

The Vertues.

The Garden Chervill by reason of the good relish it hath, is willingly put among saller herbes to make them relish the better, as also into Potlollies of stewed herbes which the *French* & *Dutch* doe much delight in, for it doth wonderfully warme the stomacke: it is a certaine remedy saith *Tragus* to dissolve congealed or clotted blood in the body, and to doe it like wise the blood by bruises, falls, &c. the juice or distilled waters of it drunke, and the bruised herbe laid to the place: it is taken also by divers to be good to procure urine and to expell the stone in the reines and womens courses, taken sythes in meate or drinke, and moreover to helpe the Pleurisie and prickings in the sides: wilde Chervill will helpe to dissolve any tumors of swelling in any part of the body, as also to take away the spots and markes in the skin and skinne of congealed blood by bruises or blowes in a short space, by applying it to the place.

CHAP. XXII.

Scandix, Shepheards needle.

THere are three or foure forts of Sephearde needle that I am to shew you in this Chapter, some of which are revived and referred to those of the ancients, and some never knowne before.

1. *Scandix vulgaris sive Pecten veneris.*
Common Shepheards needle.

The common Shepheards needle hath sundry long hard large greene stalkes of leaves, more divided, and into many more parts, and of a sadder browne greene colour than Chervill, and of no sent; the stalkes grow a foote high, bearing small tufts of white flowers, and after them five, or sixe, or more or lesse long seeds, somewhat round pointed at the ends, and a little rough, as if they were dented, all of them comming from one head or stalke with a few small leaves under them: the roote is very small and threddy.

2. *Scandix altera capite glomerato.*
Round headed Shepheards needle.

This kinde of Shepheards needle hath stalkes of larger leaves than the wilde Carrot comming somewhat neere to Parsley, smooth, and of a pale greene colour, those that grow at the joynts of the stalkes come forth out of a broad filme or skinne, as is seene in many ferulous and umbeliferous plants, and bearing at the top a round head, of many greenish white threades set close together: the roote is like the wilde Parsnippe, and of a bitter and sharpe taste.

3. *Scandix Cretica minor sive Anthriscus.*
Small Shepheards needle of *Candy*.

The small Shepheards needle of *Candy* hath sundry stalkes of very fine cut leaves, not bushing thicke like

1. *Scandix vulgaris sive Pecten veneris.*
Common Shepheards needle.

4. *Scandix cretica maior.*
The greater Shepheards needle of *Candy*.

3. *Scandix Cretica minor sive Anthriscus.*
Small Shepheards needle of Candy.

Original from UNIVERSITY OF MICHIGAN

...parted and thinne, comming somewhat neere to Camomill, but finer and a little hairy, of a ...ent and taste, among which rise slender short stalkes, somewhat hairy or hoary, with but few ...on them, at the toppes whereof stand five or six small white flowers close set together consisting ...foure leaves a roote, in the middle whereof is a darke purplish tuft or tasse longer then the rest, spreading ...like starring starre, after which follow long seedes like the first but smaller, bigger below and ending a- ...small pointed, whose edges are more rough and seeme more cleaved, and bee a little purplish as the ...are before they be ripe, which are the seedes themselves: the roote is small long and white. This hath ...observed to have a better sent that groweth in untilled voyde and grevelly grounds then that which grow- ...fields.

2. *Scandix Cretica major.* The greater Shepheds Needle of *Candy*.

...stalke hath a stalked small stalke a cubit high, parted into divers branches, a little hairy at the very ...the lower leaves be made and somewhat round, divided like unto the lesser Burnet Saxifrage one set ...another, standing upon long stalks, which together with the leaves are a little hairy about those that stand ...the flowers are much more finely cut in, and like unto the leaves of the first, the umbells are a little spread and ...greater then the first, which are succeeded by more store of long rough dented seede then the last, having ...them two small prickes at the end: the roote is small and fibrous.

The Place and Time.

...groweth plentifully in our owne Land among Corne: the second in *France*, the third both in *Candy* and ...also, and the last in *Candy*: they flower early and seede accordingly.

The Names.

...call it *Scandix* and the Latines *Scandix* also, and *Pecten Veneris*, *Acus Veneris*, and *Acus pastoria* or ...and some call it *Scandrix*. There is much doubt and controversie among our later writers, first what bethe ...*Scandix* of *Dioscorides*, *Galen* and *Pliny* should be, that was so common a hallet herbe for the people to feede ...and growing wilde with them, to that *Aristophanes* merrily taunted *Euripides* the Poet, that his mother sold ...a vile worme *Scandix*, which was accounted the meanest or vilest of all others, for our *Pecten Veneris* is not ...to be the true *Scandix* in *Candy*, as *Honorius Bellus* sheweth in his first Epistle to *Clusius*; for he there saith ...Candiots eate it not, calling it *ἀγρωστίδα*, and hath no smell, but another which they call *ἄγριον Σάνδιξ*, and ...smelleth well, for moveth nothing to Venery: divers therefore doe thinke that the *Cerefolium* of ...should be *Scandix* as *Lugdunensis* setteth it downe. *Columna* taketh the *Cerefolium hirsutum non odoratum* ...*Scandix*, which how farre they are from veritie or almost any shew of reason this one thing doth ...the scholler *Matthiolus* his *Cerefolium non Bauhino* his *Caucalis* were ever used to bee eaten as *Scandix* ...likely to grow so familiarly in Greece as *Scandix* so wilde a weed: but if I might spend my opinion ...the matter I should sooner believe *Bellus* his judgement hereof that lived long among the Graecians (for I ac- ...the Candiots to speaking Greeke and using the Greekish rites, to be as it were the off-spring of the Greeks) ...both their denominations of herbes, and the use of them besides his owne both reading and observation, ...the ancient Greeke words although somewhat corrupted, who sheweth that *Scandix*, as they usually ...have that they eate should be the true *Scandix*, then either *Matthiolus* or *Columna*, whose opinionative ...that he had found out the genuine plants of the ancients, made him runne farre awry in many things, as ...be seene in his Hyssope, *Polium* and divers others the like: so that my opinion is then our *Pecten Veneris* is not ...true *Scandix* of the ancients, but a kinde of wilde Chervill, and not used to bee eaten with them or us, as the ...also do declare of that *Scandix* which they in *Candy* (and as it is likely throughout all Greece also) ...for their foode is the true *Scandix* which we have seldome seene or knowne: next what *Anthriscus* ...should bee, whether that of *Honorius Bellus* sent to *Clusius*, or that of *Columna* in his Chapter of *Scandix*, ...take to be our *Pecten Veneris*; and whether *Bellus* his correction of *Pliny* his description be not one who ...in the matter throughly. *Anthriscus* saith *Pliny* were the same that *Scandix* is, it is hot thinner and ...leaves, which reasons being admitted, *Anthriscus* is an herbe that hath broader leaves and not so sweete ...as *Scandix*, which *Columna* as it should seeme would have to be the *Scandix* of *Dioscorides* and is our *Pecten* ...which *Columna* commendeth him so much for his fine description thereof, and so would make our ...to be the true *Scandix* of the ancients, which is neither sweete nor used to be eaten, and all this is ...because he would have his *Anthriscus Myrrhoides* to be a new plant of his owne finding, and not the *Anthri-* ...as others before him had judged it to bee, when as his description of *Anthriscus Myrrhoides* sheweth it ...of the *Scandix* by the manner of growing and the forme of the seede in admitting *Bellus* his cor- ...of *Pliny* that *Anthriscus* were the same, but that it hath finer and sweeter leaves; it endeth the whole con- ...seeming all things without doubt. I am somewhat more ample and tedious in the explanation of these ...because I thought to be, because they are intricate and various: the first here is called *Scandix* by divers au- ...and *Pecten Veneris* by others without doubting or questioning whether they were true or no: the second ...not mentioned, and the last *Bauhinus* onely hath made mention of: the other I have (hope sufficiently ...) to be called and reckon to be the *Anthriscus* of *Pliny* which *Bauhinus* calleth *Scandix cretica minor*.

The Vertues.

...and *Galen* say that Scandix is somewhat sharpe and bitter, being hot and dry in the third de- ...they say it is good both for the stomacke and belly being either eaten raw or boyled: being made into ...and taken it is good for the Liver, backe and bladder, provoketh Vrine mightily and forth the inward ...from cold causes: it also bindeth a loose body, the seede being taken with vinegar presently stayeth the ...and used in a mouthwash it helpeth the parts that are burnt with fire: *Pliny* saith that the roote of *Pecten* ...with Mallowes draweth forth splinters or any other thing sticking in the flesh. *Honorius Bellus* ...*Scandix* is used in *Candy* by the people with great delight, not onely because it is pleasant to the taste, ...it mightily provoketh to Venery and helpeth those persons that are weake or spent therein, and hel- ...women to conceive, in that it cleanseth the seminary parts.

Chap. XXIII.

Coriandrum. Coriander.

THe ancients formerly knew and set forth but one sort of Coriander, and held that it had no diversity, but the later writers have added two more unto it as shall be shewed.

1. *Coriandrum vulgare.* Ordinary Coriander.

When Coriander first springeth up the leaves are somewhat brood very like unto Parsley, but when it is growne up into a stalke which is three or foure foote high, being full growne they are finely and finer every one then other up to the toppe, where stand small loose umbells of white flowers, comming the round striped hollow seede of a whitish yellow colour when it is ripe: the roote is small and perisheth every yeare after seede time: the whole plant, seede and all while it is greene and growing hath a strong and lothsome savour fearfe to be endured, but when the seede is full ripe and dry it is of a reasonable good sent and tast without offence.

2. *Coriandrum minus odorum.* The lesse sweet Coriander.

This Coriander hath the lower as well as the upper leaves all finely cut in and jagged, the stalke grow lower not halfe a foote high, and lying almost on the ground, with white flowers on them and round seede as the other but fuller and greater, and two alwayes joyned together.

3. *Coriandrum alterum fœtidissimum.* The stinking Coriander.

This other Coriander hath sundry small stalkes that are five square being brune, and not hollow, not growne high, all the leaves whereof are as fine as the uppermost of the first: at the toppes of the stalkes stand very small umbells of purplish white flowers, after which come round seede like the other, but two alwayes joyned together: the roote is great dying yearely as the other, the smell hereof is more strong and offensive then the other to the head and sences.

The Place and *Time.*

The two first are onely sowen in Gardens as well now as in ancient times, for *Pliny* saith it is not found wilde, their naturall places being not knowne: the last was sent from *Barcinone* to *Lyons* by *Alpinus* to *Matthiolus*, who hath set it forth in *hist. is Lugdunens.*: they doe all flower in *July* and ripen in *August.*

The Names.

It is called in Greeke κόριον and κορίαννον, and so in Latine also *Coriun* and *Coriannon*, but usually *Coriandrum*, and derived from κόρις, which is that kinde of noysome fly or wotme that is called *Cimex* in Latine, a wall louse or Punie in *English*, whose stinking smell Coriander doth much imitate. There hath beene formerly long controversie betweene *Avicen* and *Galen*, and others also about Coriander, some condemning the use as hurtfull and dangerous by reason of the grievous smell, and that it maketh the voyce hoarse, procureth a kind of frenzie

1. *Coriandrum vulgare.*
Ordinary Coriander.

2. *Coriandrum alterum minus odorum.*
The lesse sweet Coriander.

like unto drunkennesse, and that the juice thereof being drunke causeth death, and that it is very cold; all these perceiues the *Arabian* Phyſitions give it the correction therefore of the ſeede they appoint to bee by ſteeping it all night in Vinegar, and dryed up againe to be ſafely uſed: but *Lobel* ſeemeth to refuſe this preparation, ſaying that the coldneſſe of the Vinegar can draw forth none of the foule and ſtinking ſpirits from it, but rather the drying of it by the ſunne, as it is uſed when they are made into Comfits, without any other preparation and then is found hurtfull but rather comfortable to the ſtomacke, &c. as alſo by the continuall uſe of it in meates and ſickneſſes among many country people of it ſelfe without preparation: and ſome commending the uſe becauſe when the ſeede is dry it hath a warming ſweete and no noyſome ſmell or taſte: the noyſome vapours ſubſiſting only in the moyſture and not in the drying, as wee may ſee in many fruits which being not ripe are ſo unwholeſome that ſcarſe one can eate them without harme, but being ripe are both mellow and ſweete, heate well working this effect: the hotter countries for the moſt part giving the mellower and ſweeter fruit. The firſt is called by all writers *Coriandrum*, the ſecond is mentioned by *Lobel*, and *Dodonæus* giveth the figure without deſcription. *Lugdunenſis* onely remembreth the laſt. The *Arabians* call it *Cuſbara* and *Elcuſbar*, the *Italians Coriandro*, the *Spaniards Culantro*, the *French Coriandre*: the high and low *Dutch Coriander*, and we in *English* Coriander and Coliander.

The Vertues.

Fruit for greene Coriander and the cooling qualitie thereof: the juice as is before ſaid being drunke killeth if that take it outwardly applyed it diſſolveth knots and kernells, being mixed with Wheate or Barley Flower, as alſo Saint *Anthonies* fire being uſed with bread, and running and fretting ſores, wheales, puſhes and pimmels and botches riſing in the skinne or fleſh, and taketh away the ſwelling and inflammation of the eyes, called the juice or greene herbe applyed: the juice thereof made into an ointment with *Ceruſſe*, *Vinegar* Vinegar and Oyle of Roſes doth the like. Now for the dryed ſeede of Coriander which is moſt in uſe, and being taken in ſweete wine killeth the Wormes in the body and encreaſeth coliure: it is alſo good againſt the ſerpent that is called *Baſiliſcus*, either drunke or layd to the bitten place: it is very comfortable to the ſtomacke, by heating and drying, the cold and moiſture thereof helpeth digeſtion and repreſſeth the vapours therein that riſe upwards, and reſiſteth fortible paines of the winde chollicke and the ſtopping of Vrine: and being a nourihment of a temperate qualitie it helpeth to encreaſe both blood and Sperme.

Chap. XXIIII.

Cancalis. Ballard Parſley.

Of theſe *Cancalides* I have above a dozen ſorts to expreſſe here in this Chapter, ſome whereof have ſmall fine cut leaves, others are larger and broad, ſome well knowne of a long time to many, and others of later invention.

1. *Cancalis vulgaris floribus albis.* The common Ballard Parſley.

This Ballard Parſley diſeth up with a ſhort ſtalke, not above halfe a yard high, ſet at the joynts with ſmall rough diverſly cut leaves ſmaller then Parſly, furniſhed at the toppes with ſmall ſweete umbells of white flowers, the outermoſt being the greateſt, after which ſucceede divers rough prickly round ſeede, two always joyned together, which maketh them but halfe round when they are parted.

2. *Cancalis Hiſpanica.* *Spaniſh* Ballard Parſley.

This *Spaniſh* kind hath divers creſted rough ſtalkes and leaves very like unto the former, but the umbells of white flowers are ſmaller and growing more round together as it were into the forme of a round head, and the ſeede which followeth is greater very much ſtriped and rough but not prickly as this, it being broken in any part giveth a ſweete milke: the roote periſheth after ſeede likewiſe but giveth no milke.

3. *Cancalis maior flore ſubrubente.* Deepe red flowred Ballard Parſley.

This red flowred kinde hath larger winged leaves then the former, being divided and cut in after the manner of the lower Burnet Saxifrage leaves: the flowers hereof are larger then of the firſt and of an equall bigneſſe, but of a deeper red colour.

4. *Cancalis maximus.* The greateſt Ballard Parſley.

This greateſt kinde bringing forth many upright tall ſtalkes three or foure foote high of more ſometimes, being creſted and hollow within with divers joynes on them, and the ſtalkes of the long and large winged leaves compaſſing them at the bottomes, which leaves are large almoſt like Angelica leaves, ſet by couples on the middle ribb which is made one at the end all of them finely dented about the edges and of a darke greene colour: at the toppes of the ſtalkes grow large umbells of white flowers, ſomewhat purpliſh or of a bluiſh colour underneath: after which come very large and flat rough ſeede, with a double point at the head and prickley, round about the roote white and woodily.

5. *Cancalis Anglica flore rubente.* *Engliſh* Ballard Parſley with reddiſh flowers.

This kinde of middle growth about two foote high, of an Olive greene colour, with a ſtrong round creſted rough ſtalke, ſet at the joynts which are two or three inches in funder, with leaves three or foure inches long, conſiſting of ſeaven or nine narrow hairy leaves ſet by couples, ſomewhat deepely dented about the edges, the uppermoſt ſtalke being a broad thinne skinne or filme, and from betweene it and the ſtalke come forth leſſer leaves of the ſame faſhion towards the toppe parted into three or foure branches, which at three inches diſtance doe each of them ſhoot out ſeaven, eleaven, fifteene foorth foure, five or ſix equall ſtems about an inch and a halfe long apeece, having a ſtrong white rib running all the length of them, and the two innermoſt ſtrings, being of a darke red colour compaſſing a cloſe umbell: at the toppes of each ſtemme grow five or ſixe long rough hairy ſmall knaps or buds out of which grow flowers of a pinkie red colour, conſiſting of five leaves a peece, the outermoſt whereof ſhewes like two by the folding of it inward, and the inner foure with five chives and a double pointed ſtewe not halfe ſo big as it when they are fully blowen: in the center of the flower lye ſix or ſeven ſuch like ſmall flowers: the leaves give forth, being broken of little or no taſte: after the flowers are paſt come the ſeede which are rough burres, ſticking

to any thing they touched, like the seede of Hounds tongue, within which are contained two browne seeds like unto hulled Oates but bigger: the roote is small and long, white and hard, perishing every yeare after seede time. It flowreth in June and the seede is ripe in August. This may seeme to be the *Caucalis rubro flore folio Latiore* of *Lobel*, and the *Caucalis rubello flore* of *Clusius* set forth without description, but the leaves of theirs are larger.

6. *Caucalis tenuifolia purpurea.*
Fine leafed Ballard Parsley.

I find in *Columna* one other very like unto this last also which he calleth *Sicilia nepeta leptophyllon purpureum*, but that the leaves as he saith are more finely cut into sundry parts like unto the wilde Carrots, and the umbells of flowers, and to the seede after them stand by three and three at a place, whose kernell or seede within is somewhat like unto hulled Barley.

7. *Caucalis arvensis latifolia purpurea.*
Broad leafed ballard Parsley with red flowers.

This Parsley hath sundry stalkes of hard rough leaves, divided into five parts, each leafe being three inches long and an inch broad, deepely dented upon the edges somewhat like unto Oaken leaves: the stalke is rough and hoary, two foote long, so crested that it seemeth square, bearing such like umbells as in the last standing 3. together but their small stems are shorter and thicker, the flowers are red like the former, but greater, having small leaves like beards under them: after which followeth the seede being smaller then the former and not so rough, containing such like seede within them but smaller and aromaticall: the roote is white, hard and aromaticall.

8. *Caucalis magno semine echinato.*
Ballard Parsley with great prickley seede.

The leaves hereof are divided somewhat like unto those of the greater Parsley leafed Daucke, set forth before in the

5. *Caucalis Anglica flore rubente.*
English Ballard Parsley with red flowers.

6. 7. *Caucalis* [illegible]
The greater and lesser Ballard Parsley [illegible]

Original from UNIVERSITY OF MICHIGAN

Chaire or Daucus and hairy underneath: the ſtalke is two foote high, and ſomewhat rough, having the like leaves & the joynts upwards but ſmaller, bearing ſmall umbells of whitiſh flowers ſtanding three together and perfecting uſually but two ſeedes on them which are twice as big as others and more rough and prickly, having a long crooked kernell within it: the roote is ſmall and white but ſomewhat ſweete both in taſte and ſmell.

9. *Caucalis minor flore rubente.* Small Baſtard Parſley with reddiſh flowers.

This ſmall Parſley hath a ſmaller and ſhort rough ſtalke, whoſe leaves are divided ſomewhat like unto Hemlock leaves, each of them broader, and the end leafe longeſt and hairy, all of them deeved deepely about the edges, and of a darke greene colour, at the upper joynts of the ſtalkes come forth ſlender branches bearing ſparſed ſmall umbells of reddiſh flowers, and ſometimes more white, and after them ſmall round, rough ſeede: the roote ſmall and white.

10. *Caucalis nodoſa echinata ſemine.* Small Baſtard Parſley with knotted burres.

This other ſmall Baſtard Parſley lyeth on the ground with long rough trayling branches, ſome longer then others by a ſmall diſtance, with long winged leaves divided in the ſame faſhion almoſt as the laſt, but ſomewhat falle ſomewhat rough or crumpled, but not hairy, and of an overworne or evill greene colour: at every joynt almoſt grow two and round about it come forth ſmall whitiſh flowers out of rough huſkes which are after the ſeede very ſharpe prickly and hard: the roote is ſmall and periſheth every yeare, the ſeed riſing by the falling of, in the fields or gardens where into it is brought.

11. *Caucalis folio Fœniculi.* Fennell leafed Baſtard Parſley.

This hath ſtalke and leafe very like unto Fennell, but riſing ſeldome above a cubit high, bearing white ſweete ſmelling flowers in umbells at the toppe ſet cloſe together, which afterwards give ſeede that is not rough like the former: and therefore *Lobel* that firſt ſet it forth ſaith, that although *Anguillara* in his time did call it a *Caucalis*, yet he liked of the others better then of this: the roote is white growing deepe, and of the taſte of a Paſnep.

12. *Caucalis tenuifolia montana.* Small Mountaine Baſtard Parſley.

The roote hereof is ſomewhat thicke and from it riſeth a ſtalke of a ſpanne long, divided from the bottome into ſmall round ſmooth branches, and they againe into leſſer, whoſe ſmalleſt branches even where the roote as well as the others, beare ſmall umbells of very ſmall white flowers, and afterwards ſmall long ſharpe ſeede: the leaves next unto the roote are divided into very fine and ſmall leaves, but thoſe above on the ſtalke much more ſmall like haires.

13. *Caucalis pumila Hiſpanica.* Dwarfe Baſtard Parſley of *Spaine*.

This Dwarfe kinde which *Bauhin* brought out of *Spaine* with a number of other fine ſeedes riſeth not with its ſtalke foote high and lower in *Spaine*, whoſe leaves are very ſmall and much divided on the ſtiffe ſtalkes, bearing ſmall umbells of whitiſh flowers and after them ſmall rough whitiſh ſeedes: the roote is ſmall and annuall; I never ſaw this beare but once, which was from the firſt ſeede I received from *Bauh*, which was thorough ripe.

9 *Caucalis minor flore rubente.*
Small Baſtard Parſley with reddiſh flowers.

11 *Caucalis folio Fœniculi.*
Fennell leafed Baſtard Parſley.

The Place and Time.

These sorts of Parsley grow in the severall countries of *Germany*, *France*, *Spaine*, *Italy*, &c. and divers of them in our owne Land likewise; and particularly the fifth was found in *Lincolnshire*, on the North banke of the North field of *Witham* nigh to *Bourne*; and doe all, save the last, flower and seede reasonable well, last the same, as I said.

The Names.

It is called in Greeke σέλινον, and *Cancalis* also in Latine, either of the *kind of heat* seede, or for the noise that the seede will make when it is dry, being shaken with the winde, or from narrow mouthed pots, by reason the seed is like, that make a noise at the powring of the liquor out of them: the first here expreſt is the *Cicutæ affinis* of *Lobel*, the *Lappa agrestis* of *Tragus*, the *Lappula Canaria Plinij* of *Anguillara*, the *Cancalis altera* of *Myrepsus*, *Lappa Dulcabamara* of *Lugdunensis*, the *Cancalis* of *Dodonæus*, *Gesner*, and others, and the second is the *Cancalis* of *Columna*: the second is the *Cancalis Hispanica* of *Clusius* and *Camerarius*; and the third the *Cicutæ folijs rubentibus flore* of *Clusius*; the fourth likewise in his *Cancalis major*, which *Bauhinus* calleth *Cancalis acaulis semine*: the fifth is of our owne country not published exactly before, although *Gerard* (meeting with the seede) had a hint of it: the sixt is the *Echinophora Lepophilon* of *Columna*: the seventh his *Echinophora purpurea*: and the eight his *Echinophora altera asperior platycarpos* also, which *Bauhinus* calleth *Cancalis echinato magno folio*, and is the *Lappa bearia Plinij* by *Lugdunensis*, and the *Daucus Xanthocarpos* of *Dodonæus*: the ninth is figured by *Bauhinus* in his *Prodromus*, but the description is of his *modo echinato semine*, which is contrary, as may soone be perceived, if they be but compared, and are both growing wilde in our owne land: thereto is the *Daucoides minus* of *Cordus in historia*, and of *Thalius*: the eleventh is the *Cancalis* of *Anguillara*, as also set in his *Adversaria* which *Lugdunensis* calleth *Cancalis Pena*, and *Bauhinus Cancalis folio Petroselini*: the twelfth *Bauhinus* his *Cancalis tenuifolia montana*: and the last I had from *Rome* by the name of *Cancalis montana*, which the *Italians* usually doe call *Cancalis Petroselo silvatico*; and the *Germanes*, as *Tragus* hath it, *Wilder Peterlin*, and we in *English* Hilland Parsley, rather then wilde Parsley, as the *Italians* doe.

The Vertues.

Dioscorides in regard that *Cancalis* was a familiar sallet herbe, and therefore used more as meate and medicine, giveth no other propertie belonging to it than to provoke urine, but our later Writers have better set forth and published divers others, as *Matthiolus*, who saith it is comfortable to the heart, and helpeth the infections of the liver and spleene, cleanseth the raines and kidneyes, of the flegme and biter gravell and the stone which ingendereth in them, if the juyce thereof be taken: the seede being drunke sharpeneth the eye-sight, and provoketh womens courses: it is likewise given to men with Milke wall, and the seede of *Agnus castus* against the swelling of the raines: it also easeth fruitfulnesse in barren women, being drunke in ware, and helpeth the paine of the Trigon (we understand it to be the Thornebacke) the *Dracunculus marinus*, which is called a Quaver, and the Scorpion being applied to the wound; if the whole herbe be taken with vineger after a vomit, it purgeth naturally and stirreth up a fainting appetite, taking away the evill of loathing once meate: all the parts of the roote, as well seede as juyce, or decoction being taken, is helpfull to melancholicke persons, and thereof are good lotions given against a quartaine ague, and the itch and scabbes, as also for the great *French* disease.

CHAP. XXV.

Selinum sive Apium. Parsley.

VNder this title of *Selinum* or *Apium*, is contained divers and sundry sorts of herbes, for with the antients, besides the *Smyrnium*, *Apium hortense*, they had *Helioselinum*, *Baleselinum*, *Hemerion Apium*, *Apium montanum*, *Hippselinum* or *Petroselinum*, *Ismelinum*, *Hippselinum*, *Apium Hispanicum*, *Petroselinum* or *Petroselinum*, *Ismelinum*, *Hippselinum*, *Hippselinum*, *Apium Hispanicum*, *Hippselinum* and others, of all which I must give you the knowledge, and therefore I thinke it meete to distribute them into severall Chapters, and to comprehend under each all the species and kinds that pertaine to that genus or kinde: and first to beginne with the *Apium hortense*, which by an ataxi received opinion is our *Petroselinum*, Garden Parsley, whereof I shall say more in its due place.

1. *Petroselinum vulgare.* Common Garden Parsley.

Common Garden Parsley is well knowne to have many stalkes of fresh greene leaves deeded into sundry parts, first into three parts or leaves, and then each of them into three, somewhat round and finely indented the edges: the stalke riseth much higher in some places than in others, according to the soile wherein it groweth with divers smaller leaves at the joynes, and still finer cut, and long like Fennell at the tops, that one would thinke them to be the leaves of Parsley; the flowers are white growing in tuftes, and the seede small and hot and sharpe alſo: the roote is white and long, with some what a rugged barke, perishing after seeding aromaticall as the herbe is also and very pleasant to the taste and smell.

2. *Petroselinum crispum.* Curl'd Parsley.

The curl'd Parsley differeth not in any thing from the former but in the leaves, which although they grow after the same manner, yet they are finely curled, or crisped, or folded in on the edges, resembling the like.

3. *Petroselinum majus sive Virginianum.* Virginia Parsley.

Virginia Parsley groweth after the very same manner that the Garden Parsley doth, but larger, having stalkes of leaves, ter by three and three as in the former, but much larger, even as large as Smallage leaves, but of yellow greene colour, the stalkes, flowers, and seede are alike, but still larger, the seede is also hotter, but not thrice as bigge as the common. the roote is greater and shorter, but perisheth like it.

4. *Petroselinum Cretense.* Candy stone Parsley.

This Parsley of *Candy* is very like to the ordinary parsley, but lesser in every part, having lesse leaves cut into such like divisions, but lesser and somewhat thicker, the stalke is like, but shorter than Parsley [illegible] the flowers, after which follow smaller seede than that of Parsley, but blacker: the roote is [illegible]

Original from UNIVERSITY OF MICHIGAN

1. Petroselinum vulgare. Common Garden Parsley.

2. Petroselinum majus sive Petroselinum Virginianum. Virginia Parsley.

that is but one, of the thicknesse of ones thumbe long, and covered with a thinne blacke barke or rinde that may easily be robbed off with ones finger, being white underneath, and of a sweetish taste, like unto the Earth Chesnut, being often eaten by the Natives, and liveth after seede time, shooting forth a new every yeare. There is another of this kind which differeth in nothing from it, but in the colour of the roote, which is reddish on the outside, and in leaves as the former: this flowereth and seedeth earlier than others, and is called *Aegilopodium* by the country people in Candy, that is, *Aegilops Pastinaca*, but hath no likenesse to a Parsnippe, but in that it is fit to be eaten. Otherwise, as *Dioscorides Anazarbeus* saith, doe call it *Saxifragia*, and use it as Saxifrage: but he himselfe saith it doth come nearest unto the *Hippomarathrum* described by *Pliny* in *lib.* 20. *c.* 1 *n.* especially that with the red roote, and hath but a vertue that the ordinary hath.

The Place and Time.

These doe all grow in gardens onely in our Land, the naturall place of the first being not certainely knowne, as the second is of the Iland of *Candy*, and the third, as the name thereof, was sent out from *Virginia*; the last in Candy they perfect their seede in *August*, but the last earlier.

The Names.

This we said, by a continuall received opinion held by most, that this Parsley is the *Apium hortense* of the Romanes and other the ancients, first, because there cannot be found another herbe that can answer both the description and the properties given thereunto, to be so pleasant and to be eaten familiarly in all countries; and next unto this, the use of this Parsley is continued to this day, as a sallet herbe among the Greekes and Turkes, and called *Persilinon Macedonico* by the vulgar Greekes usually, whereby there groweth some doubt with many whether we should call it the *Petroselinum Macedonicum* of the ancients, as *Isidorus* and *Platina*, *Matthiolus Virgilius* and *Cordus* did erre, setting, as *Ruellius* saith, it is so called throughout all *Macedonia*, *Epirus*, *Thessaly* and in Candy, and with all the Greekes, and that all Christian Nations also according to their Dialects follow the Latine *Petroselinum*: but because the seede is not bitter, as *Galen* saith the true sort is, wee as he doe, doubt it, and doe not hold it for the right *Petroselinum Macedonicum*. It is also called by all Writers *Apium* or *Apium hortense*, or *domesticum*; yet *Fuchsius* tooke it to be *Oreoselinum*; the last is declared sufficiently by the description: the *Arabians* call it *Chaffi Chareti*, or *Chaffi*, the *Italians Petrosello* and *Apio domestico*; the *Spaniard Perexil*, the *French* the *Persil*, the *Germans Peterszilgen* and *Peterlin*, the *Dutch Peterseli*, and we English garden Parsley. There is some caution to be used concerning this herbe that it is usually called *Apium* which is not to be used in any of the Greeke Authors medicines, for to *Selinon* is translated, but the *Arabians* Apium Sanitatis, which they held to be hurtfull to the eyes, and the use thereof to bring the falling sickenesse.

The Vertues.

The Parsley is much used in meate and broths, &c. in all countries as hath beene aforesaid, being of so milde a nature and so comfortable to the stomacke, that no sallet is more, and besides doth helpe to provoke urine and women's courses, and to breake winde, hath in the stomacke and bowells, and doth a little open the body, but the roote much more, and openeth the obstructions, both of the liver and spleene, and therefore is usually put among those

caske herbes and rootes that move the belly downewards, and is one of the five opening rootes, for doth vnlade the body as *Dioscorides* hath it, and thereby also is profitable for the yellow Jaundice and Dropsie: it commendeth it against the Falling sickenesse, and to provoke vrine mightily, especially if the rootes be sodden and eaten like Parsnepes: the seede is held by most to be the most effectuall part of the plant, yet some haue thought the rootes to be strongest: but the seede is effectuall to prouoke vrine and womens courses to expell wind, to breake the stone and to ease the paines and torments thereof, or of any other part in the stomacke and body proceeding of winde, and is also of vse against the venome of any poysonfull creature, and is put therefore into many poysons for that purpose, as also against the danger that commeth to them that haue taken Lunatike, as is pointed among other things that serue for the cough: The leaues of Parsley eaten after Onions, Leekes, or Garlicke taketh away the offensiue smell of them, suppresseth the vapours that may offend eyther the head or the eyes: they vse also to cast the herbe into their fish ponds if there be any sicke among them to cure them. The distilled waters of the herbe is a familiar medicine with nurses, to giue their children when they are wrung in the stomacke or belly with wind, which they call the frets, and is no lesse availeable then the water of Fennell for that purpose, and is effectuall also for them that are of greater yeares. The leaues of Parsley laid to the eyes that are inflamed with heate or are swollen doth much helpe them, if it be vsed with bread or meale and vinegar: the venemous hard lumpes that come by the curding of their milke doth abate the hardnesse quickly if it be pressed out and applyed, and doth also take away the blacke and blew spots or markes by bruises, falls, &c. the iuice powred or dropped into the eares with a little wine easeth the paines. *Trotula* writeth diuers excellent medicines to helpe the Jaundice and Falling sickenesse, the Dropsie, and stone in Reynes or Kidneyes in this manner: Take of the seede of Parsley, Fennell, Anise, and Carrowayes of each an ounce, of the rootes of Parsley, Fennel, Smallage and Carrowayes, of each one ounce and a halfe: let the seedes be bruised and the rootes washed and cut small, put them all lye in fiue eyes a pottle of white wine, and in the morning boyled in a close vessell vntill a third part or more be wasted, which being strained and cleared, take foure ounces thereof at a time, morning and euening fast and fasting, abstaining from drinke for three houres after: this doth open the obstructions of the Reynes and Spleene and expelleth the Dropsie and Jaundice by Vrine.

Cap. XXVI.

Petroselinum Macedonicum. The Macedonian stone Parsley.

DIuers authors haue set forth diuers sorts of herbes for the true stone Parsley of *Macedonia*, euery one supposing that to be the right which they propose for the all: I need not to contend in this worke, but seuerally as they fall out. I will onely in this Chapter shew you that kinde, which *Lobel* describeth currant vnder that name, and ioyne thereto another which *Lugdunensis* calleth *Petroselinum montanum*.

1. *Petroselinum Macedonicum quibusdam.*
The first supposed stone Parsley of Macedonia.

This Parsley of *Macedonia* hath diuers stalkes of leaues next the ground, diuided much like to the garden Parsley, but with greater, broader and rounder leaues, dented round about and in some places more deeply cut in or gashed, of a bright pale greene colour, among which riseth a short thicke and somewhat hairy stalke about halfe a yard high or better, full of ioynts and leaues, and branches at them that it seemeth a small thicke bush, bearing small nubells of white flowers and small rough darke greyish seede after them, somewhat like vnto ordinary Parsley seede, especially after the roughnesse is rubbed from them, yet somewhat longer and darker, of an aromaticke and sharpe taste, and of an indifferent biternesse: all the common seede the rootes haue somewhat thicke short and white perishing after it hath giuen seede, especially with one in our countrey, but yet I haue heard not to the contrary.

2. *Petroselinum Macedonicum Dalechampij.*
The second supposed stone Parsley of Macedonia.

This other Parsley taken to be the true Parsley of *Macedonia* by *Dalechampius* and not much disagreeing by *Columna*, hath a short root (not long with *Columna* like ordinary Parsley) thicke at the ends. Whereout at the head thereof, neither stalke nor leaues which is wonderfull (but *Columna* reporteth it) but more strange and bitter then the common Parsley seede) from whence ariseth vp sundry slender stalkes, with diuers very thinne cut leaues thereon, all of them like the vpper most part and the vtmost leaues of Parsley, or like vnto Dill of a blew greene colour, hauing three of the leaues alwayes ioyned together at the end of the winged stalke as Parsley hath, and smelling in like manner to Parsley: both *Lugdunensis* and *Columna* doe say, that if any should smell it when it is a little bruised that were blinde and did not know it, or hauing his sight did not plainely perceiue a difference in the leaues, he would surely say it were very Parsley: at the toppes of the stalkes stand small nubells of pale reddish or bluish coloured flowers: after which follow small seede like vnto that of Parsley, some-

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

...with brownish or yellowish or greenish like unto Cumin seede, of a very sharpe taste almost burning the mouth, of a sweete scent, but so bitter withall that it may well be accounted the most bitter of all the kindes of Parsley.

The Place and Time.

...thought originally to come from *Candy* unto *Crete* where they have sowen it and taking it to be the ordinary Parsley, have used it in their differences for *Minim-dinner* and *Thanks-dinner*, and have so...ted of it that they are loath to let any good seede come from them that might grow in any other ...while the unreasonable price hath beene set upon it hath made it the more esteemed and sought after, yet ...growing in our garden and from it have gathered good store of seede in one yeare, but never since ...nothing I could not get againe one to spring from the seede that I gathered, being sure it would not be ...for sure, nor could I get any outlandish seede since to grow with me against the other growers as *Lobel* ...in the rockie hills of *Prouincia*, and as *Clusius* hath on the hills of *Campi Iarensis* and *Pyrenæus* ...grow here with us.

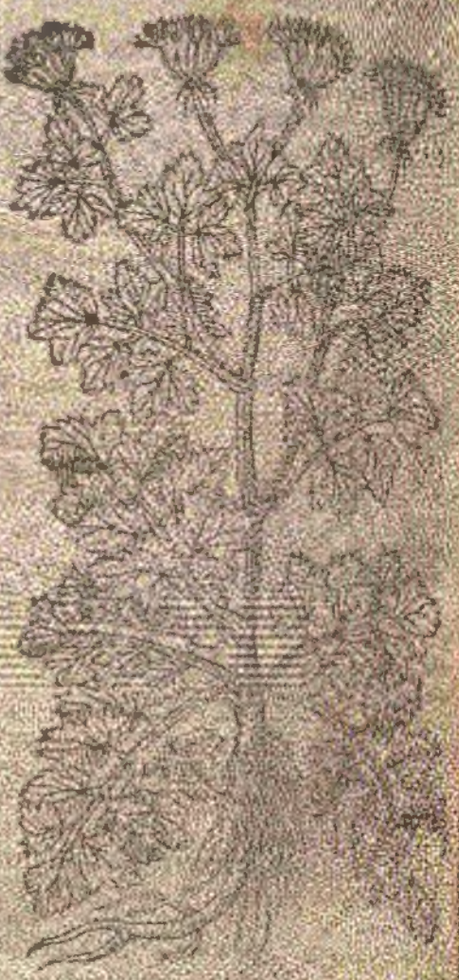
The Names.

...hath much controuersie upon divide two kindes of Parsley, concerning the tall herbe whereof ...he the second *Dancus* of *Dioscorides*, from the forme of the leaves thereof like unto *Apium agreste* ...vnto this second sort, and not to the seed as the qualities of the seede shall hereafter appeare. ...description of this Parsley *Columna* assimilateth the leaves unto *Apium vulgare* (and not to *Apium agreste* ...which is that *herba Sardonia* called *Apium risus*, for other *Apium agreste* is not yet known by ...in any place that I can finde) our common Parsley which although it doe, yet other authors for e...the stalke, and as agreeable to the second *Dancus* of *Dioscorides* in all things I thinke, but there is not ...*Dioscorides* nor any other ancient author hath given any description of the leaves &c. of the *Petroselinum* ...more then of the seede, and that *Pliny* saith it differeth in the kinde. It is a hard matter to determine ...plain to assert a relation, all being but conjecture that can be said in it, which may be briefly made ...Concerning the other he saith that the *Neapolitanes* where it groweth call it *Smirnium Hippofelinum*, and others ...from *Macedonia*. But that the first should be *Petroselinum Macedonicum*, *Matthiolus*, *Lobel*, *Dodonæus*, *Cordus* ...*Lugdunensis* and *Tabernæmontanus* doe all call it so it was in their time held to be, and still continueth the ...opinion and not undeservedly as I thinke, both the forme of the leaves flowers and seede nearely resembling ...other kinde of *Selinum* or *Apium*. Declaring it but especially the qualitie of the seed being answerable to the *pro...*vides that name doth appropriate it. And for the other it also commeth neare unto that relation of *Pliny* concer...ning *Petroselinum*, that it was another kinde differing from the other *Apium* Parsley as this doth, in the forme of ...leaves being shorter then any of them, but somewhat more like in the sharpenesse and bitternesse of the seed, ...wherefore with *Cordus* it may be ruled in the want of a better in stead of the true *Petroselinum Macedonicum*, ...which true may be had out of *Macedonia* or *Epirus*. But *Lobelius* calleth it *Apium montanum folio crassiore*.

The Vertues.

...That *Petroselinum* saith *Dioscorides* prouoketh vrine and womens courses, and is profitable against the ...wind and belchings of the stomacke and against the winde Collicke also, and easeth the griping paines and for...mes of the belly, as also the paines in the sides and the reines and in the bladder being taken in drinke; it is put ...into those medicines that prouoke vrine. The seede of the stone Parsley saith *Galen* is most in use, the herbe ...also is used alike, but are of a weaker properties but the seede is very sharpe in taste and bigger also, hot ...withall, and of a cutting properties withall, and hereby it mightily prouoketh urine and womens courses, and ...is of thin parts, and is therefore hot and dry in the third degree. This saith *Galen* in *lib. 8. simplicium me...dicamentorum*, but in his first booke *de antidotis* he doth prosecute this subject more fully, which although it were ...somewhat large, yet I am the more willing to insert it here for young students sake, that they might be acquain...ted (whose minde (who was in his faculties almost absolute) in this matter: As concerning *Petroselinum* stone ...Parsley (so he) the best is knowne to all to be that in *Macedonia*, which some call also *Effracticum*, so ...from the place wherein it groweth (for it is but very little that groweth there, the place being very ...barren and small in compasse withall; and therefore this *Macedonian* stone Parsley that is of *Epirus* ...is used and sold all nations (as for small in quantitie to be had in the countrey of *Macedonia* it selfe: but it hap...peneth to the stone Parsley of *Macedonia*, in the like manner that falleth out with the honey of *Athens* and the ...Cyrenaicke. For as the Merchants doe export into all countries of the world the *Athenian* honey and the ...Cyrenaicke they thus store Parsley of *Macedonia*, when as there doth not grow such a quantitie thereof ...that may suffice all nations: but there groweth much of this Parsley in *Epirus*, as there is much hon...ey among those Ilands called *Cyclades* or *Sporades* (which are in the *Ægean Sea*) and as the hony is carried from ...those Ilands the stone Parsley is all brought out of *Epirus* into *Macedonia*, and much of it if not all is ...there sold, whereby it is called Parsley of *Macedonia*: the same thing happeneth to the wine ...growing in a small piece of ground in *Italy* called *Falerne*, yet cunning Marchants doe so procure ...to all the subject Nations of the Romane Empire that they make it seeme the wine of ...that no time shall want this *Effracticum Petroselinum*, doe not esteeme the treacle the ...above others (for although another is not so fit against deadly poysons or the bitings of ...other diseases it may be not a little profitable, such as are the paines and torments ...cholicke of the stomacke, the Dropsie and divers other such like, which diseases ...doe promote to urine. And besides this *Effracticum Petroselinum* doth make the ...speedily being used while it is fresh, for it differeth from other stone Parsleyes, in that as it ...is a more hotter of all other Parsleyes, the seede whereof is thus described from *Dioscorides*, *Galen* ...whom any occasion of better, that it differeth in kinde from all others. The seede being like unto *Anise* ...seede, somewhat rounder and lesser then Cumin seede, but of a bitter tast, of a sharpe taste, and smelling ...strong and as *Galen* addeth most bitter.

CHAP. XXVII.



Elæoselinon. Paludapium sive Apium palustre. Smallage.

WE have besides the Smallage that hath usually beene known with us another sort thereof (as I so call it from the likenesse) which in my former booke I called *Selinum dulce*, sweet Parsley, now meane here to joyne it with the ordinary Smallage.

1. *Apium vulgare sive Palustre.* Ordinary Smallage.

The ordinary Smallage groweth up with greater hollow and more crelled stalkes then Parsley, greater and larger winged leaves, set one against another, broader, and of a darker greene colour and shining more then Parsley but dented somewhat unevenly about the edges, at the toppes of the stalkes and branches stand large tufts of small white flowers, which turne into smaller seede then Parsley: the roote is greater but not so long and slender, with a number of blackish fibres set thereat: the whole herbe and roote is strong in smell, and much more unpleasant and bitter in taste then Garden Parsley, not to be endured to be eaten alone, but being boyled and otherwise dressed it savoureth better.

1. *Apium vulgare sive palustre.* Ordinary Smallage.

2. *Selinum sive Apium dulce.* Sweete *Selinum* or Smallage.

The sweet Smallage or Parsley call it which you please, groweth up in the same manner that the former Smallage doth but larger then it, the leaves likewise are larger but not of so deepe a greene colour the flowers and seede likewise are like those but somewhat larger: the roote is great and long with divers fibres set thereat, white and much more sappie and pleasant than eyther Smallage or Parsley, with a very warming and comfortable relish also nothing offensive, but the whole herbe is so pleasant as if Sugar had beene mixed with it. This both relish and forme wee have found it hath held for the first or second yeare, the seede hath beene sowen with us that commeth from beyond sea, but as sweete Fennell doth degenerate more and more in our Land, and onely continueth sweete in warme countries, so doth this, the leaves also decay in their verdure and become nothing so fresh, but are more fullen or sad like Smallage.

The Place and Time.

The first groweth naturally in wet and marish grounds, but if it be planted or sowen in gardens it there prospereth well: the other is familiar in Greece and *Italy*, where they eate it with great delight both herbe and roote, and is onely sowen and replanted in all those places, the naturall place being not knowne to us: they both abide greene all the winter and serve in a Pottage with us.

The Names.

The Greeks call the first ἐλειοσέλινον which the Latines render *Paludapium* or *Apium palustre*, and is the same with the Greeke word: *Selinon* in Greeke was wayes rendered *Apium* in Latine, and thereunto is added the other Epithite, which doth drew or draw us backe as I sayd before in the first division of these *Apia*; but as I gave you then a caution concerning the Greeke and Arabian acception of *Apium*, so let it here be observed also that *Apium* after the *Arabian* author, whom the Latine Herbarists have most followed in their appellations, is to be understood this Smallage, which also the Greekes *Selinon*, and therefore it is by most writers called *Apium* and *Apium palustre* and *Apium dulce* and *Lobel. Cabinet.* in his eleventh booke and third Chapter sheweth how by sowing the seede (which *Matthiolus* thinketh is this *palustre* but I thinke rather he meant of the *hortense*) to make it have a tender leafe and how to make it have a crumpled leafe, and *Matthiolus* saith also that Gardiners in Italy by their rules have made this Smallage to beare crumpled leaves, onely for pleasure to looke, but for my part I beleeve they are but conceits and rather tollaries then verities, for that *Apium latifolium* is this *Apium crispum* is our curled Parsley, both of them being so by nature and not by arte, for that *Petroselinum crispum* is so naturally growing in *Sardinia*, and from thence the seede thereof hath been sowed. The other is mentioned by *Bellonius* in his observations, yet taking it as a *Selinum* altered by art of transplanting, &c. to make it to be called *Petroselinum* as I shewed you before make our common Parsley to be *Petroselinum Macedonicum* [illegible] *num hortense*, whom *Columna* doth much inculcate for it: it is generally called *Selinon* and *Apium* ans and *Greekes* likewise in their countries. I called it before *Selinum dulce*, sweete Smallage, you may eyther doe so or call it sweete Smallage which you will. The *Arabians* call Smallage *palustre* and *Apio equatico*, the *Spaniards Perexil dagua* and *Apio*, the *French Ache*, and *Epffick* and *Eppich*, the *Dutch Eppe*.

The Vertues.

Pliny hath erred much and caused others to follow his track, in following and allowing *Cleophon* and *Dio* for their writings, by mistaking the various acceptation of the word *Apium* of the Latines from the

Original from UNIVERSITY OF MICHIGAN

with the Arabians, for he doth refere that to the *Apium hortense*, which is to be understood of this *Apium palustre*, that it is an enemy to the eyes, hurtfull, and engendreth ill iuyce, not fit to be eaten: that it would breede the Falling sickneſſe, and many other ſuch like things, which if they were true of Smallage whereof very few doe beleeve them, yet can be no way true of Parſley in any part. Smallage is hoter and dryer then Parſley and is more medicinable, for it much more openeth the obſtructions both of the Liver and Spleene, ſtirreth the ſtomacke, cleanſeth it and the blood withall: it provoketh urine and womens courſes and is ſingular good againſt the yellow laundice: it is alſo very effectuall againſt *tertian* and *quartane* agues, if the juice thereof bee made and eſpecially made into a Syrupe: the juyce alſo put to honey of Roſes and ſome Barley water, is very good to gargle the mouth and throate of thoſe that have ſores and Vlcers in them, and will quickly heale them: the ſame juyce alſo doth cleanſe and heale all other fowle Vlcers and Cankerous ſores, if they be waſhed therewith: the ſeede is eſpecially uſed to breake and expell winde, to kill wormes and to helpe a ſtinking breath: the roote is effectuall for all the purpoſes aforeſaid, and is held to be ſtronger in operation then the herbe but expells more openly ſtone, and to rid away an Ague if the juice thereof be taken in wine or the decoction thereof as ſome ſay taken. *Pliny* ſaith it hath an eſpeciall propertie againſt the prayſon of Spiders. The ſweete Smallage is uſed as a Sallet both herbe and roote eaten either raw or boyled, the roote being ſcraped is ſliced and eaten with oyle and vinegar, it much warmeth a cold ſtomacke to digeſt their meate, and helpeth cold windy belches proceed of winde.

Chap. XXVIII.

Oreoſelinon ſive Apium montanum, Mountaine Parſley.

Wee have three ſorts of mountaine Parſley to ſhew you in this Chapter as they are taken by the judicious; and the reſt unto referred.

1. *Apium montanum vulgatius*. The more common mountaine Parſley.

The firſt mountaine Parſley hath divers reddiſh ſtalkes of large ſpread leaves, divided into ſundry parts lying thereof on the ground next the roote, very like unto Garden Parſley but ſomewhat larger ſmelling well: from among which ariſeth up a ſhort ſtalke of about a foote height, with divers the like leaves upon it, but narrower towards the toppe, and bearing thicke tufts of white flowers, after which come ſmall ſeede like Smallage ſmelling ſomewhat ſweete ſharpe in taſte and biter withall: the roote is long great and thicke with a buſh of leaves at the toppe being ſweete ſharpe and aromaticall.

2. *Apium montanum verius*. The truer Mountaine Parſley.

This other mountaine Parſley ſhooteth forth a hollow lexie ſtalke in ſome places, tall and high in others, ſhort and low according to the ſoyle wherein it groweth, bearing ſundry large ſpread leaves cut and divided ſomewhat like unto the leaves of Hemlocke bearing umbells of white flowers, and after them ſomewhat long blackiſh ſeede, like unto Cumin ſeede, being ſharpe in taſte and ſweete in ſmell: the roote is ſmall long and white.

3. *Apium montanum Pariſienſium*, The *Pariſian* mountaine Parſley.

The *Pariſian* mountaine Parſley hath a large, thicke, whitiſh roote, eating and ſmelling much like unto the roote of Hemlocke ſimple, the whole herbe doth reſemble Parſley long ſtalke ſtanding on the ground, the umbells of flowers are white and the ſeede is ſharpe in taſte, but ſmelling very ſweete.

The Place and Time.

The firſt growth neare unto *Vienna* in *Auſtria* as *Cluſius* ſaith and on the mountaines among the rockes in *Germany* and other places: the next is found in the borders of the fields in the mountaines of *Burgundie*: the laſt on the higheſt top of the ſame hill by *Paris*: they flouriſh in the ſummer and give ſeede ſoone after.

The Names.

The Dodonean name *Aconitum* is given to theſe plants, and *Oreoſelinum* and *Apium montanum* in Latine, and the laſt differs as well in ſeede as in [illegible] deſcription of it, and yet is [illegible] many, whereas the Second onely [illegible] *Oreoſelinum* both in ſeede and [illegible] *Dodonæus* (who [illegible] by the *Italians Peterſemolo*, *Petroſelino*, and by *Tabernæmontanus* [illegible] and *Apium montanum Dalechampij*, and by *Lobelius* [illegible] *Apium montanum Pariſienſe*, and by *Banhinus Apium montanum* [illegible] *Apium montanum* [illegible] *Oreoſelinum*.

1. *Apium montanum vulgatius.*
The more common mountaine Parſley.

The Vertues.

Dioscorides saith that the mountaine Parsley provoketh urine, if the roote and seede be taken in wine, it bringeth downe also womens courses, and is put among those medicines that are made to expell gravell: and those that doe warme any cold part. *Galen* saith it is in working like unto Smallage, but more effectuall. *Dodonæus* affirmeth downe right that the first mountaine Parsley called *Vesigutta*, that is good for many things, is hot and dry in the end of the second degree, that it doth extenuate and make thinne the thicke grosse clammy humours, that it cutteth tough flegme, openeth obstructions of the liver and spleene, and provoketh urine, breaketh and expelleth the stone, moveth womens courses, and helpeth the yellow jaundise, and being chewed in the mouth, it draweth much water and spittle into the mouth, and easeth the tooth-ach.

Chap. XXIX.

Thysselinum sive Apium sylvestre. Wilde milkie Parsley.

This kinde of wilde Parsley, hath sundry large spread leaves, somewhat resembling garden Parsley, but they are divided into more parts, and each division hath further leaves, from among which riseth up an hollow straked stalke a yard high, reddish toward the bottome, sometimes with the like leaves at the joynts where it branches forth diversly, bearing large thicke umbells of white flowers, reddish on the one side and pale on the other, and after them fat seede, somewhat like unto Parsneppe seede, but a little lesse hot in taste, and somewhat aromaticall; the roote spreadeth divers long strings, blackish without, but white within, and deepe into the ground, somewhat like unto the *Meum* Spignell, and abideth many yeares. The whole plant and every part thereof, yeeldeth a milkie juyce, if it be broken in any part.

Thysselinum sive Apium sylvestre. Wilde Milkie Parsley.

The Place and Time.

It groweth in moist and marshy grounds, and water-courses, and much also in the moist woods where Alders doe grow: it flowreth in *June* and *July*, and seedeth soone after.

The Names.

Both *Dioscorides* & *Theophrastus* have a *peculiar Epithet Apium sylvestre*, but they differ much one from another, for *Dioscorides* his is that kinde of *Ranunculus*, bee called *Herba Sardonia*, but *Theophrastus* doth not number his among his other *Selina*, and peradventure may be this that hath beene referred both by *Dodonæus* and *Lobel* unto the *Thysselinum* of *Pliny*, which *Lobel* calleth *Thysselinum Plinij*, supposing the name *Thysselinum*, but doe not agree with the forme of this plant, as comming neerest to a *Selinum*, but howsoever if it be not the same with *Pliny* his *Thysselinum* it commeth so neare it, that no other is yet found so neare, especially in the forme of the leafe and property of the roote, as you shall heare by and by; *Lobel* and *Dodonæus* doe both say, that this was in former times used in all the shoppes of the *Low Countries* in stead of *Meum*, taking it to be the right; and therefore *Dodonæus* did also call it *Apium sylvestre* as *Lugdunensis* doth likewise; *Gesner in horto* calleth it *Daucus palustris*, and *Lonicer in historia Offrutchium* from the *Germane* word *Offerich*, whereby they so called it; *Bauhinus* calleth it *Apium sylvestre tuberosa radice serpens*; and thereupon I have entituled it in *English*, Wild milkie Parsley, to distinguish it from other sorts of wilde Parsley.

The Vertues.

The roote hereof is hot and drie in the third degree, which being chewed in the mouth, draweth downe much flegme from the head to be spit out, and easeth the tooth-ach: and this quality, *Pliny* saith, the roote of the *Thysselinum* is endued withall: the other properties appropriate to the other kinds of *Apium* are no lesse to be found herein; and that to no lesse effect, as both to extenuate, cut, and open, and to provoke urine and womens courses.

Chap. XXX.

Selinum sive Apium peregrinum. Strange Parsley.

This strange Parsley hath from a long whitish roote, sharpe in taste well smelling, and rather [illegible] growing woodily, and perishing after seede time, divers long stalkes of leaves lying on the ground, which are almost round, yet a little pointed and dented about the edges, five usually and more [illegible] sometimes but three on the stalkes, set by couples and of a sad greene colour, the stalke, [illegible] leaves

Selinum sive Apium peregrinum vulg.
The Gall Bragge Parsley of Candie.

Selinum sive Apium peregrinum platifolium Clusij.
The Gall Bragge Parsley of Candie.

bearing stalkes foure foote high with divers leaves, shooting from it, divided much, and into long parts, and dented like wilde, or the coppes whereof grow umbells of small white flowers, bowing downe their heads alwhile double before they rise to be in flower, which better expressed in the former figure, after which come very small seede not so bigge as Smallage seede, but quicke and hot and of a good smell: this by the shedding of the same seede doth easily abide in a garden if it once seede therein.

The Place and Time.

It groweth, saith *Clusius*, in the borders of the Vineyards, and by the paths and wayes side in the countrey of *Valencia* in *Spaine*, and that it flowreth in *May*, and the seede is ripe in *August*, but such as it is more late before it ripen.

The Names.

Clusius who found it in *Spaine*, called it *Selinum peregrinum*, and is the best warrant. *Renealmus* calleth it *Apium peregrinum folio crassiore*, and is the third *Saxifraga* of *Dioscorides*, and the third *Daucus* of *Dioscorides* with *Cordus*, which he nameth the second with *Pliny*.

The Vertues.

The qualities of heate and drinesse perceived in the taste of both leaves and roote, but especially of the seede doth argue it to be no lesse effectuall to provoke urine, and so helpe to breake and expell the stone than some of the former Parsleyes, and besides may be also good for other diseases, as they are formerly remembred, and the seede of *Smyrnium* also, as *Crescentius* giveth it, sheweth the same: these things are probable, although we have had no certaine experience by triall.

Chap. XXX.

Hipposelinum sive Smyrnium. Alisanders.

Under this title of Alisanders, I must comprehend two sorts of herbes, each of them called *Smyrnium*, the one and the last *Petroselinum*, as shall be shewed.

1. *Hipposelinum sive Smyrnium vulgare.* Garden Alisanders.

Our common garden Alisanders groweth the greatest of all the *Selina* mentioned by the old writers or others, having divers large spread leaves, cut into many parts greater and rounder than Smallage, of a darke greene colour, and dented about the edges, of somewhat an hot and spicie taste, and a little bitternesse withall, the stalke that riseth up amongst them is thicke and round, a yard high and better, with sundry joints in them, parted into smaller divisions, with branches also rising from the joynts, each bearing large tufts of small yellow flowers, and after them great blackish seede, not full round, but a little flatned on the backe, somewhat bitter, as the leaves and roote also is, which is great, thicke, long, and blackish on the outside, spreading into many parts under ground, and whitish within.

1. Hipposelinum sive Smyrnium vulgare
Common Alisanders.

2. Smyrnium Creticum.
Candy Alisanders.

3. *Smyrnium Creticum.* *Candy* Alisanders.

The *Candy* Alisanders is the strangest in the growth of any plant upon the ground, by the alteration of the upper from the lower leaves, for before the stalke riseth, any one would take the leaves to be some sort of Fennel, the whole leafe being large, and more divided into smaller parts than the former, as it were into great hairy, of a darke greene shining colour, and dented about the edges: the stalke is round and soft, some and not hollow, foure foote high or better, untill having at the joynts whole, and almost round leaves, yet sometimes longer than round, and here and there cuts in on the edges, of a yellowish greene colour which doeth so much compasse the stalke at the bottome of them, as that the stalke in a manner groweth through them: from the joynts likewise do sundry branches, with the like yellowish round leaves on them, and the stalkes running through them are tops, where stand thicke tufts or umbells of yellowish flowers, which afterwards turne into small and blackish seede, about the bignesse of Radish seede: the roote is at the first almost round, as bigge as a great gall yet a little long withall, and white on the outside, which afterwards groweth thicker and longer, and grow at the toppe, reading small, but perishing quite after it hath borne seede, which hath nothing to loose bitter spice a taste as the former hath, especially in our country, but as some might thinke that it hath altered the *Fabius Columna* saith that even in *Naples* where it is eaten all as hath no sharpe or bitter taste nor the like it needeth with us. *Bauhine* maketh another sort hereof, the difference only consisting in the upper leaves which are longer than the other and more cut in, both which sorts hath risen in my garden from one kinde of seede, wherefore I hold them to be both one, and make no more differing sorts.

The Place and Time.

The first is found wilde in some of the fields about our own Land by Mr. *William Coxe*, a worshipfull there late inhabitant, who gave me and Mr. *William Cole* a famous Gentleman, and a great lover of plants, the seede, supposing it to be differing from the common sort, but after they were sowen up we all saw was made perfect. It is usually sowen in all the gardens of *Europe*, as farre as I heare, where they receive rather came from *Candy*. They both flower in *June* or *July*, and the seede is ripe in *August*.

The Names.

[illegible] in Greeke, is called *Hipposelinum* also in Latine, Gesner rendereth it *Equisetum*, because [illegible] the greatest of all other their *Selinum*. *Dioscorides* saith it was called by some in his time [illegible] he saith the true *Smyrnium* is an other herbe, which he describeth in the Chapter following, and [illegible] *Creticum*. There is some controversie among Writers about this *Hipposelinum*; [illegible] true *Hipposelinum* of *Dioscorides* or no, then whether it or the other *Smyrnium Creticum* [illegible] *Dioscorides* or no: for the first, *Matthiolus* sheweth the error of *Ruellius* in taking the *Paloseg* [illegible]

Original from UNIVERSITY OF MICHIGAN

...of the *Italians*, and saith he doubteth not what herbe this *Hippoſelinum* ſhould be, unleſſe it be *Leuiſticum* ...which yet he acknowledgeth not to anſwer *Dioſcorides* his notes thereof, becauſe it is in forme ſo like ...to *Selinum*, and for this opinion *Lobel* yerkes him too cruſtically, ſhewing that *Leuiſticum* is too hot and ...and in no place uſed to be eaten as a wort or ſallet herbe, and that he did unworthily taxe *Braſſauolus* for ...taking the *Smyrnium* of the *Italians* to be this *Hippoſelinum* by the falſe tranſlation of *Marcellus Virgilius*, in giving the roote of *Hippoſelinum* to be blacke without and white within, when as *Dioſcorides* maketh no mention ...of any blacknes in the roote: *Lobel* alſo ſaith that it is the true *Hippoſelinum* as they affirmed by the judgement of the moſt learned in theſe dayes, and yet by all their leaves, the roote of *Dioſcorides* is different from it, who ſaith it is white when as this is blacke, that it is ſmall, but this is not ſo, which maketh *Columna* in the beginning of *Ianuarius*, to ſay that he would further ſearch what *Dioſcorides* his *Hippoſelinum* ſhould be, as not liking this ...for a truth of to be ſo. Now concerning the other doubt whether this *Hippoſelinum*, or the other plant called *Smyrnium Creticum* ſhould be the true *Smyrnium* of *Dioſcorides* or no, the currant opinion of moſt Writers in ...times, is that this *Smyrnium Creticum* is the ſame, and yet as *Columna* hath in the ſaid place very worthily, and throughly examined the matter, it is nothing ſo; for *Dioſcorides* deſcribeth his *Smyrnium*, firſt that it was called *Hippoſelinum* in *Cilicia*, and that it hath leaves of a good ſmell, ſharpe or quicke on the tongue, with ſome pleaſantneſſe therein alſo that the ſeed is round like to Colewort ſeed, (wherein *Columna*, thinketh ſome miſtaking of the ...word to be that *στρογγύλη* is ſet down in ſtead of *σκορόδου*, for as he ſaith, the ſeed is as like to the ſeed *Coriandri* ...may be, except the black colour) black & of a ſharpe taſte like *Myrrhe* (weete Chervill, ſo that one may be miſled of the other, and that the roote is blacke without and of a whitiſh greene colour on the inſide, of a ſweete ſmell, and a ſharpe taſte, bearing the mouth, both roote, ſeed, & leaves being of an hearing properties not any one of thoſe markes or notes except in the ſeed to be blacke and round, is to be found in this *Smyrnium Creticum*, and therefore cannot be ſo in the right: whether then the *Hippoſelinum* of *Dioſcorides* can be *Smyrnium*, *Dioſcoridis*, himſelfe denieth it, and ſaith that although ſome called it *Smyrnium*, yet the true *Smyrnium* was an other herbe; even ſo doe the moſt part of *Dioſcorides* his deſcription ſet downe a few lines here before unto you: *Theophraſtus* ...unto ſet forth an *Hippoſelinum*, *lib. 9. c. 5.* and ſpoken of it in other place, which is plainely differing from the *Hippoſelinum* of *Dioſcorides*, and neereſt unto, if not the ſame with his *Smyrnium*: for *Theophraſtus* ſaith that his *Hippoſelinum* (ſeaſoned by *Daucus Epiphanes*) doth yeeld a juyce from the roote like unto *Myrrhe* or *Myrrhis*, as *Dioſcorides* ſaith of his *Smyrnium*: ſo that by this that hath beene ſaid (although it be ſomewhat confuſedly, yet I could not more briefely declare them) we finde that *Smyrnium Creticum* is not the true *Smyrnium* of *Dioſcorides*, as *Matthiolus*, *Camerarius*, *Dodonæus*, *Lobel*, *Lugdunenſis*, *Tabernæmontanus*, and *Gerard* hath ſet it downe, nor that the *Hippoſelinum* of *Dioſcorides*, which is called alſo *Olus atrum* with us is ſufficiently knowne, although ſome authors call it *Hippoſelinum*, nor is that which it is taken to be, by the defect of ſome of the notes or markes that *Dioſcorides* giveth it, and laſtly that the *Hippoſelinum* of *Theophraſtus* doth agree with the *Smyrnium* of *Dioſcorides*, but not with his *Hippoſelinum* being different plants, and ſo *Matthiolus*, *Cordus* on *Dioſcorides*, *Geſner in horto*, *Camerarius* and *Columna* ſet it downe: *Columna* his iudgement is, that the ſeede of this *Hippoſelinum*, or *Smyrnium* may ...rightly be uſed for *Petroſelinum Macedonicum*; if his other fine leafed herbe that hath the ſmell of Garden Parſley be refuſed, or not to be had; than either the common Parſley ſeede, or that of *Venice* called *Petroſelinum Macedonicum* by many, and by him *Daucus ſecundus Dioſcoridis*. The *Italians* call the firſt *Macerone*, the *Spaniards* *Perexil Macedonico*, the *French Alexandre*, the *Germans Groſſ Eppich*, the *Dutch Peterſelie van Macedonien* and *Boere Eppe* and *Peterſelie van Alexandrien*, and we in *Engliſh* Alliſanders.

The Vertues.

The Alliſanders are much uſed to make broth with the upper part of the roote, which is the tendereſt part, and the leaves being boiled together, and ſome eate them either raw with ſome vinegar, or ſtew them, and ſo eate them; and this chiefely in the time of Lent, to helpe to digeſt the crudities and vitious humours are gathered in the ſtomacke by the much uſe of fiſh at that time, it doth alſo warme any other cold ſtomacke, and by the bitternes helpeth to open obſtructions of the liver and ſpleene, to move womens courſes, to expell the after birth, to breake winde, to prouoke urine and helpe the ſtrangury, and theſe things the ſeede will doe likewiſe if either of them be ſayled in wine or taken in wine, and is effectuall againſt the bitings of Serpents. We know of no good ...in the other herb, being in a manner inſipide.

Chap. XXXI.

Selinum Segetale, Corne Parſley.

Though theſe *Apia* Parſleyes, let me ſoyne this unto them which *Iohn Gerarde* firſt gave me the knowledge of, with ſome ſeede which ſpringeth in my garden I thus deſcribe unto you; it is a ſmall low herbe having ſundry winged long leaves lying on the ground, many being ſet one againſt another, finely dented about the edges, with one at the end, which are each of them longer than Burnet leaves, and pointed at the ends, among which riſe ſundry ſlender ſtalkes halfe a yard high with the like leaves thereon, branching forth likewiſe from the joynts, and all of them bearing ſmall umbells of white flowers, which turne into ſmall blackiſh ſeede leſſe than Parſley, but as hot and ſharpe in taſte as it: the roote ſmall, long, and white, and periſhing every yeare after it hath ſeeded, and ſpringeth againe of its owne ſowing.

The Place and Time.

It groweth in the fields among the corne, or where corne hath beene ſowne in divers places of the land: it ...ſpringeth up with me untill *Auguſt*, and the ſeede ripened a month after at the leaſt.

The Names.

Mr. *Gerard* firſt gave it me by the name of *Sium terreſtre*, and after that I found it an umbelliferous plant, ...thought it might beſt be referred to the *Selina* or *Apia*, and called it then *Apium Segetale* from the compoſure of

Original from UNIVERSITY OF MICHIGAN

of the leaves like unto *Sium odoratum Tragi*; but since that I heard it, I suited it with *Selinum Segetale*, which is Corne Parsley, but it is called in some places of the land Hogweeds.

The Vertues.

Because the seede is both in forme like Parsley, and as hot in taste, there is no doubt but that it is very neere of the same propertie with Parsley, but because I have not made any triall thereof my selfe, I can say no more, but what Mr *Goodyer* related to mee, that the use of the juyce of a handfull of the leaves to be drunke in a draught of beare every morning for a fortnight, did cure one that had a swelling in her cheeke yearely there arising sometimes, but whereof it proceeded I could not be shewen.

CHAP. XXXII.

Cicuta. Hemlocke.

THere are many sorts of Hemlockes to be shewed you some greater, others lesse, some growing in the meadowes, and others by the hedge side, &c.

1. *Cicuta vulgaris maior.*

The common greater Hemlocke.

The common great Hemlocke groweth up with a hollow greene stalke foure or five foote high or more, full of red spots sometimes, and at the joynts very large winged leaves set at them which are divided into many other winged leaves, one set against another, dented about the edges, of a sad greene colour branched toward the toppe, where it is full of umbells of white flowers, and afterwards with whitish flat seede, the roote is long, white, and sometime crooked and hollow within, the whole plant, and every part, hath a strong headdy ill flavoured sent, much offending the senses.

2. *Cicuta minor foetens*, Foolish Hemlocke or counterfet Parsley.

This small Hemlocke riseth not a yard high, with whiter and smaller stalkes not spotted at all, the leaves as much smaller comming neare unto Parsley, so that many are mistaken in gathering one for another, many times found as a wilde weede in gardens of a paler greene colour, and with lesse branches, the flowers also both white as the rootes, but small, and perishing every yeare: the sent herein is much more offensive.

3. *Cicuta maxima.* The greatest Hemlocke.

This Hemlocke hath much larger winged leaves than the former, thicker set, more spred, and of a sadder greene colour (for the smell whereof, which *Lobel* calleth *foetidissimus*, I that have had it growing in my garden for many yeares could never take offence by the smell of it, it is the same that *Lobel* speaketh) the stalkes great, but riseth not so high as the common sort doth, and beareth large umbells of white flowers, whereafterwards grow large and thicke white crooked seede of no ill sent that ever I could perceive, the roote is very great and white, both growing deepe in the ground, and spreading many great branches therein, which sometimes creepeth after it hath given seede, and yet not alwayes, but at sometimes, and in some places will abide. *Lobel* hath joyned to this another, which he calleth *maxima Bruxellensis*, but he himselfe doubteth whether it be perfect with this sort, and therefore I thinke good to make no further mention of it.

4. *Cicutaria vulgaris alba.* White wilde Hemlocke.

The white wilde Hemlocke hath a white long thicke roote like Fennell, but divided into many parts, having a sweete sent, and a hot sharpe taste, from whence rise diverse stalkes of winged leaves much cut in peeces, among which riseth a slender branched and crumpled stalke, a cubit high, bearing umbells of white flowers, and long blacke well smelling seede, after falling sharpe, two alwayes joyned together with a deepe furrow between them.

5. *Cicutaria palustris rubra.* Red wilde Hemlocke.

This coloured Hemlocke hath a thicke blacke, and jointed roote with divers fibres, from the leaves of a forme like the former, but not so much cut into parts, and paler of colour, [illegible] a foote high, bearing flat umbells, with pale red, or bluish flowers, and long blacke seede, of a strong ranke smell and sharpe in taste.

6. *Cicutaria palustris rotundifolia.* Marsh or Water Hemlocke.

The Marsh or Water Hemlocke hath a great thicke hollow stalke, [illegible] leaves at them, at the joynts with the leaves which are cut into divers parts [illegible] ler come forth the branches in like sorte, bearing small umbells of white flowers, the seede [illegible] and blacke, [illegible] growing from them.

7. *Cicutaria bulbosa.* Bulbous rooted wilde Hemlocke.

This bulbous Hemlocke hath diver[illegible] stalkes of fine cut leaves, more [illegible] comming some what neare unto the *Pulmonaria arborea*, Earth Chestnut leaves, of a little sharpe [illegible]

1. Cicuta vulgaris major
The common greater Hemlocke.

2. Cicuta minor seu tenuis
Foolish Hemlocke or commonly Fooles Parsley.

3. Cicuta Matthioli
Fine green Hemlocke.

5. Cicutaria pauciflori tenuifolia
Muralis or Wall Hemlocke.

a foote and sometimes a cubit high, having thicke and knobbed joynts and leaves at them, at the toppes whereof standeth an umbell of white flowers, and after them somewhat long seede like Chervill seede: the roote is long and tuberous, somewhat like unto the roote of the round *Aristolochia* Birthwort, knobbed in sundry places, blackish browne without and white within of the taste of a Parsnep roote, but greater and somewhat longer like a Turnep roote, when it runneth to seede and perisheth yearely, being raysed of it owne sowing.

The Place and Time.

The first groweth in all countries by walls and hedge sides in waste grounds and untilled places, the second is found as well about as also in gardens, and the third in Gardens alone in these parts, the fourth and fifth in moist grounds and marshes and by waters sides in *France*, the sixt by our Thames sides in many places, and the like Rivers sides in our owne Land, and the last as *Clusius* saith in *Hungaria* and *Styria*, both wilde there and in their gardens, they all flower and seede in *July* or there abouts.

The Names.

It is called *μυῤῥὶς* in Greeke *παρὰ τὸ κατὰ μύειν, à circum virtendo, quod vertiginem & imaginem rerum circumeuntium, tanquam circumagantur ac in tenebras inducat ijs qui eam biberint, ut Festus Pictorius & Cornarius recte dicunt.* Cicuta. The first is called *Cicuta* and *Cicuta major* by all writers, yet *Clusius* calleth it *Cicutaria*, the second the *Cicuta minor* of *Cordus* and *Cornarius*, *Cicutaria sativa* by *Lobel*, *Apium cicutarium* by *Thalius*, *Pastinaca Canina* by *Tabernamontanus*, *Petroselini vitium* by *Tragus*, and *Apij romani vitium* by *Gesner* in Lucr. the third is called *Cicutaria latifolia fœtidissima*, and *Cicutaria maxima Brancursina* by *Lobel*, for as I said he judgeth them both one, and *Cicutaria Myrrhis* by *Thalius*, by *Matthiolus*, *Gesner in hort. Lugdunensis* and others *Scandix Pecten*, which *Lobel* contradicteth, but without just cause as I suppose, as I said before: the fourth and fifth is called by *Lugdunensis Cicutaria alba*, and *Cicutaria rubra*, and by *Camerarius* and *Bauhinus Cicutaria palustris flore albo* and *flore purpureo*, and peradventure may be the *Monon Selasianum* of *Camerarius* also as *Bauhinus* saith, the third called *Cicuta palustris* and *aquatica* by *Cordus*, *Gesner* and *Thalius*, and *Cicutaria palustris* by *Lobel* and others, and taken to be *Phellandrium* of *Pliny* by *Dodonæus* and *Lugdunensis*, who make it also a kinde of Smallage or Lovage, *Ligusticum sylvestre* by *Thalius*, and *Silaus Plinij* by *Cæsalpinus* and others: the last was first found out and named *Cicutaria Pyrenaica* by *Clusius*, *Camerarius* calleth it *Bulbocastanum Cynapioides*, *Tabernamontanus Myrrhis Cicutaria*, and by *Bauhinus* as I doe also *Cicutaria bulbosa*. The *Arabians* call it *Sucran*, the *Italians* Cuute the *Spaniards* Cegnda and Cambeja, the *French* Cigue and Cocue, the *Germanes* Wortzering Scerling and Wurtzering, the *Dutch* Schavlak Sulckgruell, and we in *English* Hemlocke and Kexes.

The Vertues.

Hemlocke is exceeding cold in qualitie and very dangerous, especially to be taken inwardly; For the Athenians adjudged the most wise *Socrates* to dye by taking the juice thereof, for not thinking rightly of their Gods as *Aristus* and *Melitus* accused him: yet as it was then well knowne some countries bred it stronger to inhabit other, and although some doe appoint it to be applyed outwardly to the cods of those that have venerous dreames or the like, or to maidens and womens breasts to represse their swellings and repell their milke, yet by reason the places are so tender and full of vitall spirits, it often proveth that the remedy is more dangerous then the disease: it may safely be applyed to inflammations, tumors and swelling in any other part of the body, as also Saint Anthonies fire, wheales, and pushes and creeping Vlcers that rise of hot sharpe humors by cooling and repelling the heate: the leaves bruised and layd to the brow or forehead is good for their eyes that are red and swollne and doth soone ease the paine and take away the swelling and rednesse, as also to take away a pinne and web growing in the eye, this is a tryed medicine, to take a small handfull of the herbe and halfe so much Sale beaten together and applyed to the contrary wrist of the hand for 24 houres doth within thrice dressing remove it. The roote of Hemlocke Ie roasted under the Embers wrapped in double wet papers untill it be soft and tender, and then applyed to the goute in the hands or fingers will quickly helpe this evill. The remedy for Hemlocke if any shall by mischance take the herbe in stead of Parsley, or the roote in stead of a Parsnep whereby happeneth a kinde of frenzie or perturbation of the senses, as if they were stupified or drunke, is to drinke of the best and strongest pure wine before it strike to the heart, as *Pliny* adviseth, or Gentian put into wine as others, by him *Tragus* saith that he helpe a woman that had eaten the roote, by giving her a draught of good Vinegar, but if he be given with wine it procureth death without remedy: *Matthiolus* sheweth that Asses by chance eating of the herbe fell into so deepe a sleepe that they seemed dead, which when some came to slay them they sang them in the doing it, to their amazement and merriment.

Chap. XXXIII.

Myrrhis. Sweete Chervill or sweete Cicely.

There are three or foure sorts of this *Myrrhis* to be shewed you in this Chapter three whereof are of later invention then others.

1. *Myrrhis major sive vulgaris.* The ordinary Garden Myrrs Chervill.

This sweete Chervill by reason of the so neare resemblance unto Hemlockes, I thought good to joyne next them, which groweth not so high, but hath large spread leaves cut into divers parts somewhat resembling the greatest Hemlocke but of a fresher greene colour, tasting as sweete as Anise seede: the stalke riseth up a yard high or better, being crested or hollow having the like leaves at the joynts as it hath and at the toppes of the branched stalkes umbells or tufts of white flowers, after which come long crested blacke shining seede pointed at both ends tasting quicke, yet sweete and pleasant like the seede of Anise seede: the roote is great and white growing deepe in the ground, and spreading sundry long branches downe, of taste and smell stronger then the leaves or seede and continuing many yeares. Of this kinde wee have seene much greater and larger that was brought from *Austria*, especially the leaves, which are foure times as large as the former, not differing else.

Tab. Scriptorum Icon.

Original from UNIVERSITY OF MICHIGAN

2. *Myrrhis altera minor.* The leſſer ſweet Chervill.

The leſſer ſweete Chervill is ſomewhat like the former, but the whole winged leafe is much leſſer, and divided into fewer and leſſer leaves alſo, and ſofter in handling, the ſtalkes are lower and the umbells of white flowers: the ſeede that followeth is long but much ſmaller, and not blacke but tailing neare unto the former: the roote is a buſh of many blackiſh fibres.

3. *Myrrhis ſylveſtris.* Wilde ſweete Chervill.

The wilde ſweete Chervill is likewiſe a low plant, and not much differing from the laſt in the forme of leaves but that it is ſomewhat hairy and whiter, the flowers are white, but in more thinne and ſparſed umbells, and the ſeede that followeth is ſmall, long and ſmooth: the roote is thicke and blackiſh and liveth many yeares.

4. *Myrrhis ſylveſtris Neapolitana & vulgaris Anglicana.* Wilde ſweete Chervill of *England* as well as *Naples*.

The kinde of Chervill is ſo like in leafe unto the common Hemlocke, that before it be growne up to ſtalke it deceiveth many that gather it. for the ſtalke is ſpotted ſometimes with white and red, yet ſeldome ſo with us as doth Hemlocke: but whitiſh, at the joynts whereof with the leaves which are leſſer come forth ſmall rufty downy knockes

fylueſtris, and *Cerfoil* in *hortis Cicutæ ſimilis Cicuta hortenſis* that grew in the fields, and was not ſuffered to grow in Gardens which *Ruellius* called *Anethum ſylueſtre ſemonibus leuibus*, becauſe hee calleth the laſt *Anethum* [illegible] which *Columna* called *Anethi ſylu. nouum*, *Aquilegifolium*, and I have added to the ſame *Anethum* [illegible] like his. The *Italians* call it *Mirrhida*, the *French Perſil d'Asne*, the *Germans* [illegible], the *Dutch* [illegible], the *Cornish* [illegible] and we in *England* ſweete Chervill, great Chervill and ſweet Cicely.

The Vertues.

Galen ſaith that *Myrrhis* is hot in the ſecond degree with ſome ſtrictneſſe of parts: both leaves, ſeede, and roote are ſo fine and pleaſant in Sallets as no other is comparable to it, and give a better reliſh to any ordinary herbs put with it: the tender while they are freſh and greene ſliced and put among other herbes make them ſo pleaſant: the roote boyled and eaten with oyle and Vinegar, or without oyle if any diſlike oyle, doth much good and warmes a cold or old ſtomacke oppreſſed with flegme or winde, or thoſe that have the Yellow Iaundice: conſumption of the Lungs: the roote drunke with wine is a remedy againſt the biting of the venemous worme *Phalangium*, as alſo the Plague of Peſtilence: the ſame alſo provoketh womens courſes, and expelleth the ſecundine: it alſo preſerveth an appetite to meate and helpeth to expell winde: the juice is good to heale the Vlcers in the head and eares: the candied roote of this Chervill are held as effectuall as Angelica to preſerve from infection in the time of a Plague, as alſo to warme and comfort a cold weake ſtomacke.

Chap. XXXIIII.

Leuiſticum vulgare. Ordinary Lovage.

Having finiſhed the two former rankes or order of umbelliferous plants, I am come now to ſpeake of the third and laſt ſort which is of ſuch as have broader leaves like *Panax* or *Angelica* and becauſe I could not well place the Lovage among the *Sethes* or *Apia* although it be neere like unto them, and not to be accounted one of them, let us ſet it in the forefront of this third order. The deſcription is thus. It hath many long and great ſtalkes of large winged leaves divided into many parts, ſomewhat like unto Smallage, but much larger and greater, every leafe growing out about the edges broadeſt forwards and ſmalleſt at the ſtalke, of a ſad greene colour, ſmooth and ſhining: from among which riſe up ſundry ſtrong and tall hollow greene ſtalkes five or ſix foote high, yea eight foote high in my Garden, full of joynts and ſuch like but leſſer leaves ſet at them often grow below, and with ſmaller toward the toppes long branches, bearing at their toppes large umbells of yellow flowers, wherein them flat brownish ſeede bigger by much then Dill, and leſſer then Parſneps and thicker alſo: the roote groweth great and deepe, ſpreading much and enduring long, of a brownish colour on the outſide and whitiſh within, ſa-

Leuiſticum vulgare,
Ordinary Lovage.

Leuiſticum vulgare Coloratum.
The Longer ſort Garden.

Original from UNIVERSITY OF MICHIGAN

...and every part of it smelleth somewhat strongly and aromatically, and of an hot sharpe biting taste. ...another figure of *Levisticum* which *Camerarius* in his *Epitome* upon *Matthiolus* exhibiteth, I could not ...but note it here, that the difference from the other may be seene, our rootes being great and thicke, and nothing *Germa-* ...stalkes, and in the flowers which they say are white, and are yellowish with us, which *Dodonæus* noteth *nicum.* ...also, whether either they observed it not well when it was in flower, or theirs doth differeth from ours therein, ...I passe it ouer in the *Pomæ Herculeum*.

The Place and Time.

...I finde no where wilde in *Europe* that I can here of, but is onely planted in Gardens where it will grow ...very well if it be suffered: it flowreth in the end of *July*, and seedeth in *August*.

The Names.

...is called usually in Latine *Leviſticum* (for Greeke name it hath none) and not *Ligusticum*, being farre diffe- ...rent: although some have taken them to be both one, deceived chiefely by the vicinitie of the name, as ...namely *Cordus*, *Gesner*, *Tragus*, *Camerarius* and *Tabernæmontanus*, who all call it *Ligusticum*, either *ſatiuum* or *vul-* ...*gare*. *Lobel* calleth it *Lusticum* and *Smyrnium* also, for which he is reprehended by *Matthiolus*, *Anguillara* ...writes to the *Leſerpitium* and *Dodonæus* saith it is likely to be a kind of *Leſerpitium*, and *Lobel* calleth it *Leſer-* ...*pitium Germanicum*, but *Lugdunenſes* maketh it to be *Hippoſelinum*, after *Matthiolus* his opinion, who saith, if this ...be not *Hippoſelinum*, he knoweth no other: *Matthiolus*, *Dodonæus* and *Lobel* doe call it *Leviſticum*, ...*Tragus* setteth it among the *Libanotides*, and called it *Ligusticum vulgare*; and *Libanotis ſerulæ Theophraſti*, ...for the true *Ligusticum* called *Siler montanum*, and in shoppes *Xiſelias*, I have shewed you here before. The ...Italians call it *Leviſtico*, the *French Leveſche*, the *Germanes Labſtockel*, the *Dutch Luyeriſe* and *Luyen*, and wee in ...*English* Lovage.

The Vertues.

...Lovage is hot and drie in the beginning of the third degree, and is of thinne parts also: and thereby doth open ...and digest humours, and doth mightily provoketh women's courſes and urine, as much as any of the kindes of ...Parsley: the dried roote in powder taken to the weight of halfe a drammie in wine, doth wonderfully warme a ...cold stomacke, helping digestion, and consuming all superfluous moisture and raw humours therein, easeth all in- ...ward gripings and paines, dissolveth winde, and resisteth poyson and infection effectually: the greene roote grie- ...ued or bruised in a stone morter, and steeped for twelve houres in faire water, then strained and drunke first in the ...morning and last at night two or three spoonefulls at a time, allwageth any drought or great desire to drinke ...more than a carouse of cold drinke, found true by often experience, although the roote is well knowne to be ...hot: it is a knowne remedy, and of much and continuall experience in divers shires of this Land to drinke the ...decoction of the herbe for any sort of ague, whether it be *quotidian*, *tertian* or *quartane*, and to helpe the paines ...and torments in the body and bowells comming of cold: the seede is effectuall to all the properties aforesaid, ex- ...cell the all, and worketh more powerfully: the *Germanes* and other Nations in times past, used both the rootes ...and seede instead of Pepper to season their meates and brothes, and found them as comfortable and warming to ...the stomacke: the distilled water of the herbe helpeth the quinsie in the throate, if the mouth and throate be gar- ...gled and washed therewith, and helpeth the pleurisie, if it be drunke three or foure times; the said water also ...dropped into the eyes taketh away the redneſſe or the dimmeneſſe of the eyes, it likewise taketh away spots or ...scales in the face: the leaves of Lovage bruised and fried with a little hoggs larde, and laid hot on any botch or ...sore will quickely breake it: the greene rootes may be kept in pickle made with salt and vinegar for a long time, ...and serued with Sugar is more pleasant.

Chap. XXXV.

Leſerpitium. Laserwort.

...Because Lovage was called *Leſerpitium Germanicum*, I thought good a little to declare the true ...*Leſerpitium* or *Laſer* of the ancients, both to shew what it was, and what with divers it is now ...taken to be; and withall to joyne both the *French* kinde and that which *Alpinus* hath set ...out for the true.

Leſerpitium Gallicum. *French* Laserwort.

The *French* Laserwort hath a great long roote, bigger than that of Ferula Fennell giant, of a ...reddish colour on the outside, and white within, full of a fat or thicke juyce, and smelling sweete, from ...which riseth great tall stalkes thicke and high as the Ferula, whereon are set divers stalkes of winged leaves like ...unto Fennell, but thicker, harder, and of a darker greene colour, somewhat deepely dented about the edges, and ...the lower leaues deepely iagged than others: at the toppes of the branches and stalkes stand large umbells of ...flowers like unto Fennell, and after them large flat winged seede like unto Angelica, of the colour of Boxe, and ...of like taste.

Leſerpitium Alpinum. *Alpinus* his Laserwort.

...This kinde of Laserwort, saith *Alpinus* groweth to be of three cubits in height, hollow, and of the bignesse ...of a Ferula stalke, having large winged leaves set thereon, somewhat like the great *Selinum*, or sweete ...Parsley, but greater than those of wilde Angelica, yeelding a milke being broken; the umbells of flowers at the ...top with a large broad flat seede, as *Theophraſtus* saith of his: the roote is great, and as thicke as ones arme, yeel- ...ding a milke when it is broken, which is white at the first, but groweth yellow being drie: the proportions ...and figures upon some of the ancient coynes of *Iupiter Ammon*, as *Alpinus* saith.

Leſerpitium antiquorum. The true Laserwort of the ancients.

...*Theophraſtus* describeth the true *Leſerpitium* in this manner: it groweth, saith he in *Syria*, *Armenia*, *Media* and ...other where a Ferula stalke (which they call *Maſperum*) and leaves like to *Apium*, and with a broad seede: the ...iuyce or gumme is taken from the roote and from the stalke by scarifying them: that is preferred to be best, that is ...most pure, transparent, like unto Myrrhe and not greene, of a strong fast and sweete taſte, which being moi- ...stened

1. *Laserpitium Germanicum, French Laiermuc.*

2. *Laserpitium Alpinum, Alpine Laiermuc.*

flenced with water quickly becometh white, if any shall taste the *Cyrenian* sort it will move and burne all the tormours in the body to a sweate, with a moist sweet sent, so that his breath shall smell well that hath tasted but a little: that of *Media* and *Syria* is not so forcible or good, and giveth a strange unwholesome sent, all the rootes of *Laser* are adulterated with *Sagapen*, or with Hisane flower before they are dried, the falsehood is hereof may be found out by the taste, by the smell, by sight, or by the wetting or washing it in water. Some doe call the herbe *Silphium*, the rootes *Magydaris*, and the leaves *Maspetum*; the most effectuall is the Laser, the next are the leaves and the stalkes last. This is *Dioscorides* his text: but *Theophrastus* doth more largely expresse his and *Pliny* doth him, which is too tedious to inserte here: I will therefore but onely mention a few of their things that are not perticular, and not expressed before, which are these: the seede is broad spread like a scale, and called *folium*: the gum is as yellow as gold; the stalke is annuall as is that of Ferula; the flesh of the cattle that feede thereon doth taste most savoury, the stalke is eaten by men sundry wayes dressed or boyled: it groweth wilde by nature, and will not abide to be manured or transplanted. *Pliny* saith that in his time it was not to be had but after the weight of silver, and that it was so much destroyed, that onely one branch was brought unto the Emperour *Nero* all that could be found in his time; and *Pliny* saith also that it groweth in plenty on mount *Taregine*. Thus have *Theophrastus* and *Pliny*, whereby it may be seene what losse there is of it by the great sleeme was made of it, and by the vertues it had which they have expressed, and how hard a thing it is to find out the true grape of all those are brought now unto us, although divers have referred sundry herbes thereunto as is formerly set downe, and yet still doe divers: for some would make *Rencum* the sweete gumme to be the Laser, and called *Alexandrian*, without word but derived from Laser as it is most likely, and is to farre I am realon, that I wonder how men could be drawen so to thinke the *Benzoin* being the gumme of a great tree in the *East Indies*, as all that know the same affirme, and is neither hot, sharpe, nor bitter as Laser is said to be: but it is very probable that the Sweedes, who had many of their names from the *Arabian* authors, had these likewise of *Alexandria* and *Cyrene*, and peradventure rode from *Serapio* his two sorts of Laser, one pure, and the other impure, for he saith the pure is of a stronger sent, and the impure of small sent. The *Arabians* call the plant *Asyron*, the juice *Lacer* and *Lacer Almarri*, and the *Indians Imea* and *Imgard*.

The Place and Time.

The former sort was found about *Marsilles* in *France*, as *Lobel* in *Adversaria* saith, and adjoyned the other *Rondeletius* of any other that he had seene before, flowring and seeding in the end of the yeere as before: the other is expressed in the narration before. *Alpinus* saith it was first seene in Cardinall *Bembo* his [illegible] afterwards in that of the *Mussuros*.

The Names.

It hath not found any other name since the first invention, than *Laserpitium* and *Silphium* which were the first by *Lobel*, onely *Bauhinus* calleth it *Gallicum*, and *Tabernamontanus Massiliense*, the other names the description sufficiently.

The Vertues.

There is not extant in any that hath written of the *French* kinde for what disease it is effectuall, and therefore we can say no more thereof: but of the true Laser *Dioscorides* hath given a very ample recital, which I thinke it almost needlesse to sette downe the vertues of an herbe which is so little likely to be had as [illegible]

...wise prepared, yet to satisfie those that are curious, these they are: the roote, saith he heateth, and is hardly digested, it hurteth the bladder, and helpeth knots and kernells of the throate, called the Kings evill, if it be made into a cerot or plaister, and laid to with oyle, taketh away blacke and blew spots that come by brusles or strokes: the juyce of the seed, if it be made up with *Cerotum Irinum* or *Cyprinum*: it taketh away the outgrowings about the fundament, if it be boiled with vinegar in the rinde of a Pomegranate: it resisteth the force of deadly poysonfull medicines. The Laser of *Media* and *Syria* is weaker than that of *Cyrene*, & hath a loathsomer sent: it is a juyce that is gotten out of the seed, and roote, and cureth the falling of the haire, if it be annointed with it: Wine, Pepper, and Vinegar strengthneth the sight, and discussheth the pinne and webbe in the beginning, it is put into hollow teeth being rolled in a little linnen cloth, with some white Frankincense, and being boiled with Hilops and Figges in Vinegar and Water, it is good to wash the mouth; it helpeth the biting of mad dogges, if it be applied to the wounds: also the venome of any other creature, or envenomed darts or arrowes, if it be either drunke or outwardly applied: it cureth the wounds of Scorpions if it be reteated in oyle and anointed; it is put into those medicines are ready to runne into a Gangreene if they be first scarified; it breaketh carbuncles or plague sores being annointed by it selfe, or used with Rue, Niter and Honey: it taketh away warts, cornes, and tetter skinnes growne in any place being first pared, and it mollified with a cerote, or the pulpe of a dried Figge, and healeth sores and the wormes while they are yong being applied with vinegar: it healeth the polypus in the nose, which is a fleshy excrescence growing there, if it be annointed for certaine dayes with it, made up with Coperas or Verdigreece: it eateth superfluous wens or outgrowings in the flesh being first clipped off: it helpeth a continuall hoarsenesse in the throate, and clearesh the voyce that is suddenly growen hoarse, being delayed in water and sipped off: the hoarse falling of the pallate of the mouth, being applied with honey, and helpeth the quinsie if it be put into boyled water, and the mouth gargled therewith: being taken in meates, it maketh one better coloured: it helpeth the cough being taken in a rosted egge, and being put into broaches with dried Figges it is very profitable for those that have the dropsie or the yellow jaundice: it taketh away the shaking fits of agues being taken with Pepper and white Frankincense in wine: it is given to those that have strong crampes or crickes in their ancles, half a scruple weight rowled up in waxe and swallowed: it draweth out horse-leeches that by chance are got into the throate and there sticke, if the mouth be gargled with it and a little vinegar: it helpeth those who have the pollicke ordered their breasts, and the falling sickenesse being taken with Oxymell, or vinegar and honey: it provoketh womens courses being taken with Pepper and Myrrhe, and helpeth the chollicke being eaten in a Raisin, and being drunke in Wine it suddenly helpeth crampes or convulsions, and, and burstings: it is dissolved with bitter Almonds or with Nuts, or with hot bread, to be given in potions: the juyce of the leaves worketh the like effects but feeble powerfully: that is eaten with Oxymell, to help the windepipe when the speech is lost. *Pliny* reciteth many of these things out of *Dioscorides*, but varieth from him in his remedy for teeth-ach, for I cannot devise, saith he, that any author would appoint it to be put into hollow teeth to take away the paine, when as we have had the experience thereof in a man that for the same cause threw himselfe downe headlong from an high place for which cureth oxen if it be put into their noses: and being mixed with wine, it burstleth those fat corn that use it, who are most greedy of wine, and therefore (saith he) I would perswade men not to be anointed therewith though they doe appoint it. *Galen* also *Lib. de simpl.* briefly speaketh thereof thus; the juyce of *Silphium* even but (saith he) the leaves, stalkes, and rootes, doe sufficiently heate any cold part, but they are all of them windie: secondly it is hard of concoction, but applied outwardly it is of more effect, & the juyce is the strongest of all other, having a mighty drawing facultie, yet it holdeth a certaine power to take away excrescences of the flesh, by reason of the temperature is said to be in it, thus farre *Galen*: *Serapio* likewise speaketh of the juice *Laserpitium* in this manner: Laser, saith he is knowne to the *Indians* to be of two sorts, the one sincere white and cleare, like to *Electrum*, of a stronger sent and greater price, which is brought, as it is thought from *Armenia Paltia, Media, Cilicia* and *Pisidia*, which is a cold country, and exceeding unto Chersum: the other is rude and muddy smelling fetle, which they say is brought from *Cyrenaine* to *Cirrha* in *Persia*, and from thence carried in *Persia Media, Tanopira*, and the countries next adjoyning: the *Brachmans* of *Cambaya*, who were in times past Physitians, and are now Merchants, and forbeare to eate of any living creature which was the institution of *Pythagoras* doe buy this Laser, according to their ability, and put it into their broathes and sharpe sawces, adding the vessells therewith hot, and use no other sawce to their meates being pleasant to smell unto and to tast, yet doth it not breede any loathing in any that are not accustomed to it: the taste of it is somewhat bitter as pickled Olives are, but being chewed a while longer it is very pleasant: it is used of Porters and other of meane qualitie that live on bread and water only for this, because they can buy the greatest of the price: but that which is sincere, and the *Brachmans* who deale in this kinde of merchandize use and client the impure, and doe not suffer it to be used in meates before they have cured it by the fire, and vse it as a *Theriaca*.

Chap. XXXVI.

Angelica. Angelica.

Though I have spoken of Angelica in my former booke, yet having more to say thereof, and to shew the severall other sorts thereof, I will here insert it with the rest.

1. *Angelica sativa.* Garden Angelica.

The Garden Angelica hath divers large and faire spread winged leaves, three foote long or better, set upon a long great and broad eare, set usually one against another on a middle ribbe, of a pale, but somewhat yellow colour, and dented about the edges. From among which usually ariseth but one round hollow stalke very thicke, that seldom rise foote high, with divers great joynts and leaves set on them, of like kinde fashion as the middle stalke at the bottome, and from thence also towards the toppe come forth branches with other like leaves set at them, and at their toppes, large round spread umbells of white flowers, but *Bauhinus* saith, with yellow flowers, which I never saw; after which commeth the seede which is somewhat flat, greene, and white, two always set together, and is usuall in all these umbelliferous plants, and a little

rotted on the round seede: the roote groweth great and wooddy when it flowreth, with many great long braunches from it, but perisheth after seede and will rise and spring againe better from the seede that doth fall of it selfe, then what is sowen by hand at any other time: the whole plant both leafe and seede and roote is of an excellent pleasant scent and taste very comfortable, being not fierce or sharpe but rather sweete, and giveth a most delicate relish when it is tasted or used: the leaves be the weakest and some hold the seede to bee next, and the roote to be the strongest, especially being not ready to grow up for stalke. Of this kinde wee have another sort *Dutch.* in our Gardens called sweet Angelica, not differing in any thing from the former, but in that it hath a sweeter taste then the other.

2. *Angelica sylvestris.* Wilde Angelica.

The wilde Angelica groweth up with large spread leaves on the ground having smaller stalkes and lesser divided leaves by much, of a darke greene colour, not smelling halfe so strong as the garden kinde, yet favouring so much like Angelica that by the smell one may soone see and know it to be a kinde of Angelica though wilde: the stalkes are much slender and smaller, yet growing three or foure foote high with smaller joynts and lesser leaves thereat: at the toppes grow lesser umbells of white flowers, which turne into smaller seede and blacker: the roote is nothing so great as the former neyther are the strings so great or long, and of a blacker colour on the outside not smelling halfe so well.

Of this kinde likewise there is some varietie, one growing likewise wilde with us, not much differing in the leaves, but being smaller and not so much divided, the stalkes being reddish and the seede thicker and longer, the roote being great and thicke. *Sylvestris altera.*

3. *Angelica sylvestris montana.* Mountaine wilde Angelica.

Mountaine Angelica groweth like the former wilde kinde, but much lower and smaller in every part, the roote hereof differeth most in that it is nothing so great, but sendeth forth many small brownish strings from the head round about it, yet holding the same strong scent of Angelica that the former doth.

I give you here the figures of two other sorts of Angelica, taken out of Doctor *Foers* booke of dryed herbes, which he had from *Padoa* garden, and might seeme to be the *Laserpitium* of *Alpinus* set forth before, but that they had severall denominations to them.

4. *Archangelica.* The greater water Angelica.

This Angelica groweth with a taller and much greater stalke sometimes reddish, the leaves likewise being more in number and smaller divided, and of as deepe a greene colour as the first sort: in the tufts of white flowers as it is like the first garden Angelica, and so is the seede but greater and blacker, the roote is great according to the plant, and endureth many yeares without perishing.

The Place and Time.

The first sorts are with us sowen in Gardens, the second sort is wilde both in many places of *Essex*, *Kent*, and neere *Kentish Towne* by *London* also, and in other places: the third groweth on divers mountaines in *Germany*, *Hungary* and the rest: the last is not onely naturall to grow in watery ditches, but in moist grounds also in many places with us, and in the Marish ditches by *Rederiffe*.

The Names.

This herbe hath gained many worthy names from sundry worthy persons: for some have called it *Sancti Spiritus herba*, *Lactea*, and *Dodonæus* thinke it some kinde of *Laserpitium*, *Cordus*, and some others take it to be *Smyrnium*, and *Cordus* to be *Panax Heracleum*, but all in generall call it *Angelica* from the Angell-like properties therein. All these sorts are so called by most Authors as their titles beare, and therefore I needs not explaine them further, onely the last is called *Archangelica* by *Clusius*, and *Angelica aquatica* by *Gesner*. All Carthusian nations likewise in their appellations hereof follow the Latine name as neare as their Dialect will permit: onely in Spaine they call the wilde kinde Kex, and the Weavers winde their Yarne on the dead stalkes.

The Vertues.

Angelica is hot and dry, some put it in the second and others in the third degree. It resisteth poyson by defending the heart, the blood and spirits, and giveth heate and comfort to them: it doth the like against the Plague and infection of the Pestilence, if the roote be taken in powder to the weight of halfe a dramme at a time, with some good Treakle in Cardus water, and layd to sweate thereupon in their beds: if Treakle be not at hand take the same dose in Cardus or Angelica water, the stalkes or rootes candid and eaten fasting are good helpes also in time of infection, and at other times to warme and comfort a cold or old stomach: The roote also steeped in Vinegar, a little of that Vinegar taken sometimes fasting, and the roote inclined unto are both good preservatives for that purpose. The waters distilled from the rootes simply, or steeped in wine and distilled in glasse, is much more effectuall then the water of the leaves, and this water being drunke two or three spoonefulls at a time doth ease all griefes and torments that come of cold or winde, so as the body be not bound: the said water taken with some of the roote in powder helpeth the pleurisie being taken in the beginning, as also all other diseases of the Lungs, as cough, wheezings, and shortnesse of breath, Tisicke, and so doth the Syrupe of the stalkes mentioned in my former writings: it helpeth likewise the torments of the Cholicke, the straungury and stopping of the urine, provoketh women in travaile, easeth and expelleth the afterbirth: and briefly easeth and discusseth all inward tumors and wounds, openeth the obstructions of the Liver and Spleene: and the decoction thereof being drunke before the fit come, lessen it, yea if they may sweate it be possible before the fit come, will in twice or thrice taking ridd it quite away: it helpeth also digestion in the stomacke, and is a remedy for a Suffer. The juice or the water dropped into the eyes cleareth the dimnesse of sight if any filmes doe begin to breed in them, and helpeth deafenesse by dropping it into the eares: the juice also put into hollow teeth easeth the paine; the rootes in powder made up with a little pitch into a plaister, and layd on the biting of a mad dog, or any other venemous creature doth wonderfully helpe them: the juice of the water dropped or tents wet therein and put into old and filthy deepe Vlcers, or the powder of the roote in want of the other, doth clense them and cause them to heale quickly by covering the dead places with flesh: the distilled water applyed to places pained with the Gowte or sciatica, doth give a present ease: the wilde Angelica is not so effectuall as the Gardens, although it may safely bee used to all the purposes aforesaid: the roote of the Garden Angelica is a better substitute in *Theriaca Andromachi* and *Mithridatium* then many other that have beene formerly accepted.

CHAP. XXXVII.

Imperatoria sive Astrantia. Maisterwort.

OF this herbe there are two sorts, the one well knowne, and the other set forth first by *Camerarius* in his Epitome on *Matthiolus*, and *Bauhinus* after him in his *Matthiolus*.

1. *Imperatoria sive Astrantia vulgaris.* The common Maisterwort.

Common Maisterwort hath divers stalkes of winged leaves, divided into sundry parts, three for the most part standing together at a small footestalke on both sides of the greater, and three likewise at the end of the stalk, each of which leaves are somewhat broad & cut in on the edges into three or more divisions, and all of them besides dented about the brims, of a darke greene colour, and doe somewhat resemble Angelica leaves at the first sight, untill they bee better regarded and that they grow lower to the ground, and upon the stalkes, among which rise up two or three short stalkes in comparison of Angelica, being about two foot high and slender, with such like leaves at the joynts as grow below, but lesser and with fewer divisions, bearing umbells of white flowers, and after them small thinne flat blackish seede bigger then Dill seede: the roote is somewhat great and rather groweth sidewise then downe deepe into the ground, shooting forth sundry lases withall, tasteth sharpe biting on the tongue, and is the hottest and sharpest part of any of the rest of the plant, and the seede next unto it, being somewhat blackish on the outside and smelling well.

2. *Imperatoria Alpina.* Mountaine Maisterwort.

The mountaine Maisterwort groweth somewhat like the former, but lesser in every part, having nine leaves standing on each stalke by three and three, but they are smaller and narrower, and have fewer incisions in them, or finely dented about the edges: the flowers and seede are alike, and the roote groweth in like manner, with a blackish outside, but is more sharpe and hot biting on the tongue then the former, by much.

The Place and Time.

The first is found on sundry hils in *Italy*, as also in *Germany*, yet it is usually kept in Gardens, with them as well as with us: The other was found on the *Alpes* in *Switzerland*. They flower and seede late with us, as not untill the end of *August*.

The Names.

It is called by the latter Writers generally *Imperatoria*, from the excellent vertues it hath, yet most have referred that name to sundry plants of the Auncients, not thinking that an herbe of such rare qualities should be unknowne to them, and therefore *Ruellius* tooke it to be *Leuisticum*, and *Ruellius* and *Fuchsius* to be *Laserpitium*, yet not finding it fully to answer thereunto, calleth it *Laserpitium Germanicum*. *Tragus* referreth it to *Daucus*, and calleth it *Smyrnium hortense*, and *Offerinum*; and yet nameth other herbes by that name also, and *Lonicerus* likewise unto *Strumbium*, *Matthiolum*, *Gesner in hortis*, *Lobel*, *Lugdunensis*, *Tabernæmontanus* and others, call it *Imperatoria*, *Brunfelsius*, *Dodonæus* and *Clusius* call it, *Astrantia*, *Camerarius Magistrantia*, and *Cæsalpinus* (here too, as the vulgar with him did. The other *Camerarius* calleth *Imperatoria*, *vel Astrantia Alpina*, and truly, the [illegible]

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

call it *Boxthorne*, and the former *Meisterwurtze*, and thence it is like they derived their *Magistrantia*, We in *England* call it usually Maisterwort, and by some Pellitory of *Spaine*, but falsely.

The Vertues.

The roote of Maisterwort is hotter then pepper, even to the third degree compleate, and is of very subtile parts, it is very availeable in all cold griefes and diseases, both of the stomacke and body, dissolving winde very powerfully, both upward and downeward, it is also used in a decoction with wine, against all cold rheumes, or distillations upon the lungs, and shortnesse of breath to be taken morning and evening, the same also provoketh urine and helpeth to breake the stone and expell gravell from the kidneyes, it procureth womens courses and expelleth the dead birth, and is singular good for the strangling of the mother, and other the like womens diseases: it is also said also against the dropsie, crampes, and the falling sicknesse, for the decoction in wine being gargled in the mouth doth draw downe much water and flegme from the braine thereby, purging and easing it of what oppression: it is of a rare qualitie against all sorts of cold poysons, to be taken as there is cause either more or lesse and provoke to sweate, the seede worketh to the like effect, although not with the like efficacie if they can brooke the taste thereof: and therefore many doe distill the water from both herbe and roote that they may take it with the better content: the juice hereof dropped or tents dipped therein and applyed eyther to the greene wounds or rotten ulcers, yea although they fret and creepe, and be almost gangrenated, and those also that come by envenomed weapons doth soone cleanse and heale them, or if they be bathed with the distilled water: the same also is very good to helpe the Goute comming of a cold cause. *Tragus* saith that the decoction of the roote in wine being drunke doth revive the abilitie of generation being almost extinct, which you may truly beleeve and try to be certaine of he saith: but by his leave this is against *Galens* rule, for hee saith that those things that are to hot to expell winde doe not helpe but hinder nature: the other sort as I said before is more effectuall and in especiall for great colds Agues, to expell the dead child, to purge the braine, and to expell winde and helpe the Collicke.

Chap. XXXVIII.

Podagraria sive herba Gerardi, Gourwort or herbe Gerard.

Of this herbe likewise there are two sorts, the one knowne but to few, yet the other is two well knowne especially where it getteth into any ground, and although for their likenesse one to another, divers have joyned this and the foregoing Maisterwort in one Chapter, yet because they are differing plants in many notable parts, I have thought good to part them into two.

1. *Podagraria vulgaris*, Common herbe Gerard.

The common herbe Gerard is a low herbe seldome rising halfe a yard high having sundry the like leaves standing upon brownish greene stalkes by threes as in the former, but they are smaller narrower and not cut in on the edges at all, or very seldome but snipped about and of a strong unpleasant savour: the umbells of flowers are white and the seede blackish and lesse: the roote runneth and creepeth like Quich in the ground, soone occupying a great deale of roome.

1. *Podagraria vulgaris.*
Common herbe Gerard.

2. *Podagraria hirsuta*, Hairy herbe Gerard.

This hairy herbe Gerard hath a thicke fibrous roote of a blackish browne colour on the outside, & white within endureth many yeares and of a good sent, from whence springeth up diverse stalkes a cubit high, blackish at the bottome and a little hairy, spreading into divers more branches, bearing much divided leaves thereon like to wilde Angellica or the last herbe Gerard, but more deeply gashed, of a greene colour and hairy all over the footestalkes as also the umbells of flowers are hairy and white, and followed with blackish seede.

The Place and Time.

The first groweth in hedge and wall sides and oftentimes in the borders or corners of fields and in gardens also sometimes, if it be not well weeded out: the other groweth in a part of Germany called *Lusatia*, and flower and seede somewhat earlier then the Maisterwort.

The Names.

Dodonæus hath found sundry appellations as every ones judgement hath led him, *Brunfelsius* calleth it *Pyrenaica*, *Gesner in hortis* [illegible] *Lobel* on *Dioscorides Elaphoboscon similis*, *Lugdunensibus Lapathum*, *Tragus Oftritium sylvestre*, and in another place, *Cameraria Angelica sylvestris communis*, *Theodorus Gaza*, *Bauhinus Angelica sylvestris minor sive Germanica*, *Dioscoridis herba Gerardi*, because the *Brabanders* call it *Gerwy* and *Lobel Podagraria Germanorum*, which as he saith the *Dutch* call *Hertscruit*, and *Camerarius* saith the *Germans* call it *Stratwort* or *Geerlick* and *Tragus Hynfuss* and *Wurtzberle*, and wee in *English* Gourwort or herbe Gerard after the *Brabanders*, and of some in our Land Aiswoode or Axewoode as *Lyte* and *Gerard* say: the other is onely remembred by *Bauhinus* who nameth it among the Angellicaes, and calleth it *Angelica sylvestris hirsuta minor*, and *herba Podagraria hirsuta*.

The Vertues.

Coutewort had not his name given as it seemeth at randome, but upon good experience to helpe the cold Gout and Sciatica, as also joynt aches and other cold griefes, for as *Lobel* saith his vulgar in taking it to be Elder Danewort, applyed it for the same diseases that Danewort was good for.

Chap. XXXIX.

Pastinaca Latifolia. Parsnep.

Of Parsneps there are two sorts, the tame or Garden kinde, and another that groweth wilde in many places beyond the Seas, as well as in our owne Land.

1. *Pastinaca latifolia sativa.* Garden Parsnepps.

This Garden Parsnep hath large winged leaves, that is many set on both sides of a long foote stalke, each of them for the most part standing directly one against another, and one at the end, being much larger then those of the Skirret, and closer set together and rougher, and dented about the edges: the stalke groweth five or six foote high, with divers the like leaves and branches thereon but lesser: the flowers are yellow that grow in tufts and umbells at the toppe, which turne into brownish thinne flat seede, smelling reasonable well, the roote groweth greater and larger in some grounds then in others, being white within and without, very sweet and pleasant to be eaten, when they are boiled tender and are dressed afterwards many wayes as every one list. Of this kinde I have declared in my

Extra. former booke another sort differing in nothing but the roote, which is thicker at the head and shorter, and not so savourie as the former.

1. *Pastinaca latifolia sativa.* Garden Parsnep.

2. *Pastinaca latifolia sylvestris.* Wilde Parsnep.

The wilde Parsnep differeth little from the former, but as a wilde plant, not growing so faire and large, nor hath so many leaves and that the roote (as all writers affirme of their countries) is shorter more woody, and not so fit to bee eaten, and therefore the more medicinable, but as I said in my former booke it is the garden kinde is found wilde in many places of our Land so sweete and so tender after the sowing, that by being manured it proveth as good as the Garden kinde.

The Place and Time.

The first is every where in these parts nursed up in Gardens the other growing wilde as I sayd in divers places, as in the Marshes by *Rochester* in the grounds of Sir *John Lawson* there, and flowreth in *July*, the seede being ripe about the beginning of *August* the second yeare after the sowing. For if they doe flower the first yeare, the countrey people call them madde Neepes.

The Names.

The later writers generally call it *Pastinaca latifolia* to put a difference betweene it and the Carrot which is called *Pastinaca tenuifolia*, as I said before, some authors calling it *Sativa* or *domestica* or *vulgaris*. *Enchius* calleth it *Siparum sativum magnum* and *Tuberosum*, *Elaphoselinum sativum*; but *Columna* taketh it to be the *Sicer* of *Dioscorides*. The wilde sort is called by many *Pastinaca sylvestris* or *latifolia sylvestris* as *Dodonæus* doth. *Cordus* upon *Dioscorides* calleth it *Pastinaca sylvestris Galeni*, *Matthiolus Dioscoridis* and *Pastinaca tenuifolia*, *Elaphoselinum*, *Fuchsius* calleth it *Sicer sylvestre*, and *Lobel Baucia Pastinaca sylvestris Arabum* or *Elaphoselinum*, but whether this should be the *Elaphoselinum* of *Dioscorides*, I shall referre you to the next Chapter in the 11. the Italian shops of *Italy* and *Germany* it was usually called *Baucia*, *Tragorianth* and to doth *Dodonæus*, and the Apothecaries shops of *Italy* and *Germany* it was usually called *Baucia*, *Tragorianth* and to doth *Dodonæus*, and the Apothecaries in their time did call it *Elaphoselinum* as well as the other *tenuifolia*. The Italians call it *Carota bianca*, the Spanyards *Canahoria Blanca*, the French *Pastenades*, the Germans *moren weiss*, *Pestinay* and *Pestinacken*, *Pestinacken*.

The Vertues.

The Garden Parsnep nourisheth much, and the nourishment is good and wholsome, but a little windy in it by it is thought to procure bodily lust, but it fatteneth the body much if it be used: it helpeth as they call ute as most of those herbes and rootes doe that are much eaten, which made *Dioscorides* and *Galen* so call ute as most of those herbes and rootes doe that are much eaten, which made *Dioscorides* and *Galen* so call much upon them: only it is conducible to the stomacke reines and bladder and provoketh urine: the wilde kinde is more physicall, having a cutting, attenuating, clensing and opening qualitie thereof it purifieth the bitings of Serpents: it taketh the paines and stitches in the sides, and dissolveth wind in the stomacke and bowels which is the cholicke and provoketh Urine, the roote is often used but the leaves more.

Chap

Chap. XL.

Sifer. Skirret.

HAve two sorts of herbes to shew you under this title of *Sifer*, whereof the one hath beene fetcht as farre as from *Syria*.

1. *Sifer vulgare.* The common Skirret.

The common Skirret hath sundry stalkes of winged leaves, somewhat like unto those of the Parsneppe, but that they are smaller and farther set in sunder, smoother and greener, and likewise cut about the edges, among which riseth up the stalke, little more than halfe the height of the Parsneppe, bearing at the toppes umbells of white flowers, which afterwards turne into small darke seede, somewhat bigger than Parsley seede, the roote is composed of divers small long round white roates, set together at one head, like to Spignell, bunched out, or uneven in sundry places, and rugged, or as it were wrinckled withall, and not vnlike other roates are, with a small pith within them, and very pleasant to be eaten.

2. *Sifer alterum Syriacum.* Skirrets of *Syria*, or white Carrots.

The *Syrian* Skirret hath a long, tender and smooth roote, grayish on the outside, and white within, and eaten to be sweet as sticke as ones finger, and ewise the length, having sundry small bunches or knottes thereon, like unto a kinde of a pleasant sweete talke like unto our Carrots, from whence rise many stalkes of leaves, much divided and cut into sundry parts like unto Carrot leaves: the stalkes likewise have such like leaves at the joynts and small flowers at the toppes like unto them for forme, but of a yellowish colour.

The Place and *Time.*

The first is not naturall in any places of *Italy* or *Germany* that I can understand, but in the countrey of *Narbon* in *France*, as *Lobel* saith, and is every where sowen or planted in Gardens, and with us rather sowne than planted, for sowne among Onions, the one will not hinder the growth of the other, the Onions being first drawne away that the Skirrets may have the full growth against Winter: the other groweth wilde in *Egypt* and *Candy*, but not in their gardens, as *Kentmanus* saith: they flower and seede later than the Parsneppes.

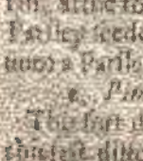
The Names.

It is called in Greeke Σισαρον, and in Latine also *Sisarum* and *Sifer*: the first is called *Sisar* by *Matthiolus*, *Camerarius*, *Dodonæus* and *Lonicerus*, and *Sisarum* by *Tragus*, *Dodonæus*, *Lobel* and others. *Cæsalpinus* calleth it *Sifer Germanicum* and taketh it also to be the *Elaphoboscum* of *Dioscorides*, as *Columna* also doth: but assuredly herein they are deceived both: for *Dioscorides* describeth *Elaphoboscum* at large, and howsoever the manner of the leaves deceived him, whether they were like unto the leaves of the Turpentine tree, yet neither is the stalke of that Peucedanum, that is round and great as that of the Parsnep is, nor hath any umbells of yellow flowers, nor seede like Dill, besides which the Parsneppe hath: for this Skirret hath white flowers and seede like Parsley, so that I wonder how such great and learned men, that in other things will censure the text of *Dioscorides* throughly before they give their judge-

1. *Sifer vulgare.*
The common Skirret.

2. *Sifer alterum Syriacum.*
Skirret of Syria, or White Carrot.

ment



ment, and yet in this have failed much, as you may understand by this that hath beene said: now whether it be manured or wilde Parsneppe should be *Dioscorides* his *Elaphoboscum*, I incline to thinke rather the wilde then the tame, although he saith, it is sweete and fit to be eaten; for as I said before, even the wilde hath failed with them, as we have shewed it to grow wilde with us. Another controversie there is among many learned men, whether this be the true *Siserum* of *Dioscorides* or no, in regard that neither he nor any other of the ancients have given almost any touch of forme of leafe or roote it had, because it was so familiar and well knowne in their time, and so it falleth out in many other things that were so common with them, that they thought it needlesse to describe them, that they are now most unknowne to the succeeding times, and to us yet in our cleerest probability that we have, is that, as *Dioscorides* saith, *Siserum* is pleasant to the palate, profitable for the stomacke, provoking urine, and procuring an appetite if it be boyled (for he doth not say eaten raw as some of their rootes are) all which agree to the Skirret: but *Pliny* in setting forth his *Sifer*, which although it agree with *Dioscorides* his *Siserum* sheweth plainely that it hath a nerve or string in the roote, which is to be taken out for the boyling, that the rest may be eaten with the more pleasure, and such hath this Skirret and no other roote that either then was or now is edible but it: and therefore there is no doubt but that it is the true *Siserum* or *Sifer* of the ancients: the other *Ranuncium* saith is called in *Egypt* by the *Arabians* there *Serenel* as *Serra* doth, and therefore this may cease all controversies concerning it, that our Parsneppe roote is not *Sifer*, as hitherto hath been taken, nor our ordinary *Sifer* neither to be *Serenel*: the *Arabians* call it *Eiserum* and *Seiserum*: the *Italians* of the *Spanish de Chirbias*: the *French Cheruy*, the *Germans Gierlin*: the *Dutch Suycker wortelen*, that is Sugar roote, and we in *English* Skirret.

The Vertues.

Skirret rootes (for no other part is in use as I know) being dressed according to every one liking doe nourish well, but not so much as the Parsneppe, it being of a stronger taste, and this more delicate and pleasant, and also very wholesome, yet engendreth a little winde, and provoketh to venery: it doth somewhat respect the kidnies and bladder by moving to urine, and a little to consume the stone and gravell in them: and this is all that we have learned it to be available for whole herbes and roots that are temperate and most used to be eaten, nor physically applied for any disease; the other as *Ranuncium* saith, is used to be eaten also by the *Egyptians*, as other rootes are and is commonly with them.

CHAP. XLI.

Saxifraga Pimpinella. Burnet Saxifrage.

HAve foure or five sorts of this burnet Saxifrage, to shew you here, some being of our owne country, and some of others, and some greater or lesser than others.

1. *Pimpinella Saxifraga tuberosa major.* Great *Germane* Burnet Saxifrage.

This great Burnet Saxifrage of *Germany* hath divers large and long stalkes of winged leaves, one set directly opposite to another on both sides, each being some what broad, a little pointed and dented about the edges somewhat deeply, of a fresh greene colour almost shining, from among which doe rise up roote round hollow stalkes, three foote high or more, set at the joynts, with the like, but lesser leaves, and beset on the toppes small umbells of small white flowers, after which come small blackish round seede like unto Parsley seede, but much better in taste, and sharper upon the tongue, the roote is small long and white, very like unto a Parsley roote, but much better in taste, and perisheth not after seede time, but endureth long.

2. *Pimpinella Saxifraga major flore rubente.* Greate Burnet Saxifrage of *Germany* with reddish flowers.

This last differeth little from the former, either in forme or greenesse of leaves or taliadge of the stalkes, the chiefest difference consisteth in the flowers which are reddish or of a blush colour.

3. *Pimpinella Saxifraga major nostras.* The greater *English* Burnet Saxifrage.

The greater sort of our *English* burnet Saxifrage groweth up in the same manner as the former doe, the forme of whose leaves is all one likewise, but that they are usually not neere than halfe so bigge or large, and not so deepely dented about the edges, but of a ladder greene colour; the stalkes likewise are smaller and shorter than the other, the umbells of flowers are white also and the seede small and blackish, but sharper than the former: the roote is long and whitish endureth long.

4. *Pimpinella Saxifraga tuberosa minor.* The smaller Burnet Saxifrage of *Germany*.

This lesser burnet Saxifrage of *Germany* hath likewise sundry shorter stalkes of much smaller leaves, every one set against other, being very narrow and much cut in or deeply dented about the edges, which maketh the leafe seeme as if it were made of many fine cut and jagged leaves set on both sides of a rough stalke, as hath sometimes groweth reddish, and is very neere of the same fresh greene colour that is to the former stalkes like as high almost, and the umbells of flowers white like the former; the seede also is blackish, smaller than the former; the roote is long and white but smaller, but more hot, quicke and sharpe at the taste than also.

5. *Pimpinella Saxifraga minor nostras.* The lesser *English* Burnet Saxifrage.

Our lesser *English* Burnet Saxifrage hath much finer cut leaves than the last, for so there is not halfe so many to be seene in them that there is in the leaves of the former, but yet divided after the same manner, of a darke greene colour as the greater *English* sort: the umbells of flowers are white, and the seede also smaller than of the last, the roote likewise is smaller, but as hot and quicke in taste as

The Place and Time.

The *German* kindes grow as well in their fields, as on the mountaines, and in rockie grounds, and with us are ranged unto me by divers in our owne land likewise; the other of our owne land, are usually growing in the pastures of this land to be easily found of them that know them, and will looke for them, for they are not to be found the easlie amongst grasse to be discerned: they doe all flower about *July*, and their seede is ripe about the end of *August*.

The Names.

The ancient Writers neither Greekes nor Latines had any knowledge of any of these plants, but are called

3. Pimpinella Saxifraga Hortensis major.
Great Garden Burnet Saxifrage.

4. Pimpinella Saxifraga Hortensis minor.
The smaller Garden Saxifrage of Germany.

the moderne Herbarists *Pimpinella* simply by many as *Cordus*, *Tragus*, *Fuchsius*, *Gesner* and *Lobel*, & *Pimpinella Saxifraga* by *Matthiolus* and *Camerarius*; or *Saxifraga hircina*, as *Gesner* & *Clusius* do: some also *Bipinella Saxifraga*, as *Lobel*, or *Bipennula* as *Lacuna*, or *Tragoselinum major* as *Fuchsius* names it: the second is remembred by *Gesner* in *hortis, & asperis montis frutex*: the third is the second *Pimpinella* of *Tragus*, yet is greater than that kinde that groweth in our owne land; and so is the fift, and is most likely to be *Bauhinus* his *Pimpinella Saxifraga tenuifolia*; the fourth is the third *Pimpinella* of *Tragus*, and is called *Pimpinella minor* by divers, and *Saxifraga hircina minor* by others, taken by *Cordus* to be *Daucus Selinoides*, and by *Lugdunensis Daucus tertium genus*, and by *Columna* to be *Thalictrum Dioscoridis*. There is growing at the rootes of these Saxifrages in some countries certaine graines that will give a scarlet die, as *Lacuna* and *Anguillara* have set it downe, and by them called *Lycoctonum radicum*, but *Amatus Lusitanus* saith that the like graines are found at the rootes of many other herbes. *Fragosus* seemeth in reciting these graines growing at the rootes of these Saxifrages, to thinke that these graines are the Cochenill that the Turkie to die their silke and cloth in graine colours; for he saith, *lib. 2. cap. 13.* that the Cochenill that commeth from *Peru* be the graines that grow at the rootes of certaine plants like unto our common Burnet Saxifrage, wherein he was much mistaken, for as *Oviedus* saith, they are gathered from the leaves of great trees in the *West Indies*, called there *Tunal*, and with us *Ficus Indica*, and as it is set downe in the eight part of the *West Indian History*, the fourth Booke and thirteenth Chapter (and in the Chaptis of the trees in this Worke) from whence it seemeth *Iohn de Laet* of *Antwerpe* in his fift Booke and third Chapter, pag. 219. of the *West Indies* History took his relation thereof, which is somewhat too large to insert in this place. I will therefore but briefely touch what he there saith, that there are divers sorts of *Ficus Indica*, some that beare no fruit growing wilde, or for the any use they are of, no more then our Thistles; others that are manured and beare fruit, which are round, and are either white, which are the best, or of a reddish purple colour dying their hands that gather them, like as Mulberies doe: and there is another unmanured sort that beareth no fruit, but is of greatest worth, and most carefully kept, because that certaine little wormes breede thereon (of which are that graine called by the *Spaniards Cochenill*, derived from the *Greeke* word *Kokkos*, and those a diminutive thereof) which they gather twice or thrice in a yeare, and kill them by casting scalding water on them, and afterwards drie them in the shadow: but of this he saith there are foure sorts, some better then other, the worser being gathered from the wilde plants, the best from those are planted in orders and manured, and tended carefully. *Tragus* calleth this Saxifrage *Piper Germanicum*, and saith that no other Saxifrage is more like or referred to the *Peucedanum Macedonicum* of *Dioscorides* than it, who compared the seede to the seede of *Ameos*, yet to be sweeter in smell like unto spice, and sharpe and hote in taste, and so growing in rockie places, and hereon complaineth that men more willingly spend their coyle on strange things fetched from farre, than upon their owne homebred and country plants, and silliestly the seed hereof is to compare it, as he doth, to pepper, withall that I thinke he had reason so to thinke as he did, when as it farre surpasseth either the *Peucedanum Macedonicum* of our moderne, I meane our Allisander seede or the new *Peucedanum Staticis* of the same commeth from *Venice*, and is now a dayes in so great account, as though it were the true *Peucedanum* of *Dioscorides*, not to be doubted of, or none to goe beyond it: but I am in doubt I shall finde among my brethren some Criticks that will taxe me for inferring this novelties: if it please not them, let the judicious censure it as they shall finde cause and reason. *Tragus* also saith that some others referred this to the *Oreoselinum* or *Apium montanum* of *Dioscorides*.

Tra-

The Vertues.

Theſe ſorts of Saxifrages are hotter than any the former kindes of *Apia* Parſlies, and as *Pena* ſaith, more wholeſome, by his often experience: it hath the ſame properties that the Parſley hath, as in prouoking Vrine, and eaſing the paines thereof, or of the Wind and Colicke: a ſmall draught of the roots or ſeede being vſed either in powder or in decoction or any other way, and likewiſe helpeth the paines of the Mother, and to procure their courſes, to breake and waſte the ſtone in the Kidnies, voideth grieuous and tough flegme in the ſtomacke, and is a moſt ſpeciall remedy againſt all kinde of ſerpents, eaſeth being boyled in the diſtilled water hereof, is ſingular good to be given to thoſe that are troubled with Fittes and Conuulſions: ſome doe vſe to make the ſeede into Comfits, as they doe Caraway ſeede, which ſerue to all the purpoſes afore ſayd, and ſome doe diſtill the water that the more tender ſtomackes may take a little ſweetened with Sugar: the iuyce of the herbe being dropped into the moſt grieuous wounds of the head doth dry vp their moyſture and healeth them quickely: the experiment is taken from Hennes whoſe head being pierced through, ſo as the braine was not hurt, were ſoone helped hereby: ſome women diſtill the diſtilled water to take away freckles, or other ſpots in the skinne or face, and to make it ſine cleere and ſmooth.

CHAP. XLII.

Panax. Alheale.

Dioſcorides maketh mention of three ſorts of Panax, *Panax Heracleum* with Figge like leaues whereof I intend to intreate in this Chapter, and with it ſome others that for their likeneſſe may be referred thereunto: *Panax Aſclepium* with Fennell-like leaues, but I haue ſpoken hereof in the fourth Chapter of this Claſſis, and *Panax Chironium* with Marjeromme-like leaues, I haue ſhewed you in the Chapter of the fifth Claſſis of this Worke, but *Theophraſtus* maketh foure ſorts, for vnto theſe three he addeth a fourth, which he calleth *Syriacum* but doth not deſcribe it. I haue to ſhew you in this Chapter many other, that for their likeneſſe haue obtained that epithite.

1. *Panax Heracleum verum ſcutatæ folio.* The true All-heale of *Hercules*.

The true *Panax* hath diuers large broad greene leaues growing next the ground, cut into three or more parts, reſembling a Figge leafe, each ſtanding on a long footeſtalk, well as well as the leafe is ſomewhat roughe edged, from whence riſeth vp a ſtalke foure or five foot high, having ſuch like leaues as grow below but leſſe & leſſe diuided bearing a large tuft or vmbell of yellow flowers, and ſomewhat large flat ſeede after them: the roote white with diuers branches thereat: the whole plant ſmelleth ſomewhat ſtrong and as it were roſen. From this it is probable the Gum *Opopanax* is gathered which commeth out of *Syria* and the parts thereabout, chiefe Mart townes, as *Damaſco, Cairo, Alexandria* and others the like, to be tranſported elſewhere. And to the plant anſwering very neerely to this diſcription haue I had growing in my Garden, the ſeede whereof was ſent me among other rare ſeeds by ſome of my diuers friends from *Italy*, but periſhed by ſome exceſſe hard winter.

2. *Panax Heracleum alterum ſiue peregrinum Dodonæi.* The more ordinary Alheale of *Hercules* in Gardens.

This *Panax* ſpreadeth many very large winged leaues round about vpon the ground, moſt of them two foot long conſiſting of foure, five or ſix couples of rough winged leaues, ſet each againſt other on a reaſonable great footeſtalke, furrowed on the vpper ſide, each of them conſiſting likewiſe of three or foure couples of rough but large faire freſh yellowiſh greene leaues & one at the end, broad below, and narrow to the top, the one of the lower ſides of the leafe, being alwayes deeper at the bottome then the other and finely dented about the edges, caſting a fierie hot and biting in the mouth, and yeelding forth a yellowiſh iuice in the ſummer moſt plentifully, hot and bitter then the leaues; from among theſe leaues riſeth vp one ſtrong great round greene ſtalke foure or five foote high or more, with foure ioynts and leaues thereat, and a few branches towards the toppes, which breake forth ſmall yellow vmbells of flowers, which afterwards giue whitiſh yellow flat thin ſeede: the roote groweth ſomewhat great and deepe downe into the ground, with two or three long branches from it, whitiſh below on the outſide and more white within, full of that yellow ſap ſhining from it if it be cut or broken, of a ſtrong ſent and hot bitter taſte more then either leafe or ſeede: this deſcription is from the plant growing in mine owne Garden where it abideth the extreameſt winter without harme.

3. *Panax Heracleum alterum Americanum ſplendente folio, Lobelianum tradituum quibuſdam Americum* Alheale of *Hercules* with ſhining leaues, ſuppoſed to be the true Lobelwort.

This *Herculean* Alheale groweth for the forme very like vnto the laſt, having ſuch like winged leaues ſet in the ſame manner, and the wings with foure or five or ſixe couple of leaues, but differing in greeneſſe and colour, neither is the whole ſtalke aboue halfe ſo long, nor are the leaues themſelues either halfe ſo great ſo long, but are rather ſomewhat ſhort, and of a deepe greene colour, very much ſhining on the vpper ſide and pale greene vnderneath, much hotter and ſharper in taſte then the former and not vnlike drawing water to the mouth: the ſtalke hereof is ſeldome aboue a yard high, with ioynts and leaues thereon, and more branches at the toppes then the other bearing larger vmbells of yellow flowers ſucceeded by ſtriped ſeede ſomewhat like vnto that of a pale browne colour the roote is white and great at the head with ſundry long ſtrings faſtened to it, decaying in the middle and endureth not after ſeede time which ſometimes is the ſecond yeare ſometimes the third. There is another ſort hereof with ruſſet and purpliſh ſtalkes, and larger browne ſpotted leaues.

Alia varietas.

4. *Panax Coſtinum ſiue Pſeudoſium Matthioli.* Coſtus-like Alheale.

This Coſtus-like Alheale differeth not much in forme from the ſecond but in the greatneſſe and that it hath no yellow iuice which this giueth not and therefore is not of that kind, for this hath ſuch like leaues ſet in the ſame manner but leſſer together, each leafe whereof is larger then a Parſley leafe, thicker and more crumpled alſo and dented about the edges: the ſtalke is ſmall and about two cubits high, with ſuch leſſer leaues ſet at them, branched towards the toppes and bearing round tufts of yellow flowers, after follow flat and ſomewhat round ſeede: the roote is ſappie with a thicke fleſhy barke, of a ſtrong ſmell and bitter and ſharpe in taſte.

5. *Panax Heracleo similis Tatarica Ungarica dicta.* The *Hungarian* Allheale of Hercules.

This *Hungarian* or rather *Tartarian* herbe hath the leaves much cut in and gashed on the edges somewhat like unto Turneps, but more nearely resembling those of the Allheale of *Hercules*, full of a rough hairinesse of a pale greene colour, with other smaller ones lesse divided and lesse rough also, among whom arises a rough hollow stalke two foote high, and of the thicknesse of ones thumbe, full of joynts and such leaves set there as grow below, but smaller and more divided compassing the stalke at the bottome: at the toppe of the stalke commeth forth umbells of yellow flowers, after which follow the seede very sparingly set on the umbells (the flower doth not perfit the seede many more failing then holding) which is very great and thicke, resembling those of the Cathrus, and straked like thereunto: the roote is very great and long even as thicke as ones arme, and a cubits length which perisheth after seede time, and doth smell very lowly that one cannot well endure to smell, but rather cast them out of the garden, yet this before it be growen to seede is taken and eaten both by the *Hungars* and *Tartars* in stead of bread, and is pleasant to them being of great use with the *Tartars*, because out of it they could not marke their long journeys through the Desarts where no seede is to be found.

6. *Panax racemosum fructu coccineo Americanum.*

The cluster berry Allheale of *America*.

6. *Panax racemosum fructu coccineo Americanum.*
The cluster berried Allheale of America.

This herbe of *America* riseth up with a round pithy brownish purple stalke, set at the joynts with large leaves divided into many parts usually by three or a space, little dented about the edges, bearing both at the joynts with the leaves and at the tops, on sundry branches, many tufts of flowers made of small threds like Vine blossomes, at the first greenish, but whiter afterwards, which turne into small bunches of greene berries, which grow to be darke red, when they are ripe, full of a pleasant tasted juyce, with many seedes therein: the roote is of the thicknesse of ones thumbe, and very long: it looseth both stalke and leaves every yeare, and new spring up againe after winter. The whole plant both leaves and roote, are eaten as sallets and potherbes, of the Indians where it is naturall, and the *French* also that live amongst them, and taste more pleasantly then the berries themselves.

7. *Panax moschatum Americanum.*

Sweete scented Allheale of *America*.

The first leaves of this *Panax* are large and about a foote long, onely dented about the edges, somewhat like unto Colmary leaves, lying on the ground, and compassing the long white roote at the head, but those that follow are so deeply cut in that they reach to the middle ribbe almost, the stalke riseth to be two cubits high, without any leaves thereon save onely about the middle, where it hath a knot and a leafe that compasseth it of a differing forme from the rest, the toppe branches are so heavily laden with umbels of white flowers, that before they open they hang downe their heads, which have so excellent a sweete smell, that they smell like Musicke, a great way of the place where it groweth: the seede that succeede are like, but not so broad as the ordinary *Panax*. The leaves taste sharpe, and a little bitter, but the roote lesse.

The Place and Time.

The first groweth in *Naples* as *Matthiolus* saith, on the *Apenine* hills also and the sea coasts by *Siena*: the second is thought to grow in some places of *Italy* also but generally in our gardens: the third came first from *America*, the seede being imparted to sundry persons received sundry names, and came to us one of them for *Panax Asiaticum*, and is set downe in *Cornutus* for *Angelica Incisa Canadensis*, and the other for *Angelica purpurea Canadensis*: the fourth as *Matthiolus* saith groweth on mount *Olympus* in Bithynia the like in *Italy* and *Hungaria*, the two last in *America*, and doe all flower and seede in the end of summer.

The Names.

It is called in Greek πάνακες ἡράκλειον, and *Panax* or *Panaces* also in Latine, because it is reported by some as *Pliny* taketh it from *Hercules*, to be the first founder of it, and some would have it called so because it was found by a Cary in *Candy*, but the name *Panax* is referred to many plants, as *Panax Asclepium*, *Panax Chironium*, *Panax Heracleum*, and *Dioscorides* saith *Origanum sylvestre*, called also *Cunila bubula*, and *Origanum Heracleoticum* was called also *Panax Heracleum Centaurium* and *Panax Heracleum*. The first here set downe is the *Panax* or *Panaces Asclepium* of *Matthiolus* in *Italia*, *Lobel*, *Lugdunensis*, and others, but *Dodonæus* taketh that *Panax Heracleum* that grew in every Gardens, bearing white flowers, to be rather another sort of *Sphondylium*, to which I could not but plant with such broad leaves and white flowers, is a greater *Sphondylium* then the ordinary, of which in the next Chapter love one, that which *Lobel* saith he saw in the gardens at home *Panax Heracleum* is a differing plant from it, and may be the true *Panax Heracleum* or *Heraclion* of *Dioscorides*, the *Panax Altissimo crescit in orno Oleastri aut Fraxini folio* of *Lobel*, the *Panaces peregrinum* of *Dodonæus* by *Lugdunensis*, who calleth it *Panax Chironium Dodonæi*, when as *Dodonæus* taketh the *Panax Heliantes* or *Helianthemum* of *Pliny* as it is, and so by *Clusius*, *Cordus* and others, *Ruellius* thinketh

Pannax Syriacum of *Theophraſtus*, whereof there is great probability: for the ſeede of this plant as *Lobel* ſaith was found among the gum *Opopanax*, and ſowen by *Vandenbergh* a famous Apothecary in *Antwerpe* which no doubt was from the plant that brought forth that gum *Opopanax*, out of which it was taken, which as you ſee differeth much in forme of leaves from that of *Dioſcorides* and *Theophraſtus*. The third was ſent to us by the name of *Laſerpitium arcum*, but having well conſidered it, I found it remembred by *Cornutus* among his *Canada* plants, calling it *Angelica Canadenſis*, but not rightly, for the ſmell of the root with me, is more like unto Turpentine then Angelica, the other ſort hereof he calleth *atro purpurea*. I cannot reſemble it better to any plant, then to the *Pannax* ſave onely it is like a face thereunto, and therefore call it *Pannax Heracleum alterum Americanum*, &c. The firſt *Matthiolus* hath ſet forth by the name of *Pſeudoceſtus*, and ſo many others have called it ſince, and *Lobelius* calling *Cameraria in hiſtoria* ſaith, that ſome called it in his time *Pannax Chironium*, and *Tabernamontanus* called it *Malum Coſtinum*, and *Coſtus Illyricus*, but *Ceſalpinus Herba Coſtæ*, and *Bauhinus Pannax Coſtinum*, whom follow the firſt *Clusius* ſetteth forth by the name of *Tartaria Ungarica*, and *Bauhinus* thinketh it may be the *Balſam* which *Joſephus Barbarus* ſaith he ſaw in *Tartaria*, whereof he ſpeaketh in his journey into *Perſia*, that the Tartars of the decoction of the leaves make their drinke, and the *Hungarians* their bread of the roote, and *Lobelius* thereupon calleth it *Pannax Heraclea ſimilis Ungarica*. The laſt are ſo named by *Cornutus*, as they are ſet downe in their titles. The *Arabians* call it *Stenſir Ieuſir*, and *Giauſir*. The *Italians Pannace Heraclee* and thereafter all other Chriſtian nations that know it, and we in *Engliſh* Allheale of *Hercules*, according to the Greeke ſignification of the word.

The Vertues.

From the rootes and ſtalkes of this *Pannax Heracleum*, being cut ſaith *Galen*, commeth forth that juyce or gum called *Opopanax*, which is of much more uſe then any other part of the plant, and is hot in the third degree, and dry in the ſecond, being of an heating mollifying, and digeſting quality, the barke of the roote is heating and drying likewiſe, but in a meaner degree, having withall a little clenſing property, whereby it is good for virulent and malign vlcers, and to cover with fleſh the bones that are bare: the ſeede alſo ſaith he is hot, and is mixed with thoſe medicines that procure womens courſes. the juyce or gum ſaith *Meſues* hath a ſpeciall property to mollify tough tacke and clammy flegme from the more remote parts, as the braine, nerves, ſenſitive parts, ſinues and breſt, and therefore probably applyed to all the cold greefes incident to any of thoſe parts, as to helpe a weake, hot, an old cough, ſhortneſſe of breath, purſiueſſe and wheſſing and is good alſo for the ſciatica, the griefe of the knees and feete, it is good likewiſe for crampes, convulſions, palſies, and ſtitches in the ſides, by the windineſſe, ſwelling and hardneſſe of the Spleene, for the ſtrangury alſo and difficultie in making vrine: it likewiſe diſtaſteth the windineſſe hardneſſe and ſuffocations of the mother, provoketh their courſes and expelleth the dead birth: being alſo drunke in mede or wine it helpeth the itchings and ſores in the bladder: & incaſeth ſcarſ, ſcabs or Plague ſores, and is profitably applyed with mollifying ſalves, and thoſe that cure wounds in the head, it helpeth the toothach, being put into an hollow tooth, and helpeth the biting of a mad dogge, and againſt all other poiſons of venemous creatures. The leaves of the *Hungarian Tartaria* boyled in water is a familiar & vſuall drink with the *Tartars* as the roote are bread to the *Hungarians* as is before ſaid: the operation of the *American* plants are found to be more alimentall then medicinall, being familiarly eaten of the natives and *French*. *Matthiolus* doth recount the properties of his *Pſeudoceſtus* or *Pannax Coſtinum* in this manner. It is ſaith he hot & dry in the third degree compleat, it openeth, clenſeth, cutteth & maketh thin, and ſeeming ſomewhat bitter, ſharpe and ſomewhat ſweet, it may performe all thoſe things that are related of it, that is, it helpeth cold greefes of the head and nerves, and is alſo helpfull for the cough, ſhortneſſe of breath and the like, as alſo for the windy Collicke and againſt the obſtructions of the Liver and Spleene, the Stone and gravell in the reines and bladder and the diſeaſes of the mother, to bring downe the courſes, and to expell the dead birth: it likewiſe helpeth all old greefes of the head, the ſwimming and turning of the braine, the falling ſickneſſe, the Lethargy, Frenſie, Crampes, Gouts and the like: it killeth alſo the wormes, and provoketh urine, and helpeth all ſtitches.

Chap. XLIII.

Libanotis latifolia. Herbe Francumſence with broad leaves.

That kinde of *Libanotis* that hath Fennell-like leaves with all the ſorts thereof, I have ſpoken before in the fourth Chapter of this Chaſſe, there remaineth ſuch to bee entreated of that beare broad leaves which ſhall follow in thoſe I there promiſed.

1. *Libanotis Theophraſti major.* The greater white herbe Francumſence.

The greater *Libanotis* hath many great long ſtalkes with wings of large broad leaves ſome eight inches long and foure broad, five being ſet together whereof one at the end, one againſt another, three or foure ſmaller below and ſmaller to the end, being ſomewhat hard in handling, of an over worne greenish colour, ſomewhat ſnipped about at the edges, among which riſeth up a ſtrong round ſtalk foure or five foot high ſometimes, with ſuch like leaves on the joynts but fewer and leſſer then grow below and a few branches ariſing from the upper part bearing large ſpread umbells of whitiſh flowers, and after them ſmall hard flat and round light ſeede of a pale yellowiſh colour, white on that ſide where it is joyned, and ſtraked with rough crumpled ſtrakes on the backe or round ſide, and of a pale browne colour when it is ripe but a little purpliſh before: the roote groweth deep and long in the earth on the outſide with a tuft of haire at the toppe, abiding long, ſmelling and taſting like ſtrong as many other umbelliferous rootes doe, but the ſeede much ſtronger.

2. *Libanotis Theophraſti minor.* The leſſer white herbe Francumſence.

This leſſer *Libanotis* agreeth with the former both in the forme of leaves, flowers, ſeede and rootes, but that it is much leſſe, and the number of leaves are more ſet together on every ſtalke, being alſo more deeply dented about the edges: the roote is white but more bitter then it.

There is another ſort hereof which *Bauhinus* calleth *Libanotis latifolia minor ſamiæ crifpo*, and differeth onely in having fewer leaves on the ſtalkes, although as ſmall and but one or two deepe cuts on the edges.

3. *Libanotis Theophrasti Apij folio Crenis,*
The truest herbe Francumsence of *Theophrastus.*

1. *Libanotis Theophrasti major.*
The great white herbe Francumsence

This plant which I take to be the truest *Libanotis* of *Theophrastus Apij folio*, that is yet extant, hath a stalke about a cubit high, divided into some branches, with leaves both below and above set sparingly, somewhat resembling Smallage for the largenesse of the leaves, and dented about the edges, bearing white flowers, and large, rough, crooked brownish seed: the roote is covered with a blackish barke, and very white underneath, smelling strong like Francumsence.

4. *Libanotis latifolia Aquilegiæ folio.*
Columbine leafed herbe Francumsence.

This herbe Francumsence hath a thicke rugged browne stringie roote, with a white pith in the middle, smelling somewhat sweete and bitter in taste, having a tuft of blackish haires at the toppes, from whence rise sundry leaves upon long foote stalkes, broad & hollow at the bottome like a skinnie huske, compassing one another as those do also on the upper stalkes, and are hard in handling, yet of a shining darke greene colour above, and whitish underneath, with divers purplish veines running through them, not all of them divided like unto Columbine leaves, but many of them parted into five leaves, with three divisions apiece, others into three leaves, each standing on a stalke: it hath one white round stalke, straked with purple, rising up more than three cubits high, with divers joynts thereon, and branched towards the toppes, bearing every one a large umbell of small white flowers, and after them long and broad striped seede, of a purplish colour somewhat bitter, hot, and drawing water into the mouth, if it be a little chewed thereon, and somewhat sweete in smell.

The Place and Time.

The two first sorts are found in many places in *Germany*, and the parts neere adjoyning, the third in *Spaine*, and the last it is likely came out of *Æthiopia*, by the name was given it. The two first seede with us yearely, after they are well growne, but the two last very seldome, unlesse the yeare prove hot and kindely.

The Names.

It is called *Λίβανος* in Greeke, from the sent of Francumsence which it hath, and *Libanotis* in Latine, and some *Cerinus albus*, and *Cerefolium album*, but generally *Libanotis latifolia*, that it may be knowne and differ from the former, which is called *Ferula folio*, ie is translated *Rosmarinus* by divers, when as properly the *Rosmarinus* of the Latines, is but the first kinde of *Dioscorides* his *Libanotis*, called *Stephanomatica*, that is, *Libanotis Coronaria*, because it onely was put into garlands, and so *Galen* did account it: the two first here set downe, are accounted most of the later Writers to be the *Libanotis fertilis* of *Theophrastus*, which is set downe in his 9. Booke and 15. Chapter, with leaves of Smallage, but much greater, the fruit or seede whereof was called *Cenotes*, with a great white tuncke roote smelling like *Tus* or *Olibanum*: but how any can well make the leaves hereof to resemble Smallage I cannot see, or that the seed hereof was ever called *Cachrys*, having a cauliculus quality, or the nature & smell of *Olibanum*. I onely touch this as a *Quære* further to be considered of: and it is probable that the seed that *Matthiolus* giveth for his *Ligusticum alterum*, was intended for this *Libanotis*, the five leaves being mistaken in the placing, for that they should not be set so close together, or else he intended it for the *Seseli* following. He calleth this *Libanotis*, *Seseli Æthiopicum* in another place, as *Gesner* in *Horto*, *Lugdunensi*, *Clusius* in *Pannonicis* doe, calling it *Seseli Æthiopicum Matthioli*, and therefore to helpe the matter *Dodonæus* called it *Seseli Æthiopicum herba*: it is also *Tragus* his first *Seseli*, and the *Daucus alterum genus* of *Fuchsius*, *Tragus*, and *Lobel*: the third *Camerarius* saith that it was sent him out of *Italy* by the name of *Siler Creticum*, and the *Rosmarinus Seleos folio*, that *Honorius Bellus* maketh mention of in his 6th Epistle to *Clusius*, & saith it is called *Siler Creticum* by many, but is by him taken to be the true *Libanotis Theophrasti*, to whose judgement I adhere thus farre, that it is the truest and the likeliest of any other we know extant; the last is called by *Camerarius* *Herba Seseli Æthiopicum alterum*, and saith the seede was in smell and taste somewhat like Cinamon. *Tragus* calleth it, as I doe, *Libanotis latifolia Aquilegiæ folio*. *Bauhinus* in his *Pinax* maketh another seller of it, *Apij folio*, and referreth the *Daucus angulosa caule* of *Cordus* in his history thereunto, with the *Libanotis alba altera* of *Thalius*, whereas both it and that of *Cordus*, as also that *Libanotis Tragi* nor of *Lobel* are all comprised under his *Latifolia altera sive vulgatior*, and are not severall plants, as I thinke.

The Vertues.

This herbe Francumsence is of a mollifying and digesting qualitie, helping the old griefes of the breast & lungs, the falling sicknesse, and the jaundise, if it be taken with pepper in wine: it increaseth milke in nurses

Original from UNIVERSITY OF MICHIGAN

breeds, if the roote be taken in wine, it likewise easeth the paines of the stomacke and belly, and the biting of venemous beasts and serpentes, procureth womens courses and the urine being stopped: the leaves being bruised and applied staieth the bleeding of the piles or hemorrhoidall veines, the heate also and swelling of the fundament, and bringeth those hard tumours and impostumes to ripenesse, which doe hardly yeeld to be easily cured: the dried roote mixed with honey and put into foule ulcers cleanseth them throughly: it helpeth likewise those that are bitten, or that have convulsions and cramps, and the gout, being bruised and applied with the meale of Darnell and some vinegar: and being used with vinegar, it taketh away the morphew or discolouring of the skin, or the leprye also the juyce of the leaves and roote cleareth the eye-sight, and sharpeth it, and also the thicke films that fall into them, applying it to the forehead: the seede also of any of these sorts doe the like, but if it be that seede, which is called *Cachrys* that is forbidden to be taken inwardly, by reason of the caustick and burning qualitie therein to inflame the mouth and throate being taken or drunke.

Chap. XLIIII.

Sphondylium, Cow Parsneppe.

Although formerly there was but one sort of the Cow-Parsneppes knowne and divulged to the world, yet there are now divers others found out, some in our owne land, and some in others, all which shall be entreated of together in this Chapter.

1. *Sphondylium vulgare.* Ordinary Cow Parsneppe.

The ordinary Cow Parsneppe groweth with three or foure large spread winged rough leaves, lying often upon the ground or else raised a little from it, with long round hairy foote stalkes under them, parted usually into five divisions, the two couples standing each against other, and one at the end, and each division or leafe being almost round, yet cut in somewhat deepely on the edges, in some leaves and places, and not so deepe in others, and of a whitish greene colour, smelling somewhat strongly; among which riseth up a round creased hairy stalke two or three foote high, with a few joynts and leaves thereon, and branched at the toppe, where stand somewhat large umbells of white flowers, but sometimes a little reddish, and after them flat whitish thinne winged seedes, two always joyned together, as is usuall in most of these umbelliferous plants: the roote is long and white, with two or three long tongues growing downe into the ground, smelling like wise strongly and unpleasant.

1. *Sphondylium vulgare.*
Ordinary Cow Parsneppe.

2. *Sphondylium majus sive Acanthus Germanica major.*

The great Cow Parsneppe of *Germany*.

This greater sort differeth onely from the former, in the large smoothnesse of leaves and stalkes, being neere twise as large. I meane every single leafe or division, which are seldome above foure on a great long foote stalke, above halfe a foote long, unto the leafe, which is hairy and rough, of the like evill greene colour, and a little fouided in or crumpled, and dented beside on the edges, the flowers and seede are alike, but larger, as I said, growing higher, of an lesse unpleasant taste, but not so unpleasant as the other: the roote is white, and like the other but greater.

3. *Sphondylium majus aliud Laciniatæ foliis.*

Jagged Cow Parsneppe of our owne Land.

This jagged Cow Parsneppe groweth as high or rather higher than the tall, and with greater stalkes, and a white hairinesse on them, the sowre leaves grow very large and much spread, divided into sowre paires or winged leaves, two couple standing directly one against another, cut of another forme, for each of these leaves or divisions are parted into distinct parts, yet closely joyned to the middlemost one, the two sides leaves or divisions being not much lesse in length than the middlemost is, which is in some a handfull long, or rather above five, and not above halfe a handfull broad, each of them having a deeper cut or notch at the upper part, than is on the rest of the leafe, which yet is dented with deeper notches than in small narrow leaves, the upper or middle leafe being usually parted into five long divisions or leaves, and those in the like manner, little or nothing hairy, but of a deepe greene colour on the upper side, and grayish underneath, the umbells of white flowers are as large as in the tall, and the flat seede, white, and like to it, but a little whiter, that they are hardly discerned one from another, but onely in taste and smell, which is little or nothing in either: the roote is great, thicke, and white, living with me after the manner, and springing a new every yeare.

4. *Sphondylium Alpinum parvum.* Small mountaine Crow Parsneppe.

This small sort hath a stalke a foote high, parted into two or three branches, and pale greene great leaves on every stalke, whereof are parted into three divisions, and others into five, being somewhat but round some of them, and

2. 3. *Sphondylium maius & latifolium.* The greater Cow Parlesppe of *Germany*; and another with jagged leaves.

5. *Sphondylium Alpinum glabrum.* Smooth mountaine Cow Parlesppe.

and others pointed, hairy likewise, and dented about the edges, the flowers on the umbells are white, and the seede thinne and broad.

5. *Sphondylium Alpinum glabrum*, Smooth mountaine Cow Parlesppe.

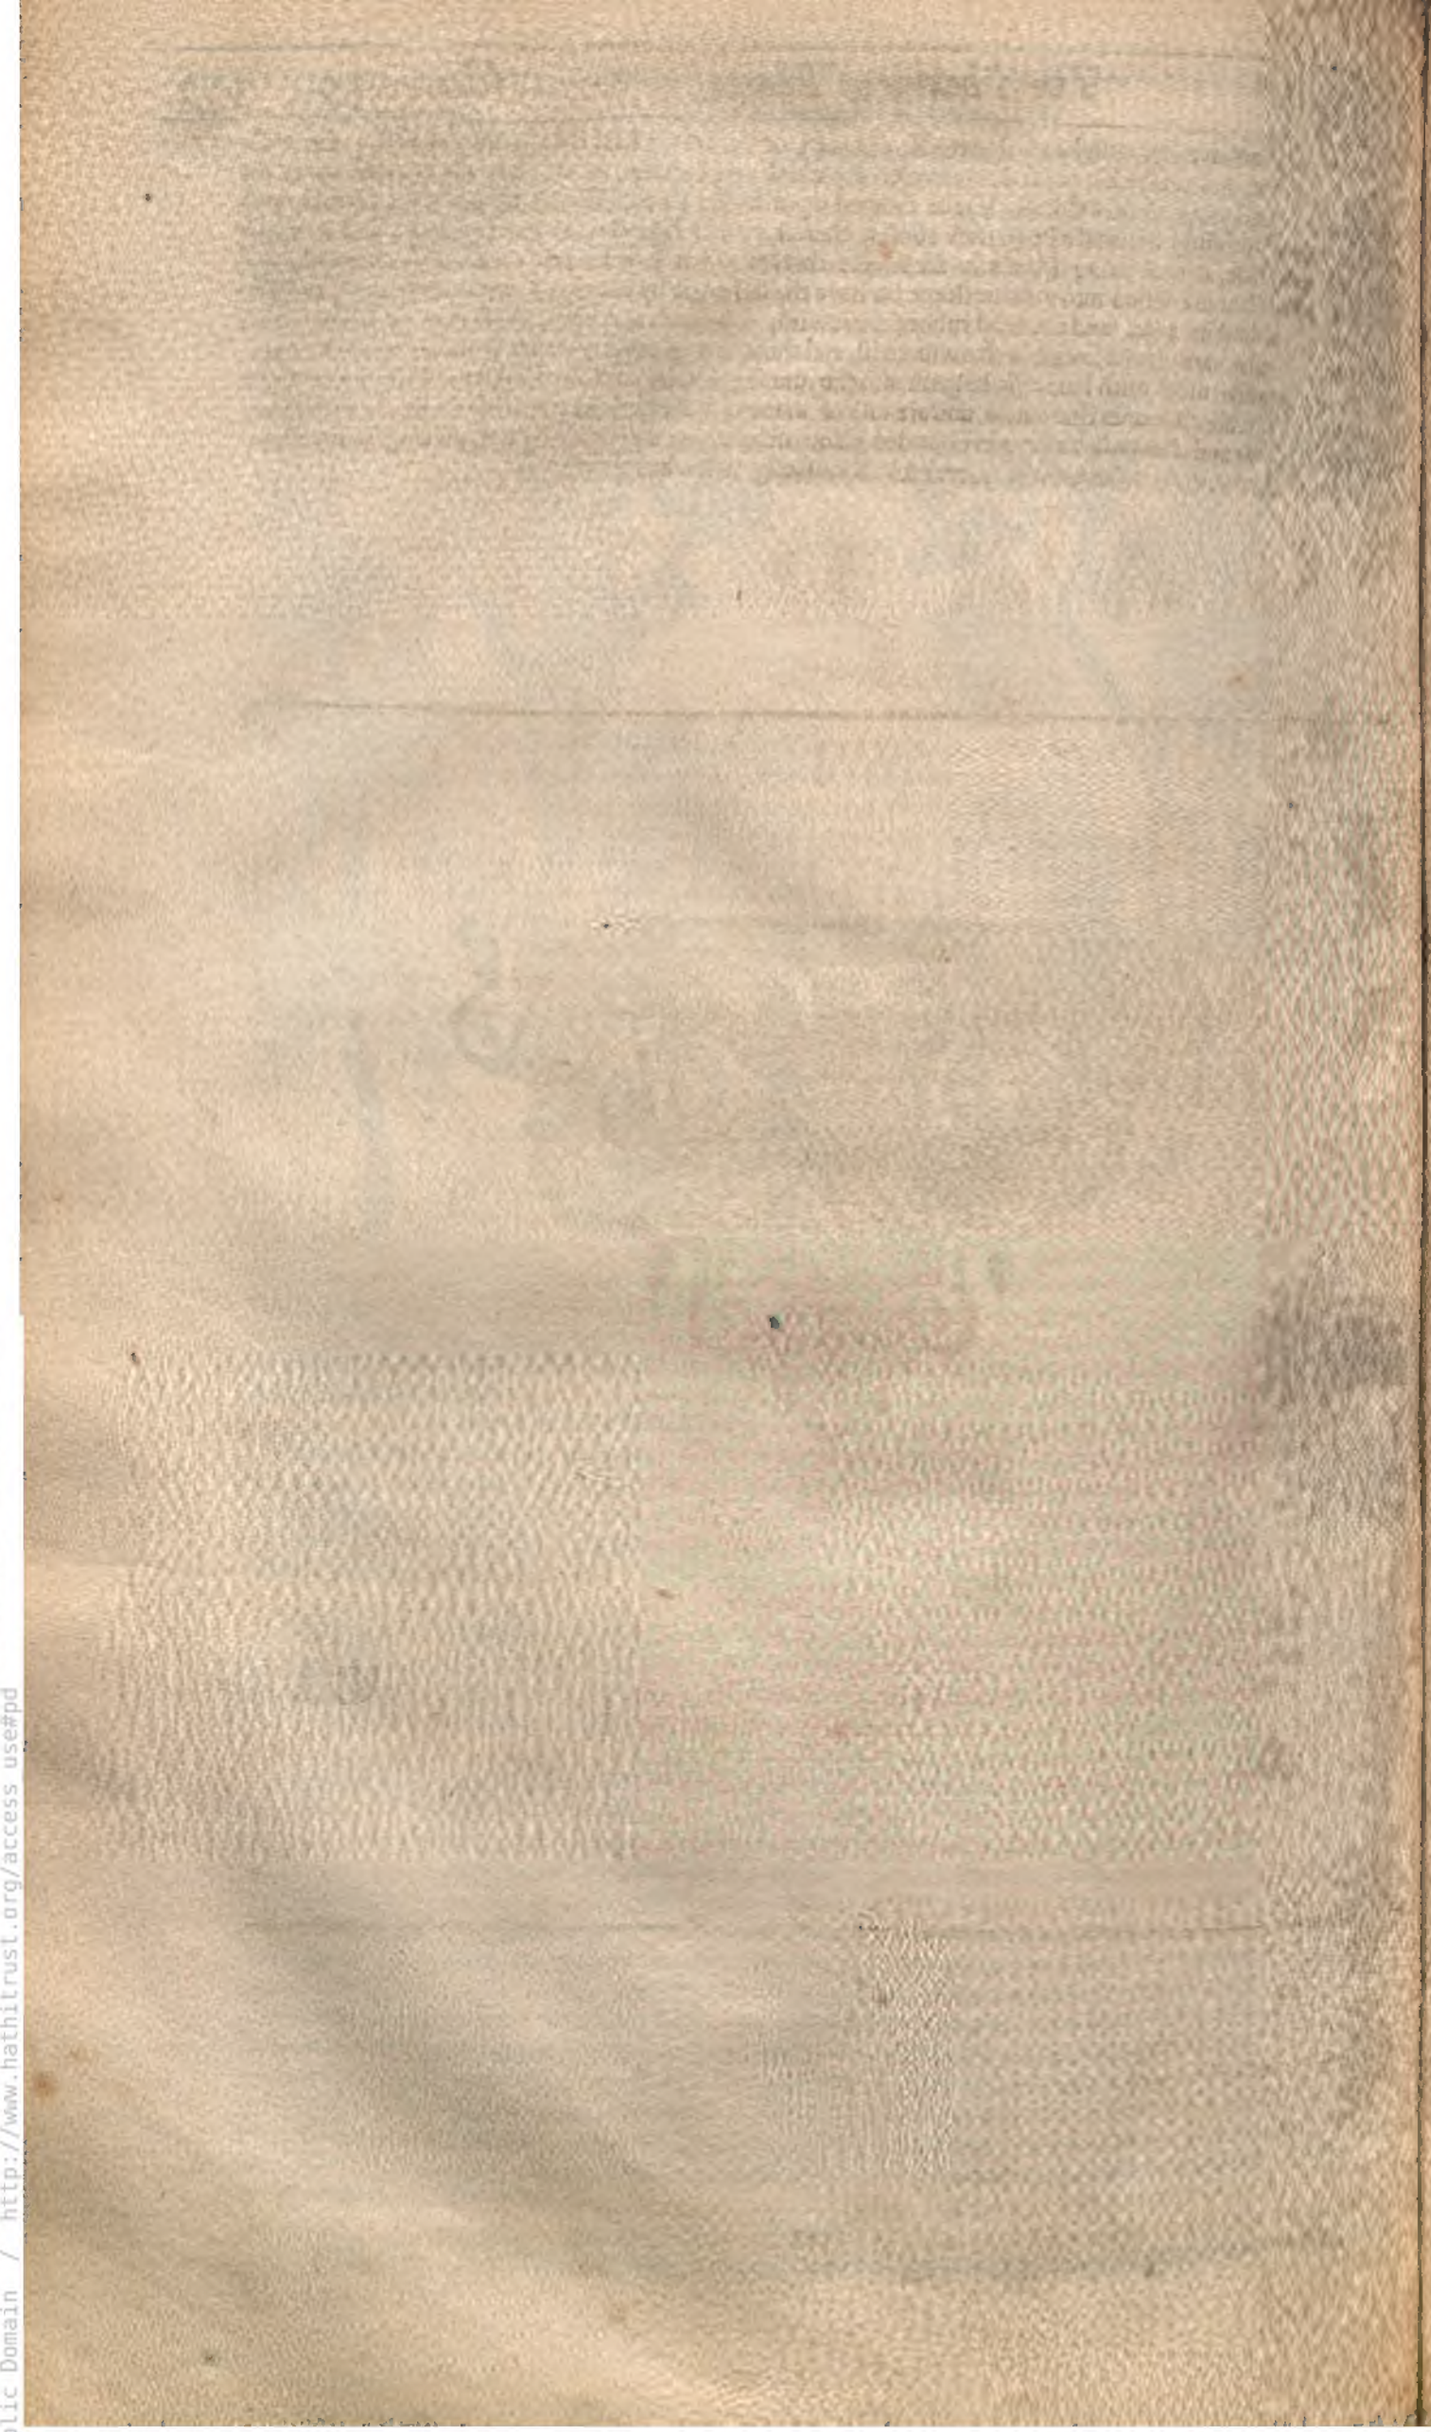
The roote hereof is white and great, the stalke jointed, and two foote high, the leaves like vnto Finge-leaves and smooth, being a hand breadth long and two broad, besides the foote stalkes which are a little rough, vsually divided into three parts, but not to the middle and dented about the edges; the toppes of the branches have vmbells of smaller white flowers standing on them than in the other: the seede is flat and round, but having a small pricke or point at the end.

The Place and *Time.*

The first groweth in moist medowes, and the borders or corners of fields, and more dimely generally through the land: the second is proper only to *Germany*, as I thinke; the third was found by Mr. *George Handy* a worthie and industrious Gardeman in *Shropshire*, as I take it; the fourth on the *Alpes* of *Austria*: the last on the *Alpes* of *Basil*: they flower all flowre in *July* and seede in *August*.

The Names.

It is called in Greeke [illegible] and more [illegible] *Sphondylium* and *Spondylion*, for both are vsuall in good authors derived as it is thought from *Spondyle*, a ioynt linking like this: *Matthiolus*, *Gesner*, *Lobel*, *Dodonæus*, and others doe call it *Sphondylium*, but *Fuchsius*, *Cordus*, and some others call it *Branca vrsina*, and *Pachyphorbe*, *Germanica*, and so is most vsually the second sort called by them: and this is the plant, which I mainly *Dodonæus* in his Chapter of *Panax*, did rather take to be *Spondylium altissimum*, because it hath white flowers and [illegible] seed, not very thicke, for that which *Lobel* saith he saw with yellow flowers and [illegible] it is a plant lately found out to grow in our owne land, so I have given it a name correspondent as I thinke [illegible] forme, yet I thinke verily it is the same that *Bauhinus* hath described in his *Prodromus* by the same name [illegible] *Sesquium folijs inæqualiter incisis*, and is, as I also verily thinke the same that *Matthiolus* [illegible] *minus* and *Lobel* in his Observations [illegible] *Sphondylium* for so calling it [illegible] *sonchi folijs*, which why they should [illegible], the one with the [illegible] neither any delicious [illegible] none of them doe, or that it should be called an *Egyptian*, the other with the *Cretans*: I can [illegible] two last are specified by *Bauhinus* in his *Prodromus* by the same titles that I give them: the [illegible] the *French Branc ursine*, the *Germans Barenclaw*, the *Dutch Beerenclaw*, and we in *English* Cow Parlesppe Medow Parlesppe by some.



The Vertues.

The seede of Cow Parlesppe, as *Galen* saith, is of a sharpe and carving qualitie, and therefore is a medicine [illegible]

wardneſſe of thoſe that have the cough and ſhortneſſe of breath, or the falling ſickneſſe, or the jaundiſe: the roote of the ſame be vſed, and availeable to all the purpoſes aforeſaid, and beſides, is of great vſe to take away the hard callous skin that groweth on a Fiſhes, if it be ſcraped vpon it: the ſeede likewiſe hereof being drunke doth expell the belly from rough flegmaticke matter abiding therein, eaſeth them that are liver growne and womens paſſions of the mother, as well being drunke, as the ſmoke thereof when it is burned received underneath, and likewiſe raiſeth ſuch as are fallen into a deepe ſleepe, or have the lethargie by burning it vnder their noſe, and if it and the roote be boiled in oyle, and the head rubbed therewith, it helpeth not onely thoſe that are fallen into a ſwoune, but thoſe that have the lethargie or drowſie evill, and thoſe that of long time are troubled with the headache. It is likewiſe vſed with Rue: it helpeth all ſorbe running ſcabbe, and the ſhingles: if the jayce of the flowers be dropped into the eares that runne, and are full of matter, it cleanſeth and healeth them. It is ſaid that the people of *Poleni* and *Lituania* make a certaine decoction of the leaves and ſeede hereof, putting barme thereto as huſed in beere with us, whereof the poorer ſort doe uſually make their drinke.

CAR-

CARDUI ET SPINOSÆ PANTÆ.

THISTLES AND THORNIE PLANTS.

CLASSIS NONA,

THE NINTH TRIBE.

CHAP. I.

Cardui & Spinosæ Plantæ. Thistles and Thorny Plants.

UNto the Thistles I thinke meete to joyne such prickly or thorny Plants, as were neither fit for any of the former or subsequent Classis; yet I must except out of this number (although they pertaine to the Classis) those Thistles, or other prickly plants, as I have entreated of in my former Booke, referring those that would be informed of them to the Booke it selfe; whose names are these; *Acanthus sativus*, and *sylvestris*, *Eryngium Pennonicum sive montanum flore cæruleo & flore albo*, *Cardum mollis*, *Carlina humilis*, *Cardum Sphærocephalus sive Jacobææ major & minor*, *Cardnus Eriocephalus sive Tomentosus*, *id est*, *Caput monachi sive Cornu Patrum*, *Cinara diversarum specierum alimentosa*, & *Cardnus benedictus*.

1. *Cardnus pratensis latifolius*. Broad leafed field Thistle.

The broad leafed field or meadow Thistle sendeth forth sundry large and long leaves cut in on the edges, and prickt or finely dented, and set with small prickles that are very tender, of a whitish greene colour: those that grow higher upon the stalkes are smaller, two of them set together at a joynt where they imbrace the stalke, that they will containe water in them, even as the Teasell doth, at the toppes upon long stalkes grow single greene scaly heads, out of which start pale coloured thrummes, compassing a few purple threads in the middle, and when they are faded and gone, small whitish seeds somewhat bigger than those of *Cyanus*, Corne flowers, which seede are wrapped in downe, as all the sorts of Thistles are: the roote is somewhat long and great, abiding many yeares.

2. *Cardnus luteus sive Acanthi folijs laciniatis*. The yellow jagged medow Thistle.

The yellow jagged medow Thistle hath very large leaves, almost a foote long and somewhat broad, cut in on both sides into many deepe dents, green in the middle ribbe, set with prickes at the dents of the edges, from whence issue small stalkes about two foote high, set with a few lesser leaves, at the tops whereof stand divers small greene scaly heads, out of the middle yellow threds or thrummes, which afterwards give leede inclosed in downe: the roote is great, long, crooked, and spreading in the ground.

3. *Cardnus Gallicus Asphodeli radicibus*. The *French* bulbed Thistle.

The whole leaves of this Thistle are of an hand breadth long, somewhat fat and thicke cut in on the edges, with many deepe dents, and prickt at every dent with small sharpe prickes: the stalke is two cubits high hairy and rienged, with a few leaves thereon, at the toppe whereof stand harmeles prickly heads upon long foote stalkes, full of purplish thrummes, wherein afterwards lie the seede inclosed in much downe: the roote consisteth of divers cherous small long clogs like unto those of the Asphodill fastened together at the head.

4. *Cardnus Pratensis Asphodeli radicibus*. Medow Thistle with Asphodill rootes.

This hath divers blackish cloggie rootes like unto the Asphodill or Piony, which withher and perish yearely (but give encrease from it before) which sendeth forth divers thicke, and long pale greene leaves

cut into many parts, armed with sharpe prickles on all sides, every pricke ending in three points, from whence riseth up a tall stalke, somewhat branched with one or two prickly heads at the toppes of every the branch, out of which come purplish flowers, and afterwards small long seede wrapped in downe.

5. *Cardnus pratensis polycephalos.* The many headed medow Thistle.

This Thistle hath but few leaves lying next the ground, being both broad and narrow, armed with divers long prickes, the stalke is round staked and without prickes, spread into sundry small branches bearing small heads with purplish flowers, made of thrummes or threads thrusting out of the middle scales, set with large and sharpe prickes: the seede is inclosed in downe as the reliare. The roote is long, hard and woody.

6. *Cardnus palustris.* The moist Medower Thistle.

The roote of this Thistle is single, the stalke three cubits high, straight and full of prickes, thicke set with fine greene leaves unevenly waved, and sometimes more deepely cut in on the edges, having a few prickes, winged and branched toward the toppe, with many small heads upon slender stalkes, and reddish purple flowers therein, and then turne into downe.

7. *Cardnus Creticus siue vliginosus & vinearum repens.* The Creeping way or Vineyard Thistle.

The rootes of this Thistle are very small and whitish, running both deepe and farre about under ground into quiche grasse, but have no knotted joynts therein like it, but shooteth up heades of leaves from the sides of the roote, so that it will be as ill, or worse than Quiche to weede out, if it be once got into a ground: the leaves are of a pale greene colour, somewhat like unto the rough or prickly Sowthistle, a little rugged and were crumpled on the edges, armed with very small, and sharpe hard prickles, the stalke groweth to a foot high, staked and prickly, with some such like leaves thereon as the lower be, but smaller to the toppe, where it is flored with small sharpe prickly heads and purple flowers made of thrummes in the middle falling downe.

8. *Cardnus Auenarius siue Moschatus.* The Oaten land or Muske Thistle.

This Thistle that riseth sometimes to the height of a man among the corne, is found growing in wet places, having divers very sharpe prickly jagged leaves set round about the stalkes, and at the toppes where they are branched many small short heads set close together, out of which come the flowers consisting of many thrummes, as in other Thistles, some whereof will be white, some of a deeper, and others of a pale purple colour tending to a blush, in many places smelling sweete like Muske, which being faded, the seede followeth wrapped in much downe like the rest.

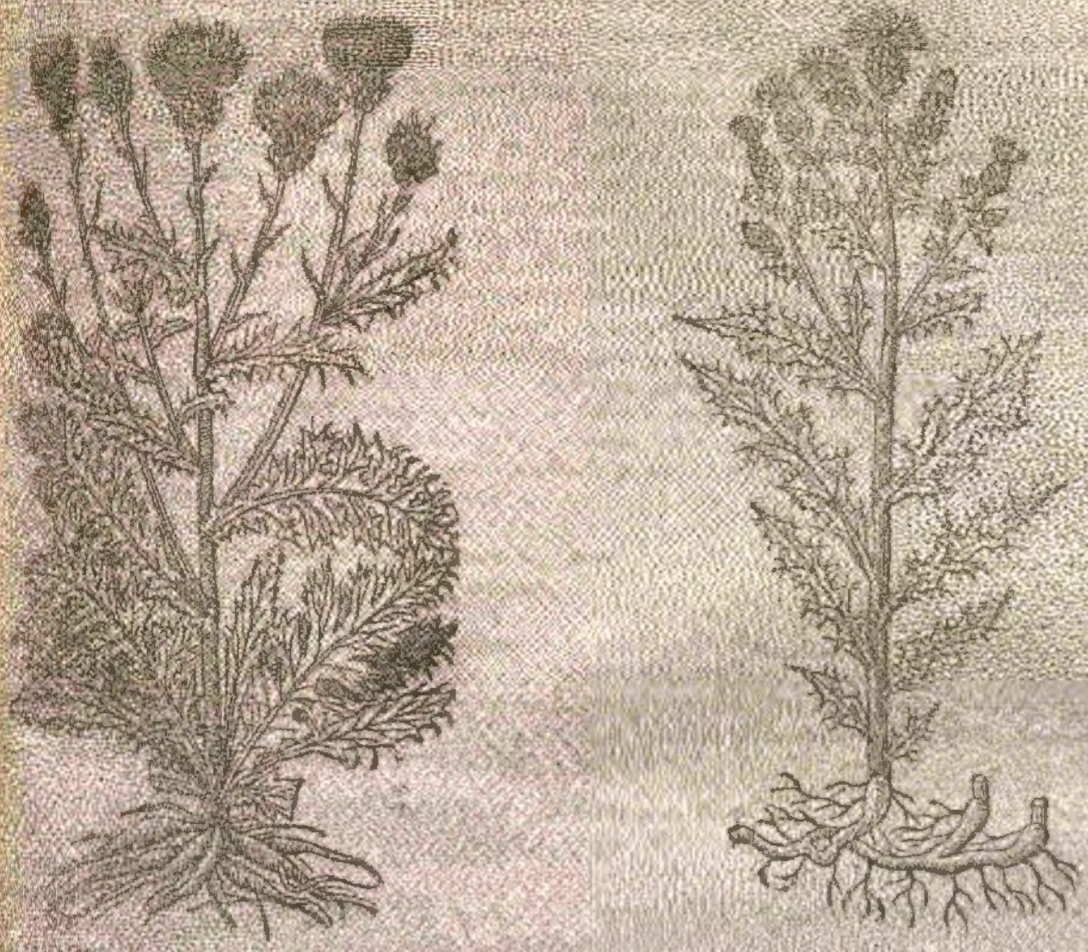
9. *Cardnus Creticus minimus.* The small Thistle of *Candy*.

This small Thistle hath rising from a small long roote divers long leaves, somewhat like unto the *Aranella* or Dittaine Thistle, but smaller, and armed with sharpe prickles: the weake leaning stalkes are divided mainly into two other, betweene which groweth on a foote stalke a small Thistle-like head armed with a dozen very small long prickes standing up round about it, being so finely netted that it maketh admirable the Workemaker, the middlemost head, ever growing lower than the rest round about it: when these heads open, the blew flower appeareth never spreading much, after which come small white seede inclosed in a little downe, which will flie away with the winde, the heades are sweete and edible before they flower.

The Place.

All these sorts of Thistles grow in fields and medowes in Vineyards and grounde lowne and warme, as well in warr lowne Land, as beyond the sea, some of them also on Heathes, Greenes, and wall grounds in many places, as the *Cretenses* on *Kentish Downs* greene abundantly.

3. *Cardnus pratensis latifolius.* Broad leaked field Thistle.



4. *Cardnus hortensis monstrosus.* The Cornish Thistle.

The Time.

They doe all flower in *July* and *August*, and their seede is ripe quickly after.

The Names.

The Ἀκανθα in Greeke in my judgement is most properly *Cardum* in Latine, for from thence be all the kinds called *Acanaceæ*; the prickly heads whereof being called Καρδοὶ Ἐχῖνοι, the Latines call *Echinocardos*. *Theophrastus* in his fifth booke and sixteenth Chapter mentioneth Ἀκανθαι with Ἀκαρνα and Βατις as of the same kinde of Thistle. Some would thinke that ονοβρυχις in *Theophrastus* should better agree to denominate the small kinds of Thistles, written as well with Ypsilon as Iota, because *Cato* doth alwayes translate it *Onopordum* and generally all the Latines: to which opinion *Lugdunensis* seemeth also to encline in the Chapter of *Serratum*: The first here set forth is the *Cardinus pratensis* of *Tragus*, of *Gesner in hortis* and *Lobel*, by *Lugdunensis Acanthus sylvestris*, and is thought to be the *Erinnone* of *Theophrastus*, *lib. 6. c. 3.* which he putteth among the Thistles of prickly leaves, but *Gesner* hath very evilly translated the word to call it *Herba sylvestris*: the second *Bauhinus* *Lugdunensis* doe set forth under the name *Carduncles* taking it to be that of *Pliny* in his 26. Booke and 7. Chapter, which *Bauhinus* calleth *Cardinus pratensis Acanthi folijs laciniatis*: the third *Lobel* saith the learned *Gesner* called *Cardinus bulbosus*, & he thereupon called it *Cardinus bulbosus Montpelienssium*, but *Clusius* called it *Cardinus crocodes*, and *Angulare Leucacanthe*, *Bauhinus* calleth it *Cardinus pratensis Alsidoth* the fourth is called by *Lugdunensis Acanthus sylvestris alter Dalechampij*, by *Tabernemontanus Leucacanthe* the second, and by *Gerard* which followeth him *Jacea tuberosa*, but by *Bauhinus Cardinus pratensis Alsidoth* the *Arabum* or *common Icterus*: the fifth is called by *Bauhinus Cardinus fullonum*: the sixt likewise is called by *Bauhinus* by the name of *Cardinus palustris*: the seventh is taken to be the *Cnecus* of *Theophrastus*, and called both by *Dioscorides Lugdunensis* and *Columna*, by *Bauhinus Cardinus viscosus vel repens Italus*. The last is called *Cardinus sylvestris minor* and *Thalius Cardinus Avenacensis*, *Tabernemontanus Cardinus* the sixt, and *Cardinus montanus*, and by *Bauhinus Cardinus in montosa provincia*, which *Lugdunensis* mistaketh to be *Onopordon* and would have take *Scolymus*.

The Vertues.

All these Thistles are temperate in heate and drinesse, and are good to provoke urine, and to asswage the long smell thereof, as also the ranke smell of the arme holes or of the whole body to be boyled in wine, with the same also is said to helpe a stinking breath, and to strengthen the stomacke. *Pliny* saith that the sap applied on that place which wanteth haire or is fallen of, will cause it to grow again speedily.

Chap. 11.

Cardinus mollis Cirsium dictus. The soft Melancholy Thistle.

Of this Thistle there is much varietie, some growing in medowes, some on mountaines, some with broad leaves others with narrow, some greater others smaller as you shall finde them described.

1. *Cirsium maximum montanum.* The greatest mountaine *Cirsium* or Melancholy Thistle.

This great mountaine *Cirsium* hath divers large whitish greene leaves lying on the ground, somewhat broad and long, pointed at the ends, as also dented about the edges or as it were a little jagged, set also with small short prickles: among the which the stalkes that rise up being great hoary and frosted or mealie three or foure foote high, bearing sundry such like leaves but lesse up almost unto the tops, where upon long and naked stalkes stand gentle, prickly, scaly whitish greene heads, nothing so great as the large mealie of a plant might promise, from the middle whereof thrust forth divers small purplish threddy tufts, which when they are past the head openeth being full of downe, having very small white seeds, far smaller then in any other Thistle almost lying therein, which are carried away together with the windes: the roote is composed of many whitish great tuberous long clogs, like unto those of the Asphodil which abide the winters, with a few greene leaves at the head thereof.

2. *Cirsium majus latifolium.* The great soft Melancholy Thistle with broad leaves.

This great Melancholy Thistle hath large and long leaves, larger and broader then those of the former, dented or set with soft prickles about the edges, the stalke which is tender brittle or easie to breake and somewhat like unto large leaves thereon is the flower set, but somewhat more rent or torne on the edges, bearing on the tops, and heades on each of them from among a tuft of small prickly leaves a small prickly Thistle like head or such spring many purple threads which passe into downe: the roote is small and long with divers annexed to it.

3. *Cirsium alind montanum.* Another soft Melancholy Thistle.

This other Melancholy Thistle riseth up with divers stalkes about a foote high, winged as it were with leaves from the bottome, and leaves growing thereon which are somewhat like the former, but narrower, and about the edges set with prickes, and of a pale or blewish greene colour at the tops of the stalkes are naked stemmes stand small, scaly, prickly, single heads, with purple thrums or threads in the middle, which when they passe in withowne hang downe their heads, and conteine within them larger, thrummy and tawnie tufts then the former that fall downe or are blowen away into the winde: the root is composed of many long clogs of the thickenesse of ones finger, which shooteth forth heads for encrease at the tops on the sides, and fellech hang.

4. *Cirsium Anglicum primum.* The first *English Cirsium.*

The former of these *English* Thistles riseth up with a tender single hoary greene stalke bearing [illegible] five long hoary green leaves dented about the edges, the points whereof are little or nothing prickly [illegible] usually but one head, yet sometimes from the bosome of the uppermost leafe there shooteth forth another head which are scaly and somewhat prickly, with many reddish purple thrums or threads in them which being gathered fresh will keepe the colour a long time, and standing on the stalke fadeth [illegible]

1. Cirsium vulgare folium
The great Melancholy Thistle.

2. Cirsium vulgare alterum
Another sort Melancholy Thistle.

3. Cirsium Anglicum primum.
The tall English Cirsium.

4. Cirsium alterum Anglicum.
The other English Cirsium.

Plate 5

time while it perfecteth the seede, which is of a meane bignesse lying in the downe: the roote hath many long strings fastned to the head or upper part which is blackish and perisheth not.

5. *Carduus alius Anglicus.* The other *English Carduus.*

This other *English Carduus* is very like unto the former *English* kinde, whose leaves are as little prickly; but more hoary underneath and more greene above: the stalke also which is about two foote high beareth but one large scaly head with many purple threads and Thistle like seedes lying in downe: the roote is somewhat tuberous at the head, and blackish on the outside with divers fibres thereat, and shooting forth long strings which send forth heads for encrease.

6. *Carduus angustifolium Germanicus.*
Narrow leafed *Carduus* of *Germany.*

This *Carduus* hath divers long and narrow darke greene leaves lying on the ground, dented and set with a few prickes, the stalke riseth to be two foote high, set from leafe to leafe with sharpe finnes which make the stalke seeme winged, having shorter leaves, more prickly and more divided on them then those below, branched into many parts, each bearing naked long stems and single small heads at the toppes which are prickly like the rest, and have purplish red threads in the middle of them as the others.

7. *Carduus montanus capitulis compactis.*
Mountaine *Carduus* with tufted heads.

This mountaine *Carduus* hath softer leaves then the former, and somewhat more cut in on the edges, being long and somewhat narrow, and set with small prickles: the stalke rising to be two or three cubits high hath divers the like leaves thereon but lesser and lesse divided, bearing at the toppes a tuft of many small scaly and prickly heads set together with purplish red threads in the middle: the roote is made of many long strings and blackish long.

7. *Carduus montanus capitulis compactis.*
Mountaine *Carduus* with tufted heads.

The Place.

The three first sorts grow in those fields that are on the mountaines in *Germany* in many places: the fourth also fist in many moist medowes of our owne Land as well in these Southerne as in the Northerne parts: the fift was found on the hill *Wasserfall* not farre from *Bassil*: the last by *Mompelier* in the moist grounds neare the plaine towne.

The Time.

All these Thistles flower about *July* and some in *August*, their seede ripeneth quickly after.

The Names.

It is called in Greeke κίρσιον and not σείριον as divers suppose for it commeth from κίρσος *varix quasi fanes ut Dioscorides refert*, the Latines also call it *Carsium* and some *Spinachia*, *Fuchsius*, *Ruellius*, and *Lonicerus* in their times thought that the great *Buglossum* was both in outward shew and inward qualities not much differing from it, but therein they were much mistaken as *Matthiolus* observed and objected against them. *Lobel* supposeth that none of these come to neare the description of *Dioscorides* his *Cirsium* as the third sort here expressed. The title *Cirsium* maketh this first *Carsium*, whereunto the former *Cardnus bulbosus Monspelianus* was like, which *Bauhinus* calleth *Cirsium maximum Alpinodes radice*: the second is the first *Cirsium* of *Dodonæus*, as *Lugdunensis* setteth downe from his *French* booke, and the third in his *Pemptades*, which *Bauhinus* calleth *Cirsium Lusitanum*, making it another sort, whereunto he coupleth the next which is my third together, which is the first *Cirsium* of *Lobelius* in his *Pemptades*, and the third *Cirsium* of *Clusius* which *Bauhinus* calleth *Cirsium Hispanicum spinosissimum*: the fourth and fift are generally called *Cirsium Anglicum primum* and *alterum*, and of *Clusius Cirsium Pannonicum primum perenne*, and *Cirsium Anglicum* or *Britannicum secundum*, the first *Bauhinus* calleth *Carduus angustifolius*: the last is the *Cirsium* of *Matthiolus*, *Gesner in horto*, *Lacuna*, *Lobel* and *Lugdunensis*, and is the third *Cirsium* of *Dodonæus* in his *Pemptades*, and the fourth of *Clusius*, which *Bauhinus* calleth *Cirsium folio non spinoso floribus roseis*. The *Italians* call it *Cirsio*, and so doe all other nations, but with little varying termination of words, because I would have it beare an *English* name in some sort answerable to the *Greeke*, and also I have entitled it The soft Melancholy Thistle.

The Vertues.

There are no other properties found out or knowne whereunto any of these Thistles may be applyed then those which *Dioscorides* setteth downe taken from *Andreas* (who brought in many figures and notions to confound in Physicke) that the roote thereof being bound into the veine in the legge or other parts of the body swollen with Melancholy blood doth quickly helpe and heale it.

Cap.

Chap. III.

Atractylis. The Distaffe Thistle.

This *Atractylis* or Distaffe Thistle is accounted a wilde kinde of *Cnicus*. The sorts whereof I have set forth in this Booke here before, and the *Cardous Benedictus* Blessed Thistle in my former booke accounted another sort of this *Atractylis*, which I shall not nor needs describe againe; the other sorts I shall shew you here.

1. *Atractylis flore luteo.* The yellow Distaffe Thistle.

The wilde bastard Saffron or Distaffe Thistle (for so it may by both names duly be called) hath the lower leaves somewhat long and narrow, much cut in on the edges, very hairy, or as it were a little hoary, and not prickly while they are young, and before the stalke riseth, but then are harder and more prickly, and still the higher, the more charged with prickles, which rising to be three or foure foote high, are rough, round, and branched, from the middle upwards, & hath at the top of every branch a few smaller, but more prickly leaves, under every pricklie head, which from the middle of them shoote forth a few pale yellow threads, which are the flowers, and being past, there in them divers blackish hard seeds somewhat bigger than those of the Garden *Cnicus* or bastard Saffron, and lesser than those of *Cnicus altera Clusij* lying in downe, but nothing so much as in it the roote is whitish and woody, perishing every yeare after seede time: the leaves hereof before they grow hard and old being gently chewed, doe not torment, will yeeld a reddish or bloody juyce.

2. *Atractylis flore purpureo.* Purple Distaffe Thistle.

This Thistle differeth from the last in the flower, which is of a purplish red colour, and in the leaves that they are not hairy or hoary, and in the stalke that it riseth seldome so high, in all other things it is altogether as even in the bloody juyce also, that one would say it were the very same.

3. *Atractylis purpurea Cyprii.*
The purple Distaffe Thistle of *Cyprus*.

This Thistle that *Lobelius* setteth forth, and *Lugdunensis* after him hath leaves like unto the manured *Cnicus*, or bastard Saffron, but softer and somewhat cragged or crumpled, from among which riseth up a stalke, bearing a Thistle like head at the toppe, from whence spring broder branches, bare or without leaves, halfe a foote high or more, having on each of them a small prickly head, with a purple flower in the middle (like unto an *Auemone*, as they say, but how truly I cannot tell) but in other places enclining to yellow: the whole stalke and branches rise to a cubits height, and have white seede like unto *Cnicus* or bastard Saffron.

The Place.

Clusius saith he found the first in the corne fields of *Seville* and *Castile* in *Spaine*: the second and third grow in many countries, as about *Montpelier*, and *Narbone* in *France*, in *Italy*, *Greece*, &c. the last is said by *Lobelius* to be found in the Ile of *Cyprus*, and *Lugdunensis* saith it is also found in *France*, but somewhat differing in the colour of the flowers.

The Time.

They flower towards the end of Summer, and the seede ripeneth in the end of *August*, yet the last doth flower and seede sooner than the other two.

The Names.

The Greeke call the manured kinde of *Cnicus*, and so doe the Latines also, as I shewed before: but *Theophrastus* saith, *Cnicus quoque quidam pratensis, vel hortensis, quem quidam pratensem vocant, similis sylvestri, parua spina de facies, flos purpureus*, or rather as in the colour of the flowers, *Eam quidam carpam nature vocant*, as *Dioscorides* call it *Kentron*, from whence the names *Centaurea* is derived, whereof you have growing in the Apothecaries shoppes, hereof there are two principall kinds, the greater or lesse, and the wilder as *Dioscorides*, *Theophrastus*, and *Pliny*, from them doeth arise, of the wilder there are two sorts recorded by *Theophrastus*, and *Pliny* from him, the former more like, and like unto the manured kinde, which of divers is taken to be *Atractylis*, the other trailing on the ground, and more like unto a Thistle, which of all in generall is taken to be our *Cardous benedictus*, unto the former *Virgil* giveth a blacke and greater fruit, and more hairy than the other: but *Pliny* unto his former giveth a greater and whiter seede, which because that *Pliny* saith the former *Cnicus sylvestris* we called *Atractylis*, we see much controversie among many worthy Writers, some affirming the *Cnicus sylvestris* prior to be *Atractylis*, and others refuting that opinion, because that *Theophrastus* speaketh difinctly of them both in several places, as I have alleadged, that altogether which is the same that *Dioscorides* useth, who so shall diligently observe the foresaid places in *Theophrastus* (*Gualandinus* in *Fuchsium*) giving this note, that there are many things taken up in him, by sundry names) shall certainely finde that the *Atractylis* here set downe, which is the same *Atractylis* with him and *Dioscorides*, and the *Cnicus sylvestris prior* of *Theophrastus*, and *Pliny* notwithstanding, for divers relation of the seede, as is shewed before: for there never could be found of any that could shew any *Cnicus sylvestris* with a white seede, and our *Atractylis* doth fully answer in all

Original from UNIVERSITY OF MICHIGAN

all things the contrary, the seede being blacke and bitter also that none can doe more, as also in that property contrary to *Atractylis*, as *Theophrastus* recordeth, which yeelderh a bloudy juyce as ours doe, and therefore it was called *sweet cruer*, and is taken from the leaves, not by bruising and wringing out the juyce, as the rest of other herbes are taken, but droppeth out of the veines of the leaves of it owne accord, being broken off, or any thing to receive it, in the same manner as I have shewed you here before the juyce of Aloes is prepared, but that I may enforme you thoroughly how to doe it, the time is chiefely to be regarded, that is, while the leaves are young, or before they grow hard and stalketie upon the stalkes when they are old: for both leaves, stalkes, and young heads being broken off will yeeld that red or bloody juyce. The *Atractylis* is in some copies of Dioscorides the *Matthiolus* the weede, called *Cnicus sylvestris*, and derived from *Cnecos*, *id est Pungo*, whereupon Dioscorides calleth it *Pungitorius*, the dried stalke whereof, as Dioscorides saith, the women in ancient times used in stead of a Rocke or Distaffe, yet *Columna* thinketh it tooke the name from the head, which being floured, as it were, with hoary downe, the rest of the stalke underneath being bare resembleth a Rocke or Distaffe with wooll upon it, and thereupon some called it also *Colus rustica*, howsoever *Matthiolus* thinketh, that the diversitie of the names should certainely demonstrate two severall plants, but you see they are indifferently used, and so called of ancient Authors themselves, viz., either for a Rocke or Distaffe, or for a Spindle. The first here following, called by *Clusius Cnicus alter*, because, as he saith, it is so like the first *Cnicus* called *sativus*, and from him *Cnicus* by *Lobel*, *Lugdunensis* and others doe so call it, or *Cnicus carnleus*: the second and third is called *Atractylis* or *purpurea* by many Authors, but *Matthiolus* in striving to shew a *Cnicus sylvestris* differing from *Atractylis*, hath my opinion cited much for as I said before, the most judicious of our times can finde no other *Cnicus sylvestris*, but the *Atractylis* which he doth not so acknowledge, but maketh the *Atractylis* of *Matthiolus* (which *Cordus*, *Durantes*, *Lecuse*, *Lugdunensis* and *Gerard* do follow, exhibiting the same figure of his, which is acknowledged *Carduus tertius* (or as I take one) to be the true *Atractylis*, which *Matthiolus* into little did not be known, because, as he said, it wanted the true properties of *Atractylis* to yeeld a bloody juyce, and more yet comes in the *Carthamus sylvestris* of *Clusius*, with the *Carduus vulgatissimus viarum* of *Lobel*, and his *Carduus latifolius vulgaris*, and maketh the *Acarna* of *Lugdunensis*, and the *Scolymus Plinij* of *Dodonæus* to be the same with those of *Tragus*, *Fuchsius*, *Cordus*, *Gesner* and others, which he would rather call *Cnicus sylvestris flosculis purpureis*, as also making the *Atractylis* of *Columna*, to be a differing herbe from that of those former Authors, whose his description and notes thereof shew it to be the same and no other. *Bauhinus* against maketh the *Cnicus purpureus* of *Anguillara* and *Lugdunensis* to be the same *Atractylis flore purpureo* of *Lobel*, *Dodonæus*, and *Lugdunensis*, when as they plainely distinguish them; and lastly, he maketh the *Chalcithrion* of *Dioscorides* (as I said in the first Edition he wrote to *Clusius*) to be a differing plant from *Atractylis vulgaris*, when as *Clusius* himselfe and that saw it growing with him that it was like the ordinary *Atractylis*. It may be called in *English*, either wild bastard Saffron, as referring it to *Cnicus* or Distaffe Thistle unto the *Atractylis*.

The Vertues.

The *Atractylis*, as *Galen* saith, is of a drying facultie, and moderately digesting. *Dioscorides* saith that the seed doth take away the stinging of the Scorpion for so long as it is held by them, but that the patient returns as soone as they lay it by. *Pliny* saith that it helpeth greatly against the venome of all creatures, as also against the harme that commeth by eating Mushromes: I finde no properties expressed of the other herb here called *Cnicus*. The properties of the *Spanish* Saffron or gardenballard Saffron called *Cnicus*, is briefely set downe in my former booke, but because I was there in more haste than was convenient or expected, I thinke good to set downe the vertues thereof in this place somewhat more amply. *Galen* saith little of it, the seede onely, saith he, is used onely for purgations, and is hot in the third degree being outwardly applied: but *Actius* speaketh more largely thereof in this manner: it is hot in the first degree and dry in the second, the pulpe or kernell of the seede is chiefely used, yet the flower is not unprofitable, which being taken inwardly purgeth flegme and water by vomit, and is doth it also being used in a glister, which therefore is profitable against those diseases are bred thereof, as also for the collicke and the like: it cleanseth the stomacke and lungs of tough flegme sticking therein, expressly being made into an Electuary or Lohoc, with the oyle drawne from the seede, which also maketh the voyce cleare that was hoarse, as also encreaseth the sperme, if he much used, but it is of evill nourishment, very horrid to the stomacke, procureth loathing and trouble thereunto, he therefore adviseth to use Romane kall in lieu of it, *Ambrosy*, and the tangs or *Mallowes* if necessitie so require, or of those that are more forcible, that is, *Carduus benedictus*, Ginger, and the like, which quicken his operation, and preserve the inward parts from harme: the flowers thereof steeped in sweete wine helpeth the jaundise, for it cleanseth and openeth, yet in a meaner degree than the milke thistle (which I understand to be the Tithymales) the Lohoc that *Actius* so much commendeth against the disease of the chest and lungs is made in this manner. Take three drammes of the inner kernells of the seede of *Cnicus Carthamus*, one dramme of Almonds, and halfe a dramme of Pinenapple kernells, these to be made into one Lohoc or Quary with honey, wherein the dried scales of Scylla have beene boyled is admirable good for the said purpose. This note is given also of the seedes hereof, that those that come out of the *Levant* countries are more powerfull in purging, and more powerfull in operation than those of these neerer parts.

Chap. IIII.

Acarna. The Fish Thistle.

BEcause this Thistle is said to be *so* like unto the *Atractylis* and *Cnicus* that it might seeme to be one onely differing in the colour of the leafe and juyce, I thinke it not amisse to joyne it next unto them, because the ancient Writers thereof, which are *Theophrastus* and *Pliny* have spoken very little of the description thereof, or rather have given none at all, or but by comparison, the moderne Authors have referred divers Thistles thereunto as every one opinioned them, of all which it is my purpose to speak in this Chapter, and withall to shew you which of them is held to come nearest unto that of the ancient

Acarna

4. *Acarna flore luteo patulo.* The fifth Thistle with a broad yellow flower.

This Thistle hath many leaves lying in a compasse upon the ground, smaller, narrower, harder and more prickly then either *Cnicus* or *Atractylis* of a yellowish greene colour on the upper side and grayish underneath, the prickles are small and yellow, and when the stalke being one or more riseth up are set thereon on all sides in the middle without order, where it brancheth forth into two or three parts bearing small prickly heads, from whence come forth the flowers composed of many small leaves of a yellow colour standing as a pale or border about a long yellow thrum, in forme of an After or Starre-wort, which when they are past the seede being small and grayish is found wrapped in downe: the roote is about a foote long of a fingers thickenesse, and of a wrinkish tough pith divers fibres growing thereat, smelling sweet and yelding also a white milke sweet in taste and viscous, hardly quickly growing thicke.

5. *Acarna flore purpureo rubente patulo.* The fifth Thistle with broad reddish flowers.

The small Thistle hath shorter and broader leaves then the former denied or cut in on the edges, and set with long sharpe prickes greene on the upper side and grayish underneath: the stalke riseth nothing so high as the former, bearing smaller leaves thereon but not lesse prickly and sucky like heads and flowers at the toppes as in the other, but that the pale or border of leaves are not yellow but reddish set about a middle yellow downe or.

3. *Acarna altera Apula.* The Neapolitane Fifth Thistle.

The Neapolitane Thistles lowest leaves are spread on the ground somewhat like unto the *Atractylis* or diffused Thistle, but broader and set with more and sharper prickes, from the middle of whom rise up divers somewhat reddish stalkes about a cubit high, having such like leaves set thereon which yeeld a white milke like the last, and bearing at the tops (not severall heads like the last but) a tuft or umbell of many small prickly heads set together, some what like unto the toppes of the blacke Chamæleon Thistle, and out of them rise small leaves as beards of a deepe yellow colour set about a middle thrum, of a paler yellow colour, the milkie juice that thus giveth becommeth condensate and made thicke is like unto Gum.

6. *Acarna globosis capitulis.* Round headed fifth Thistle.

This Cluse Thistle is a small plant about a foot high shooting forth from the head of the roote which is long and hath many leaves some of an inch or more, or two inches long, and a scarce halfe an inch broad, much cut in on the edges and thicke set with prickes growing round about the stalke without order, at the toppe whereof is set a round head, nerved as it were all over, and compacted of many very small and narrow leaves, armed on both sides with long sharpe prickes, out of whose middle starreth forth a small yellow flower, from the toppe of which stalke ariseth forth sometimes two other stalkes bearing each of them a round head like the other but lesser: the whole beauty of the plant consisteth in these young heads formed like a nut.

5. *Acarna bimaculis scabris foliosis.* The low fifth Thistle with winged stalkes.

The stalke of this low thistle is winged from the bottome to the toppe that is having a jagged prickly slime set on both sides thereof, and long narrow jagged prickly leaves two set at a joynt, from whence it brancheth forth divers plants unto the toppes, and bearing thereon shining yellow flowers like those of *Cnicus* or *Atractylis*, ye-

1. *Acarna flore luteo patulo.*
The fifth Thistle with a broad yellow flower.

2. *Acarna altera Apula.*

Original from UNIVERSITY OF MICHIGAN

the rest of long prickly heads, with such like leaves under them: the seede that followeth is small and blackish, like unto the *Acarna* or bastard Saffron: the roote also is not much unlike it perishing every yeare.

6. *Acarna major foliosa caule.* *Clusius* his Chamæleon Thistle of *Salamanca*.

The stalke of this Thistle likewise is winged like the last but not with so large a filme nor so much jagged, from whence shoot forth branches on all sides with longer and narrower leaves thereon, somewhat hoary and not so deeply jagged, but set with long & sharpe prickles, at the tops of the branches stand many such like sharpe prickly heads from among which rise five or six small prickly heades as it were in a ruft set together, out of which come pale yellow flowers consisting of threads, in which after they are past lye the seede wrapped in downe, in forme like unto the *Cnicus* or bastard Saffron but smaller and of a blackish gray colour.

7. *Acarna major caule non foliosa.* The supposed true *Acarna* of *Theophrastus*.

The true *Acarna* of *Theophrastus* as it is supposed by divers, hath sundry leaves lying on the ground in a compasse, which decay to wither as soone as they rise up with the stalke, being sometimes but one, and sometimes more, reddish and covered with downe, the leaves that are set thereon without order are long and narrow, and deeply cornered, hoary or white underneath, thicke set with short prickes very like unto the upper leaves of *Atractylis* or Cardus Thistle, whose toppes are set with such like leaves also, and very pale yellow flowers made of threads, rising out of the midst of small prickly heads, after which come small slender seede of the fashion of *Cnicus*: the roote is small short and white, with divers fibres thereat.

8. *Acarna minor caule non foliosa sive Leo & Cardunculus ferox.* The cruell sharpe Thistles.

This cruell prickly Thistle that is almost wholly composed of sharp prickes, groweth little above an hand breadth high, whose leaves are long and narrow, thicke set with most cruell sharpe prickes on all sides, at the toppes stand the flowering flowers in sharpe prickly heads, so strongly armed that the most cautelous cannot touch it without being pricked: the roote is long and stringie.

The Place.

The first groweth in *Spaine* as *Clusius* saith: the second and third in the kingdome of *Naples*: the fourth in Italy from whence *Gerlandus Reel* brought it, & shewed it us as well as *Clusius* who doth remember both him & it in the 66. page of his *Curæ Posteriores*: the fift *Lobel* saith groweth in the countrey of *Crau* among those of Arles in the Province of *France*: the sixt as *Clusius* saith about *Salamanca* in *Spaine*: the seventh on the beach ground among the *Sequanis* as *Lobel* saith, and the last on the *Appennine* hills and in some places of *Italy*.

The Time.

Some of these Thistles flower very late with us so that there is seldome ripe seede to be gathered from them, they flower and seede in *July* and *August*.

The Names.

They are called in Greeke ἄκαρνα and ἄκορνα and so likewise *Acarna* and *Acorna* in Latine, reckoned by *Theophrastus* and *Dioscorides* to be a kinde of *Cnicus* or *Atractylis* because it is so like that it might be said to be the same but that the one is whiter and this more browne or yellow, and that it giveth not a bloody juice which is proper unto *Atractylis*. The first here set downe is thought to be *Eryngium Arcticum* which hath the leafe of *Atractylis* and the yellow flower of *Euchinolmum*, with *Clusius* and *Dodonæus* it is *Carlina sylvestris minor*, with *Lobel* it is *Cardunculus Sequanorum Cirsij Carlinæ varietas*, with *Lugdunensis Acarna spinosa Carlina sylvestris minor*, and with *Bauhinus Acarna flore luteo petalo*: the second is called by *Columna Acanthoides parva Apula*, and by *Bauhinus Acarna flore purpureo rubente petalo*: the third is called by *Columna Acarna altera Apula*, and by *Bauhinus Acarna spinosis luteis in umbella*: the fourth *Clusius* setteth forth in the 66. page of his *Curæ posteriores*, by the name of *Carlina aliud genus*, but called by *Bauhinus Acarna capitulis globosis*: the fift is called by *Lobel Picnocomos Acanthi folio spinosissimo*, by *Lugdunensis* it is called in his Chapter of *Atractylis*, *Atractylis marina Tragacantha Plini*, but in the Chapter of *Chamæleon* he giveth another figure with the same title of *Picnocomos Creticus Lobelij*, accounting it diverse to be a kinde of *Chamæleon niger* as *Lobel* and *Pena* themselves say it may best be referred unto: yet *Bauhinus* maketh thereof no mention among the *Chamæleons* but in the *Scalygeris Theophrasti Tabernæmontanus* and *Gerard Chamæleon niger*, and by *Bauhinus Acarna humilis caule foliosa*: the first *Chamæleon niger Ruellij* or *Carlina*, *Dodonæus* and *Gerard* who follow him, by *Tabernæmontanus Chamæleon*, and by *Bauhinus Acarna major caule foliosa*: the seventh or *Acarna Theophrasti* of *Dodonæus*, *Lugdunensis* and *Tabernæmontanus*, called *Cirsium luteum Sequanorum* as *Pena* saith, and *Gesnerus* of Germany, and is the most likely to be the true *Acarna* of *Theophrastus* and *Pliny*, as by all these mens judgements it appeareth, and called by *Bauhinus Acarna major caule non foliosa*: the last is called by *Dodonæus Leo Cardunculus* and by *Lobel Picnos Leo*, *Carduus ferox*, and by *Bauhinus Acarna minor caule non foliosa*.

The Vertues.

The vertues of these either of the one or of the other are not set downe by any that have made experience thereof, but are to be sought for among those of *Atractylis*, to whom they are in qualities also, unto it therefore it may be referred till more certaine proofe hath beene declared of them.

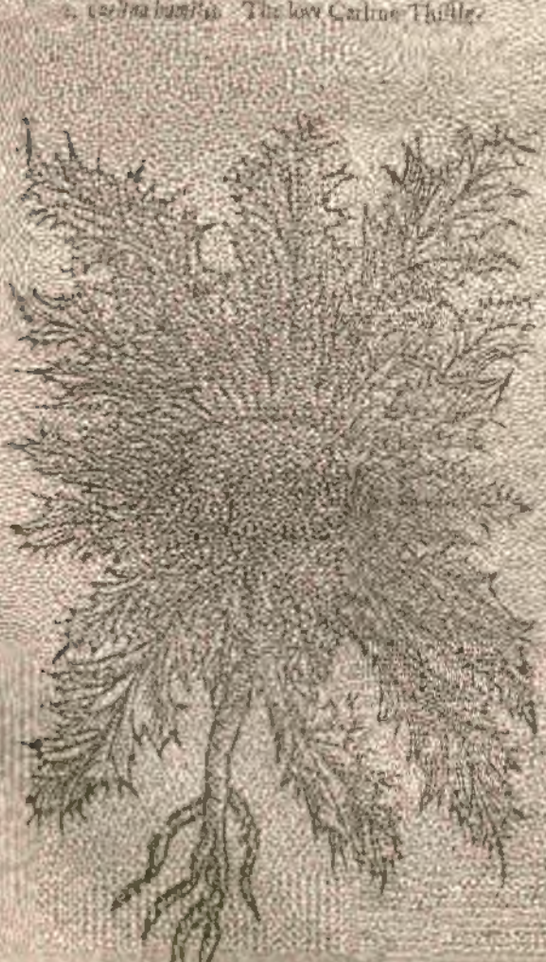
Chap. V.

Chamæleon & Carlina. The Camæleon or changeable Thistle, and the Carline Thistle.

The Chamæleon Thistle is divided by the ancient writers into white and blacke, both which I intend to shew in this ensuing Chapter but the true knowledge of them and their right distinctions hath troubled many as also whether the Carline Thistle be a different plant from the white Chamæleon Thistle.

Chamæleon albus verus sine caule. The true Chamæleon or changeable Thistle without a stalke.

The true Chamæleon or changeable Thistle without a stalke (which differeth from the Carline Thistle without stalke as you shall heare by and by) hath sundry large leaves lying on the ground a foote long or more cut in on the sides more prickly then the Carline Thistle, whose cuts or divisions are more like unto those of the Artichoke



Artichokes being white and somewhat hoary and sometimes greene, and reddish when they grow old, whose ... Thistle-like flowers ... such as is the cause of the name, which make many to believe they were ... and ... hairy underneath among these leaves ariseth a round hoary prickly head ... bigness of a great Thistle head in which the flower is contained, and is not compound of ... a middle thrumme as the Carline Thistle hath, but out of the head ... divers flowers made of three ... ring in five parts or points in the same manner as is to bee seene in the flowers of the ... mallow like, but not of such a purplish colour, but rather of a pale reddish colour which ... in the head small long and grayish hoary leaves lying as it were in the form of every ... Thistles, but are not thicke and round or cornered as ... thistle and such like ... leafe are, which when they are ripe the head openeth it selfe as other Thistles doe, and ... downe are carried away with the winde: the roote is ... thicke and ... outside and white within, yeelding plentie of milke if it be never so little broken or cut, which ... thicke and viscous ... hardeneth quickly and falleth into small droppes or ... of a strong but ... unpleasant, and quickly ... the ... whole ... is ... and fit to be eaten ... about the ... ly heads ... of ... sometimes ... and in some places ... a certaine ... of ... like ... which ... is soft and ... and being ... is harder ... to the milkie ... of the roote.

1. *Carlina humilis steuli.* The low Carline Thistle.

The low Carline Thistle (which is usually accounted for the white Chamæleon Thistle) hath many large leaves lying on the ground cut in on both sides, and set with sharpe prickles, but not so ... sharpe as the former or true white Chamæleon Thistle, among which riseth a large head ... with ... parted about with divers long and narrow leaves, cut in on the edges and as prickly as the ... which ... of a ... purple ... underneath, set about with leaves like a crowne or border as in the ... many other the like flowers, which leaves are thinne ... somewhat long ... and ... the ... middle thrumme ... and made of many small and thicke yellow flowers like threads ... in some places a kind of viscous ... with gum ... from the roote ... also about the Thistle head when the ... ned resembleth white Mallow very notably: the head before it ... with ... day ... ...

3. *Carlina subacaulon.* The Carline Thistle with a ... stalke.

This Carline Thistle never ... wreth low like the last, but ... with a reddish ... stalke ... on narrower greener and more prickly leaves then the ... kinde, the heads of ... are many, every one standing on his owne ... stalke, compoſed of a border of white ... smooth and whitish like the former, whose middle thrumme is yellow: ... open but then are of a reddish purple colour, which thing ... one ... beside it well ... plants: the roote is ... broken ... yeeldeth such like ... white viscous milke, and ... to a gumme as ...

Thistle hath leaves like Sengreen, but smaller, and more deeply cut in, and set with sharper prickles, and of a more whitish green colour, and lying flat upon the ground, but without stalks.

1. *Carlina acaulis sempervirens.* Our low wilde Carline Thistle.

Thistle with many very long and narrow leaves very much cut in, set with sharp prickles, and of a whitish green colour, lying flat upon the ground, but without stalks.

1. *Carlina acaulis sempervirens.*
Our low wilde Carline Thistle.

2. *Carlina sylvestris major.*
The greater Carline Thistle.

3. *Carduus Pinea folio, Tragi.*
The Pine apple Thistle.

Carduus Pineæ sapore.
The head of the Pine apple Thistle.

on from it, among which at the later end of Sommer commeth forth a stout stalke foure foote two inches long, having thereon a large round scaly and prickly head with many bright purplish threads rising out of the middle, which abide in their colour a long time, and being past among the downe in the head lye many small white coloured seede, somewhat like unto the tuft Chamæleon Thistle but shorter and smaller; the roote is great and blackish on the outside and whitish within enduring many yeares.

5. *Carlina Sylvestris major.*

The great wilde Carline Thistle.

This wilde Carline Thistle hath sundry slender round hairy prickly stalkes rising from a small long roote bearing divers narrow long leaves thereon very prickly and somewhat like unto the former Carline Thistle, but lesser, and at the tops of each a flower, whose bordering leaves are yellow and the thrumme reddish.

6. *Carlina pinea sive Pinus Theophrasti.*

The Pine Thistle.

This brave Thistle hath a long thicke blackish yellow roote, of the thickenesse of ones thumbe, growing smaller downe to the end, but white within, smelling sweete and tasting hot, somewhat like the Carline Thistle, but of a weaker and pleasanter smell: the many leaves that rise from thence are long and of a fingers breadth, with a middle rib therein, somewhat like to the leaves of Cyperus, but harder whiter and broader, without either dents, notches or prickles, in the middle of which leaves lyeth hid a prickley head, armed fully with long prickes or thornes in manner of stroles, which growing ripe hath within it a hard white thickie substance, wherein as also from among the thornes without on the head, issueth forth a yellowish sweet gumme much like unto Mastick of a hot taste. *Alpinus* saith that hath *Dillo* and *Bellonius* & *Dalechampius* likewise took this thistle to be *Chamæleo albus*, but unruly, for *Theophrastus* maketh mention of *Chamæleo albus* in another place; but saith *Alpinus Chamæleo albus* differeth not from *Chamæleo niger* but onely in the colour of the leafe & therefore (saith he) I doubt not to affirme that the *Carlina* having blacker leaves then *Chamæleo albus* which hath white leaves is the *Chamæleo niger*, but *Theophrastus* putteth not any such difference in the leaves to be blacker or whiter, for that hee referreth to the rootes, and the leaves of the white *Chamæleon* to bee greater and the blacke smaller then roote of *Bellonius*, and such distinction in the leaves *Dioscorides* also maketh, but in shewing their differences more amply then *Theophrastus* doth: that the white Chamæleon hath no stalke, and the blacke a stalke of a cubite height, the white hath purplish flowers and the blacke variable coloured flowers and like a Jacinth, which by *Alpinus* his leave are not to be seene in *Carlina*.

7. *Chamæleon niger verus.* The true blacke Chamæleon Thistle.

The true blacke Chamæleon Thistle hath many long leaves lying about the roote, much deeper and more prickly then the white Chamæleon Thistle, much cut in alio on the edges into many fine peces or pegges, which also like that grow up among them are sometimes greene, and sometimes whitish, and sometimes reddish, and brancheth forth on all sides, and in each of the toppes of them many small prickly heades in a like reception like unto scaly, out of which come divers small long blew flowers, ending in five and sometimes in six sharpe pointed points or eares, somewhat like unto those of the Cornish Jacinth, with five or six white threads in the middle of them: the stalke groweth great and the head at the head ending in many great long thornes, and is of a whitish colour on the outside and pale yellow within of a most sharpe taste as the leaves are also, possessing, stinging, nipping, and almost exulcerating the skinne if the face or other tender part be touched therewith, the hands that have handled it doe smell the like as *Bellonius* hath observed.

The Place.

The first is not so frequently found in the Westerne or Transalpine countries as the second which is often found upon the hills and mountaines in many places of *Germany*, and the *Alpes*, where it is generally more plentifull then the Chamæleon Thistle, though called the Carline Thistle, but the true Chamæleon Thistle is more common in *Italy*, *Greece*, and those parts where the Carline is more rare, the third is oftentimes to bee found in the same places the second and oftentimes by it selfe and in other countries also: and this wee have observed also that many seede of the low kind sowen in our Gardens sometimes it hath growen high and not abiden low the first yeare: it groweth in our countries, especially in *Kent* every where almost, as the former are in others, and is also found in *Germany* and *France*, especially the more Northerly parts: the first also many times with us but the last rare: the warmer countries: the last is found but in *Greece* and *Asia* and those hotter countries.

The Time.

All the three flower but in the yeare with us, but in Sommer in their naturall places, but the Carline Thistle will well abide the colds of our climate, although the white Chamæleon will hardly, but the blacke and true Thistle seldome doe both.

The Names.

The Chamæleon Thistles both the white and the blacke are called in Greeke [illegible] and Latine *Chamæleon* or *Chamæleo albus & niger* (*Gaza* translateth them both *Terentinus*) and so called from [illegible]

appearance of the leaves. *Dioscorides* saith it of the white, but *Pliny* both of the white and blacke, the Carline thistle is called in Latine *Carlina quasi Carolina*, for it is supposed that the great Emperour called *Charlemaine* and *Carolus Magnus* had it shewed him in his sleepe by an Angel, with the roote whereof he might cure his Army infected with the Plague: it is thought as I said of many to be the *Chamæleo albus*, but of others observing the differences, it is thought not to be knowne to the ancient writers. *Lugdunensis* striveth with many words, and by altering and corrupting the Greeke text of *Dioscorides* to prove them both one plant, yet lastly hee saith that many skilfull Herbalists did call *Carlina Ixine Theophrasti*; and so doth *Fabius Columna* indeede judge, and that the *Ixine spina Theophrasti* (mistermed *Helxine* by *Plinie*) which *Gaza* translateth *Cardunus pinea* & *Ixia* also, better doth agree with *Carlina* then with the *Chamæleon albus* of *Dioscorides*: and that because as it is likely hee never saw the true *Ixine* of *Theophrastus*, which is a much differing plant: but *Dioscorides* saith the white Chamæleon Thistle was called *Ixia* by some in his time, because in some places there grew about the roote a kinde of birdlime, which they wonted in stead of Mallicke, and *Pliny* saith the *Cretanes* especially tooke a little thereof after supper, to keepe them waking in working in the night, but being a by name I thinke it also a false name, for *Ixia* is taken for a deadly poyson by *Dioscorides* himselfe, who sheweth it with the remedies thereof, in his 1xt booke and 1. Chapter, and the roote of the white Chamæleon is said by *Dioscorides* to be an *Alexipharmacum* or counterpoison, so that it or any thing growing from it can no wayes be accounted deadly or dangerous: but that clammie gum or birdlime (call it what you will) indeede that groweth at the roote of the blacke Chamæleon is truly called *Ixia* and *Viophonon*, that is, the corruption or corrupter of the blood, and *Pliny* in his 22. Booke and 18. Chapter doth say that the roote of the blacke Chamæleon was called *Viophonon* and *Cynoxylon* (misliking *Dioscorides* this *Cynoxylon*) and as it is set downe in the divers appellations of herbes attributed to *Dioscorides*, the blacke Chamæleon also is called *Viophonon* by some, and *Ixia* by others, and *Cynoxylon*. Some also have affirmed as *Matthiolus* doth shewe within his comments upon the *Ixia* of *Dioscorides*, that *Ixia* should be the *Ixine* of *Theophrastus* whom he confuteth effectually, shewing that *Theophrastus* in describing *Ixine* doth not declare any evill quality therein, but rather the contrary, he saith that it yeeldeth a *Lacryma* or Gum that is of a good taste, and called *Acanthine* or *Spinalis Mastiche* because it was in like Mallicke, and grew on a Thorne or Thistle, and although *M. Matthiolus* saith, he had neither any Gum about the roote of *Ixine* (which hee mistooke for the white Chamæleon both in that and in other places, *viz. Italy*, yet saith that such was sent him both from *Cornelius* of *Padua* and *Calceolarius* from *Verona*, and that he understood by a *Candiot* Herbarist, that the Fletchers in *Candy* did use the said Gum to glew their feathers to Arrowes as others doe with Glew: *Matthiolus* setteth forth the *Carlina caulescens* (as it is thought by the best) to bee the true *Chamæleon niger* of *Dioscorides* and *Theophrastus*, although himselfe findeth fault therein, and likewise impugneth that which *Marranta* sent him from *Naples*, as not answering the description thereof, which is now received by the most judicious to bee the indubitate blacke Chamæleon. *Columna* likewise doth thinke in the discourse of *Chamæleo albus* and *niger* that *Ixia* (and not *Ixine*) was a small low plant more agreeing with the blacke then the white Chamæleon, especially seeing that *Dioscorides* in the end of his Preface to his first booke numbreth *Ixia* as well as Chamæleon among the roots that are venemous. The first set downe is his *Cnicus alcyone Apulus purpureo flore gummifer* of *Columna* differing from the usuall *Carlina* which is taken by many to be *Chamæleon albus* as is evident the by description: it is also the *Chamæleon albus gummifer acanthii folens* of *Bauhinus Pollus*, expressed in his first Epistle to *Clusius*: but *Bauhinus* calleth it *Carlina acaulis gummifera*, whereof I much marvaile that he should continue that opinion of *Chamæleo albus* and *Carlina* to be but one plant, knowing that *Columna* hath shewed them plainely in his booke to be different, although that *Carlina* as well as *Chamæleo albus* giveth a like gum also: and that *Theophrastus* his *Ixine* hath such like wise which *Columna* as is said being deceived thought to be *Carlina*: the second is the *Carlina humilis* of *Columna*, taken by him for the *Ixine* of *Theophrastus* as *Anguillara* did before him) and *Dodonæus*, and called by *Lobel Carlina herbariorum* (but thought by him & *Clusius* to be the *Chamæleon albus* of *Dioscorides* as *Guilandinus* in *Papiro* did thinke before) by *Matthiolus Cordus* and *Lugdunensis*, by *Cæsalpinus Carlina vulgo*, and by *Gesner in horto Cordopatium caule nullo*, by *Ardoin Cordus Cardunculus pumilus sen parvus*, by *Camerarius Carlina sessili flore*, by *Dodonæus* in former times *Spina Arabica*, and by the Monkes that commented upon *Mesues Antidotaries* of *Dioscorides*, and by *Lobel Carlina acaulis magno flore*: the third is the *Carlina caulescens* of *Columna* and *Camerarius* both in *horto* and *Pannonia* by *Dodonæus Carlina sive Leucacantha*, by *Cæsalpinus Carlina alterum genus*, by *Clusius Carlina minor* (not that by *Lugdunensis Carlina caulem habens*, and taketh it also to be *Crocodilion*, by *Gesner in horto Cordopatium caule alio caulem habens*, and called by *Lobel Chamæleo albus caulescens*, but *Chamæleo niger* by *Lacuna*, *Dodonæus* and *Lugdunensis*, *Chamæleon niger vulgaris* by *Tragus* and *Besler* that set forth the *Hortus Eystettensis*, *Chamæleon* as *Kentmannus* saith in his *Matthiolus Ebermontz* that is, *Apteradix* (and from hence came the name *Carduus mariæ*) and *Cardopatium*, but in his *Pinax* he referreth this name of *Brunfelsius* unto the *Carlina acaulis*, *Chamæleon* as seemeth the *Germanici* call both sorts *Ebermutz*, he himselfe calling it in his *Pinax Carlina caulescens*, and in his *Catalogus*, *Carlina caule donatior*: the fourth is called *Chamæleon albus pumilus* by *Lugdunensis*, and *Lacuna*, and *parvus* by *Lonicerus*, by *Columna Chamæleon Septentrionalium vulgaris appellatione*, by *Lobel Cardunculus acaulis Septentrionalium*, by *Clusius Carlina minor purpureo flore*, who saith that some thinke it does not farre unlike unto the Chamæleon of *Theophrastus* in his first Booke and third Chapter, *Carlina acaulis minor purpureo flore*: the fift is the *Carlina sylvestris vulgaris*, the first sort of *Dodonæus*, and the *Acarna vel Cirsium luteum Sequanorum* of *Lobel*, &c. the fixt is set forth by *Lobel* in his Booke *Stirpium icones*, and called also by him as *Gesner* did *Cardum Pinea*, but is not, although some-what like to the latter called *pumilo Narbon* of *Lobel*: the last is called *Chamæleon niger Dioscoridis* by *Anguillara*, *Camerarius*, *Lobel* and *Columna*, and *Chamæleon niger alter* by *Matthiolus*, *Chamæleon niger* by *Lugdunensis*, but thought to be *Crocodilion* by *Tabermontanus*, and called by *Bauhinus Chamæleon flore cyanoides hyacinthino*. The *Italians* call the white and blacke Chamæleon Thistle *Cardo asinino*, and the white more usually *Carlina*, the *Spaniards* call both sorts *Cardo pinto*, the *French* the white *Carline* and *Chameleon blanc*, but the blacke *Chardousette*; the *Germanes* as is said before call all *Carduus*, as the *Dutch* doe *Ebermutzle*, and wee in *English* Chamæleon Thistle or Changeable Thistle, the blacke or as they are set downe in their title, and the rest accordingly.

The Vertues.

The roote of the white *Chameleon* Thistle, saith *Dioscorides*, taken to the quantitie of a spoonefull in redde wine, wherein *Origanum* hath beene boyled killeth the broad wormes in the belly: a drammie thereof taken in wine helpeth dropsie persons, for it extenuates their belly: the decoction thereof is profitable for them that cannot make water orderly; *Theophrastus* and *Pliny* from him saith, that the roote hereof cut into peeces & long vp on threds to dry, & afterwards boyled in brouth, or otherwise taken doth help the defluxions of the vuine that fall from the head to the eyes, teeth, nose, or lungs. If any saith he, would trie whether a sicke person should die or live, it is but to take and endure three times washing with the decoction of the roote he shall not die: it is as a Treacle or antidote against poison being drunke in wine, and from hence it is supposed that the *Carline* Thistle roote was singularly vsed against the plague in the Emperour *Charles* his army (although it be suggested to be declared by an Angell, which was an Allegory or allusion to the good Angell from due observation and practise, which hath since found it very effectuall both to resist the infection, as also very powerfull against the biting of a mad dogge, or the sting of serpents, and yet *Dioscorides* saith, the roote of *Chameleon albus* given to dogs, swine, or mules, killeth them, which propertie is also found in divers other things, as on the contrary side divers creatures do feede on that which are poysonous to men. The blacke *Chameleon* Thistle is said by *Dioscorides* to cure the itch, the roote being drawen and mixed with *Axungia* and so vsed, and being boyled in vinegar and some brimstone put to it killeth nits and ringwormes: it cleanseth the face and skinne from all blemishes, deformities, and discolouring being vsed with some brimstone: it is put with other things that doe digest and mollifie, and also with those that corrode and eare the flesh, and therefore is vsed to helpe foule sores, and stincking vlcers: hereby you see he doth not appoint it to be vsed inwardly for any disease, by reason of the virulent qualitie therein, but onely alloweth of the decoction thereof to gargle the teeth in the extreme paines of them; or by the roote bruised and boyled in vinegar to loose the tooth-ach and to breake them if they be touched therewith. Of our wilde Carline Thistle I have not read or heard of any that have made any experiment, although I am perswaded that it commeth neere to the vertues of the low Carline Thistle, that is so much commended, as you heard before: and of the gummes, either of the white *Chameleon* or Carline Thistle, there is no other speciall propertie set downe by any than is declared before, that as it is called Mastiche of the Thistle, so is it vsed as Mastiche to chew in the mouth, both to abate the evill savour of the breath, and by reason of the glewing qualitie to stay the tome, and to strengthen loose teeth: the juyce doth follow the propertie of the herbe or tree from whence it is taken: and although the gumme of white *Chameleon* be called *Ixia*, as *Dioscorides* saith, yet the *Ixia* that is poysonous is another thing quite & cleane from this, for neither *Dioscorides* nor *Theophrastus* doe attribute any venemous or evill qualitie thereunto: the qualities both of the white and blacke *Chameleon* *Galen in 8. simplicium med.* saith that in the roote of the blacke *Chameleon* Thistle, there is somewhat that is deadly, and therefore the vse thereof is outwardly for scabs, itch, tetters, &c. and to cleanse the skin: but the roote of the white *Chameleon* Thistle, besides that it killeth the broade wormes in the body or belly; it is given also to those that have a dropsie, and is somewhat like in the temperature vnto the blacke *Chameleon*, but that it is more bitter than the white. *Paulus* and *Actius* in their Treatise of poysons, after they have spoken of the poysons in both sorts of *Chameleon* Thistle, and of their cures, doe entreate the poysonous *Ixia* in the same manner that *Dioscorides* doth, wherefore we may conclude that *Ixia* hath a double interpretation, and doth as well signifie the harmelesse gummes of the white *Chameleon* and *Carline* Thistles as the poysonous gumme or roote which is deadly: but because we are not sure that it is taken from the blacke *Chameleon* Thistle, I thinke it needlesse here to set downe the cure of it.

Chap. VI.

Carlina Theophrasti, id est Scolymus Dioscoridis, & Scolymus Theophrasti qui Erysimum dicitur.

The prickly or wilde Artichocke Thistle, and the golden Thistle.

Of all the sorts of manured Artichockes, whether prickly like Thistles, or not being fit to be eaten, I have sufficiently spoken in my former Booke; and intend not further to speake of them at this time: but of some other kindes that are more prickly, and more like Thistles, whereof there are two or three sorts which shall be here expressed.

1. *Scolymus Dioscoridis.* The prickly or wilde Artichocke Thistle.

This prickly or wilde Artichock Thistle hath divers long thicke, hard, but narrow leaves, ending in long points somewhat cut in on the edges, set with strong and sharpe great prickes, which growing on the stalke keepe them at the bottome, and are of a darke greene colour: at the toppe of each stalke and braunch standeth one thicke and prickly head, fuller than those of the *Chardons* that are kept to be eaten, from the middle whereof put forth divers bright purple crimson threads, which after they have stood some time passe away, the heads or the heads being flat and like other Thistles: the roote is great and spreadeth much.

2. *Cynara sylvestris Cretica.* The Candy wilde Artichocke.

This wilde Artichocke from among the long and hoary white leaves somewhat broader than the former, set on the edges, and thicke armed with long & sharpe prickes, rise vp sundry round stalkes, set with the like leaves and branched into two or three parts some times, at the toppes bearing small scaly sharpe prickly heads, which are eaten by the Peasants of the country, both greene and boyled after the scales and sharpe prickes are taken off with salt, oyle, and pepper, and are as pleasant to their palate, as a dainty Artichoke: it groweth long, and groweth deepe.

3. *Scolymus Theophrasti sive Erysimum luteum Alonsellense.* The golden Thistle.

The golden Thistle shooteth forth divers stalkes & prickly stalkes, which in some places [illegible] sight, and in other countries, as *Alonsella*, and ours also, bendeth with them into the ground, [illegible] joynt both a braunch and a leafe, [illegible] long and somewhat narrow smaller at the bottome than [illegible] much cut in on the edges, as set with small white prickes in some places marked with white [illegible] deepe greene leaves, but in others & in my garden none at all: at the joyns betweene the leaves [illegible] and at the toppes also come forth severall small heads, smaller than any of the former, compos[ed] [illegible]

Original from UNIVERSITY OF MICHIGAN

1. *Scolymus Dioscoridis.*
The Prickly or wilde Artichoke Thistle.

2. *Cynara Sylvestris vulgaris.*
The Common wilde Artichoke.

3 *Scolymus Theophrasti sive Eryngium luteum Monspelliense.* The golden Thistle.

with very sharpe prickes at the ends, out of the middle whereof start forth many gold yellow threeds, which abide not long and wherein when they are pull, the seede is contained, being small and thinne scales lying close together: the roote is long of the bignesse of a finger, very sweete and pleasant to eate like unto *Eryngium* Sea Hollys both roote and leaves doe yeeld a white milke, especially when they are young, and perish every yeare.

The Place.

The first is found about *Monspelier* and the last in *Spaine*: the second is naturall of *Candy*.

The Time.

They doe all flower in the end of Summer, and their seede ripeneth quickly.

The Names

[illegible] called the first in Greek [illegible] *Scolymus*, which he confoundeth generally with *Cardunus* simply, and *Theophrastus* maketh the last also, yet there is great difference betweene them, for that of *Dioscorides* was knowne unto *Theophrastus*, and called a wilde Thistle (being the same that is called *wilde Artichoke*) and *Cynara* for it is written both waves by *Pliny*, and *Columella* and *Palladius* thinke tooke the name of the soyle wherein they delight to grow, but is not likely that they derived their names from Latine appellations, but rather the Latines from the Greekes, for so the ancient Poets and Orators doe declare, as *Sophocles*, *Hecataeus*, *Aristophanes* and others: and *Athenaeus* in his second booke and fifteenth of *Cynara Ipsea*, some Poets have therefore invented a fable of a faire maid called *Cynara*, metamorpholed into a flower, and some againe thinke it tooke the name from the hound, and that *Lacrus* a King asking counsell of *Apollo* touching [illegible] it was answered him that hee should there build a City where he should be bitten by a woodden Dog, whereupon walking hurt in the Legge by a wilde Artichoke,

where it grew did there build his City: but *Didymus* in *Athenæus* saith it was the *Cynarocephalon* Carduus, or Fryer bush, but the *Scolymus* of *Theophrastus* was not knowne unto *Dioscorides*. *Pliny* in his 21. booke 17. chapter doth both the kinds of *Scolymus* together, as if they were both one plant, giving the vertues of both promiscuously, and saith moreover that the *Scolymus* of the *Greekes* is called also by another name *Leuacum*, which is the *Leuacia* of *Theophrastus lib. 6. c. 12.* which *Gaza* very fitly translateth *Rapa sylvestris*, whereas *Theophrastus* reckoneth it among the Thistle-like plants, and is a differing Thistle from *Scolymus* set downe in the same place. *Matthiolus* calleth the first *Cynara sylvestris*, because as he saith it doth so nearely resemble the *Cynara sativa*, as also *Cynara sylvestris sive Chamæleontis Mesuæ Serapioni*, and *Lugdunensis Scolymus Dioscoridis*, his *Tertium genus sylvestre latifolium*: the second is called by *Hieronymus Bellus* (as it is set downe in his second Epistle to *Caspar Wecker*) *Cynara sylvestris*, the *Germans* as he saith calling it *Artischocken*, and by *Pona* in his *Italian Balsa Scolymus Cretica*, by *Tragus Cynara sylvestris Cretica*, and thinketh it may be the *Cynara sylvestris Bauhini* set downe in his *Cruce posteriori in quarto, fol. 66.* the last is called by *Clusius Scolymus Theophrasti*, wherein he giveth two figures, the one of the *Spanish* plant growing upright, the other of that which groweth at *Mompelier* leaning downewards, and called by him *Narbonensis*, whom *Dodonæus* following, giveth both his figures, calling the one *Cardui Chrysanthemi*, and the other *Cardui Chrysanthemi alterius non* and so doth *Lobelius* also saith it is the *Eryngium luteum Montpelientium* of *Cæsalpinus* and *Tabernæmontanus*, *Gerarde* called it *Eryngium Tragi*, and *Bellonius* saith it is called in *Candy Afrolymbrot*, and by the Latines *Chamæleon*, he saith, wherein I thinke he is deceived: *Bauhinus* calleth it *Scolymus Chrysanthemos*, and saith it is the *Cynara marina* of *Lugdunensis*, which as I said before in the Chapter of *Artichoke*, he saith with the *Thuscans* of *Latium* is *Pecu*, and yet as I shewed you in the Chapter of *Acarna* he maketh it an *Acarna* likewise, calling it *Acarna mas caule folioso*, but it cannot be both an *Acarna* and *Scolymus*, this double denomination of plants is not agreeable to *Dioscorides* minde, who is never found of himselfe to name one plant in two severall places, or one plant by two severall names, although he shew the divers appellations of others. *The Italians* as *Ruellius* saith doe *in agro Romano* call the last *Spina borda*, and thinketh it to be that plant which the ancients did call *Xerophœnix*, the *Spaniards* of *Salamanca* did call it *Sylibum*, but as he saith it cannot bee *Silibum* of *Theophrastus*, and in their owne Language *Cardon Iechal* or *Iechar*, id est, *Cardans lactans*, because of the white spots upon the leaves: the *French* call the last *Chardonnette*.

The Vertues.

Dioscorides saith that his *Scolymus* is good to expell strong and stinking Urine, and to amend the stinking savour of the Armeholes, or of the whole body, if the decoction of the rootes in wine be drunken: those shootes also are eaten like unto *Asparagus*, and the young heads also in *Spaine* before they flower: for they use to raise up the earth over the young shootes untill they bee risen to a good height, which then are not only white but more tender and delicate, to be eaten raw as their usuall manner is with Oyle, Pepper and Salt, or else boyled or stewed: the flowers are used by the *Italians* as *Lobel* and *Pena* say to curdle milke whereof they make Cheese, as also are perswaded that the said flowers given to women with child in their broths or drinke doe hinder aborsments, and cause them to goe out their full time in good plight, and also is very good for those that doe use to eate or are barren, and cause fertilitie. The *Cretanes* used their wilde Artichoke in the same manner that the *Italians*, *Spaniards* and *French* use their *Cardons* or Chardons. *Theophrastus* also saith that the roots of his *Scolymus* is most pleasant being boyled or eaten raw, but then chiefly when it is in flower, at which time the outer substance of the heads are eaten. *Clusius* saith that they of *Salamanca* use to eate the young plants rootes and all, being washed either raw or boyled with Salt, and that with the milkie juice thereof they use to curdle any milke, and with the flowers doe counterfeit saffron, for the likenesse as in other places they doe with the flowers of Ballard Saffron.

CHAP. VII.

Acanos Theophrasti. The ancients Thistle.

THis Thistle riseth up with a great thicke prickly stalke three or foure foote high, sending forth all sides from the very bottome, set at the joynts with somewhat large leaves, broad without, set in on the edges, and set with sharpe prickes at the points and corners: at the tops of the branches come forth severall fine tufts of Thistle-like heads, out of the middle whereof ariseth purple flowers, parted all many deepe purplish threads, after which come long whitish round and rough seeds of a dusky colour lying in downe: the roote is thicke with divers long strings at it.

The Place.

It groweth in *Candy* from whence the seede hath beene sent into divers other parts of Europe.

The Time.

It flowreth in the end of Sommer, that is, somewhat late as other sorts of Thistles that come at that season.

The Names.

It is called in Greeke *Ακανος*, which doth as well signifie a peculiar plant of it selfe, as also any Thistle here set downe as the head of any thistle, or any other Thistle-like head of any other plant: *Theophrastus* only (and *Pliny* from him) making mention both of this and that, for in his fifth Booke and seventh Chapter he nameth it among the *Acanthodes*, those plants that beare prickly leaves, but in his first booke and fift Chapter, some saith he, have prickly leaves as *Acanthus*, *Spina alba*, and *Spina nigra*, but not to be the head of a Thistle also (which *Dioscorides* calleth *Acanthus* from whence comes the name of *Acanthodes* as from *Acanos Acanaceus* signifying all Thistles or Thistle-like plants) in his ninth booke and sixteenth Chapter, where speaking of the Chamæleon Thistle he saith that, *Acanos Cyri regis habet hujus magnum Acanos genus, unde quidam Acanion dicebant*, and in his first booke and fourth Chapter he

Acanos Theophrasti.
The Thistle of the ancients.

The Virtues.

Because I finde any properties peculiar imparted to this Thistle by either ancient or moderne writer, and therefore what can be offered I must be silent as others are.

Chap. VIII.

Synonyma Cardui lactei. Our Ladies Thistle, or the flirp milkie Thistle.

Although formerly there hath beene but one sort have of knowne to Herbarists, yet of late by the diligent search and observation of some that have beene curious, there are some other sorts found which together must be handled in this Chapter.

1. *Carduus Mariæ vulgaris.* The common Ladies Thistle.

The common Ladies Thistle hath divers very large and broad leaves lying on the ground cut in and [illegible] somewhat hollowly on the edges, and of a white greene shining colour, wherein are many [illegible] white veines running all over, and set with many sharpe and white prickles all about, [illegible] are of a more [illegible] round and prickly stalkes, set full of the like leaves up to the toppe, [illegible] and every branch commeth forth a great prickly Thistle-like head, strongly armed with prickes [illegible] out of the middle of them: after they are past the seede groweth in the [illegible] of the soft white downe, which is somewhat harsh and shining, large and [illegible] spreading on the ground with many strings and small leaves folded to them, all the [illegible] and the whole supposed not to be without very good effect.

2. *Silybum maculatum.* Great Milke-Thistle of a yeare.

[illegible] this sort of Thistle hath a round stalke growing a yard high with somewhat large greene leaves, not unlike [illegible] but somewhat smaller, and smeared with white lines, somewhat cut in also on the edges, and set [illegible] with few or no branches, but beareth at the toppe and the upper joynts two or [illegible] heads, very like to the double purple threads or thrummes, and somewhat great browne seede [illegible] Carduus, the roote is long and perisheth as soone as it hath given seede.

3. *Silybum minus Italicum.* The small Spanish milke Thistle.

The [illegible] of this Thistle are somewhat broad and thinly cut in on the edges, of a pale greene colour, with [illegible] white lines and marks thereon lying foorthlike upon them, but those that presently rise up with [illegible] are somewhat longer and broader towards them below, where being narrow they compasse the stalke

and

1. *Cardui Mariæ vulgaris.*
The common Ladies Thistle.

2. *Silybum minus hortense.*
The small spanish milke Thistle.

and are more cut in on the edges and set with some small sharpe prickes, and marked with white lines at the ribs, the upper leaves being still more divided and lesser at the upper joynts, and at the tops come forth very small prickly heads with purplish threads breaking out of the middle, and after they are all come very small white seede lying in some downe, which by reason of a kind of fleate white Gum that issueth out of the head, sticketh so fast to the seede that they can very hardly be pulled in sunder, especially after they grow ripe and the Sunne hath dryed them: the roote is small and woodily and perishe every yeare.

The Place.

The first is frequent on every ditch banke in the fields every where: both the second and the last I received among divers other seedes that *Guillaume Boel* brought out of *Spaine*, and I believe the last may be the same, that *Camerar.* saith he picked out of *Epithymum*, and that *Rauwolfius* gave him brought out of *Syria*, because the seede being white in both and the leaves marked white doe demonstrate them to be both one.

The Time.

They flower and seede in *June*, *July* and *August* when other sorts of Thistles doe.

The Names.

This is generally supposed to be the *Carduus hortensis Silybum* of *Dioscorides*, but thereof he hath made so great a doubt in that it is hard to say which is the right indeede: for he saith onely thus, *Silybum* is a great Thistle which leaves are like unto the white Chamæleon: *Plinie* in a manner saith the same in effect for the description, but saith *Cilicia*, *Syria*, and *Phœnice* where it groweth it is hardly boyled tender, and that it hath many in Physicke, surely the white lines and markes in this Thistle is such an evident note and so remarkable, that I thinke could not be overpassed in silence by all the old writers if they had knowne it: and described it: some learned doe thinke that it more fitly agreeth with *Leucacantha* and *Spina alba*: *Lacuna*, *Matthiolus*, *Camerarius*, *Dodonæus*, *Parisiensis* and *Lugdunensis* take it to bee *Leucographis* in *Pliny*, *Brunfelsius* calleth it *Cardum altera sive hortensis*, *Ruellius* and *Lobel Cardopa Latinis*, some *Carduus argentatus* and *Cardus sanctæ Mariæ*, *Tragus*, *Gesner*, *Brunfelsius*, *Turner* and *Camerarius* call it *Cardus Mariæ*, *Cordus* on *Dioscorides* and *Tabernæmontanus* *Cardus Mariæ vulgaris*; *Dodonæus* *Cardopa Leucographis*, *Anguillara* and *Lobel Silybum*, *Columnæus* *Cardus Sylvestris* of *Theophrastus*, and *Acanthus Theophrasti*: but *Bauhinus* *Carduus albus maculis notatus vulgaris*: the second is not (as I hereof) author before now, but from the likenesse there of unto the former I have so called it as it is principall *Mariæ* *Carduus*. The last as I say I had out of *Spaine*, and to regard it doth so nearly in all things resemble *Cardum Latinum Syriacum* of *Camerarius*, I presume it is the same which *Bauhinus* referreth as a variety to *Carduus Ladeus* or *Hedypnois Arabum* of *Rauwolfius*, which *Bauhinus* saith came to him by the name of *Cretensium*, and calleth it *Carduus albis maculis notatus exoticus*; our wilde kinde is generally called in *Sanctæ Mariæ* in Latine, by the *Italians* *Cardo di Santa Maria*, by the *French* *Chardon nostre Dame*, by the *Spanish* *Cardo de Santa Maria* and *Frauwen distel*, by the *Dutch* *Onse Vrouwen distel*, and wee in *English* our Ladies Thistle or milkie Thistle.

The Vertues.

Our Ladies Thistle is thought to be as effectuall as *Cardunus benedictus* for all the purposes whereunto it is put, namely for Agues and for the infection of the Plague, both to prevent and cure it, as also to open the obstructions of the Liver and Spleene, and thereby is good against the Iaundies, and provoketh Vrine, breaketh and expelleth the stone, and is good for the Dropsie; some doe hold that the young stalkes peeled and distilled as the stalkes of the other Chardons and wilde Artichokes are, and eaten doe helpe to encrease milke in Nourses breasts: it is effectuall also for the paines in the sides, and many other inward paines and grippings: the seede is held as powerfull if not more for the purposes aforesaid and so is the distilled water also, and besides is often applied both inwardly to drinke and outwardly with clothes or sponges to the region of the Liver to coole the distemperature thereof, and also to the region of the heart against swownings and passions of it.

Chap. IX.

Cardunus Sphærocephalus sive Globosus. The Globe Thistle.

In my former Booke I have given you the knowledge of two or three sorts of Globe Thistles, that is of the greater and the lesser Globe Thistle, and of the Fryers Crowne Thistle which is accounted one of them, although the head be a little more flat at the toppe then the rest: there remaine some other sorts to be shewen to you in this Chapter.

1. *Cardunus Sphærocephalus acutus minor.* The smaller Globe Thistle with long prickles on the head.

This small Globe Thistle hath divers long and narrow leaves, so much cut in on both sides, that every jagge or peece with a leafe, so to make the whole leafe winged each part cut in alike, and the corners set with sharpe prickes growing on the whitish stalke up to the toppe, where stand divers round heads each upon a long foote stalke, compacted of bearded huskes in the same manner that the two sorts of Globe Thistles expressed in my former Booke doe, but that the ends are longer and sharper, out of which rise more blewish flowers than are in the lesser sort.

2. *Cardunus Sphærocephalus acutus major.* The great prickly Globe Thistle.

This other greater prickly Globe Thistle hath larger leaves and broader, somewhat like unto the former great Globe Thistle expressed in my sayd booke being nothing so much cut in on the edges, in all other things it is not unlike the former here set downe, but that the flowers out of these prickly heads are of a deeper blew colour.

3. *Cardunus Sphærocephalus minimus acutissimis fulgit.*
The smallest Globe Thistle with the most prickly leaves.

This small Thistle hath the smallest jagged leaves and most cut in of any of the rest, and most sharpely set with prickes on the edges: the stalke groweth lower then any of the other, and the round heads at the toppes smaller

1. *Cardunus Sphærocephalus acutus minor.*
The smaller globe Thistle with long prickes on the head.

2. *Cardunus Sphærocephalus acutus major.*
The greater prickly globe Thistle.

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

also, but not armed with such long sharpe prickes as the former out of the huskes whereof come whitish flowers.

4. *Carduus spinosissimus sphærocephalus Cardui Arabici nomine missus.*
The *Arabian* Globe Thistle.

This Thistle hath a winged prickly stalke two foote high having large leaves thereon somewhat broad and long, set thicke with sharpe prickes, but sparingly placed on the stalkes bearing round sphæricall heads, thick and strongly armed with long prickes; out of the midst whereof breake forth white threads somewhat sweete: the seede is long and cornered.

The Place.

All these Thistles are strangers to us, neither in their naturall places certainly knowne, but imparted and sent by friends with whom as rarities they have beene accepted.

The Time.

These flower at the same time with the rest, that is, in *June* and *July*.

The Names.

We cannot finde certainely that they were knowne eyther to the ancient Greeke or Latine writers, but *Anguillara* and *Lobel* suppose that the first is the Νάρδος ἀκανθώδης Spina alba of *Dioscorides* (some also take the greater kinde mentioned in my former booke to bee *Spina alba*, as *Camerarius*, *Matthiolus* and *Lugdunensis*, which as he saith is the *Redeguar* of the *Arabians*, and some take it to be Ἀκανθίον Crocodilion *Dioscoridis* as *Lucina* and *Lobel*, and some to bee Χαμαιλέων Χαλκήδονος *Theophrasti*, which *Gesner* translateth *Echeracia* as *Lugdunensis*, and some to be Τετραλὶξ *Tetralix sphinosa Theophrasti* as *Lugdunensis*, and is called *Spinosa* as a distinction from *Tetralix Atheniensium* which is *Erica*, of both which *Pliny* maketh mention, and some to be Ἀκάνθη ἀδέσποτος *Spina Arabica*, as the said *Lugdunensis* also and in some to be Βάτος & Ῥάμνος or *Rubus Theophrasti* as *Lobel*, and some to be *Silybum* as *Lugdunensis* according to the description, and some to be *Chamæleon verus* as *Tragus* and *Fuchsius*, and some to bee *Echinopus* as *Gesner in horto*, but *Cordus in historia* as I take it well called it *Carduus Sphærocephalus* or *globosus* most properly, and from him *Camerarius*, *Dodonæus* also calleth it *Spina peregrina*, and *Tabernæmontanus* and others call it so: the lesser sort also of that *Carduus Sphærocephalus* mentioned in my booke is so called by many of the said authors: these things I thought good to note here having so fit an occasion, although I have a little digressed from the matter in hand) but *Dodonæus* and *Lugdunensis* from him call it *Carduus Sphærocephalus primus*, *Dodonæus* maketh the second here set downe to be his third *Carduus Sphærocephalus secundus*: the third is the said *Dodonæus* his *Carduus Sphærocephalus quartus*, and *Lugdunensis* also mentioneth these from him as *Bauhinus* doth also: the last *Bauhinus* calleth *Carduus spinosissimus Sphærocephalus primus Dodonæi*, & saith it was sent him under the name of *Carduus Arabicus*. Although the *Carduus Sphærocephalus* or *globosus* be with most herbarists now a dayes called *Corona fratrum* that it doth some what resemble the bald or shaven head of a Fryer, yet this is not that Thistle which *Bartholomæus Anglicus* and *Anglicus Salernitanus* mention, and *Anglicus Salernitanus* or Fryers say they have growing in the confines of *Aragon* neare *Cassile*, which while they were digging up, demanded of a country man there passing by them if he knew the name thereof, who answered they called it *Spinarella*. The Fryers Crowne, which say they had leaves spread upon the ground like to those of the *Cyclus*. There is bore divers heads of Thistles set close one unto another without any stalke under them, whereof the midst was greatest, and the rest to the number of eight or ten or more or lesse smaller ones standing round about it, of the bignesse of a Walnut or greater: which name say they may not inconvenietly be given to it, in that the middle head seemeth as a father and the smaller as his children, that so as brighten they compasse their head in fashion of a Crowne. The roote say they when they had digged up part of it was of the bignesse of a finger, being white and tender and of a pleasant taste, yet with some astriction; *Dodonæus* mentioning this saith *Dioscorides* hath set the true figure of it in the Chapter of *Atractylis* or *Iacea spinosa cyani folio*, of others, but hee saith withall that the *Carduus tomentosus Anglicus* of *Lobel* is the true figure of this: of others *Carduus tomentosus* that he calleth *Corona fratrum herbariorum*, and *Ruellius* maketh that the *Carduus montanus Dalechampij* is the same also.

Carduus Tomentosus Corona fratrum dictus.
The Fryers Crowne Thistle.

The Vertues.

I finde nothing recorded by any that have written of these Thistles that they are applyed to any thing, neither have I any thing to declare of them by particular experience.

CHAP.

Chap. X.

Acanthium & Cardui Tomentosum. The Woolly or Cotton Thistle.

There be divers sorts of woolly Thistles, although there bee but one or two that can fitly bee referred to *Genus Acanthium Theophrasti* which is also woolly. I have therefore put the other to recount in one Chapter.

1. *Acanthium vulgare.* The common Cotton Thistle.

The common Cotton Thistle hath many large leaves lying on the ground, somewhat cut in, and as it were scalloped on the edges, of a greene colour on the upper side but covered over with a long hairy woolt or downy Downe and not much more white or hoary underneath, set with moll sharpe and cruell prickles. From the middle of whole heads of flowers thrust forth many purplish crimson threads, and somewhere white, but more seldome, the seede that followeth in theirs heads lying in a great deale of fine white Downe is somewhat liter, long and round, resembling the seede of *Syllibum* or Ladies Thistle, but somewhat paler; the roote is great and thicke spreading much, yet usually dyeth after seede time.

2. *Acanthium Illyricum.* The greatest Cotton Thistle.

The great Cotton Thistle remembred by *Lobel* and *Pena* in their *Adversaria* that *Peter Castellan Doctor of Lyes* in *Italy*, brought out of *Sclavonia* and sowed at *Lyons* in *France*) groweth to be two or three cubits higher then any man, almost to the height of a Speare or Pike branched forth on all sides, set with a prickly hume all alongst as it were the other, and with large and long rome leaves fully fraught and armed with as cruell prickles and prickly large heads with purple flowers and seede like the former.

3. *Cardnus tomentosus Anglicus.* Our *English* woolly Thistle.

This woolly Thistle hath divers large and long leaves all covered over with a woolt or downe, but in very deepely in the edges at certaine distances into severall parts or leaves even to the middle rybbe small, making as it were leaves winged with small and long leaves on each side, and set in divers places with long sharpe prickles: the woolly stalke riseth up to the height of two or three cubits, with few leaves thereon, and with few branches, bearing at their toppes a large round hoary head somewhat flat, covered over as it were with fine woolly threads like unto a net, not very prickly, with many purplish threads in the middle like unto those of the Artichoke, after which succeede Thistle-like seedes, greater and rounder then those of the first: the root is great and thicke, brownish on the outside and white within, not unpleasant to the taste.

4. *Cardnus tomentosus minor.* The lesser woolly Thistle.

This lesser woolly Thistle hath many whitish woolly or hoary long leaves, much cut in on the edges into many parts, and each part also divided and set with small prickes: the stalke is not very great, nor much above two foot high branched towards the toppe, white and woolly also, bearing on them small prickly roundish heads having many purple threads rising out of the middle, and small Thistle-like seede after them.

1. *Acanthium vulgare.*
The common Cotton Thistle.

2. *Acanthium Illyricum.*
The greatest Cotton Thistle.

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

3. *Cardunculus tomentosus capitulis minimè aculeatis flore Arachnoides Dalechamps Lugdunensis.*

The fine Cottony Thistle without prickly heads.

3. Cardous Cotonifer Anglicus. Our English woolly Thistle.

This fine Cotton Thistle hath long and somewhat narrow whitish or hoary leaves, larger at the lower end of the small stalke, which is about a foote high then they are above, somewhat cut in on the edges, but much & thick set with small short and soft prickes in some places: from the middle of the stalke up to the toppe at every leafe commeth forth a small whitish scaly head somewhat rough, but not prickly, and at the toppe likewise three or foure such like heads, out of which rise purplish flowers made of threads as in other Thistles whereunto the seede is like also. I doe thinke this doth rather resemble a *Lacea* then a *Cardous* but that I have not seene the place, and therefore doe follow mine author.

6. *Cardunculus tomentosus capitulis spinosis flos Leucacantha Monspelliensium.*

The *French* supposed white Thistle.

This supposed *Leucacantha* of the *Montpelier* Herbarists, sendeth forth from a thicke soppe roote meanely set with fibres, many stalkes about a cubit high, branched from the middle upwards, set with many long hoary or woolly leaves, much cut in or torne on the edges, and armed with divers sharpe prickes: the heads that grow at the toppes are small, somewhat long and prickly, sending forth many bright red purplish threads from the middle, after which come the seede which are somewhat long and round like unto the other Thistles seedes.

The Place.

The first groweth on divers ditches, bankes and in the Corne fields and high wayes generally every where throughout the Land, it is also often found growing in Gardens: the second as is said was brought out of *Illyria* before groweth in divers barren fields in *Sommersetshiere* as *Lobel* noteth it, and in divers other places: it doth *Dodonæus* saith he onely saw in some Gardens in the Low Countries, and *Matthiolus* saith it was sent him by *Ferrari* the 3d groweth in *France* in dry and sandy grounds, the last about *Montpelier* where some young Physitians take it to be *Leucacantha* of *Dioscorides*.

The Time.

They all flower and beare their seede about the end of Summer, when other Thistles doe flower and seede.

The Names.

The first is taken by most of our moderne writers to be *Xanthium Acanthium* of *Dioscorides* which name the Latines keepe also, no other being found that better agreeth thereunto, as *Matthiolus*, *Dodonæus*, *Lonicerus*, *Camerarius*, *Lobel*, *Tabernæmontanus* and *Lugdunensis* doe all agree, yet *Tragus* taketh it to be the *Acanthium spina alba* of *Dioscorides*, and *Cæsalpinus* calleth it *Spina alba sylvestris*, *Anguillara* and *Gesner* in hers *Onopordon Alterum*, as also *Ruellius*, *Matthiolus*, *Cæsalpinus* calleth it *Cardous sylvestris*, and *Lugdunensis* by his name taketh it to be *Scolymus sive Leucacantha Lonicer*: and *Bauhinus Spina alba tomentosa latifolia spinosa*, is the second to the *Acanthium Illyricum* of *Lobel*, & peradventure may be the *Acanthus Belloni*, *Bauhinus* doth certainely set it downe for the *Onopordon* of *Dodonæus*, *Camerarius* and *Lugdunensis*, and as certainly for the third *Onopordon Dalechampi* of *Lugdunensis*, and saith also it is the *Cardous viridis* of *Gesner* and others, in all which I am perswaded he is most mistaken for however the seeded Thistles of these authors may be in some things like it, yet they are not the same: the third, *Lobel* hath made mention in his *Adversaria*, and called it *Cardous tomentosus Anglicus*, *Bauhinus* taketh whether it be the *Spina Arabica* of *Anguillara*, but saith it is the *Spina Arabica Matthioli* in his last correct edition, as also *Spina Arabica* of *Cæsalpinus*, and he himselfe esteemeth it *Cardunculus tomentosus capitulis minimè aculeatis*: the fourth is the *Cardunculus Sphærocephalus quintus* of *Dodonæus*, which in that some referre to the *Spina alba* of *Matthiolus* and *Lugdunensis* and others, to the *Spina alba altera* of *Matthiolus* and *Camerarius*, *Bauhinus* calleth it *Cardous tomentosus capitulo minore*; the fift is called by *Lugdunensis Cardous Acanthoides Lobelianus*, and by *Bauhinus Acanthus tomentosus capitulis minimè aculeatis*: the last is the *Cardunculus Polycephalos* from *Dalechampius*, *Lugdunensis* saith and called by *Bauhinus Cardous tomentosus capitulis minimè aculeatis*. The Dutch call the first *Acanthus*, the *French Cardon argent*, the *Germanes Wolff wegedistel*, the *Dutch* and we in *English* the white Cotton Thistle.

The Vertues.

Dioscorides and *Pliny* in the same manner write, that the leaves and rootes of *Acanthium* the common Cotton Thistle taken in drinke, doth helpe those that have a cricke in their necke, whereby they cannot turne their head but the whole body must turne likewise. *Galen* saith that the roote and leaves hereof are of an heating quality and good for such persons that have their bodies drawen together by some spasme or Convulsion, or other infirmitie, which disease is truely to be called the Rickets, which happening sometimes to children so to binde them in their Nerves, Ligaments and whole structure of their body, that it suffereth them to grow to a proper stature in height strength or alacritie.

Carl.

CHAP. XI.

Cardui quidam Theophrasti spinosissimi. Certaine very prickly wilde Thistles.

There are some other wilde Thistles that are very prickly, to be intreated of, which have not yet beene mentioned, which I thinke fit to place together in a Chapter, which are as followeth.

1. *Onopordon.* The common way Thistle.

This common Thistle hath divers long leaves lying compasse-wise on the ground, very hairy all over, and especially while they are young, of a deepe or sad greene colour, long, and somewhat narrow, rent and indented edges, and set with many very sharpe prickes, from among which rise up very prickly stalkes armed with sundry sharpe prickly sinues, branching forth in divers places, and set with the like leaves up to the tops, where stand divers heads exceedingly stored with sharp pricks on all sides, from out of the middle thrust forth many threads, of an excellent lively colour, after which come somewhat small seede like unto other Thistles of the same: the roote is blackish, hard, and woody, where the stalke riseth and perishing every yeare after it hath borne.

2. *Onopordon alterum angustifolium.* Another narrow leafed way Thistle.

This common Thistle differeth from the former, in that the leaves hereof are longer, narrower, more deepely cut or indented at the edges and not hayrie, but smooth all the leafe over; in the flowers which are purple and sometimes white in the seede and roote, and in the prickles like a Thistle, it differeth little or nothing.

3. *Onopordon mitius aculeatum.* The gentler way Thistle.

This differeth from the other, chiefely in the heads which grow many together, and are not finally set with sharp prickles, growing so much as the other, but the leaves are more jagged, and set very thicke with short prickles which are rooted and a little prickly, but not armed as the other, the flowers are purple like others.

4. *Onopordon.* The Asses cracking Thistle.

This Thistle hath many long leaves set on the cornered woolly stalkes, which grow as high as any man, but not so tall, the leaves seeming like branches being a foote long, and much divided into many leaves, some broad and narrow, and others smaller and shorter set with them at certaine spaces, each ending in a sharpe long prickle from the upper joynts of the stalkes, with the leaves, and at the toppes also come forth woolly heads upon long stalkes, set with long prickes, from the midst whereof thrust forth divers bright reddish purple threads, the seede that followeth is like unto other Thistles; the roote is a foote long, blacke and blacke with many strings set thereon.

5. *Polycephalos.* The most prickly Thistle.

The most prickly Thistle is as it were compoted wholly of prickles, for the leaves are short and narrow, so thicke set together with small sharpe prickes, that they take away all shew of leaves; the stalkes also and branches are exceedingly stored with sharpe prickes up to the toppes, so that nothing else is to be seene; the heads also are in the same manner thicke set with prickes, out of which rise purple threads, as in other Thistles.

6. *Carduus Polycephalos.* The many headed Thistle.

The stalke of this Thistle hath neither sinue nor prickle upon it at all, but branched forth into divers parts, and those againe parted into other smaller branches, on which stand many heads and smaller ones under them, with sundry prickles about them, out of which rise purplish threads, as in others, the leaves are but few upon the stalkes being short and narrow, but as thicke set together as the silly almost: the roote is hard and woody.

7. *Carduus Theophrasti, vel Serpentarius.*

The wandring Thistle of *Theophrastus*.

This Thistle seeme to be compoted onely of leaves, for it hath no other leaves, many set together on the middle rybbe in rufts at certaine distances one from another, a cubite high, with two such rufts of leaves; the toppes of the stalkes are compassed with a ruffe or ruft of hath long leaves like unto those which grow lower, among many small white flowers, consisting of many small leaves, and not of threads, like other Thistles: the downe of the heads is small and white like, very like unto Rice in the husk when it is taken away, it is very yellow, like unto Corne-flower seede: the roote perisheth every yeare after the seeding time is past.

8. *Carduus vagans. Lugdunensis.*

The wandring Thistle.

This Thistle growth up with divers slender stalkes a cubite high, with long leaves and not so much cut in many parts, finally cut in or divided

8. *Carduus altera angustifolius.*
Another narrow way Thistle.

4. *Onopordon.*
The After-cracking Thistle.

1. *Hyacanthus.*
The most prickly Thistle.

3. *Carduus Theophrasti Serpilleri.*
Serpillon's or Clowny Thistle of Theophrastus.

2. *Cardui Lanceati variationes.*
The greater broad spear Thistle.

and many small points, with a short foote stalke, compassing the stalke at the lower end: at the toppes grow single scaly, greene and prickly heads, from the middle whereof throtteth a number of long threads, which in some plants are purplish, in others whitish, and in other very red, or of a bright crimson colour, the seede that followeth is small, smooth, and reddish: the root is white and thicke, and groweth not very deepe.

2. *Cardaus Lanceatus latifolius sive major.* The greater broad Speare Thistle.

The stalke of this Speare Thistle is armed with prickles like many other wilde Thistles, and the leaves set thereon are very long, cut in or divided on the edges in two or three places, set at distances one against another, and the severall parts runne into five or six points or corners, sharpely armed: the end being long and narrow, pointed like the head of a Javeline or Pike: whereof it tooke the name, the flowers are purplish in scaly and prickly heads.

10. *Cardaus Lanceatus angustifolius.* The narrow Speare Thistle.

The narrow Speare Thistle is like unto the last in the skinny prickly stalkes, being strong and standing upright two cubits high, stored with few leaves, but jagged, prickly, and narrower than the last, yet the end is somewhat broader than the other, of a darke greene colour on the upperside, and hoary gray underneath, the heads are many small and scaly set at the toppes of the stalkes as prickly as they, with purplish, and sometimes white flowers of threds rising out of the middle of them, as in other Thistles.

11. *Cardaus Chondrilloides.* The jagged Succory-like leaves.

The leaves of this Thistle are long and very much jagged very like unto the jagged, Cumose-Succory leaves, and prickly at the corners, the stalke riseth up a foote high, with such leaves on them up to the toppe, but shorter, broader and lesse jagged, where it branches forth in two or three parts, each bearing a stalke unto a Thistle like scaly head, out of which groweth a yellow flower made of many leaves, set in cuppe like a starre, which passing away the huske containeth within it much downe wherein the small seede lieth, and is carried away with the winde: the roote is white, long, slender, and woodily, set with some fibres, and perishing after seede time.

12. *Cardaus palustris.* The Marsh Thistle.

The Marsh Thistle hath a prickly round stalke, two or three cubits high, with some branches towards the toppe set with long and narrow darke greene leaves, somewhat jagged about the edges, with a few prickles on them: the toppes of the stalke and branches stand many Thistle-like heads with purple threads, as in other Thistles.

The Place.

The two first sorts are found in divers places of our owne country, upon ditch bankes, about hedges and groves: the first groweth in the fields of *Micklefield* by *Basil*: the seventh not farre from the sea, in the Marsh country in *Italy*: the eight in corne fields, as well of oates as other grains: the ninth, tenth, and eleventh, neere *Wisa* and *Micklefield* marshes about *Basil*: the eleventh in craggy and stony places about *Lyons* in *France*.

The Time.

They doe all flower and seede much about the time that other Thistles doe.

The Names.

Ὄνοπορδον in Greeke, and *Onopyxus* in Latine *quasi crepitus asini*, and so *Gaza* rendereth it out of *Theophrastus*: *quod ejus cibus genitalium, & summopere expetitur*; yet some thinke it should be rather *venereos quod ad eum modum asini gregarios delectare & hortari*: *Onopordum*: the signification thereof is rendred by *Pliny*, and *Columella* *quia crepitum reddere dicuntur*, which Greeke name, saith *Dalechampius*, they about *Paris* keepe still use, calling the said Thistle *Pet d'asne*, all the aforesaid constantly affirming, that when Asses feede thereon they will be more subject to cracking, and breaking winde backwards, than at other times when they doe not feede on them. Aptly *Dioscorides* ἐπωνύμον ἀπὸ τῆς πρὸς ἀφροδίσια ἐπιτηδειότητος, *Onopordon a lascivia, quod asinos ad venerem & coitum excitet*, *Columella* *Polyacantha*, *quasi spinis multa*, *Gaza* translateth *Acrolepsa*, and *Matthiolus*, *Polycephalos*, *multiplex capita*, of the many heads, as the other of the many thornes or prickles: the derivations and significations of the rest are cause enough to be understood. The names likewise are most of them, as other Authors call them: only the *Onopyxus* is called *Cardaus sylvestris* by *Dodonæus* and *Cardaus asininus* by *Lobel*, *Tragacanthos Theophrasti* of *Lugdunenses* and *Tabernamontanus*, is by *Ruellius* called *Agriacantha*, by *Lobel* *Acanthus sylvestris*, or *Onopordon* by *Gerard*, and the *Cardaus Chondrilloides*, doth in my opinion better resemble *Sonchus* or *Chondrilla* than a *Cardaus*.

The Vertues.

The vertues properties attributed to any of these Thistles, are to the most common way Thistles that are hot and dry in the second degree: and the rootes boyled in wine and drunke, are good to expell flatulency, urine, and to cause the ranke smell of the armeholes and whole body, as also good against a stinking breath, if the joyce of the leaves be taken before it floweth, and if the place be bathed therewith where the haire is gone, it causeth it to grow again.

Chap. XII.

Dipsacus sive Cardaus fullonum. The Teasell or Fullers Thistle.

The Teasell there are two kindes, the tame or manured and the wilde: of the tame or manured there is no variety to differing sort, but of the wilde there are two or three sorts, as shall be shewed in their severall places.

1. *Dipsacus sativus.* The garden or manured Teasell.

The manured Teasell hath the lower leaves for the first years very large and long, fashioned somewhat like unto Borage leaves, of a pale greene colour, more gentle or not so hard, as those that are set on the stalkes, somewhat about the edges, and the middle ribbe on the backe or underside set very thicke with short prickles, among which rise up the stalkes, three or foure foote high, armed from the bottome to the toppe, with hard short and sharpe prickles joyned in severall laces, and two such leaves set thereat, both of them so joyned together at the

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

the bottome, and so compassing the stalke about that they doe containe the raine and dew that falleth, and are somewhat harder and stiffer and more prickly then the lower: from betweene the leaves and the stalkes on each side rise branches prickly also, and joynted with the like compassing leaves, but lesser on them, and from their joynts rise long stalkes bare of leaves but not of prickes, bearing on each of them a round head somewhat long, armed with stiffe short and crooked prickles fashioned like hookes bending downwards, greene at the first and white being ripe, from about which come forth whitish hoodded flowers appearing in circles flowring by degrees for the most part beginning in the middle and so downewards and upwards, in the severall cells whereof which conteined the flowers grow small and roundish round seede somewhat long, the middle part of the head being often hollow, and conteining sometime small whitish wormes like unto Magots: the roote is white long and somewhat great at the head with divers long strings and small fibres set thereat and dyeth every yeare after the heads be ripe.

2. *Dipsacus sylvestris.* The wilde Teasell.

The wilde Teasell is in all things like unto the manured saving in the heads, whose prickles are small soft and upright not hooked or stiffe (which is contrary to the nature of all other wild plants almost, which have harder and more prickly then the manured) and in the flowers which are of a fine blush or pale carnation colour.

3. *Dipsacus sylvestris laciniatis foliis.*
Wilde Teasell with jagged leaves.

This wilde Teasell (whereof I have no knowledge and but follow mine author, whom I will not so farre mistrust as to say there is none such, for who knoweth all the severalties that other countries doe produce) is in all other things like the last saving in the leaves which are not whole and onely dented about the edges but torne in on both sides into deepe gashes.

1. *Dipsacus hortensis.* The garden or manured Teasell.

2. *Dipsacus sylvestris.* The wilde Teasell.

4. *Virgapastoris.* The Shepherds Rod.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

4. *Virga pastoris.* The Shepherds Rattle.

The shepherds Rattle is a kinde of Teasell also, but differeth therefrom in many notable parts, for the leaves growing large are of a ladder greene colour, and not so prickly on the backe ribbe, but finely dented about the edge: the stalkes grow higher and not so prickly, yet having some thereon, and leaves set by couples at the joynts for conteining the stalke to hold water in manner like the former: the severall branches beare small heads not much bigger then Wallnuts, with soft prickles thereon and bluish flowers like the wilde Teasell.

The Place.

The Rattle only manured and sowen in gardens or fields for the Clothworkers use, by sayning the Woll therewith the crooked prickles of the heads, make it lie for their theeres to cut it smooth and thereby leave a better nap thereon pleasing to all: the other sorts except the third grow in moist places neere ditches and rills of water in many places of this Land; the third sort in some places of *Germany* and the last in sundry places of our own Land.

The Time.

They flower in *July* and are ripe in the end of *August*.

The Names.

It is called also *Virga Dipsaca* in Greeke, *quasi sitibundum, good reason (say divers authors) quoniam concavitates earum foliorum vetustissimum excipiunt, quo valent ad abigendas pilas & ictericas aberrationes*: but I thinke not for the water contained in these leaves grow rather bitter by standing in them, & therefore not fit to quench but to increase thirst rather: the Latines also call it *Dipsacus* and after the Greeke *Labrum Veneris, cujus quidem usum & circuitus foliorum bacilla continent, quo se ambage ante illuvie pluviarum pulvis ipsorum recollitur, & mox se humorem vestiunt*: but I am of a different opinion that it tooke the name of *Venus* lippe from the likenesse it hath to a Women lippes, which as the leaves the raine, so they are ready to receive all mens offers and as the heads of Teasells, so they ready to card and teare all mens skins that have to doe with them, until they leave them lacerated: pardon I pray this extravagancie who follow *Constantine* and other good authors herein, that in the midst of their naturall philosophie doe sometimes mix a little morallitie: it is called also *Cardunculus Venerius* and *Cardo Veneris* it may be upon the like information: it is thought also to be the *Gallitrychon Xenocratis* of *Pliny* & *Columella*: also and some *Virga pastoris*, but that is more usually given unto the last sort, and so called because the stalke clenseth from the pitch, for so much as might be held in one hand serveth the Shepherds to weather their sheepe withall, transferring the name of *Virga pastoris* to the *Dipsacus sylvestris*, calling it *Virga pastoris* and thus other men as *Rauh* and *Dodonæus* doth. Some, saith *Lugdunensis* take it to be *Plumbago Plinij*, *Lobel* saith I doubt whether it should bee the *Spina Solenitis Theophrasti Gesneri*, *Camerarius* calleth it *Dipsacus Tragorum*, *Dodonæus* upon *Pliny* taketh it to be *Matthiolus Pliny*: The *Arabians* call it *Chor* and *Mulcen*, the *Italians Virga* and *Cardo*, the *Spaniard Cardo penteador* and *Cardencha*; the *French Chardon de foulon* and *verge pastor*, the *Dutchmen Karten disels ruben straal* and *Weverkarten*, the *Dutch Carden* and *Cardus Gustavi*, and the *English* Teasell or the Fullers Thistle.

The Vertues.

Dioscorides saith that the roote bruised and boyled in wine untill it be thicke, and kept in a brasen vessell or shard after spread as a salve and applied to the fundament doth heale the clefts thereof, as also Cankers and filthinesse therein: the same also saith he taketh away warts and wennes: *Galen* saith it is drying in the second degree and hath withall some cleansing faculties: others hold it to be cold and dry, and therefore they say the leaves applyed to the forehead and temples qualifieth the frenzie or madnesse: the juice of the leaves dropped into the eares killeth the wormes in them: the distilled water of the leaves is good to bee dropped into the eyes, to take away the rednesse in them and such mists as darken the sight: the said water is often used by women to preserve their faces in heate, and to take away all rednesse and inflammations, and all other heate or discolourings. The decoction of the leaves is held profitable for no disease that wee know of.

Chap. XIII.

Eryngium. Sea Holly.

Although *Dioscorides* hath made mention but of one sort of *Eryngium* (which is suspected by many to be rather a kinde of *Acanthus* or *Carduus*) because he saith that it groweth in fields and other rough places and not at the Sea side, when as his description may as fitly be referred to one as the other, whereas yet *Pliny* maketh mention of the Sea kinde also, and the later age hath added divers others unto it which for some resemblance in leafe, head or roote, they have so termed. The *Eryngium Pedemontanum* and *Alpinum*, I have exhibited in my former booke, which is assuredly the *Eryngium Germanicum* of *Matthiolus*, although *Dodonæus* doth make them different: the rest shall bee handled in their order.

1. *Eryngium marinum.* Our ordinary Sea Holly.

The leaves of our ordinary Sea Holly are gentle or nothing so hard and prickly as when they grow older, being smooth and deeply dented about the edges, hard, sharpe pointed and a little crumpled also, of a blewish colour, standing upon a long foote stalke, but those that grow up higher with the stalke doe as it were imbrace the same with their stalkes, for the stalke it selfe is round and strong yet somewhat crested with joynts and leaves as it were set one above another, sharpe and prickly, and branches rising from thence which have likewise other smaller branches, round about them bearing severall blewish round prickly heads, with many small jagged prickly leaves set therein standing like a starre, and are sometimes found greenish or whitish: the roote groweth long even to eight or ten foote in length, set with rings or circles towards the upper part but smooth and without barks downe lower brownish on the outside and very white within, with a pith in the middle, of a pleasant taste but much more delicate being artificially preserved and candid with Sugar.

2. *Eryngium mediterraneum foeminæ.* Vpland Sea Holly.

The female Sea Holly (which groweth in vpland grounds is therefore more answerable vnto *Dioscorides* his *Eryngium*, but else as I sayd before his description doth answer them both directly) hath slenderer or not so thicke stalkes as the former, and hath the leaves more divided, more prickly and lesse aromaticall: the heads are likewise smaller, and the roote slenderer and shorter, neither so sweete nor fit to be preserved, nor so aromaticall in other things it is very like the former.

3. *Eryngium plenum marinum.*

The small smooth bastard Sea Holly.

This bastard Sea Holly hath the lower leaves smooth and whole of a pale greene colour, somewhat long and round pointed narrow at the bottoms, and somewhat broader and indented at the edges: the weake stalkes that lying upon the ground take roote againe at the joynts and rise not above a foote high, have with smaller leaves that grow below, others that are finely parted into many parts and sharpe pointed, from out of which all along the stalkes and at the toppes also, come forth blew heads lesser than those of the vpland kinde: the roote is compacted of many thicke and long strings which perish not after seede time, but abide many yeeres.

4. *Eryngium pumilum Hispanicum.*

Small bastard Sea Holly of *Spaine.*

The small bastard Sea Holly hath divers leaves lying flat compasse vpon the ground somewhat long, broad toward the middle, smallest at the foote, and deeply dented or jagged about the edges and somewhat like vnto the *Hungarian* kinde: but those that are set at the joynts of the stalke which is branched from the very bottome, are not so much divided into many small narrow leaves dented about, hard also and sharpe pointed or prickly: at the toppes of the stalke and branches, upon every one standeth a round prickly head, with six or eight narrow, long prickly leaves under it spreading like a starre, which ouergroweth with the head and flowers that come thereout are of a faire blew colour, which give small flat chaffie seede like the *Hungarian* kinde: it is seldome seene to have either the lower leaves, or almost any on the stalke and branches when it is in flower, but they all wither and are dead and dry before: the roote also perishing as soone as it hath given seede, and is long hard and woodily.

5. *Cardopatium Eryngioides, sive Cardunculus montana Lupi Lobelio & Penæ.*

The small French Thistle of *Lobel* and *Pena.*

Of this small Thistle-like plant among the *Eryngia* (herein following *Bauhinus* and *Alpinus* *lib. de exoticis plant.* who else as *Lobel* and *Pena* in *Adversar.*) say might be accounted a *species* of *Atractylis purpurea*, if as they thy saw not the very same, but I would rather referre it to the *Pacea* or *Cynara*) which sendeth forth divers long and deepe cut leaves, somewhat prickly, among which a slender smooth stalke ariseth fearce a spanne high with the like leaves thereon, at the toppe whereof out of the middle of some long leaves stand two or three large, great, roundish yellow scaly heades bigger than may seeme proportionable to the plant, set with sharpe hard white prickles which are often eaten by those where it groweth naturally, from the middest whereof issueth forth divers purple flowers like unto the *Atractylis* or Distaffe Thistle saith *Lobel*, but *Alpinus* saith they are like unto *Cyanus* or Corne flower, after which come yellow Thistle-like seedes; the roote is edible white and fleshy, thrusting some deepe into the ground with divers fibres thereat.

6. *Eryngium trifolium.* Trefoile Thistle.

This small plant sendeth forth at the first many long hard and narrow leaves from the roote which is like vnto *Eryngium* and aromaticall, whereof some are parted into three, but those that are set on the stalke have commonly but three long leaves joyned together at the end of the footestalke at distances: at the top of the stalke and two or three heads somewhat like those of *Eryngium montanum* with purple flowers, and long leaves about them: the roote also is broad long and small like unto it: the rootes encrease Venery and provoke Vrine.

The Place.

The first groweth almost in the sea coasts almost in every country as well hot as cold, as *Spaine*, *Italy*, *France*, on our sea coasts almost every where and new countries also, and others more Northerly: the second groweth as *Camerarius* saith in the Vineyards and high wayes every where, but not about *Norimberge* where he lived as he saith, but in the up and further remote parts from the Sea in *Narbone* in *France*, as *Lobel* and *Pena* say: the third *Lobel* saith he never saw but in *Iohannes Antonius* his garden the seede hath beene imparted to friends, but it is said to come out of some hot country, because it flowreth late in these colder countries, and seldome commeth to perfection, even as the fourth doth also, which *Clusius* saith, he gathered at the foot of certaine hills not farre from *Valentia* in *Spaine*, and in no other place: the fift *Pena* saith groweth on that side of *Mons Lupus* that is next the sunne, neere unto a small brooke of water.

The

The Time.

The first and second flower in the end of Summer, and give ripe seede within a moneth after: the later with us, and therefore seldome doe their seede ripen with us.

The Names.

It is called in Greeke Ἠρύγγιον *Eryngium*, quasi Ἔρυγγα *five rictum, dictum eleganter à labiorum rictu*, for that *Pliny* was the first author of the fable, that one Goate cropping a branch of Sea Holly caused the whole flocke to follow him, untill he spewed it out againe; or as others say untill the Shepheard take it out of his mouth: the *Latines* keepe the same name of *Eryngium*, yet in many Apothecaries shoppes it is called *Acanthus*, of some *Carduus capitatus*, *Pliny* calleth it *Eryngo*, and saith that some did referre *Acanthi* unto *Eryngium*, which doth therein make some doubt, and others referre it to *Dioscorides* Ἀκάνθη Ποιμενική, as he saith also *Cordus* in his *Annotations* of *Dioscorides* and *Pliny*. *Lonicer* calleth it *Glycyrrhiza spuria*, all other authors generally the first *Eryngium maritimum*, onely *Ruellius* and *Others* after him call it *Eryngium montanum*, the second *Eryngium vulgare* by *Camerarius*, *Clusius* and *Bauhinus*, because in Germany there is no other to be found but this, not being now so well knowne as being farre from the Sea side where onely it is naturall: *Fuchsius*, *Tragus*, *Lonicer*, *Lobel* upon *Dioscorides*, *Cesalpinus* and *Tabernamontanus* call it simply *Eryngium* without any addition. *Tragus* and *Lonicer* make it their first *Eryngium*; *Matthiolus*, *Dioscorides* and *Lugduno* call it *Eryngium vulgare*, *Fuchsius*, *Gesner* and *Gerard* *Eryngium mediterraneum* and *Lobel* *Eryngium tertium genus*: the third is the *Eryngium pusillum planum Matthioli* of *Lobel*, *Lugdunense* and *Clusius*, *Lobel* also calleth it *Eryngium alterum latifolium*: the fourth is called by *Clusius* *Eryngium pumilum hispanicum*, whom *Bauhinus*, *Lugdunus*, *Tabernamontanus* and *Gerard* do follow: the fifth is called by *Lobel* & *Pena* *Cardo stellatus quorundam*, by *Lugdunenses* *Carduncellus Pena sive Cardui marini species*, and *Bauhinus* Ἐρύγγιον πολύκαυλον ἀκανθῶδες μικρὸν, *Eryngium caule frutescente spinoso*: as *Clusius* mentioneth this, calling it *Cardunculus Eryngioides* ἀκανθῶδες *Alpinus*. The *Italians* call the first *Scarzo marino*, The *Spaniard* *Cardocorredor*, the *French* *Chardon roulant*, according to the Latine *Carduus capitatus*, and of some also *Panicaut*, the *Germanes* *Wasserdistel* or *Meers trawe*, the *Dutch* *Meere wortele*, *Sudtlove* and *Cruys distel*, and we in *English* Sea Holly, or Sea Thistle.

The Vertues.

Both the Vpland and Sea Holly are temperate in heate, somewhat drying and cleansing, but our Sea Holly more effectuall than the Vpland kinde in all things whereunto it may serve, yet is it to neare (or nothing) accepted in the diet thereof, and that to very good purpoles, being not much inferiour, what commodity I shall shew you of the Sea kinde, you may transferre to the other, as divers other good Authours doe. The young and tender shoores are eaten of divers, either raw or pickled: the decoction of the roote in wine is very effectuall to open the obstructions of the spleene and liver, and helpeth the yellow jaundice, the stone, and the paines in the loynes and winde collicke in the guts and bowells, provoketh urine, and expelleth it out, and procureth womens courses: the same also, or the powder of the roote, to the quantity of a dramme or two, with some wilde Carrot seede drunke in wine, or as *Dioscorides* doth appoint in the broth of boyled Snailes, or as *Heraclides* saith, in the broth of a Coote, is available against the sting or biting of Serpents, and divers more creatures, the poylon also of the Aconite, and other poysonous herbes: the continued use of the decoction of three or three dees taken fasting, and next to bedwards, doth helpe the strangury, the pissing by drops, the stopping of the urine and the stone, and all infects of the reines and kidneyes, and if the last drinke be continued long it is said perfectly to cure them that are troubled with the stone, that the paines shall never returne againe, giving patience on them that have beene troubled along time therewith, declaring it to be true: it mightily helpeth Venereous actions, and is good against the *French* disease: the roote bruised and applied outwardly helpeth *Scrophulæ*, or the kernells of the throate, called the Kings evill, or taken inwardly eaten, and applied to the sting or biten place of any Serpent, &c. healeth it speedily: if the roote be bruised and boyled to oile, *Auncient* or tallow, and applied to broken bones, thornes, &c. remaining in the flesh, doth not only draw them forth, but healeth up the place againe, gathering new flesh where it was consumed, or almost fallen away: the juyce of the leaves dropped into the eares helpeth unpolluteth therein. The distilled water of the whole herbe when the leaves and stalkes are young, is profitably drunke for all the purposes aforesaid, and doth helpe the melancholy of the heart, and is available in *quartane* and *quotidian* agues, as also for them that have their mouthes sore, or cannot tosse them without they tosse the whole body therewithall. The other sorts are here little used, to be had in Physicke, but the two last sorts are much used by the Natives to make Vener[illegible] heads.

Chap. XIIII.

Carduus Stellatus. The Starre Thistle.

Of the Starre Thistles there are two or three sorts, some whereof have beene but lately exhibited to be knowne; the other of more ancient cognisance, the *Spinosus Cornutus* [illegible] one of the number in that it doth so meerely resemble them, as shall be presently shewed. [illegible] opinion dicle [illegible], but that custome hath entitled them Thistles, might as well be referred [illegible] leaves of Knapweedes with prickly heads, as divers others there placed are, and even *Clusius* [illegible] more fitter *capitatis spinosis*, as the full among the Thistles, doth afterwards change his minde, and [illegible] former.

1. *Carduus stellatus vulgaris.* The ordinary Starre Thistle.

The common Starre Thistle, hath divers long and narrow leaves lying next unto the ground, [illegible] edges somewhat deeply cut many, almost even parts, soft or a little woolly all over the [illegible] somewhat white, among whichrise up divers weake stalkes parted into many branches all [illegible] downe to the ground rather than much raised up, that it seemeth a pretty bush set with divers [illegible] leaves up to the toppes, where severally doe stand long and small whitish greene heads, set with very sharpe [illegible]

Cardus Bafilicatus Lobel.
Cardus S. Barnabæ Thistle.

white prickes, no part of the plant being in any wise elſe prickly, which are ſomewhat yelloweſh, and ſharpe as in any other Thiſtle; out of the middle doth ariſe the flower compoſed of many ſmall red-purple threads, and in the heads after the flowers appeare ſome ſmall whitiſh round ſeede lying in downe under the flower. The roote is ſmall, long, and wooddy perishing every yeare, and raiſing it ſelfe from it owne ſeede lying

2. *Cardus ſtellatus flore albo.*

The white flowred Starre Thiſtle.

There is no difference in this Thiſtle from the former, but the white excreſſe of the leaves, and the white flowers in the flowers.

4. *Cardus ſtellatus latifolius.*

The broade leafed Starre Thiſtle.

This Thiſtle hath broader and ſhorter leaves than the former, but not ſo much or ſo deepely cut in on the edges, but more ſtarre fetched and more at the corners; the flowers are ſet and ſtand as the former, but the heads are more divided, having ſeven branches ſet with their ſeede, and at the toppes ſmall round thicke white heads, ſet thicke with prickes, many ſet together, in the white like thoſe of the former, ſeven for the moſt part ſet forth at the toppes, the breadth of them being middle-ſized, not ſo great as the former, but ſomewhat ſhorter; out of the middle of the heads ariſe reddiſh purple threads like unto the other Thiſtles; the roote is ſmall and annuall.

5. *Cardus ſtellatus Dodonæi. Dodonæus his Midſommer Thiſtle or S. Barnabies Thiſtle.*

This Thiſtle of Dodonæus hath long leaves lying next to the ground deepely cut in on the edges into many long and narrow parts, the lower part being ſomewhat broad and ending in a long point, of a blewiſh greene colour, from among which ariſe up divers upright ſtalkes two foote high, with diverſe long and narrow leaves, ſomewhat divided but the uppermoſt without diviſion, and all of them without any prickes upon them, at the toppes ſtand ſundry ſmall ſharpe prickly heads, whoſe prickes are as white or rather more then

in

in any of the other, and are so cruelly sharpe that they pricke the Thighes and Legges of those that rashly will passe thereby, in the middle whereof stand a few yellow threads; the seede is white and long, not much unlike those of the former sharre Thistle: the roote is blackish, long, and slender not growing deepe, parted or divided in divers places somewhat wooddy and bitter in taste, somewhat like unto the long Cyperus grasse roote. *Lobel* gaveth a figure hereof whose lower leaves are as little jagged as the upper, which I have here set to let you see the difference.

Solstitialis Lobelij.

The Place.

The first groweth in the fields about *London* in many places as at *Mile-end* greene, in *Finsbury* fields beyond the Milles, and in many other places: that with white flowers is much more rare and not to be met with in any compasse: the third is found about *Narbone* in *France*, and the last about *Montpelier* in good plentie but is rare to be found wilde with us.

The Time.

The first flowreth early and seedeth in *July* and sometimes in *August*: the last is usually in flower about Midsommer or a little after.

The Names.

It is very probable that the *Cardous Stellatus* or *Stellaris* is the *πρεσβυτερον Μυακανθος* of *Theophrastus*, lib. 6. (and not the *νεωτερον*) either of *Dioscorides* which is *Asparagus petræus* or *Ebur* which is *Carduus asperagus* which is *turca spina* a bushy wody of thornes) which hath thornes or prickes not upon the leaves, but sides them, as *Capers*, *Onons* and *Tribulus*, for with them he setteth *Myacanthes* as being of a like smalle, and called because the prickly heads being stucke upon salted flesh that was hung up, would sufficiently defend it from Mice or other vermine that would devoure it: *Brunfelsius* calleth the first *Eryngium* and so doth *Gesnerus*, *Tragus* maketh it his *Eryngium alterum*, *Matthiolus* calleth it *Carduus lanatus Cæsalpini Cacalibulon foetidum nigrum* and so doth *Cæsalpinus* also: who thinketh withall that it may bee the *Stœbe Theophrasti* whereof you shall hear more a little after: *Dodonæus* and *Camerarius* call it *Cardous Stellatus*, and so doth *Lobelius* and *Gesnerus* in shape beyond the Sea in divers places doe. *Horatius Augerius* calleth it *Stellaris* and *Cupani* in *Panormo Cardous flore luteo sive Stellaris*, *Cardus Polyacantha*, *Tabermontanus Spina stella*, *Lugdunensis Argyracantha*, *Theophrasti Dodonæi*, *Clusius Cardous muricatus*, *Columna Hippophaestum vel Hippophaes*, *Dioscorides* and *Ruellius*, *Cardous stellatus in papaveris arreatici*: the third is called by *Lugdunensis*, *Cardous stellatus Italicus longus*, and *Bauhinus Cardous stellatus luteus folijs caulescens*: The last is thought by some to be the *Acanthe Dioscoridis*, *Spina regia Theophrasti* &c. is called by *Cæsalpinus in horrida Spina cognita flore luteo*, and *Spina Solstitialis* and so doe *Tabernæmontanus*, *Lobel* and *Gesnerus* who also call it *Cardous Solstitialis*, *Lugdunensis Lanceacantha quorundam*, who as *Lobel* also saith the *Rustici* call it *Auricles* in divers places, *Cæsalpinus Calcitrapa altera*, and *Columna Spina Solstitialis altera*: *Dodonæus Cardous stellatus minor*, and *Bauhinus Cardous stellatus luteus folijs expansis*, *Gerard* his figure thereof is amongst his *Cardous stellatus* which *Mr. Johnson* hath noted, yet giveth a figure for *Solstitialis* like or nothing differing from the *Stellatus*, when as this true figure hereof is extant in *Lobel*, and whereas *Gerard* his *Solstitialis peregrina* is supposed to be *Acanthium peregrinum* of *Tabermontanus*, which *Bauhinus* knew not what to make of; it is plaine by *Gerards* owne words that he ment it by *Clusius* his *Jacea lutea capitata spinosa* &c. which must have passed *Mr. Johnsons* correction, which I am loth in every place to exhibit, knowing that none of all can publish any thing but there may bee slippes and errours in many places thereof. The *Italians* call the sharre Thistle (as I said before) *Cativerpola*, the *French Chaussetrappe*, the *Germans Wolfsmilch*, the *Dutch Boerde-fiel*, the other we call in *English* S. *Barnabies* Thistle or Midsommer Thistle.

The Vertues.

The seede of the Sharre Thistle made into powder and drunke in wine doth provoke Vrine and helpeth to breake the stone and drive it forth: the roote in powder given in wine is good against the Plague or Pestilence by drinking thereof daily fasting for some time together is very profitable for a Fistula in any part of the body. They about *Francfort* doe use the rootes hereof in stead of *Eryngium* which groweth there together with it. *Camerarius* saith, *Bonifacius Vandus* doth much commend the distilled water hereof being drunke to helpe the *Frenzie* disease, and to open the obstructions of the Liver, and clense the blood from corrupted humors and also profitably given against both quotidian or tertian Agues: The Midsommer Thistle is used by the *Germans*, *Camerarius* saith, and both flowers and roote admirably commended against the evill disposition of the whole body called *Cachexia*, against the Dropsie, daily Agues, maidens pale colour by reason of the greene sickenesse, or other obstructions, the countrey people saith hee, doth much use the distilled water or the decoction thereof against the swellings of the spleene and prickings in the sides, as also to provoke Vrine and to helpe the Iaundice or paines in the huckle bones called the Sciatica.

CHAP. XV.

Cardous mollis. The gentle Thistle.

ALthough of these kinds of gentle Thistles I have published in my former booke and therefore had no need to speake againe thereof in this place, but of the rest as they follow.

1. *Cardous mollis laciniato folio.* The gentle Thistle with jagged leaves.

This jagged gentleman hath many leaves, some lying on the ground, others standing more upright, all much jagged or cut in on the edges, even to the middle ribbe, greene on the upper side, the nether white and woolly underneath like unto the younger and softer leaves of the first sharre Thistle, not having any or many prickles on them, of a little drying and bitter taste: from among which rise up one or two, and sometimes more stalkes about two foote high, of a reddish colour yet covered with a fine Downe or Cotton, set with divers leaves as the lowest whereof are like those on the ground but smaller, and those up higher are narrow and long without any division, the ends and points of them being usually reddish, at the toppe of the stalke which is some-what without branches, groweth one head compoted of many scales, set together with very soft and gentle prickes

...mour of the middle whereof riseth a reddish or stammell flower made of divers soft and woolly threads; ...ceede that followeth is great and somewhat cornered; the roote is somewhat long and of the bignesse of ones ...spoken with on the outside with some fibres thereat.

2. *Cardaus mollis angustifolius.* Narrow leafed gentle Thistle.

The other Thistle hath shorter stalkes and narrower leaves then that sort I have set forth in my other booke, ...ower and hoary underneath, having a few soft prickles about the edges, at the toppes of the stalke flan... ...leafy head greater then any of the other, from the middle whereof commeth many fine bluish purple ...like wooll of the said colour.

3. *Cardaus mollis Helenij folio Camerarij.* *Camerarius* his gentle Thistle.

This Thistle groweth very tall having large leaves next the ground, very like unto those of Elecampane, of a ...ome green colour on the upper side and whitish hoary or woolly underneath, those on the stalkes are like the ...ower sort, having no prickles on the edges, the toppe whereof is furnished with small scaly heads upon short ...scaly heads with reddish threads for the flower in the middle: the roote is blackish and spreadeth it selfe exceed... ...long and tuberous fibres.

4. *Carduus mollis latifolius Lappæ capitulis.* The Burre headed Thistle.

The stalke hereof is about a cubit high, set with divers soft and short prickles, with divers long and broad leaves ...hose of the lower leaves, being smooth, thinne and full of veines, and with a fewe of some small prickles about ...ers in the toppes of the stalke from divers small prickly heads like unto Burres, both for the forme and ...of which heads issueth a stammell coloured threads which are the flower.

The Place.

...be found on all the hills that runne from *Colebery* unto the *Alpes* and in other places in ...*Camerarius* in the hill *Swallow*: the third *Camerarius* saith is frequent on all the hills of the *Hercynian*; ...saith the last was found on the hill *Tonezon* in *Austria*.

The Time.

...all flowers in July and *August*.

The Names.

...which are not fully termed Thistles wanting prickles, but might more justly here be referred ...growing plants lately found by the diligent search of *Clusius* and others, they have no ...Genus or Latine name whereby they may be called, *Camerarius* therefore and *Clusius* have impo... ...as seem to their choyce most fitting to their natural formes. *Clusius* calleth the first *Cardaus mollis* ...and *Bauhinus* *Cardaus mollis laciniæ folio*: the second *Clusius* calleth *Cardaus mollis angusti folius* and ...and *Bauhinus* *Cardaus mollis folio oblongo Cirsij capitulo*: the third *Camerarius* calleth *Cardaus* ...*Bauhinus* calleth it *Cardaus mollis Camerarij*, and *Bauhinus* *Cardaus mollis folio helenij*: the ...*Camerarius* setteth forth by the name of *Cardaus mollis latifolius Lappæ capitulo*.

The

The Vertues.

We have not knowne or heard unto what disease any of these plants have beene applyed, and sometimes as we have somewhat worthy the relation we must be silent, leaving them to every one, judgement to apply them according to discretion.

Chap. XVI.

Acanthus sive Branca ursina. Beares-breech.

There are two sorts of this herbe, the one smooth and without prickles either on the leafe or head, the other very prickly in the leafe but not on the head: which although I have set forth in my owne booke, yet I thinke good to repeate them here againe, in that I would a little more commend them, and shew you more fully their specificall vertues.

1. *Acanthus sativus.* The garden gentle or manured Beares-breech.

This gentle Thistle (as it is accounted) shooteth foote many very large thicke smooth and fad green leaves upon the ground with a thicke middle rib, and parted into sundry deepe gashes on the edges, from among which after it hath stood long in a convenient place, riseth a reasonable great stalke 3 or 4 foote high without side branch or leafe thereon, but onely from the middle upwards, set with a spike as it were of white hoodwinked gaping flowers standing in brownish huskes, somewhat sharpe at the points, and a small long undivided leafe under each flower after which come in the hotter countries (but not in ours as far as I can learne) broad flat round thicke, brownish yellow seede; the text of *Dioscorides* hath them somewhat long but such did I never see which having put into the ground hath sprunge with me and growne, the roote are many great thicke and long, spreading farre and deepe in the ground, of a darkish colour on the outside and whitish within, very clammy more then the leaves, so full of life that a small peece left in the ground, will spring up againe, but will need shelter or defence from the extremetie of the winter wether.

2. *Acanthus Sylvestris.* The wilde or prickly Beares-breech.

This other wilde or prickly sort hath likewise sundry long leaves, lying on the ground but much more devided on the edges into smaller parts, and each part with small motches, and very sharpe white prickles at them, from among which a taller and lower stalke ariseth, with the like spiked head of flowers, and sundry leaves thereon in their way comming up, standing in more sharpe and prickely huskes then the former: which the seede that it produceth, is as small as a little Peafe, hard, blacke, and round: the roote likewise pierceth not so deepe, or farre as the former, nor groweth so great but is more tender to keepe from the Winter colde.

The Place and Time.

They both grow naturally in many places of *Italy*, *Spaine*, and *France*, but are onely nursed up in the gardens

Original from UNIVERSITY OF MICHIGAN

...monious with us: the hill flowring in *June* Iuly or in *Iuly* but giveth no perfect seede with us, the other hardly flowreth and scldome or never yet gaue us any shew of ripe seede.

The Names.

They are called in Greeke ... and ... *Acanthus*, and *Acantha* and ... *Mespacantha* by some, and the smooth sort ... and ... & *Pedaros* and *Melampyllos* at *Oribasius* and *Pliny* haue it. *Pachylus* also saith that it was formerly called *Marmoraria* by the *Romanes* which is corruptly turned into *Mandeleia* among the vulgar names of *Dioscorides*, because the forme of the leaues was vsually the patterne for many engravings, as pillows and other workes, their pots and cups also shewed with the same. The first is called *Acanthus vulgaris* and *Sativus* by all others, or *mollis Virgilij*, and *Branca ursina* by the *Italians*: there are some that make doubt whether this be the true *Acanthus* of *Dioscorides* partly for the difference of the seedes as you haue seene, and partly of the colour of the rootes to be red, but all other parts so exactly agreeing thereunto hath put that doubt: some againe make a question as *Pandora* mistaking the matter, whether the garden kinde be the *Acantha* of *Theophrastus lib. 4. c. 11.* which he putteth among the herbes: but he distinguishing *Acantha* from *Carduus* to make them two things altereth the same wonderfully, as you may see it in *Bauhinus* his *Pinax* where he turneth *Acanthus* and comparing it with *Theophrastus* his Text: but I thinke I may more truly wonder why the first *Acanthus* should be numbred *inter Spinas & Cardua*, being so smooth an herbe without any sting or prickles or thornes in leafe or heade; which if I might giue an answer thereunto, might rather proceede from the length of the thyrsus or spike of flowers vnto the wilde or prickly sort then of it selfe: the other was called *Acanthus Dioscoridis* with *Lobel* who call it *Acanthus sylvestris* and *Scolymo Dioscoridis similis mediterraneus* some *Spina alba* and some *Spinachia* but it cannot bee *Chamaeleontha Monspeliensium* which hath a prickly Thistle like head, although the title ouer it in *Lobels Icones* importeth so much. The *Italians* call it ... and ... *Acanthe* the *Spaniards Tersa gigante* and *Branca ursina* the *French* also *Branche ursine* the *Germanes Wilde Barenklawen*, the *Dutch Beren claeuw*, and wee in *English* Beares breech and not Beares lace which is another herbe shewed you here before to be *Hellebore alter minor*.

The Vertues.

By reason of the mucilaginous in the leaues they are often vsed in our stoues in the decoctions for glisters, to soften passages more easie and slipperie: but *Dioscorides* saith that they binde the belly, and are good for those women that are out of ioynt to conferme and strengthen them which no doubt it may doe by the slimy matter in the leaues and rootes, and soone convertible by heate into a binding quality; for as *Galen* saith 6 *simpl.* the iuice hath a drying as well as a gentle cutting faculty, being of thinne parts: and the leaues often mesnely digested with all the rootes by *Dioscorides* and *Pliny* are applyed to helpe those places that are burnt with fire, and those that are bursten, Crampes likewise and the paines of the Goute, to be outwardly applyed, and the decoction of them taken inwardly prouoketh vrine, and is good for those that are falling into a Consumption.

Chap. XVII.

Anonis sive Resta bovis. Rest Harrow or Cammock.

After I haue shewed you all the Thistles that are vsually knowne, let me to finish this Classis include those shrubbes or bushes that are thorny and prickly, some of which number are already entreated of in my former booke, and those are the Roses of all sorte for a Garden, the Raspis berries, the Gooseberries and Barberries, the Pallurus or Christs Thorne, the Pyracantha or ouergreene Hawthorne and Sauine tree, the *Ficus Indica* or *Indian* Fig, and the *Indian Iucca* which hath a prickly pointed leafe, & in the second Classis of this worke the purging Rhamnus or Buckes thorne: of the rest I shall speake here in order as they come next hand, and first of the Rest Harrow which is distinguished into two kinds, the one thorny, the other gentle without thornes which is to be ioyned to the other for the names sake, of each whereof there is some varietie as the ensuing Chapter will shew.

Anonis spinosa flore purpureo. Common Rest Harrow with purplish flowers.

The common Rest Harrow that is frequent as well in arable as waste grounds and by hedges, riseth vp with diuers woody twiggie, halfe a yard or a yard high, set at the ioynts without order, with little roundish leaues more then two or three at a place, of a darke greene colour, without thornes whiles they are young, but afterwards armed in sundry places with short and sharpe thornes: the flowers come forth at the tops of the stalkes and branches whereof it is full, fashioned like Pease or Broome flowers, but lesser, darker of a faint purplish colour, after which succeede small pods containing within them small seede: the roote is blackish on the outside and whitish within, very tough and hard to breake, of a sweetish taste, and as hard as an horne when it is dryed, thrusting downe deepe into the ground, and euery little peece being apt to grow againe if it be left in the ground.

Anonis spinosa flore alba. Rest Harrow with white flowers.

This Rest Harrow differeth in little else from the former then in the leaues which are a little fresher greene, and the colour of the flowers which are very white in some places more then in others, in other things they

Anonis spinosa montana lutea major. The great yellow prickly Rest Harrow.

This differeth from the former onely in the leaues which are somewhat larger and longer and in the flowers which are yellow like the other yellow kinde without thornes.

Anonis spinosa lutea minor. The lesser yellow prickly Rest Harrow.

This other yellow Rest Harrow that hath thornes or prickes thereon is like the last yellow sort, but lower and seldome rising aboue halfe a foote high, differing not in any other greater matter from the last.

Anonis non spinosa flore purpureo. Purplish Rest Harrow without Thornes.

This Rest Harrow hath no other difference in it from the most common, but that this hath no thornes or prickes

Original from UNIVERSITY OF MICHIGAN

upon the sprigges, no not in Autumne when the other will have very many. Of this sore there is one likewise that beareth white flowers which maketh all the difference.

Flore albo.

6. Anonis non spinosa lutea major.

The greater yellow gentle Rest Harrow.

This great yellow gentle Rest Harrow shooteth from the roote which is long rough and blackish, divers flexible woodly twigges branching forth on all sides, covered with a brownish red barke set reasonably thicke with leaves, which are for the most part three standing together upon a long foote stalke somewhat like unto Trefoile, but somewhat small narrow and long with notches at the ends so much overspread with a strong fented clammineſſe that it will sticke so fast to their hands that touch them, especially in the heate of the yeare, and in the hot countries that it will hardly be taken off againe: at the toppes of the branches stand many Peaſe blossome-like flowers, of a faire yellow colour, after which come small & long code with a crooked point at the end of every one of them, wherein is conteined small flatrish seed. Of this kind we have had from *Basil* of *Lisbonne* a lesser sort, whose flowers smelt better then the former: the roots of both are annuall perishing yearely. As also another with a more reddish flower.

Minor flore rubente & f. purpurante.

7. Anonis non spinosa lutea variegata.

Variable yellow gentle Rest Harrow.

This differeth in no other thing from the last yellow, but in the flowers which are of a paler yellow colour, striped all the length of the flowers with reddish stripes, which make them the more conspicuous and regarded.

8. Anonis viscosa minor lutea pendula.

The lesser yellow gentle Rest Harrow.

This lesser yellow gentle Rest Harrow groweth very low and small not much above an hand breadth high, having many branches of two or three inches long a peece, with leaves set thereon, three joyned together for the most part and clammy also like the other yellow sorts, the flowers stand in like manner at the toppes of the branches

1. *Anonis non spinosa lutea major.*
Common Rest Harrow with yellow flowers.

6. Matth. Plinij sive Anonis non spinosa lutea major.
The greater yellow gentle Rest Harrow.

7. Anonis non spinosa lutea variegata.
Variable yellow gentle Rest Harrow.

allow but smaller and hanging downewards: the seede that followeth is much like the other, but smaller and in smaller cods. Of this sort also wee have had from the said *Bord* two other sorts with reddish flowers both of *Vine asters & perennis sinuata*, them growing low and small, the one being but annuall and the other abiding.

The Place.

The first second and fift with the varietie thereof grow in many places of our Land, as well in the arable as pasture grounds, but the third and fourth I never met with growing naturally any where in our country, although I had of the fourth that it groweth as well about *Brifford* as *London*. *Lobel* saith the third groweth on the hills about among the *Pyrenæi*, and *Columna* saith the fourth groweth in the kingdome of *Naples*: the first, second, fift with the varieties groweth as well in *Narbone* in *France*, and about *Montpelier* as in *Spaine* and *Candy*.

The Time.

They all flower about the beginning of middest of *July*, and their seede is ripe in *August*.

The Names.

Dodonæus and *Gesner* call it *Ononis Anonis*, *Theophrastus* and *Galen Ononis Ononis* the Latines keepe both names; *quia quod pro cibo animalibus apponitur, dicitur onobrychis, siquidem oneratos eo asinos ferre solet, onus enim Græcis dicitur quod pro cibo animalibus apponitur: nisi quis ex adverso somen indicum putaverit: Ononis à Græcis dicta, quasi onesis, ab utilitate, quam ex ea percipiunt rustici, quidam affirmant asinos in ea se volutare & delectari, sed tum arietes libenter pascere*, in English *Arrestbeeues* and *Restharrow*, and *Remoram aratri*, because the roots are both so tough that the Plough cannot easily cut them, and so deeply and strongly fastned in the ground that the Coulter happening under it makes the Oxen to bee at a stand for the time twitch, not being able without more then ordinary strength to pull it forth. *Cordus* in *Dioscorides* calleth it *Acanthia*, because the thornes doe pricke those that unwarily goe into the fields. *Matthiolus* adviseth not to bring *Ononis* into a garden least it prove *Anonis* that is not lightly to be rid, but with much adoe, not easie to rid it out againe. *Augustanus* tooke it to be *Lycopsis Cretensis*. All writers elle call it *Ononis Anonis*, *Remora* or *Resta bouis* with the severall distinctions of *spinosa* or *non spinosa*, and according to the varietie of flowers onely the great yellow without thornes is taken of most herbarists to be *Natrix Plinij*, which I will not gainsay in doubtfull, saying, hee will neither guesse nor divine by what argument it is supposed: nor will I bring much to disprove them, yet *Dioscorides* doth rather thinke the *Genistella spinosa* the *Natrix*. The *Italians* call it *Arresta Bouina* and *Resta bous*, the *Spaniards Gatilloes* and *Gatimos*, the *French Arreste bœf*, the *Low Dutch Harbarsse* and *Ockenbreck*, the *Dutch Krangwortele*, alias *Stalkruyt*, and wee in *English* Rest Harrow or Rest Plough rather then Rest Oxen as it is in other languages, in some countries also Cammock crooke white.

The Vertues.

Galen saith that the decoct of Rest Harrow is hot in the third degree having some cleansing and cutting facultie, therefore it is singular good to provoke urine when it is stopped, and to breake and drive forth the stone, and the powder of the barke of the roote taken in wine performeth effectually: *Ætius Callisthenes* writeth, that many were freed from those diseases that used the said powder in wine for many dayes together, and the same doth he perhaps difficile called *Ramices* or *Hernia carnosa* the fleshy rupture, that is, that fleshy carnositie by and by consumed, in taking the said powder for some moneths together constantly, when as the Physitions of Chirurgions had given them over, as desperate or no otherwise to bee cured but by cutting or burning: the decoct thereof made with some vinegar and gargled in the mouth easeth the paines of the toothach especially of the gumme: some also affirme that the decoction hereof drunke doth helpe the painefull hemorrhoides: it is certainly found true that the said decoction taken is very effectuall to open the obstructions of the liver and spleene, and the other parts: a distilled water made in *Balneo* with foure pounds of the roots of Rest Harrow, first sliced small, and afterwards steeped in a Gallon of Canary wine, is singular good likewise for the purpose aforesaid, and to cleanse the passages of the urine, not suffering any matter that is clammy to gather and of hard to become a stone: the said quantitie of the roots sliced and put into a stone pot close stopped with the like quantitie of wine, and so set to boyle in a *Balneo Mariæ* for 24. houres is as daintie a medicine for the headache as any the daintiest Lady in the Land can desire to take, being troubled with any the aforesaid griefes. The powder of the said roots made into an Electuary or Lozenges with Sugar, as also the broke of the roots boyled tender and afterwards beaten into a Conserve with sugar worketh to the like effect. The decoct of the roots applyed upon the hard callous, brims of ulcers, or the said powder mixed with any other fit thing and applyed doth consume the hardnesse and cause them to heale the better: it is reported that the young sprouts and tender stalkes before they became prickly were pickled up to bee eaten as a sallet, wonderfully commended against a stinking breath, and to take away the smell of wine in them that have drunke overmuch. *Pona* in his *Italian Baldus* saith that divers Apothecaries with them there in *Italy* doe prescribe the yellow Rest Harrow in stead of Melilot either through want or ignorance.

Chap. XVIII.

Tragacantha. Goates Thorne.

Bauhine differeth from *Bauhinus* who differenteth from *Clusius* and others, that make *Poterium* another kinde of *Tragacantha*, and differing from the *Pimpinella spinosa*: for I shall doe contrary to him, and that for good reason for it, as shall be shewed by and by, and speake of the *Pimpinella spinosa* in a Chapter by it selfe, because I finde the difference betweene *Poterium*, *Tragacantha* and *Pimpinella* so great as I could in many things.

Tragacantha vera. The true Goates thorne.

This shrub groweth to a small outline plant rising up with many tough pliant or flexible woodly stemmes of a cubit or two foote high divided into many slender branches, covered with a white hoarinesse, and armed with white thornes in a double row, among which rise up divers winged leaves that is, many

Original from UNIVERSITY OF MICHIGAN

small long and round leaves set on each side of a middle ribbe, which abide on all the winter long and fall not away vntill the spring doe bring on fresh, and then fall away, at the roppes of the branches and among the leaves come forth the flowers which are of a whitish yellow colour, fashioned some what like vnto the flowers of Pease, after which come small short vpright white cods, wherein are contained small whitish kidney like seede, the roote is very great and long, spreading much and farre in the ground, which being broken or wounded, yeeldeth a rough pure thinne white gumme, in small crooked peeces falling some what sweete. There is another sort hereof whose stalkes and branches are blackish and woodily, having small thinne leaves all set on one side, and not oppolite as in the former, the flowers and seede is some what like, but the roote yeeldeth no gumme.

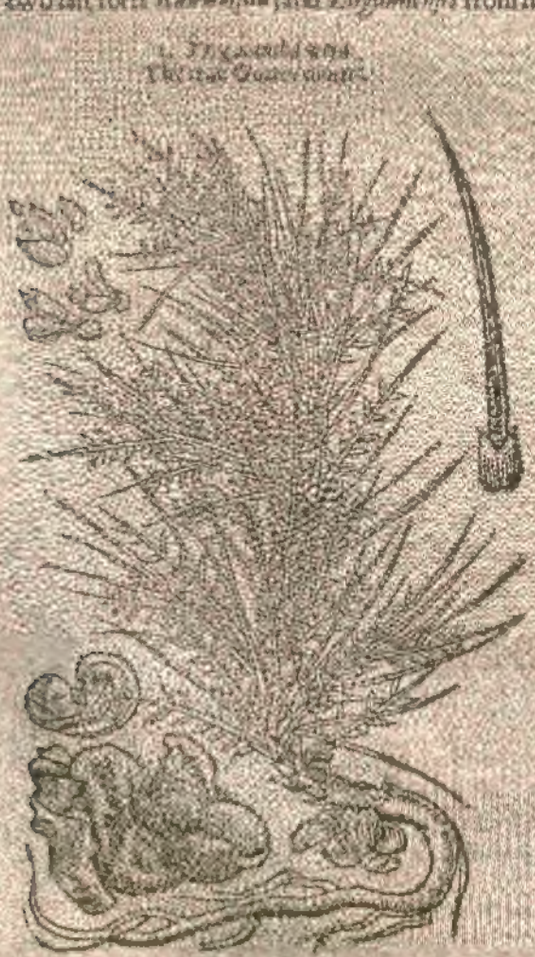
Altera non spectatur.

3. *Tragacantha Theophrasti Asiatica Peltarion forte Dioscoridis.* The small Creetes thorne.

This other Goats thorne is so like the last that it is often mistaken for it, growing lower and smaller from the other, yet spreading and shooting forth plant flexible stalkes, covered as it were with scales, about a foot high from whence springeth vp a cottony or woolly head, which breaketh into sundry winged leaves in the spring of the yeare, made of many small and almost round leaves being set on both sides of a middle ribbe, which are very hoary and as it were woolly at the first budding forth, which the former hath not and to continue long vpon as they abide on the ribbe, which proveth a thorne very cruell sharpe and prickly at the end when they are fallen away, so that all the winter long no leafe is seene on any, and the thornes that have all their leaves have any more growing on them, but abide bare and naked thornes ever after, the roote seeming all the winter long nothing but long sharpe white thornes: from the upper parts of the stalkes come forth two or three small flowers standing together, made of two leaves a peece an vnder, and an vpper, both formed like vnto hoods, each flower in a hoary huske or hole, the pod that followeth is hoary, white, thicke, short and not very broad, ending in a point wherein is contained whitish seede, some what like vnto a *Kidney* seede, the roote great long and rough, blackish on the outside and white within, some what sweet and gummy, yeelding but little gumme and that more yellowish. There is another sort hereof whose branches are very many not rising much above the ground, but they are many and thicke growing together, the roote being woody yeeldeth a gumme like vnto *Tragacantha*.

Pyrenaica aliud.

4. *Tragacantha Syriaca flavescens.* The yellow *Syrian* Goates thorne.



This *Syrian* thorne differeth very little from the last but in the flowers which are yellow, standing in round yellowish huskes, and that the whole plant groweth lower.

5. *Tragacantha Syriaca purpurascens.* Purple *Syrian* Goats thorne.

This other *Syrian* kinde is as low as the last, having many browne thicke stalkes, thicke set with leaves and many white heads at the toppes, out of which come purple flowers like the former which are very beautifull.

The Place.

Both the former sorts with their varieties have beene found as well in *Candy* as about *Atramithe* and *Thessalonica*: the first anciently known both there and in other places sufficient plentifully, but the other was also found by *Clusius* in the kingdom of *Granada*, a more exact figure whereof was sent vnto him after he dyed from *Constantinople*, which is not farre from *Adrianopolis*, and is published in his *Curæ posteriores* in quarto, pag. 115. the other two last sorts *Rauwolfius*, and *Lugdunenſis* from him in his *Appendix* setteth forth to grow in *Syria*.

1. *Tragacantha vera.*
The true Goates thorne.

2. *Tragacantha altera spinosa tenuifolia seu Digitata.*
Small leaved thorne.

Original from UNIVERSITY OF MICHIGAN

The Time.

All these doe are very tender to keepe with us, not enduring the cold of these cold climates without extraordinary care and provision, but in their naturall places flower and seede in the beginning of Autumne.

The Names.

That is undoubtedly knowne to be the *τραγακανθα Tragacantha* of the ancients, *id est, Hirci spina* not from any thing that of a Goate as the *Tragium* and *Tragoriganum* have, but from the sharpe forme of the bush with the leaves growing representing a Goates beard, the gumme likewise that is gathered from the rootes when they are cut or broken in the heate of the yeare is called *Gummi Tragacantha*, and in the shoppes of Apothecaries *Gummi gratia dragant*, the varieties there of is mentioned by *Alpinus* in *Libro de exoticis plantis*: the second supposed by the best herbarists in these times to be the *Spinosa Poterium* of *Dioscorides*, which as they say he calleth *Veneris quod nervis omnia sit & Poterium quod petrie herba subdolcem & gummique solum emittat*, as some say, for both it was called also *Pterocnum*: this differeth from the *Tragacantha* but yet commeth neare the same unto the *Pimpinella spinosa* as you shall heare in the next Chapter, the chiefest difference betweene the *Tragacantha* and *Poterium*, consisting in that it keepeth no greene leaves in Winter as *Tragacantha* doth, is more hairy or woolly and spreadeth more abroad with the branches then *Tragacantha*, which groweth more close and upright but agreeth there with in the small leaves and sharpe thornes and in the roote which yeeldeth a gumme, somewhat like to gumme *Tragacantha* but the *Pimpinella spinosa* hath both differing leaves branches and fruit, smaller and lesser prickly thornes and a dry lapidose roote which yeeldeth no gumme, and abideth ever green. Now let others judge whether this be more likely referred to *Pimpinella spinosa* as *Bauhinus* or to *Tragacantha* as *Lobel* doth who calleth it *Tragacantha altera forte Poterium*, and so doe *Lobel, Tabernæmontanus, Alpinus* and *Lugdunenses* and *Bellonius* likewise as it is likely. *Bauhinus* himselfe although he severs from the Cistus of Crete who yet calleth it *Tragacantha affinis*. *Matthiolus* calleth it *Poterium* and so doth *Tabernæmontanus* and *Lugdunenses*. *Rauwolfius* misseth it but saith *Tragacantha* and *Lugdunensis* in his *Appendix* in the like sort alters him: the particulars are set downe by *Rauwolfius* in his second booke and in the said *Appendix* of *Lugdunenses*.

The Vertues.

Thou must note that the leaves flowers, seedes or rootes of *Tragacantha* are used to any purpose, but only the gumme of the, which besides the physicall uses serveth to many purposes as a kinde of starch or glew to binde other things withall: the gumme dissolved is often mixed with pectorall Syrupes, honey or juice of Liquorice to take the cough or hoarsenesse in the throate sake, and sharpe distillations of rheume upon the Lungs, being taken in a morning or put under the tongue so to distill gently downe: the said gumme dissolved in fayre water a long time and drunke, is available for the gnawing paines in the bowells and the sharpenesse and frettings of the, either in the reynes or bladder, especially if some harts horne burnt and wall be mixed therewith: the said gumme is in ocular medicine helping thereunto, being used alone or mixed with other things to the purpose, to take the heate and sharpenes of hot rheums falling into them, and strengthneth and hindereth more then *Sarcocolla*, the oil gumme mingled with milke taketh away white spots growing in the blacke of the eyes, the whites also of them and wherles and scabbes that grow upon the eyelids being somewhat terrified and mixed with the juice of Quinces and used in a glister is good against the bloody flux. And generally used where there is cause of making smooth any of these parts that is the Lungs, Chest, Throate or Windepipe growen hoarse or sharpe by meanes of to represse or dry up defluxions of sharpe and thinne matter to the throate, jawes, &c. as for Vlcers any of these parts it is an excellent and approved remedy: the rootes of the second which as I sayd is verily held to be the true *Poterium* of *Dioscorides* boyled in wine and drunke is profitable against the poyson of the red toade, and being made into a pultis and applyed to any of the Neeves or Sinewes that are wounded cut or hurt closeth them and soder them together, as also all other sores of wounds and cuts: the said decoction of the rootes in wine is also effectuall for the said purposes to bee drunke, and for inward wounds and veines that are broken.

Chap. XIX.

Pimpinella spinosa. Thorny Burnet.

The thorny Burnet (taken of divers to be *Poterium* but much differing therefrom, as I have said before, and shall here more plainely) spreadeth divers woodily schurish twiggy stalkes round about, not rising much above a cubit high branching and interlacing it selfe one within another very much bearing finely winged leaves of many set together on both sides of a middle ribbe, which upon the first appearing are closed together, and afterwards spread themselves more largely and deeply cut the leaves small sharper leaves, greene on the upper side and hairy white underneath, with many little thornes, not very strong or sharpe, set confusedly upon the stalkes and at the ends, at the toppes and the branches stand divers small reddish greene flowers set together, after which come small berries growing together like unto small Blacke berries, or Mulberries, greene at the first and reddish afterwards: the root is greene long and slender, spreading much under ground, being tough and not easie to breake, without any gum comming therefrom when it is broken.

The Place.

This groweth in *Candy* as *Honorius Bellus* saith and *Alpinus* also upon the hills where Time, Savory and Asparagus grow with them having Vodder growing upon it also: and upon the side of mount *Libanus* in *Syria* as *Rauwolfius* saith, and as *Clusius* saith in the vallies beneath the hilly woods in *Savoy* about *Aurra* which is a little mount from *Montmelian* but is never found in wet or marshy places.

The Time.

It flowreth in the end of Summer, and the fruit is ripe in Autumne when the young leaves begunne to spring

Pimpinella spinosa. Thorny Burnet.

The Names.

This plant is generally called *Pimpinella spinosa*, and by some as is aforelaid *Poterium* but falsly for *Poterium* as you have heard before hath very strong and long white thornes, the leaves are like lentills, the fruit are cods wherein lye the seede and the roote yeeldeth a kinde of gumme, all which are contrary herein as you may perceive by the description, the leaves hereof being dented about, and in shew very like Burnet which together with the prickes hath caused the name of thorny Burnet. *Honorius Bellus* in his second Epistle unto *Clusius* sheweth very learnedly and by sound and good reasons, that this plant being called *Stoebe Stechada* not onely in *Candy* but of the Greekes in generall (which name is but corrupted from *Stoebe*) is the true *Stoebe* of *Dioscorides* although hee hath not given any description thereof (but differeth much from the *Stoebe* of *Galen*) but because the names are so like, then that the drying qualities herein are answerable to the *Stoebe* of *Dioscorides*, next hee sheweth that the *Phleon* of *Theophrastus* l. 6. cap. 1. called also *Stoebe* of some as he saith (and not *Phleum* which is a marsh or water plant) the affinitie of the names having deceived many learned men in taking them to be both one, is numbred by him among the thorny plants that have thornes beside the leaves as this Burnet hath (and not as *Gaza* translateth it, as the thorny leafe hath another leafe placed with it) comparing it therein unto *Ononis* and *Tribulus*: and that *Stoebe* is a thorny plant, *Plutarke* in the life of *Theseus* sheweth, where saying, *Ixion* the sonne of *Mona* perceiving care to plant a colony at *Caria* from whence the *Ixiones* and their originall, have this custome among them that they neither borne the thornes of *Asparagus* nor of *Stoebe* but have them in reverence and honour: *Ælian* also in his third booke and 29. Chapter affirmeth that *Epithymum* (or rather *Cuscuta*) groweth upon *Stoebe* but whereas *Theophrastus* in his 6xt booke and third Chapter seemeth to make it peculiar to *Phleo*, *Cappari* and *Trifolium*, to have not onely a thorny stalke but a prickly leafe also, but differing herein much from himselfe for in the same booke and 8th chapter hee saith, that *Phleos* and *Hippophaes* (which *Gaza* translateth *Lapsana*) have gentle leaves and not prickly as *Intybus* or *Cappari* hath: but *Pliny* in his 21. booke and 95. Chapter as rightly considering what *Theophrastus* had written of *Stoebe*, hath not onely erred himselfe but hath been the cause of many other mens errours. Now concerning *Phleum* that it is a plant farre differing from *Stoebe* and reckoned alwayes by the Greeke writers among the marsh plants and not among the thorny, these things may sufficiently induce. Last *Plutarke* in his second booke of naturall questions saith thus, *Learn* must know that all marsh plants such as *Typha*, *Phleum* and *Ulva*, doe neither spring nor grow if the raines fall not in their proper season. *Aristophanes* also saith the same in his Comedy of Frogs, where the quire saith, we have been skipping among the *Cyperi* and *Phleum* rejoycing in their longs: and *Theophrastus* lastly in his fourth booke and eleventh Chapter numbreth *Phleum* among the plants of the lake *Orchomenus*, and appointeth two kindes, the male doth beareth fruit and the female that is barren serving onely to binde things withall, and saith also that the fruit of this *Phleum* is called *Antherix*, whereof they used to make a kee, and is a certaine flat thing like a Cake loft among dish, which plant is yet unknowne to the best herbarists of these times. *Aegilops* tooke the *Pimpinella spinosa* & *Chalcitis sive Creria Theophrasti*, and *Clusius* doth so entitle it also. *Anguillara* saith that the Moors of the country about *Libanus* call it *Bellu* and saith it may well be the *Sanguisorba spinosa* of others: *Clusius Canarensis* call it *Pimpinella spinosa*, and *Bauhinus Poterio affinis folijs Pimpinella spinosa*, as though there were other *Pimpinella spinosa* and that this had leaves but like unto it.

The Vertues.

This is of a very drying and binding qualitie, and therefore is taken to stay laskes and fluxes of the body in herbs being boyled and the decoction taken fasting, which *Honorius Bellus* saith that they of *Candy* doe use to be a sure medicine to helpe them, whensoever they neede for that purpose.

CHAP. XX.

Aspalathus. Spanish thorny bush or Broome.

Dioscorides maketh mention of two sorts of *Aspalathus* the one reddish or purplish under the rinde, and the other white, both which are almost unknowne to the most judicious at these times: *Lobel* in his *Icones* and *Matthias Lobel*, hath expressed the figure of the first *Aspalathus*, and in the *Theatre* of the second differing from those of *Clusius* and others, growing with *Signor Comparini* all which I thinke fit to shew you here.

1. *Aspalathus altera Monspeliensis. Dioscorides* his second *Aspalathus* according to those of *Montpelier*. This *Aspalathus* or thorny bush of *Montpelier* (where the learned did judge to be the second *Aspalathus* of *Dioscorides*

...is a small low bush or shrubbe not rising much above a man, stored with divers branches and sharpe short crooked thorns heading downwards set on them, as also many small green leaves, divers set together on both sides of the middle rib, and ...ggles their Lentill leaves, and such likewise the young branches have, but smaller: the flowers stand on the stronger twigs or branches, three or foure or more standing together of the fashion of Brooms flowers, sometimes more yellow, and sometimes paler, after which come small seedes in small pods.

2. *Aſpalathus alter ſecundus Cluſij.*
Cluſius his other sort of *Aſpalathus*.

This other *Aſpalathus* of *Cluſius* groweth greater higher and longer then the former, and set with sharpe crooked thornes ...ficiently as it, with small leaves on them in the same manner as the coppes whereof grow the flowers like the other, but greater of a paler colour, in the rest there is little difference to ...likenes betweene them.

1. *Aſpalathus alter tertius hiſpanus.*
Small *Aſpalathus* with hairy leaves.

This small *Aſpalathus* groweth usually lower then the first, at ...ne or three foote in height furnished with more slender yet ...der stalkes, but divided into many such smaller branches, ...ey being almost as small as those of Southernwood, being hard and prickly; from the elder branches shoote forth in the spring of the yeare other smalles stalkes bearing many hoary leaves like those of Lentills but softer and larger then those of the first: the flowers likewise being yellow like the other ...ut greater then they by a little: the seede likewise keepeth a proportion like unto the rest.

4. *Aſpalathus ſecundus Dioſcoridis legitimus Pona.*
Dioſcorides his true second sort of *Aſpalathus* according to *Pona*.

The true *Aſpalathus alter Dioſcoridis* (first described by *Honorius Belli* of *Candy* in his first Epistle to *Cluſius* and the figure thereof afterwards exhibited by *Pona* in his *Italian Tables*,

3. *Aſpalathus ſecundus Dioſcoridis legitimus Pona.*
Dioſcorides his true second sort of *Aſpalathus* according to *Pona*.

1. *Aſpalathus alter hiſpanus.*
Dioſcorides his second *Aſpalathus*, according to the ſhape ...

5. *Aſpalathus primus Dioſcoridis odoratus.*
The first sweete *Aſpalathus* of *Dioſcorides*.

wherein is many more rare plants set forth then is in the Latine, and received from *Signor Comaro*, (who hath a Garden stored with the rarest plants that can bee gotten from all parts) is as the said *Belon* saith generally knowne through all *Grecia* retaining yet the old name, wherewith they not onely make hedges and barre their grounds but in some places whole Groves are found stored therewith: and is a small hedge bush growing with many upright stemmes, branched forth into many parts, set full of small sharpe white thornes or prickes without order, and at every thorne on the young and tender branches one trefoile pale greene leafe standing on a footestalke, whose ends are round and dented in in the middle: the flowers stand at the toppe, after which are fashioned like unto Broome flowers at some times, and places, wholly yellow, and at other more reddish or inclining to purple, of so sweete a sent that with the winde it is felt a good way off: whose flowers are fallen there come up in their places small pods, containing within them foure or five small seede like Vetches, lesser then those of *Acacia altera*: the roote is wooddy and brancheth forth in the ground sending forth suckers whereby it is plentifully encreased: the substance of the wood is very hard heavie and white, the heart or core whereof is blackish and utterly without any sent while it is greene, but dryed is better.

5. *Aspalathus primus Dioscoridis vulgatus.* The first and sweete *Aspalathus* of *Dioscorides*.

Although this plant be not throughly described and set forth as the former: with the leaves, flowers and fruite being but declared with the trunke or body and with an arme and a few branches cut short with those onely appearing, yet I thought it not inconvenient to set it forth as it is extant with so much description as is added to it, that others may understand thereof and have thereby some knowledge of it, to further them when they shall happen to meete with it. The barke of the tree is of a blackish ash colour, of an astringent and somewhat bitter taste and biting withall, which being taken off, the inner barke is of a faire purple colour, especially the uppermost which is very thinne, fine and full of small strings or threads, the substance of the wood is some reddish but sinketh not in water as Ebony doth, of a pale colour and blackish for the most part in the middle, of a strong sent, somewhat quicke or fierce: There have beene formerly divers woods shewed and taken to bee true *Aspalathus* as by some the *Lignum Rhodium* and by some the wilde Olive, &c. but all have erred in their judgement, every one of them wanting the notes of the true in some part or other, and this onely consenting and tending thereunto in every thing.

The Place.

The first groweth about *Salamanca* in *Spaine*, as also about *Mompelier* and in *Narbone* of *France*: the second in old *Castile* in *Spaine*: the third at the foote of the *Pyrenæan* hills towards *Spaine*: the fourth in *Candy* & divers places in *Greece*: the last is not declared from whence it come.

The Time.

They all flower somewhat early in their naturall and warme countries, and give their fruit or seede in Summer; but in these colder climates they will hardly endure the first colde of our Autumne: so my selfe have growed who have had them sprunge from the seede that I sowed and have abiden onely the Summer Season.

The Names.

The Greekes call it *ἀσπάλαθος Aspalathus*, and so doe the Latines also, yet *Plinie* from *Dioscorides* saith it was also called *Leptis spinosa* and of some *Serpyllum*. The first three sorts *Clusius* doth acknowledge not any of them the true *Aspalathus alter Dioscoridis*, yet because saith hee others did call the first so (and the others are like unto it) he calleth it and them *Aspalathus alter primus secundus & tertius*. *Lobelius* to impleth them all *Genista spartium spinosum* as *Lobel* doth, set forth in his *Icones*; but in his Observations he calleth it *Aspalathus flore Monspeliensium*, and *Lugdunensis Aspalathus primus Monspessulanus* but should be *secundus* being the former fault; *Augustana* tooke it to be *Acacia altera*, and *Tabernemontanus* calleth it *Scorpius minimus*: the fourth is the *Acacia altera* of *Matthiolus*, *Lacuna*, *Lonicerus*, *Lobel*, *Lugdunensis*, *Gesner* and *Camerarius*: but *Florentinus Bello* in his first Epistle unto *Clusius* sheweth (as *Penna* also from him doth, and as I said in the description) that in Candy and throughout all *Grecia* it is called *Spalathos* to this day, and therefore is confident to call it *Aspalathus primus Dioscoridis*, as *Gesner* also in his Epistles did before him. Who was *Belon* his Tutour: but *Bauhine* because he would go with the greater although not the better number as it should seeme (for he is one of the simplest hunters that I doe here, from that call it *Acacia* and *Aspalathus*) calleth it *Acacia trifolia spinosa*: all onely *Penna* set forth in his Latine and *Italian* description of Mount *Baldus*, who saith that the wood is pale, and yet *Bauhine* in setting it downe in his *Pinax* as having received a peece thereof from *Penna* and some he saith that it was *Lutea cortice cinereo lævi purpureo* making the wood to be purple when as nothing but the inner rinde is so of *Penna* saith that the Spaniards call the first *Enkala*, the second *Aulago*, and the third *Hallada*.

The Vertues.

Dioscorides saith that *Aspalathus* is hot in the first degree and dry in the end of the second, almost to the third. *Serapion* saith it hath an heating qualitie with some attriction, but *Galen* hath it simply moderate saith that *Aspalathus* is so rolle sharpe, together with some attriction also, the faculties therein being of alike parts, yet sharpe whereby it is heating; and harsh or fowre, whereby it is cooling by both which it is drying, and very good against putrefactions and Fluxes of all sorts: a decoction thereof made in wine and gargled in the mouth singular good to heale the fowle Vleers thereof, as also those in the nose to bee smelled up or injected, and those Vleers of the genitoryes or secret parts, if they bee bathed therewith: the said decoction likewise stayeth the laske of the belly and helpeth the spitting of blood, it helpeth also those that cannot make water, and dissolveth hardnesse and swellings. *Pliny* saith the same, and further saith that it helpeth the chappes in the hands or other parts, and that the barke is effectuall against the strangury, as also available to binde the belly, and the decoction thereof stayeth bleedings.

Cxxii.

Chap. XXI.

Genista Spartium spinosum. The pliant thorny Broome.

Of this kinde of Plant *Ranbinus* maketh many forts, some whereof I have placed in the former Chapter as fittest for that place in my opinion rather then this, the rest shall be doctured here.

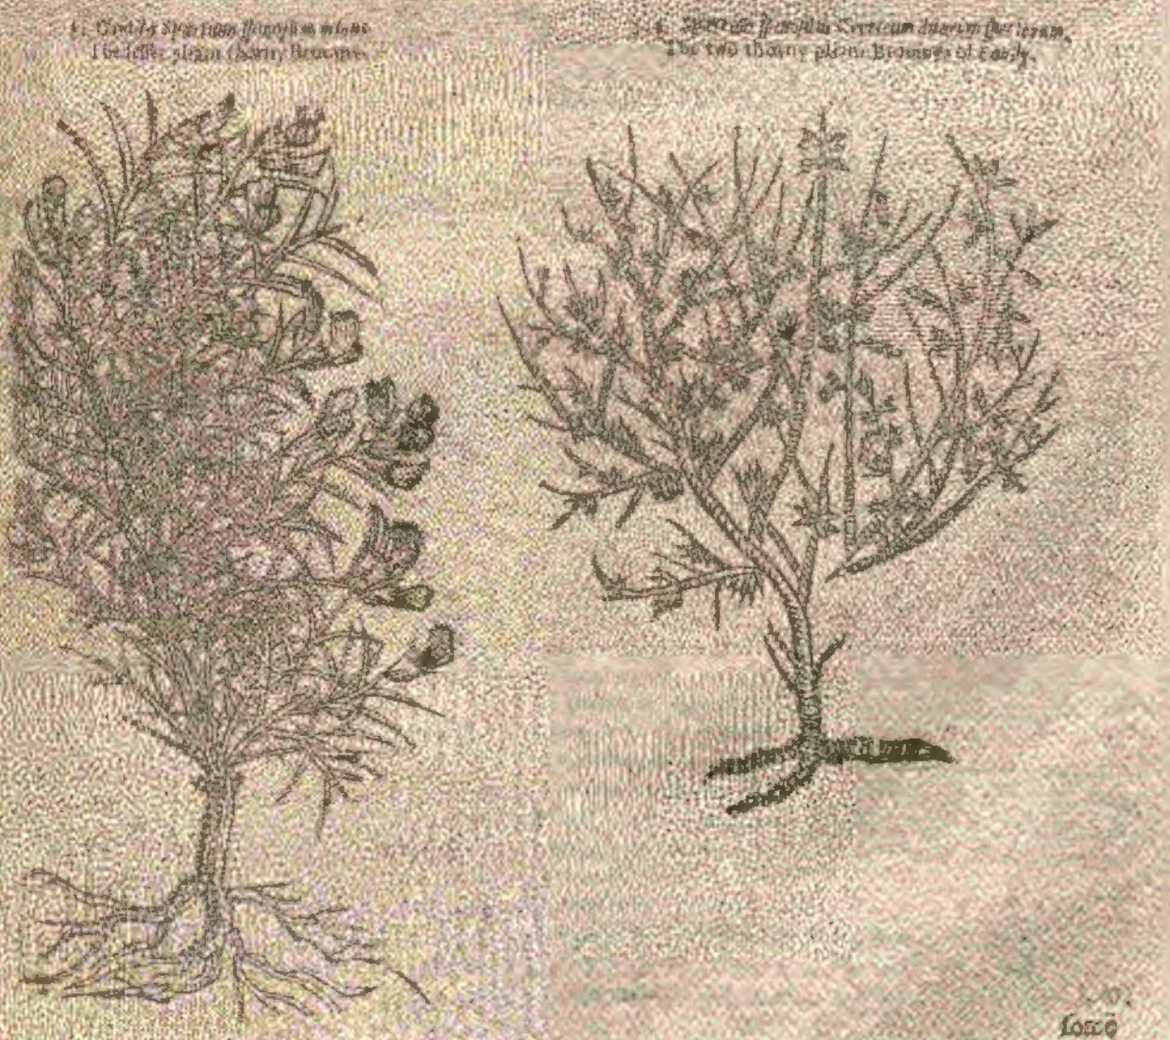
1. *Genista spartium spinosum minus.* The lesser pliant thorny Broome.

This small thorny bush riseth about a foote high set with most sharpe thornes, placed in order two and two together one against another, of a pale greene colour, many branches of these thornes springing from the stalke towards the top, at the ends whereof stand three or foure such yellow Broome like flowers as are described in the former, after which come small short pods like cyclosel in a hoary woolly downe that they seeme as if they were covered with cobwebs, wherein lie small seede lesser then Vetches: the roote is long and spreadeth wide.

2. *Genista spartium spinosum Syriacum.* The pliant thorny Broome of *Syria*.

This thorny plant riseth up more then a cubit high, set with divers branches and small long ash-coloured leaves somewhat soft and gentle then the other, and more sparsedly placed also, having divers long and narrow ash-coloured leaves with thorns like unto those of Knotgrasse: the flowers are of a purple colour, growing in small red husks, after which come small long pods like unto the Scorpion podded seede vessells, containing seede within them: the roote is long and browne.

3. *Spartium spinosum Creticum.* The pliant thorny Broome of *Candy*.



This thorny Broome riseth up with a woodily stalke or Rennne covered with a blackish barke, spreading sundry long blackish branches, and they againe divided into smaller like rushes, all ending in sharpe thornes, between which here and there at the joynts of the branches, where also come forth fine small hoary leaves standing: the flowers are small and yellow succeeded by small long pods and small seede in them.

4. *Spartum spinosum aliud Creticum.* Another pliant thorny Broome of *Candy*.

We have added the figure hereof with the foregoing plant, and that it should not passe undescribed, but take it for such as it growth very tall & high, bushetli and branchetli forth very much, the slender pliable greene branches mantled with small white spots, having three small leaves at a joynt, with yellow flowers and small pods with seede: each branch and twiggs ending in a long thorne at the last.

5. *Erinaceus Hispanicus Clusij.* *Clusius* his *Spanish* Hedgehog Thorne.

This rare thorny plant groweth to be scarce a foote high spreading many stalkes and branches one entered among another, and all set in a round forme or compasse replenished with a number of small sharpe thornes growing at the toppes of the branches, stand three or foure flowers, always together of the same fashion and forme, but of a blew with purple colour set in rough and hairy hoary husks, while it flowreth there are

1. *Genista Spartium spinosum minus.* The lesser pliant thorny Broome.

3. 4. *Spartum spinosum Creticum diversum per icones.* The two thorny plant Broomes of *Candy*.

5. *Echinopodes Hispanica cluſii.*
Cluſius his ſpanish Hedgehog thorne.

6. *Echinopodes frutex Creticus.*
The Hedgehog Thorne of Candy.

ſome few ſmall leaves to bee ſeene upon it in ſundry places, but they quickly wither and fall away, leaving the buſh without a leafe thereon all the yeare after, which by the round forme of the branches with the thornes ſticking forth, doth repreſent a Hedgehog ſo fitly that the inhabitants thereupon have termed it *Echinos*, that is, an Hedgehog, the roote ſpreadeth many long ſtrings and fibres on them under ground.

6. *Echinopodes frutex Creticus.*
The Hedgehog Thorne of *Candy*.

The other ſmall Thornie buſh groweth up with many thorny greene ſprigges and branches ſet cloſe together, having always three prickes or thornes growing together at every place, and is ſeldome ſeene likewiſe to have any leaves thereon becauſe they fall away ſo quickly; *Cæſalpinus* ſaith it never beareth any) the flowers hereof groweth at the toppes of the branches in great plentie (but *Alpinus* denyeth it and ſaith it beareth but very few) are yellow but like the other in forme, whereof the Bees never doe taſte, ſtanding in whitiſh greene huskes, a little hoary all over, and afterwards ſmall pods with very ſmall ſeede in them; this is very tender to keepe, not enduring any cold place Sommer or Winter.

7. *Echinus Creticus.*
The ſmall round Hedgehog Thorne of *Candy*.

This Thorne (ſaith *Alpinus*) doth better reſemble a *Tragacantha* then the former *Echinopoda* as *Honorius Belus* would have it; for the round formed thorne is not much bigger then a hand Verſum or Hedghog, ſtarting aboue two or three fingers from the earth, but ſpreading the blacke branches halfe way within the ground, very thicke ſet together, and ſhooting out ſmall roots at the joynts as they ſpread, all which end in ſmall ſhort white and broad ſharp thornes thwarting one another thereby forming as it were croſſes or ſtarres, not having any leaves at all upon them, but innumerable ſmall flowers like unto *Hyacinths* for their forme, but much ſmaller, after which ſucceede ſmall long pods like unto thoſe of the other *Tragacanth*: it groweth round and ſpreadeth not further out of that forme: the *Candiots* call it *Calaſcharvida*.

The Flaw.

The firſt as *Cluſius* ſaith groweth on the hills neare the kingdome of *Granado* going to *Cordoba*, the ſecond *Reinolfius* found about *Aleppo* in *Syria*: the third *Cluſius* found in the kingdome of *Valentia* in a ſmall towne called *Sietenguas* moſt plentifully, which is in the way to *Madrill* the laſt *Belonius* found in *Candy*, and *Honorius Belus* ſaith in all *Grecia* likewiſe beſides.

The Time.

All these doe flower in the beginning of Somner, yet *Clusius* saith hee found the third in flower in *April* where it grew naturally.

The Names.

Bauhinus as I told in stituleth all these plants *Genista spartium spinosum*, calling the first *minus*, because he made the third in the last Chapter to be *majus*. *Clusius* calleth it *Scorpius secundus*, and thinketh it may be the *Echinospartos* of *Honorius Belus* for that as he saith it grew very like it, and *Lugdunensis* teemeth it *Aspalathus foliis carduo similibus* calleth it *Genista spartium spinosum alterum*, *Cæsalpinus Spina Christi* and *Dodonæus Genista spinosa altera* and *Tabernæmontanus Scorpius tertius*: the second *Lugdunensis* in his *Appendix* sheweth out of *Rauwolfius* journal, that the Moores of *Aleppo* did call it *Alhagi* on whose leaves a kinde of Manna called by the *Arabians Terenjabin*, and by the Moores *Trunschibin* was used to be gathered especially in *Persia* and calleth it *Hostia spinosa glumacea Alhagi*, and *Bauhinus Genista spartium folio polygoni* the third *Alpinus de plantis exoticis* calleth *Spartum spinosum*, and the fourth *Spartum Creticum* the first *Clusius* calleth *Erinacea* from the *Spanish* word *Erica*, for the thistle in the growing round with prickles and thornes unto an Hedgehog, *Cæsalpinus* calleth it *Genista rotundo glomerata flore*, *Lobel Spartum aphyllon frutescens juncea aculeis lunatis folia*, *Tabernæmontanus Scorpius quartus* and *spartum aculeatum aphyllon*: *Gerard* maketh it his fourth *Genista spinosa humilis*, and saith it groweth in the South and West parts of this Land, but sure I am he is much mistaken therein, for in his description hee saith it hath yellow flowers which this hath not: *Bauhinus* calleth it *Genista spartium spinosum folijs Leucoii flore obscure cærulea purpurascentibus*: the first is mentioned by *Belonius* in his first booke of Observations and 18. Chapter calling it *Echinopoda*, and as he there saith is very like unto *Aspalathus*, but *Honorius Belus* in his second epistle to *Clusius* contrary to him therein, shewing that *Echinopoda* differeth much from *Aspalathus* both in the greatnesse of the plant or both, being much greater then *Echinopoda*, as also having fewer thornes, and three leaves together, long abiding contrary to *Echinopoda* and sheweth it to be very common in all *Greece*, and in the Iland *Chio* or *Scio*, and that *Dalechampius* was much deceived herein in his marginall note upon *Athenæus*, making *Echinopoda* to bee *Cardui Chij genus*, and that it may appeare to her commonly growing there, and so he, *Plutarke* in his *Symposiaks* and *libro de auditione* towards the end, setteth downe this old *Distichon*,

Inter Echinopodas velut asperum & inter Ononin,
Interdum crescens mollia Leucoia.

And to doth *Athenæus* likewise mention it in his third booke of *Dipnosophistes*, as still growing among *Onons* and *Leucoia* is still being one, *Pliny* also in his eleventh Booke and eighth Chapter mentioneth it under the name of *Echinopus*, *Adelphius Gallogræcus* knew it not, for in his Epistle to *Longinus* he numbreth it among the unknowne plants to him.

The Vertues.

The second *Rauwolfius* saith is hot and dry, and that the *Syrians* with an hand full of the leaves make a decoction in water and drinke it, whereby they purge themselves: but I doe not finde any mention of the vertues of any of the rest of these plants, eyther used by the learned or by the inhabitants where they grow, and therefore until I can learne more of them I must be silent also.

Chap. XXII.

Scorpius sive Genista spinosa. Thorny Broome and Furse.

Having as well before in this Worke as in my former Booke shewed you all the sorts of smooth Broomes or without thornes, and in these two last Chapters divers thorny bushes comming nearest to the thorny Broomes, it remaineth for me to declare them also, which although some grow so wild on barren heaths and dry grounds in our owne Land that they are not thought fit to bee planted in a Garden, yet there be divers others that are, let me not therefore sever them into many places, but set them together in this Chapter, the common Furse bushes being of the same tribe or family.

1. *Genista spinosa major vulgaris sive Scorpius Theophrasti quem Gaza Nepam transtulit;*

The ordinary great Furse bush or Scorpions Thorne of *Theophrastus*.

The ordinary Furse or Furze (as it is called in some places) is well knowne to grow much higher in some places then in others, yet still keepeth his forme, which is to send forth many wooddy grayish stalkes full of greene branches, and set with sharpe pointy thornes on all sides, so thicke that it seemeth nothing but thornes, and is seldome seene to have leaves on it, for if they be not heeded in the Spring when they come forth on small stalkes, long, round, and almost round, yet pointed at the ends, and some a little narrower and longer, many set together like unto tufts, of a middle size, of a grayish greene colour above, & silver like or hoary white underneath, they quickly fall away and are not seene, so that many have thought it never bringeth forth any: the flowers are many standing at the ends of the branches, like unto those of Broome and almost as yellow, but not so shining, after which succeede thicke and short pods covered with a whitish hoary fleece, and with a twisting point or end, wherein are contained small blackish seede: the roote is long tough and spreading.

2. *Genista spinosa flore albo.* The white flowred Furse bush.

In the Northern parts of this Land I heare that in divers places, the Furse or Gorse bushes as they there call them have very white flowers, differing in nothing else from them that beare yellow, for they are oftentimes seene both growing together in one ground.

3. *Genista spinosa minor.* The lesser Furse bush.

The lesser Furse bush groweth alwayes lower, full of branches, and with smaller and shorter thornes thereon in the Summer time hath many small greene leaves standing in the same manner which abide much longer on the branches before they fall away, which is not until the end of the Spring or beginning of Summer, so that leaves and flowers are oftentimes seene a good while together: the flowers are smaller then the former and of

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

of a paler colour: the cods are small and short without any treese upon them, blackish when they are ripe, and the seede reddish within: the roote is long, tough and wooddy.

4. *Genistella aculeata.* The small prickly Broome.

This small Broome seudeth from the roote divers upright slender greene stalkes set with many small sharpe and short prickles on all sides from the bottome upwards, and branching forth into divers parts, having many small hard greene leaves growing on the younger branches, at the toppes whereof stand many small pale yellow flowers, much smaller then any of the former, and small long pods a little pointed with small seede therein following them: the roote groweth not very deepe, but spreadeth tough long strings.

4. Genistella aculeata
The small prickly Broome

1. Genistella Monspeliaca spinosa,
Small thorny Broome of *Monspelier.*

This French thorny Broome hath divers slender pliant twigs bending downewards, of a span long or more, whose lower part is divided into many very short branches which are nothing but thornes, and from the middle upwards spread also into branches that are hairy, but without any thorne or prickle on them, having many small hairy leaves set on them and some smaller also with them: at the toppes grow such pale yellow flowers like unto the last. A greater sort hereof hath beene brought out of *Spaine.*

Orig. Hispan.

6. Genistella minor Asparoides,
Small prickly Broome like *Asparagus.*

This small bush groweth a foot high or more, with a round wooddy stem covered with a reddish bark, set here and there very sparingly with some few small thornes divided into branches, which likewise are parted into other smaller branches, whereon are set a few small and long leaves, and some more round also, the flowers stand not all on the toppes, but some from the bottome of the stalkes and leaves, not much smaller then the last, and of as pale a yellow colour, the branches not ending in a thorne as it doth.

The Place.

The foure last sorts grow in our owne Land on dry barren

5. Genista hispanica.
The Spanish Broome

6. Genistella minor
The small prickly Broome

...and other waste gravelly or sandy grounds, and so doth the last as also about *Orleance*; but the first is found about *Montpelier* and hath beene brought out of *Spaine* likewise.

The Time.

They all flower in the Summer months but the greater sorts somewhat earlier then the lesser.

The Names.

...which are generally taken to be the ... *Scorpius Theophrasti*, which *Gesner* mistaketh: *Nepa in lib. 6. cap. 1.* ... with *Carrum* and *Scorpius* are wholly compacted of thornes, because that *Scorpius lib. 9. c. 14.* whose ... doth represent a Scorpion, and is good against the sting thereof, and which here calleth *Pelliphonon* ... Chapter of the same ninth Booke, which doth most properly decipher out the *Dorycnium* whole ... very like unto Scorpions as I have shewed before. So that the word *Scorpius* is ... word of many significations in *Theophrastus*, but *Gesner* doth most unpeoperly make them both *Vepres*, there- ... ranging this prickly *Scorpius* with the other: The first is the *Scorpius prior* of *Clusius*, *Scorpius alter* and ... of *Dodonæus* and *Tabernæmontanus*, and *Genista spinosa* of *Bauhinus*, *Lobelius* calleth it *Genista spinosa* ... the second as I take it peculiar to our owne Land, and not mentioned by any but ... yet *Bauhine* referreth it to the next: the third is the *Nepa Theophrasti* of *Lobel*, *Camerarius* and *Ta-* ... and *Scorpius Theophrasti* of *Lugdunensis*, *Scorpius sive Nepa* of *Anguillara*, and called by *Bauhinus* ... *Genista minor brevibus aculeis*: the fourth is the *Genistella* of *Tragus*, *Fuchsius*, *Dodonæus*, *Lugdunenses* and ... *Genista minor, seu Genistella spinosa* of *Gesner in horto*, *Genistella minor* of *Lobel* (who doubteth not to say ... *Plin. lib. 20. c. 4.*) *Excrescentiæ* and *Lanceræ*, called by *Cæsalpinus Corymbosis floribus spinosa*, and ... *Genista spinosa, minor Germanica*: the fift is called by *Bauhinus* in his *Pinax Genista spinosa Ma-* ... *rissimo*, but in his *Prodromus Genistella Monspeliana spinosa*, and saith that some of *Clusius* are called ... *Germanicæ*: the last *Bauhinus* calleth *Genistella minor Alpestris aculeata vel Genista spinosa Anglica*, as ... last of *England* by the name of *Genista spinosa* (which is probable was found in some place of our Land ... some one to use the plant it selfe is, and lent him as a raritie, who saith the like thereunto was found about ... in *France*. The *Italians* call the first *Scorpione barba*, the *Dutch Gaspistorren*, and wee in *English* Furre, ... and of some Whinne, and thorny Broome, but that may be generally given to all these thorny bushes, and ... peculiarly to appropriate to the fourth sort, which the *French* call *Genesta spinosa*, the *Germanes Stechend* ... and the *Dutch Stechende Brem*, and we in *English* the small prickly Broome.

The Vertues.

The third and third are held to be hot and dry, good to open obstructions of the Liver and Spleene, some have ... the flowers of either in a decoction against the Iaundies, as also to provoke Vrine and to ... the Kidneyes ... or stones ingendred in them. The others no doubt are partakers of the same qualities.

Chap. XXIII.

Rhamnus. Buckethorne.

Vnder the name of *Rhamnus* are comprehended divers sorts of shrubbes, some much differing from ... others: the elder age in *Theophrastus* his time acknowledged two sorts, the one white, the other blacke ... and both ever greene: *Dioscorides* in his time acknowledged three which have beene concentred by ... writers in these later times, wherein there are more sorts found out; some of our later writers have ... *Rhamnus catharticus*, that is the purging thorne, as a distinction from the other that are not so, whereof ... is entreated in the second Classis of this worke, and of the third *Rhamnus* or *Dioscorides* (as the most judici- ... same is) called *Paliurus* Christs thorne. I have entreated in my former booke of the tall sort that are re- ... *Prunus spinosa*, and called *Rhamnus* by other authors: all follow in this Chapter, and beginne with that ... which is most frequent in the Low Countries, by the Seaside as well as in the upland countries, and in our owne ... the sea walls in many places also.

1. *Rhamnus primus Dioscoridis, Lobelio sive Lyciastis.* Sea Buckethorne with Willow like leaves.

The Buckethorne shooteth forth many and sundry plaine woggie stemmes branched into divers small sprayes ... whereon doe grow many long and narrow leaves without order, covered as it were with a white dust or ... and the stalkes are also, with divers small thornes standing among them: at the joynts with the leaves ... and the upwards grow sundry small greenish moisie flowers together, which turne into round berries, ... white first, and of a yellow with rednesse when they are ripe, having a juice or fleshie substance with- ... and a harish round grisly kernell within, of a blackish browne colour: the roote is tough, long and ... deepe under ground: this abideth with the leaves on the twigges all the winter long, and is alwayes ...

Matthiolus reporteth downe that this *Rhamnus* doth vary in some places: heere the leaves, that ... are broader, doth bring forth broader and longer leaves hath but one or two berries set together upon a stalke: but that ... by the *Danow* and the River *Lycus* hath shorter and narrower leaves, and hath divers berries ...

2. *Rhamnus Dodonæi, Monspelliensium sive primus Clusij.* White flowred Buckethorne.

The Buckethorne as it hath use to make hedges withall, rising up with divers straight upright stems, ... and into many branches, armed with very strong and sharpe thornes standing out, from whence the small ... and narrow darke fleshy leaves come forth foure or five standing together, almost round at the point fal- ... into two, one before, other have sprung forth: the flowers stand at the layd joynts with the leaves in hoary ... tufts or Laure together, being somewhat long and round ending in five leaves, of a pure white colour ... after they are fallen a certaine round thing groweth like unto that of the *Iasmine* which is oftentimes coumeth ... any three cornered seede in it like unto creeping farre away.

3. *Rhamni primi Clusij altera Species.* Red flowred Buckes thorne.

This other buckes thorne is like unto the last in most things, onely growing not so high, bushing with more ...

...and somewhat leaser leaves, thicker white and ...ly sharpe; the flowers stand in the same manner set of a purplish red colour.

3. *Rhamnus niger Theophrasti.*

Blacke pierced Buckes thorne.

The blacke Buckes thorne groweth unto the bignesse of a blacke thorne bush, having a blackish barke covering the young armes and body, set with divers narrow and long darke green leaves together at the joynts like unto the ...thorne, but of a more stringent taste like unto Rue-leave wood with long sharpe thornes, each branch ending in a long sharpe thorne; the flower is small and of a purple colour, comming forth in the spring of the ...and the fruit followeth in the Autumne which is small and blacke like unto a Sloe and hath also a stone.

4. *Rhamnus Bavaricus.*

The *Bavarian* Buckes thorne.

The *Bavarian* Buckes thorne groweth to the height of a tree with a reddish barke, and many very sharpe long thornes, thicke set on the branches, with leaves thereon of a fine green colour, some what broad and long like unto Bay leaves or evergreene, but finely dented about the edges, and with some smaller and rounder leaves set with them on each twiggy ending in a thorne: what flowers or fruit the beareth is not yet come to our knowledge. But by the likenesse of the growing, and being a thorny evergreene it hath beene accounted a *species* of *Rhamnus* and so called.

5. *Rhamnus Myrtifolius ex Insula Sancti Christophori*

Sant Christophers Myrtle leafed Buckes thorne.

In the naturall places this groweth great and tall, but in ...where whether it was brought (cause a cubit high, the ...being greene and smooth, the leaves many set together on the stalkes by couples, some what like as that

4. *Rhamnus Bavaricus.*
The Bavarian Buckes thorne.

5. *Rhamnus Myrtifolius ex Insula Sancti Christophori.*
Buckes thorne with Myrtle like leaves of Sant Christophers Island.

Wallnut tree leaves grow, but each leafe resembling those of the greatest Myrtle: at each knot on the branches where the leaves shoot stand one or two small short weake thornes on each side: the further nature whereof we not give y. n because the plant perished through the intemperature of the climate.

The Place.

The first as I sayd groweth not onely neare the Sea coasts in the low countries and in our Land also, but in the uplands also of the higher and lower Germany also by rivers sides, as *Cordus*, *Gesner*, *Clusius* and others have set downe: the second as *Clusius* saith groweth in divers places of *Spaine*, *Portugall*, and *Narbone* in *Provence*, the rest he saith he only found at the farther border of the kingdome of *Valencia* in *Spaine* about the Citie *Hornachos* neare the River *Segura* and in no place else: the fourth he likewise saith he found plentifully amongst other thornes in the waste grounds of the kingdome of *Granada* and *Murcia*.

The Time.

They flower in the Sommer, and the fruit is ripe in *September*.

The Names.

There is great controversie among our moderne writers as I said before concerning this *Paliurus* or *Rhamnus*, as the Greekes and Latines call it, every one almost appropriating one thorny bush or other thereunto, for *Cordus* and *Tragus* judge the *Grossularia* or *Feuerpaum* our Goose berry bush, to be the *Rhamnus verus* of the ancients, and call the *Spina infectoria* before set forth in this worke to be *Rhamnus alba spinosa*, neglecting any proofe thereof as others afterwards did, and thereupon called it *Rhamnus Catharticus* or *solutivus*. *Matthiolus* setteth forth likewise a kind of prickly bush for the *Rhamnus sexangulus Dioscoridis* which *Tragus* and *Lobel* following, giving another to be read thereof, which they say commeth neerest to the description of *Dioscorides*: yet the ancient authors themselves are not constant nor free of variation herein: for as before said *Dioscorides* maketh three sorts of *Rhamnus* (whereof the third sort is much doubted of by divers, some thinking the Text of *Dioscorides* to be corrupt, and the third sort to be added or superfluous) *Theophrastus* hath but two sorts, which he sets and mentioneth *Paliurus* as a peculiar plant by it selfe, saying also it is of many sorts, and *Galen* maketh mention but of one sort, as if there were but one of that the rest were comprehended under that one. *Pliny* makes two sorts, but he without consideration referreth them to the *Rubus* or Bramble. The first here set forth is the *Rhamnus secundus Dioscoridis* of *Matthiolus*, *Dodonæus*, *Clusius*, *Lugdunensis*, as also of *Lacuna* and *Lugdunensis*, neere and *Lobel* in *Adversaria* make it the first of *Dioscorides*, *Cordus* upon *Dioscorides* and in his history also calleth it *Oleaster Germanicum*, and in his *Observationum sylva*, *Oleaster pumilum spinosum*: *Lonicerus* in his and in *Scopa* calleth it *Rhamnus spinosus*, and *Cæsalpinus Rhamnus alterum genus*, *Bellonius* in his Observations maketh it also a *Rhamnus sexangulus* which it is probable in this. *Columna* taketh it to be *Hippophaes Dodonæi*. *Bauhinus* calleth it *Rhamnus Salicis folio aculeato flore racemoso*: the second is the *Rhamnus primus Dioscoridis* of *Matthiolus*, *Anguillara*, *Lacuna*, *Lonicerus*, *Cruserius*, *Dodonæus*, *Lugdunensis* and *Rauwolfius*: *Lobel* called it *Rhamnus alter Dioscoridis Adversariis*, *Cordus* upon *Dioscorides* and *Bauhinus* call it *Rhamnus spinosus*: *Tragus* also *Rhamnus spinis oblongis flore candicante*. *Rauwolfius* saith that the *Arabians* call it *Hadek*, and they about *Tripoli* in *Syria* or *Syria Hantzyr*: the third is *Clusius* his *Rhamnus primus alter spinosus*: the fourth who knows *Rhamnus*, and so also it is of *Dodonæus* and *Tabernæmontanus*, and of *Lobel Rhamnus primus spinosus flore luteo* and is likely to be the *Rhamnus quartus baccas nigras* in *Gracia* of *Bellonius*, *Bauhinus* calleth it *Rhamnus tertius Theophrasti* and *Rhamnus cortice flore luteo et fructu nigro*: the fift *Lugdunensis* exhibiteth from a skilfull Herbarist as he saith that brought it to *Delechampius* gathered in *Bavaria*, and not knowing unto what plant to referre it otherwise called it *Rhamnus Bavaricus*, which name doth so continue untill it can be better disposed of: this last *Jacobus Cornutus* onely exhibiteth in his *Canadensium plantarum historia*. The *Arabians* call it as is aforesaid *Rhamnus* and *Maurica*, the *Spaniards*, *Espina de Sombrero*, the *French Bourgepine* in some places. For that want is given to divers plants in sundry places: *Augerius* saith that generally *Dioscorides* his fruit *Rhamnus* is taken to be that plant which at *Rome* is called *Spina Santa*, and of others *Spina de Christo*, *Matthiolus* in his booke *de venenis* calleth it *Salicis herbæ* and *spina alba*: *Cordus* also witnesseth that *Rhamnus* is called by the Latines *Spina alba*, but wisely advised that this shrub *Spina alba* be not confounded with the other two sorts of Thistles so called also. *Ovid* also speaketh of it *lib. 6. Fastorum*, shewing the use of it in his time to expell incantations in these verses.

Sat fortes, spinæque sues tristesque pelurre possent
A sylvis nostis, hæc erit alba, dedit.

And in another place not farre from the former he saith the same of the same plant, otherwise called *Virgo Deæ* in this manner;

Virgaque, lanea delpina comitur alba,
Quæ tumeat thalamis, parva fenestra dabat.

The Vertues.

These thorny plants are in qualitie one much like another, being as *Galen* saith cold in the end of the first degree or in the beginning of the second and drying and digesting in the second, and thereby helpeth inflammations, Saint *Anthonies* fire and other fretting and eating Cankers and is good against pushes, whelks &c. as the young leaves whiles they are fresh. A decoction of the leaves and inner barke thereof made in wine and drunke a little all one is put is very good to wash the mouth when there is any inflammation in. Vlcers or sores therein. *Clusius* saith that the *Spaniards* doe eate the young shoots of his first *Rhamnus* as a sallet herbe and that they use the decoction of the blacke berries of this fourth sort, to bathe those places that are numbed with and to helpe the paines of the Goute.

CHAP. XXIIII.

Lycium sive Pyracantha. Box thorne.

ALthough we are not certaine that any of these thorny shrubs here set forth in this Chapter doe exactly right *Lycium* of *Dioscorides* agreeing thereunto in all things, yet because all of them have some correspondence therewith in divers particulars, they have beene by the judicious ranged and referred into it as shall be shewed.

1. *Lycium*

1. *Lycium vulgatius.* The most common Box thorne.

The most common Box thorne is a shrubbe or low tree yet growing sometimes foure or five cubits high, with many branches spreading therefrom, covered with a darke greene barke, some what grayish in the body and older wood: set somewhat thicke with small hard and almost round leaves like Box, two for the most part at a joynt, from whence also groweth forth a small sharpe thorne: the flowers grow many together in a cluster at the severall joynts upwards of a greenish colour, after which come small berries, greene at the first and blacke when they are ripe, of the bignesse of Privet berries but full of a bitter unpleasant sappe: the roote spreadeth diversly.

2. *Lycium Italicum.* *Italian* Box thorne.

The Italian Box thorne is a smaller and lower shrubbe, whose older barke is rugged and of a darke colour, but the younger have it thinne smooth and greenish, the branches ending in a thorne, whereupon are set small leaves cornered about the edges ever like unto those of the Sloe bush, and of a darke greene colour, harsh in taste and somewhat bitter withall: at the joynts with the leaves come forth a few flowers of a whitish greene colour, made of five leaves a peece, after which follow small greene berries and blacke when they are ripe, with two and sometimes with three leaves as it were on the berries: the roote is wooddy and spreadeth.

3. *Lycium Hispanicum folio Buxi.* *Spanish* Box thorne with small round leaves.

The Spanish Box thorne hath divers slender but yet upright stemmes about two foote high, covered with reddish barke parting into many branches every one not onely ending in a thorne, but having divers thornes by them and there upon them, many times but weake and short, and at other sharpe and strong with many leaves growing on them, somewhat like unto the small Box Myrtle leaves being of a clammy acide taste, bitterish withall, neyther flower nor fruit hath beene observed hereof.

4. *Lycium Hispanicum folio oblongo.* *Spanish* Boxthorne with longer leaves.

This other Spanish Box thorne riseth up but with one stemme, parted into sundry branches whereon grow very narrow leaves for without order.

5. *Lycium latifolium Monspeliacum.* Broad leafed Box thorne of *Montpelier*.

The small thorny bush groweth and spreadeth like an hedge bush, set thicke with sharpe long thornes, and many leaves somewhat broad with them, whereat likewise come forth small flowers which turne into small berries, blacke when they are ripe, three for the most part standing together, having a reddish yellow juice within them, giving that colour on paper, leather, &c. and with three seedes in them, and of a quicke sharpe taste.

6. *Lycium Gallicum Avenionense.* The yellow graine of *Avignon*.

This thorny shrubbe groweth to the height of three or foure cubits, whose lower barke is of a grayish affection, spreading divers branches ending in thornes, set at the joynts with many small leaves very like both for colour and the knee unto the small Box but somewhat narrower and longer, whereat also come forth small flowers and after them small berries upon short footstalkes some being three square and others foure square according to the number of graines within them, at whose head is set a small cup or cover, and is of an astringent taste somewhat bitter, which being dryed are much used of Dyers and others to give a yellow colour.

1. *Lycium vulgatius.*
The most common Box thorne.

2. *Lycium Italicum.*
Italian Box thorne.

7. *Lycium Creticum primum Belli.* The first Box thorne of *Candy*.

This Candian thorne groweth to be foure or five cubits high covered with a rough or scabbed barke, of a grayish colour, stored with sharpe thornes, three alwayes growing together at a joynt, where the leaves also come forth three or foure together which are small somewhat neare unto Box leaves, and lesser then those of the Barbary bush, lightly snipped or dented about the edges: the flowers are yellow comming forth at the joynts with the leaves which turne into small long berries not fully round, therein somewhat like unto a Barbary berrie when it is ripe, each of them standing singly by it selfe upon a small footestalke, of a taste betweene sweet and sower: the wood hereof is yellow and the roote much more giving an excellent yellow dye: divers have accounted it a kinde of mountaine Barbary for the resemblance thereunto more then unto *Lycium*: but it differeth from the Barbary in that the leaves thereof are greener then of this, and the Barbary hath the berries growing many together in a long cluster, and this but singly one at a place as is before said, and from the true *Lycium* it differeth in the fruit not being round like Pepper, and is not bitter as the berries of that sort of the same.

8. *Lycium Creticum alterum.* The other Box thorne of *Candy*.

The other *Candian* bush riseth up not above two or three cubits high thicke set with branches and thornes, and upon these, the berries are round, as small as Pepper and blacke when they are ripe, whereof is made a blacke yellow colour.

9. *Lycium legitimum Rauwolfii.* The true Box thorne of *Syria*.

The true Box thorne as Rauwolfius setteth it forth in the fourth Booke of his journall or Itinerary is a small bushie tree, bearing many flowers from the roots, set full of thornes and small leaves somewhat like unto Sloe leaves in forme and colour.

10. *Lycium Indicum creticum Alpini.* The supposed *Indian* Box thorne.

The Box thorne supposed to be the right *Lycium Indicum* by *Prosper Alpinus* in his Booke of *Egyptian* plants, springeth from the roote divers upright woodly stemmes three or foure cubits high, set thicke with joynts, at every where comes forth both long and sharpe thornes, and foure or five small long whitish greene leaves together and whiter then those of the true tree: at the joynts likewise with the leaves stand two or three small whitish flowers, very like unto those of the Oriental Iacinth, which turne into small and blacke berries very like unto Wall-wort berries of an astringent and bitter taste.

11. *Lycium Indicum verum Garsiæ.* *Garsias* supposed *Indian* Box thorne.

Garsias of Orta in his first booke and tenth Chapter of his *Indian* history of Drugges sheweth that the *Indians*, *Persians* and other nations of *Asia major*, use a certaine juice which they call *Cate* or *Cato*, mixed with *Betre* and *Areca* as a most familiar junket continually to chew in their mouths, which he thinketh to be *Lycium*, having

the

the properties of the true *Lycium*, the juice thereof being drawn forth in the same manner that the true *Lycium* was made; but the tree as he describeth it doth much differ from that of *Lobelius* as *Garcias* saith he is a great tree as bigge as an Ash tree, having fine small leaves thereon (except I am like (whereas *Dioscorides* saith that his *Lycium* is a shrubbe with leaves like Box, full of thornes and waxes abiding greene) it beareth flowers but no fruit as the inhabitants reported unto him: the wood of it is verie heavy and strong, neyther subject to corruption, neither eaten of the worme, and thereupon called by them *Lignum imperiosum* Evergreene wood.

12. *Agnabalid, Aegyptiaca Lycio affinis.* The *Egyptian* tree like unto *Lycium*.

This tree groweth to the height of a wilde Peare tree, having but few armes or branches growing crookedly in the growing, for with many long and very sharpe thornes and small Box-like leaves, somewhat broader, seldome but one sod usually two or a joynt, the flowers are small and white like *Oleaster*, in the bud but redder, where afterwards stand small blacke round berries both bitter and astringent: the leaves are somewhat sower and astringent.

The Place.

The first groweth on the *Alpes* of *Liguria* and in *Dalmatia* as *Lugdunensis* saith: the second on Mount *Ida*, and in divers places of *Italy*: the third *Clusius* saith he found neare unto *Compluium* in *Spaine* by the River: the fourth *Lobel* saith was brought from *Spaine*: the fift as *Lobel* saith groweth not farre from *Avignon* upon the River *Loire*: the sixt as is said about *Avignon* and *Carpentoratte* in *France*: the seventh and eight as *Honorius Belon* setteth it downe in his first Epistle to *Clusius*: the ninth on Mount *Lybanus* and many places of *Syria*: the tenth in *Egypt* by the bankes of that arme of *Nilus* that is called *Cuig* that runneth into the sea: the eleventh groweth as *Garcias* saith in many places in the *Indies* where it is of great age: the tall *Agnabalid* I saw in the garden of a *Turke* in *Cayre* which was brought out of *Ethiopia*.

The Time.

Their times of flowring and fructifying are according to the countries where they grow, some earlier others later.

The Names.

The Greeke name of *Lycium* (and of *Pyracantha*) is imposed on the dryed juice as well as of the bush, so called as it is thought because it was brought out of *Lycia* and *Cappadocia*, and was of most in former times but not of later dayes, because what was brought was well knowne and perceived to be counterfeited, being made of the berries of Privet or of the Honysuckle or Dogge berry tree or of them all together, and not of the roots of the true *Lycium* which are these: it is blackish on the outside of the whole cakes or rolles, the inside being broken of a browne ish yellow colour within, and quickly growing blacke as pitch, having no rare sent, but of a bitter salte astringent withall: the *Indian* kinde which is the best will have a salt on the outside, to be especiall note the true and best will have, that being put into the fire it will burne and flame, and being moistned it will give a reddish (*Garcias* say some and others as reddish) fume or smoake: but that sophisticate or counterfeit *Lycium* which of late dayes hath been used hath none of these true properties in it: and *Dioscorides* doth well know that both the new that there wanted not impostors in their time, to counterfeit the true and old *Lycium*, that is, the rotten roots or lees of oyle with it to make it turne, and with the juice of Wormwood as the gall of an Oxe to make it bitter, and as *Galen* saith they did so cunningly counterfeit it that it was hard to know it false from the true. The first or the most frequent in thought by divers and *Lugdunensis* standeth manifestly for it to be the right: notwithstanding that *Aegineta* saith it is not the right *Lycium*: although it is to be seene by *Matthiolus* & *Tabernamontanus* call it *Lycium*, & *Lugdunensis*, *Lycium Avenum*, *Dodoneus*, and *Lonicerus* & *Lobel* in *Adversaria* setteth forth a *Lycium sive Pyracantha Narbonensis*, which it may be is this called it *Lycium Brevifolium*: the second *Matthiolus*, *Lugdunensis* and *Tabernamontanus* call *Lycium Italicum*, but therefore in his description of *Mons Baldus* that it is the same that *Clusius* calleth *Spina alba Ovifraga* and *Belgica*, and *Lycium sive Prini sylvestris sive Italicum*: the third *Clusius* calleth *Lycium quercinum*, and saith the dryed where it grew call it *Tamujo* and *Tamujos*, and thereof make Brooms and heate their Ovens and Kils: but *Lugdunensis* much mistaken in thinking this of *Clusius* to be the same that *Lobel* in *Adversaria* upon the first observation calleth *Lycium Hispanicum*, which is my fourth sort here, and hath longer & narrower leaves than that of *Clusius* which hath rounder leaves more like Box and *Bauhinus* observing well the differences calleth the *Lycium Hispanicum folio brevi*, and the other *Lycium Hispanicum folio oblongo*: the fift *Lobel* in *Adversaria* calleth it *Ilicis aculeatae peregrinae*, but hath mistaken the figure thereof in his *Icones*, putting the figure of *Pyracantha* like to that of *Ilex* of the *Dioscorides* which as he saith hath an ever greene leafe, and is not the Barbary as divers do mistake for one, which he setteth downe in his *Adversaria*, but in his *Icones* the said figure of *Pyracantha* is put under the title of *Balsamae alter peregrinus* and of *Rhamno tertio Dioscoridis* also. *Bauhinus* not taking it to be any kinde of *Balsamus* calleth it *Lycium latifolium*: the first *Lugdunensis* saith *Dalechampius* seemeth to be a *Lycium* but therefore calleth it *Lycium Dalechampii*, and withall saith that some called it *Perdicium genus*, that is *Gratiola* or *Tendrac* and others call it *Crocus jacobi* and some *Crocus S. Antonii*. *Bauhinus* calleth it *Lycium Avenionense* and may be called *Graecum Avenionense*: the seventh *Honorius Belon* of *Candy* saith it is there called of the inhabitants, but he himselfe calleth it *Lycium Creticum*, yet saith also because it is not the right *Lycium* it may be called *Berberis Alpina non spinosa*, for *Silvaticus Tragus* reported unto him that he found the same very frequent on Mount *Lybanus* in *Syria*. *Pona* followeth *Belon* in his *Italian Epitome*, and calleth it by the same names. *Rauhinus* referreth it rather to the Barbery, making it another *genus* thereof: the eighth as *Belon* saith is also another sort of *Lycium*, and called by the *Candiots* [illegible] *Perdicia Peregrina dicta hoc est spinosa exotica*, but yet hath no resemblance to our *Rhamnus*: it is called of *Clusius Lycium legitimum Ranwolfii*, and by *Ranwolfius* himselfe *Frutex spinosus pyri folio, baccis ovatis Lauri*, *Bauhinus Lycium Indicum folio pruni*: the tenth is by *Prosper Alpinus* called *Lycium creticum*, and saith it is called *Uzef* by the *Egyptians*: *Bauhinus* calleth it *Lycium Indicum aliorum*: the [illegible] is called by *Garcias Cole sive Lycium*, and saith the true is called *Hanjeli*, which thereupon I have inserted [illegible] *Indicum spinosum Garcia*, and by *Bauhinus Lycium foliis Ericae*: the last *Alpinus* saith is called by the *Egyptians* *Agnabalid* and may not unfitly be accounted a *Lycium*, *Bauhinus* thereupon calleth it *Lycium [illegible]*

The Decoction.

of Licorice is that that onely is to be used, of all the parts of the tree, which is made as ... leaves and berries, but First hath of the roote and branches, which being scraped ... and then evaporated untill it came to the thickenes of ho... liquid medicine as Gelatine with a saturate, to elle dryed up to the thicknesse of Opium ... Lakes, which is used worse to us, because know the goodnesse the scumme ... away in the boyling is put with other medicines that serve for the eyes, the rest is put to ... it is also for downe by him, to be effectuall to ta e away the dimnesse and mistes ... light. It helpeth Fluxes of all sorts both of the belly and humours, as the Laske and Bloody flux, ... of Women courses, and the whites, bleedings at the mouth or nose and spitting of blood: it is ... for all Ulcers and creeping Cankers, Vicers and sores, whether in the mouth throat or other parts of ... the inflammations of the throat, and especially for all sores in the privie parts of man or woman: it is good for ... boyled with Water, as also against the biting of a mad Dogge: being put into the eares that ... it helpeth them: it is good also against the itch and scabbes, and to clense the skinne: it colou... and also giveth a yellow dye not onely to Leather and skinnes, but also to Dyers also and ...

Chap. XXV.

Rubus. The Bramble.

... the brambles there are divers sorts, some having thornes or prickles upon them, where of ... long, some growing higher and lower then others, some also carefully nourished in ... are called Strawberries of divers sorts, whereof I have to my former Booke given you the know... ledge sufficiently and shall not be here againe described.

1. *Rubus vulgaris niger.* The common Brambler Blacke berry bush.

The common bramble or blacke berry bush is so well knowne that it needeth no description, every one that ... knowes being able to say that it thooteth forth many very long ribbed or flesht branches, which although they ... stand upright, yet by reason of the length ... they bend againe downe to the ground, there ... rooting againe, all of them thicke set with short ... hooked thornes, and leaves likewise at severall places upon ... their foote stalkes, three and sometimes five set toge... the edges whereof were crumpled with small prickes or the ... like fashion of a darke greene colour and greyish under... which doe well away all the winter untill all the sharpe ... cold (whereby the country man doth observe that the ... winter is past when the fall off) and that new ... shoots doe begine to shoot forth againe: the flowers ... grow together at the ends of the branches, which consist ... of five leaves like those of the white Rose bush and ... are of a pale Carnation, with small threads in the ... middle, after which come the fruit every one by it selfe ... consisting of many graines or berries as it were set together ... and are like a Mulberry greene at the first, reddish after... wards and blacke and sweete when they are ripe, which ... are of a purplish colour: the roote groweth great and ...

2. *Rubus arvensis repens.*
The bramble or blacke bush.

2. *Rubus arvensis repens.* The trailing or ground Bramble.

This bramble hath very slender, slender, lying and trailing ... creeping, never raising it selfe up as the former doth, ... but as it runneth, set with crooked thornes, but ... not so many as the other with fewer leaves and flowers ... more whitenesse, and berries not so many, and of a blewish ... colour when they are ripe like unto a Damsine, and a ... little sharpe tasted, but with lesser tuppe ... there here of to speak about, and from the ... joynts and knees of branches. Of this kinde there is ...

3. *Rubus saxatilis odoratus.*
The Raspis.

... Bramble or Raspis. ... (for so rather it may bee ... long stalkes rising from the roote without ... sticking with soft haires, from whence shoot forth the broad and large leaves without ... any thornes, but divided into five parts almost to the middle ribbe, and sometimes but into ... three, whose deepe dented about the edges of a very sweet scent but falling away in winter: the flowers are ... of a large size, the colour purplish violet colour, with divers yellow threads in the middle ... standing

fruite at the toppes of the branches, after which come the fruit very like unto Bramble berries but reddish or purple but not so well relished: the roote spreadeth much about under ground.

4. *Rubus ideus.* The Dewy berry or Winberry.

The lower berry hath slender weake branches like the last mean when lying downe, then being raised up with helpe of pricks and thornes thereon they are tall, the leaves likewise are usually but three set together, more seldome on the branches, yet almost as large as it and seaven set together on long footstalkes: the flowers are white and small, the berries usually consisting one of three small berries or graines set together in one, yet many times I have seene them but one, of a little sweete or plesant then the other: the roote hereof creepeth under ground as doth the last.

5. *Rubus saxatilis Alpinus.* The stone Bramble or Rocke Raspis.

This small low plant which by *Clusius* is more truly referred to the Raspis then the Bramble hath divers slender weake twiggy hairy branches little more then a foote high, without any thorne at all on them, set here and there with rough leaves upon footstalkes three alwayes joyned together and dented about the edges of a very deepe and greene colour: the flowers stand at the toppes of the branches three or foure together consisting of foure leaves a peece, of a pale or whitish Rose colour, which afterwards turne into small fruit, composed each of foure or five graines or berries set together, greater then either in the Raspis or Bramble of a reddish colour when they are ripe, almost transparent, full of a most pleasant sweete and acid juice grateful to the palate, having in each of them a white rough kernell or stone: the roote creepeth all about and shooteth forth sundry stalkes from the joynts as they creepe.

6. *Chamæmorus Anglica.* Our Knotberry.

The Knotberry riseth up with slender browne stalkes not a foot high set with foure or five large leaves one above another, of severall winged joynts, each of them divided into five parts, and each of them somewhat deepely cut and dented also round about the edges, rough and as it were crumpled each upon a long footstalke, which joyneth to the stalke: from the joynts have two small peeces like eares set thereat; each stalke being furnished at the top with one flower consisting of five round pointed leaves of a darke purple colour, after which followeth a large berry like unto a Mulberry of divers graines set together, of a reddish colour when it is ripe and of a sowrish sweet taste, the roote creepeth much and farre shooting forth small fibres at the knotty joynts whereby it is fastned in the ground and sendeth forth divers new shoots for stalkes.

7. *Chamæmorus Cambro-Britannica sive Lancastrensis Vaccinium nostras.*

The Welsh Knotberry or *Lancashire* Cloud berry.

This small and low Bramble that scarse appeareth above the ground mosse, among which and the blacke berried heath &c. it groweth, hath small creeping rootes running under ground, and shooting forth here and there faire long leaves almost round a little divided as it were into five parts, and a little unevenly dented about the edges, somewhat rough and full of veines of a darke greene colour on the upper side and paler underneath, as also slender stalkes with two or three the like but lesser leaves on them, and at the toppe a purplish small flowre which changeth into a Raspis like fruit, in some smaller in others greater consisting of sundry graines together, sometimes more and sometimes lesser, of a pale reddish Orenge colour tasting reasonable well (though) not so good as a Raspis.

8. *Chamæmorus Norvegica.* The Knotberry of *Norway.*

This Knotberry of *Norway* is very like unto our first Knotberry, having many slender browne twigges rising out and about a foote high, whereon are set divers broad leaves upon long footstalkes more round then the last, cut or parted into three or more short divisions, each indented or dented about the edges, and having 3. great ribs on the underside with divers small veines from them to the edges: from the toppes of the stalkes rise divers flowers each upon a long footstalke compased of five white leaves for the most part, with divers white threads ripe with thrums in the middle: after which follow the fruite, of the bignesse of a Strawberry, some reddish and some more pale, of a soft pulpy substance somewhat clammy, yet not unpleasant with small kernells therein.

9. *Chamæmorus Norvegica altera.* Another *Norway* berry.

The leaves of this small herb unto the last which are very like unto those of the *Rubus* or red Currant bush called the name of robe joyned thereunto, the stalkes are of a like shortnes, of a blackish colour when they are young, and cut in somewhat more deepely into sundry parts, the berries stand at the toppes of the stalkes in small clusters together as it were in a tuft every one upon a short stalke, red when they are ripe and somewhat astringent in taste.

The Place.

The first is frequent every where: the second groweth sometimes by woods and hedge sides and sometimes in moorish fields in many places in this Kingdome, the third groweth on the hills and higher grounds of the North parts well known in the North parts of this land, as *Cheshire, Lancashire* & *Yorkeshire*: the fift in many and rocky places both in the Ile of *Thanet* and other places of *Kent*, as also in *Huntingtonshire* and *Northamptonshire*: the first and second in woods, hills in *Lancashire* and *Yorkshire*, the one called *Ingleborough* the other *Penells*: the two highest of the Lancashire hills: the seventh was first made knowne unto us by *Thomas Hacket* a painefull Chirurgion and Simplicist of London who gave us a note or sight thereof, but Doctor *Lobel* going both into *Wales* and the Shires of Lancaster found it there growing, and on *Ingleborough* hill in *Lancashire*, as Mr. *Braidshaugh* a Gentleman of Lancaster did like wise and sent it up to us, where the people call the fruit cloud berry, because the hill seemes as it were continually covered with clouds: and the two last are declared by their titles to grow naturally in those places.

The Time.

All these flower about *July* and their berries are ripe in the end of *August* or beginning of *September*.

The Names.

The Bramble is called in Greeke *Batos Baton*, the Latines call it *Rubus* and *Sentis*. *Theophrastus* hath three sorts under the name *Chamæbatos Hamatis rubus*, or *Hamirubus* and *Cynosbatos Rubus canonus* or *Canis rubus*. *Pliny* hath described it in a different manner: the two first sorts of *Theophrastus* are generally knowne of all, but of the third there is some controversie, for *Tragus* maketh the *Spina oppaca* or *Oxyacantha* our white thorne or Hawthorne to be *Cynosbatos*, and so doth *Dodonæus* also. *Cordus, Lacuna, Marcellus* and others thinke the *Rosa*

Canina

Cæsius or *Matthiolus* reduce it, *Pliny* as I thinke being the author of that opinion, *lib. 24. cap. 3.* where he treateth of another kinde of *Rubus* whereon a Rose groweth, called *Cynosbatos* by *Theophrastus*, giving it a larger leafe then the Bramble, against *Pliny lib. 16. cap. 17.* saith that, *Rubus Mons Idæus & alia genera fruticum, ferunt & Cynosbatos*, but in *lib. 25. cap. 2.* he describeth *Cynosbatos* to have a stalke like unto a bramble, bearing a blacke fruit or Grape, in whose kernell there is a nerve or sinewe wherewith it was called *Nervalia*: whereby it appeareth that he contradicteth them and the veryth that *Pliny* in setting downe the noble Rose, called by a proper name *Cynosbatos Rosa Canina* and not *Cynosbatos Canis sentis*, and the description of *Theophrastus* (whereby he meant no sort of Rose, for else it had been vaine for him to have said *Cynosbatos* is like a wilde Bramble) he compareth the leaves to Myrtle leaves, and the fruit to be like Olive stones wherein lyeth a downe or wooll that stoppeth the windpipe by sticking thereto if it should be drunke, but speaketh of no seeds to be reserved to sow as other Roses: but saith the fruit being dryed and drunke in Wine doth bind the belly. *Theophrastus* in the 4. booke of *Plants* 10. chapter, bearing a reddish fruit like unto a Pomegarnet, and a leafe not unlike to *Agnus castus*, hath specified of *Cynosbatos Rosa Canina Rubus* among the other sorts of Brambles, whereby it is plaine as he saith that *Cynosbatos* the wilde or dogge Rose doth much differ from *Cynosbatos* the dogge Bramble: and yet *Lecluse* in contempt of *Theophrastus* his reasons striveth by finding fault with the text both of *Dioscorides* and *Theophrastus* and mending that as he thinketh fit, to reconcile them and make the *Cynosbatos* to be the wilde or sweet Bryer, but unhandsomly in my opinion. There is little variation of names among Writers concerning the two first, the third and fourth I have not finde that any hath written being bushes more peculiar to this land then others. *Clusius* calleth *Rubus fruticosus sive petræus sive Alpinus*. *Gesner in horto* calleth it *Rubus Alpinus Camer. Tabern. Rubus ramosus* and *Rubinus Chamæbatus sexangulo*: the last and the two first are mentioned by *Clusius* by the names of *Chamæbatus Anglica, Norvegica & alibi* as they are in their titles: the seventh hath a sent of Rose even in his smell to counterfeit, and to put all out of doubt concerning *Gerards* Cloud berry, as he hath received it from the rude draught of Master *Hickes* doing as it is very likely, but the more exact hand is here present. The *Brabanters* call the Bramble *Braem* and *Haiebe*, the *Italians Rovo*, the *Spaniards Carrasco* (*Rosal*) the *Dutch Roose*, the *Germans Brombeer*, *Brem* and *Brames*, *Brasmen* also: and *Wee* in *English* bramble or blackberry bush: the fruit or berries are called in Greeke Μόρα as *Galen* saith which some have made *Pasas in Latin Passi*, but in the Apothecaries shoppes *Mora Rubi*, and of some *Mora Rubi*, the berries of the Mulberry tree are called by them *Moraceli*.

The Vertues.

Galen lib. 6. simpl. med. saith that the buddes, leaves, flowers, fruit and roote of the Bramble are all of great binding quality, but yet somewhat in a differing manner, for the buddes, leaves and branches whilest they are fresh and greene have a cold earthly quality, joyned with a watrie watery substance, but little or none astringent before they are ripe of good use in the Vlcers and putride sores of the mouth and throate, and for the Gummes, and likewise to heale other fresh wounds and sores: but the fruit when it is ripe because it is sweet hath a temperate warming juice therein, whereby and by their small attrition it is not unpleasant to be eaten, although not yet ripe it is of an exceeding cold and earthy substance, sower and very astringent, and being kept are more strongly bind then when they are fresh: the flowers are of the same propertie that the unripe fruit is of, and therefore are very profitable for the Bloody flux, Lasks and the weakenesse of the part comming thereof, and also a sir remedy against the spitting of blood: the roote also holdes the binding quality thereof in such a vehemence whereby it is available either the decoction or the powder taken, to breake and drive forth gravell or the Stone in the Reynes and Kidneyes: the leaves of Brambles as well greene as dryed are excellent good to be stroo, for the sores in the mouth and secret parts: the decoction of them and of the brandles when they are dryed doe bynde the belly much more, and is good for women when their courses come down too plentifully: of berries saith *Pliny* or the flowers are a present remedy against the mall violent poyson of the Prester or Dipsas (which are most violent Serpents) the Scytalon and other venemous Serpents, as well drunke as outwardly applied, and helpeth also the sores of the fundament, and the paine full and bleeding piles: the juice of the leaves hereof mixed with that of Mulberries, maketh the medicine more effectuall to bind, and to helpe freshing or cankred sores and Vlcers wheresoever, and is good for the Stomacace, the sores in the mouth with the looseness of the gummes and teeth: the same being taken alone, or mixed with some *Hydromel* and Honey saith *Pliny* is a remedy for choller when it gnaweth the stomacke, which some call hartburning, and is good also against the passions of the heart and fainting: the distilled water of the branches leaves and flowers, or of the fruit is as in every of Violets, and is very effectuall besides the facilitie and pleasantnesse in taking, in all hot fevers or distemperatures of heate in the body, the head, eyes, and other parts, and for all the purposes aforesaid: the leaves of brambles boyled in lye and the head washed therewith doth heale the itch, the mattering and running sores thereof, and maketh the haire blacke: the powder of the leaves strewed on cankerous and running Vlcers doth wonderfully helpe to heale them. Some use to condense the juice of the leaves and some the juice of the fruit to keepe for their use all the yeare for the purposes aforesaid: the other sorts are very neere of like quality and therefore worke the same effects no doubt: but the *Norway* Knotberry is much commended against the Iaundice, Scurvey, and other crude putrid and melancholy diseases wherewith those Northerly people are much afflicted, which *Clusius* out of *Hoierus* Epistle declareth at large, and the nature of the ayre and water infected therewith as well in Winter as in Summer, whereunto I refer those that would more at large

CHAP. XXVI.

Rosa sylvestres. Wilde Roses or Bryer bushes.

HAving given you the knowledge of all or most of the manured Roses in my former Booke of Plants, I will now shew you the knowledge of them some of the wilder kindes also as the Sweet bryer or Eglantine, the evergreene Rose which is very like thereunto, and the great Apple Rose which shall not be further related here, I will proceed to all the rest in this Chapter.

1. *Rosa sylvestris inodora sive Canina.* The ordinary wilde Bryer bush.

The wilde Bryer bush groweth of it selfe in the hedges very high, with upright hard woodly stemmes covered with a grayish barke especially the old ones, set with sharpe thornes up in the toppes but not so thicke as the sweete Bryer, having divers leaves somewhat larger thereon and not so greene on the upperside nor so grayish underneath as the other, the middle ribbe whereof hath divers small crooked thornes and without any rent at all: the flowers stand at the toppes of the branches divers set together, of a whitish blush colour, made of five faire pointed leaves somewhat longer then the Sweet bryer or Eglantine Rose, standing in their like sortes as the other Roses doe: after the flowers are past come the fruit somewhat long and rowned, of a yellowish red colour or reddish yellow colour when it is ripe, having a sower sweetish pulpe under the skinne, and seedes lying therein, which berries are much devoured by the poorer sort of women and children that eate them gladly: the roote runneth deepe and farre in the ground growing somewhat great. Upon these leaves as well as upon the Eglantine is often found a burre or ball of browne threads, and I have often seene it also upon the greene Apple which is extant in my former Booke.

Rosa sylvestris odorata Canina flore.

2. *Rosa sylvestris odorata carnea flore.* The wilde sweet Bryer Rose.

The wilde Bryer Rose is so like the former that it is hardly discerned from it, either for the height of the stem or leaves, roughnesse or smalnesse of the leaves but onely for the flowers which are somewhat larger, and of a more pleasant pale purple colour somewhat sweet withall.

3. *Rosa sylvestris Rubea.* The wilde Bryer of *Heidelberg*.

This wilde bryer hath woodly reddish yellow stalkes rising from the roote growing to rather bunches not so high as the Gilliflowers in divers places with thornes set thereon like a Bryer or wilde Rose: the leaves are not so many as in the wilde hedge Bryer or rather smaller, and turning red in Summer: the flowers are single and small of a purple colour.

4. *Rosa sylvestris Virginiana.* The *Virginia* Bryer Rose.

This *Virginia* Bryer Rose hath divers as great stemmes and branches as any other Rose, whose young are greene having a few greene set with many small prickes and a few great thornes among them, the leaves are very greene and shining small and almost round, many set on a middle ribbe one against another somewhat like unto the single yellow Rose: the flowers stand at the toppes of the branches consisting of five small leaves, of a pale purple or deepe incarnate colour like unto those of the sweet brier, which fall away quickly as they and the rest doe.

5. *Rosa campestris flore albo odora.* The single sweete white Rose.

The single Bryer Rose hath woodly stemmes about two cubits high, set as thicke with sharpe thornes as every where is the wilde Bryer or Eglantine is, and set with the like leaves but not so greene, at the tops of whose branches stand usually but one flower a peece, consisting of five white leaves reasonable large and of a sweete smell, with divers yellow threads in the middle: in their places come such like round and short heads or

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

are in other Roses, but are blacke when they are ripe and not red, with white seedes lying in Rockes as in the others doe.

6. *Rosa fylvestris Austriaca flore phœniceo.* The Vermillion Rose of *Austria*.

The younger branches of this Rose are slender and reddish, the elder brownish gray, set with divers thornes growing thicke, great and sharpe: the leaves are somewhat larger then those of the single yellow Rose, else not unlike: the flowers are single and as large as of that yellow Rose whereof I take it to bee a *species*. Like vnto it is the colour for this is of an excellent Orenge tawny colour, with an eye of Vermillion cast over it, and of a pale yellow on the outside, after which succeede the fruite.

7. *Rosa pumila rubra Austriaca.* The single dwarfe red Rose of *Austria*.

This little Rose groweth not much above halfe a yard high, with slender greene stemmes, set with few or no thornes below, but furnished up higher with many, having whitish greene leaves upon them like the ordinary red and grayish underneath five or seven set together upon a stalke: at the toppes of the branches come forth great hooked huskes, wherein stand large flowers made of five leaves a peece, somewhat sweet, red at the first decayning with fairenesse, growing much more pale before they fall away, with yellow threeds in the middle, after which come the fruit which are red as the others but greater then any of those before declared, and somewhat more like unto a peare then others.

8. *Rosa Pomponella sive Pomifera minor.* The small Burnet Rose or Pimpinell Rose

This small Rose seldome riseth above a foote high being of two sorts, whereof the one hath but few thornes on the stalke and the other full of small thornes (both which are oftentimes found in one ground, but the thorny more frequent) set with long winged stalkes of leaves, being many small round greenish leaves set one against another upon the stalke finely dented about the edges, seeming like unto a Burnet leafe for the forme and number together: the flowers are single small and white without any sent, after which come small round heads somewhat like when they are ripe full of seede as in other Roses.

9. *Rosa pumila campestris alba.* The Dwarfe single white Rose.

This one of the smallest Roses scarce rising a foote above ground, being set with small thornes and leaves according in the proportion of the plant and the wildnesse of the kind, the flowers are white and small giving sent and seede like the rest: the roote creepeth about more then others.

10. *Rosa simplex pumila sine spina.* The single Dwarfe Rose without thornes.

This Dwarfe Rose also groweth very low, even almost upon the ground with greene stalkes without any thornes at all, set with small winged leaves, so small that they seeme scarce to be leaves of a Rose: the flower consisteth of a pale reddish colour and single, in some places very sweete, and in others little or nothing, flowring in divers places both in the Spring and Autumne.

The place.

These Rose grow in the hedges of our Land every where almost, yet the second not so frequent as the first: the third came from *Muscovy*: the fourth from *Virginia*: the fift from *Germany* in sundry places: the sixt and seventh from *Austria*: the eight is found in divers places of our owne Land both in barren heathy grounds, and by woods and hedges sides: the ninth on some of the hills among the *Switzers*, and the last neare unto *Lyons* in France upon *Pilate* hill there.

The Time.

Some of these Roses flower earlier then others, for some come in *May* others not untill *June* when other are gone.

The Names.

The Rose is called in Greeke *ῥόδον διὰ τὸν ἐκ τοῦ ἄνθους ἐκπίπτοντα ἀποβλύοντα ἀπὸ τῆς ῥίζης ἰχῶρα*, from the great sweetnesse thereof that falleth, in Latine *Rosa*. *Theophrastus* and *Pliny* have very diligently observed the severall differences of Roses in their times, *Theophrastus* in generall termes and in the number of the leaves, some few some many, as also the roses in the colour and sent, and *Pliny* by severall names, yet not expressing all their colours, which the ancient authors formerly have appropriated to those Roses were extant with them: but if I shall undertake the labour to shew their correspondencie with ours herein, as I shall endeavour in declaring my opinion to shew how they doe and agree with them in some of them, so I shall (how free from errour I leave to others to censure) offend many men in others: but first because I intend to make *Pliny* my author to comment upon I thinke it fit to consider the text of *Pliny* in order as it lyeth *lib. 21. cap. 4.* The Romans (saith he) have in greatest account the *Campana* and *Campani*, some have added unto them the *Milesia* which hath the reddest colour not exceeding a little scarlet, next hereunto is the *Trachinia* not lasting, then the *Alabandica* more vile or of lesse esteeme with Mithridates, the meanest (*sed ignominiosa ut abigeant nidi passeres*) with very many but very small, even the smallest of all is *Semula*, there is a kind thereof called *Centifolia*, and a little after he saith there is also one that were the flowers of the *Graecula Lychnis* growing but in moist places never having above five leaves, of the bignesse of a Violet without any sent; another is called *Graecula*, with leaves as it were closed or always ready to open, and another called it is called upon having the broadest leaves: Another hath a Mallow-like stemme and leaves like unto Ivie covers, called *Malacuton*, among these is that which beareth in Autumne of a middle size, all are without sent save the *Coronola* and that which groweth on a Bramble. Thus farre *Pliny*, how truly other authors have fitted the Roses of these times unto those of *Pliny*, and hit for the most part generally esteemed to be our Damaske Rose, yet *Lugdunensis* saith it is the red Rose, among which *Matthiolus*, which is here and *Camerarius* say the *French* call *Rose de Provins*. The *Campana* is generally held to be our white Rose. The *Milesia* is generally held to be the best red Rose, the deepe colour that *Pliny* speaketh of, and a rare matter to know it by; and is called by many in *Germany Rosa fina* as *Camerarius* saith, because it keepeth such colour and sent best when it is dryed, whereof as hee saith there is both single and double, which is a deepe red Rose to be it; but because the colour as deepe though the sent be small, and is never exceeding leaves. The *Trachinia* is our pale red Rose which *Lugdunensis* saith the *French* call *Rose incarnate*, but *Camerarius* to be so saith it is a purple Rose of a deepe or blackish red colour with a pale violet colour within, some *Germans* he saith call it *Kaiserin*, and differeth little from the *Milesia* but that it is greater and lesse fully so deepe a red colour as *Camerarius* alloweth unto it cannot agree unto *Pliny* his *Trachinia* which hath the leaves of a paler red colour, and therefore I thinke it is the worst sort of our red Rose, whose

colour commeth farre short of that deepe or excellent red colour is in the bell red Rose. The *Alexandrina* with his tuft leaves and of lesse esteeme *Camerarius* taketh it to be the *Rosa Canina* (but *Lugdunensis* therewith agreeth not) the ancients the *Alabandica Spinosa* and *Centifolia* were accounted to be flowers the thickest of leaves that did agree unto the smaller white Rose as I thinke that *Bauhinus* referreth it to the *Rosa sylvestris* or *Rosa simplex* our double Eglantine Rose, but this Rose is not of so small esteeme as *Pliny* saith the *Rosa Spinosa* or as others have it *Spinosa*, but *Hermolaus Barbarus* thinketh it should be rather *Spermos* or *Spermos* saith others did thinke it should be read *Cremos*, but *Bauhinus* hath *Syedra* & the *Cinnamomea* double Cinnamon Rose, which he saith was usually called with them *Fenicea*, & of others *Frumentalis*, being luckily Rose with small but thicke flowers of a pale red colour, and of a sweete red colour in the middle of a sweete sent. The *Centifolia* saith *Pliny* is a kind thereof which divers since the knowledge of the great Holland Rose have referred it thereunto, but in that it is sayd to be without sent: *Camerarius* and others take it to be the white Rose called also of *Plinie Lactifolia*. The *Lychnis* of the Grecians and the *Cruce* of the Latines, *Gesner* taketh it for the single Cinnamon Rose: *Lugdunensis* taketh it as others also doe as hee saith to be that red Rose that they call *Rose de Provins*, that is, *Provincia rubra*, but I thinke that *Pliny* did meane our single red Rose which was *Lychnis* indeede. The *Crocea* as *Camerarius* saith agreeth best to that sort of red Rose which he calleth *Rubicunda* and *Rosa Bacchanica*, because it doth never fully open, and is of so red a colour that is fitte to make Conserve and sugar of Roses withall, and thereupon the *Germanes* call it *Zucker rosen*, *Lugdunensis* taketh many to be originally of the *Rosa Damascena genus*, which the *French* call *Rose de Damas incarnate*, and because the flowers doe not the day be fully open, having a smell like Cinamon, *Bauhinus* taketh it to bee the *Cinnamomea*. *Lobel* saith it is but a fairer *Rosa rubra pallidior*. *Clusius* taketh it to bee the *Alba mensis* (but unlikely in my opinion, for the *Holosericea* though it have as large leaves as small, yet it keepeth not close but alwayes open, and although the *Alba mensis* bee commonly closed and never fully open, yet is both in the leaves as the *Cruce* as *Pliny* would have. The *Moschata* some take to bee the Muske Rose but the Italians are greener then in other Roses, like unto a Mallow and that the name doth the better assume therewith, but this hath not Olive like leaves, and therefore it is much doubted of by divers. *Camerarius* saith, and taketh that the name commeth not from Muske which was not knowne in *Pliny* time, but hee rather thinketh it tooke the name from *Moschus* because it riseth with many stemmes, or else because it was planted as well by slippes as Vines are, as by roots, some say it is a part among the *Dumetorum*, that is, the wilde hedge Roses (yet *Lugdunensis* understandeth the Muske Rose by *Rosa Damascena* which take to more greene then others) but some reade the leaves to bee too odorous, *Lobel* and not *Gale* of an Olive. The *Corymbifera* that beareth in Autumne is generally held by all writers to be the double Muske Rose which commeth only at that time, and is very sweete: the *Italians* call it *Rosa Corymbi* and the *French Rose Muscquette* and *Muscadelle*. The *Cynorrhodon* of *Pliny* is taken by all writers to be the *Rosa sylvestris Canina*, one of the Brier or Hepiree, and therefore *Tragus* and *Dodonæus* because they would have found *Cynosbatos* with *Cynorrhodon*, the description being so different both in *Dioscorides* and *Theophrastus* termed the *Cynosbatos* as I said in the Chapter before to the white thorne or Hawthorne, and the *Cynorrhodon* the wilde Rose which agreeth thereunto, and yet many even to this day doe referre the *Cynosbatos* unto the Rose. The parts of the Rose are sufficiently knowne to all as the huskes, the beards, the leaves, the stayles and the eales in the middle which wee very foolishly call the seedes, and the Apothecaries *Barbas Rosarum* from the Greeke word *ἄνθος* as *Anthos flores rosarum* but called more properly by divers *Capitamenta rosarum* for *Antonius Gallus*, *Aetius*, *Paulus*, *Actius* and others is the name of a compounded medicine appointed for divers parts as *de floribus Aromaticis &c.* found in the forme of powders as found when they were made up with honey did holding the same name, not taken from the flowers of Roses, whereof in many of them there was none put in, but from the lively colour of the ingredients whereof the compound medicine was made. Another error in my opinion is generall and needeth to be amended, which is, that the nailes of the Damask Rose are not cut or clipped away, that are used in the infusion to make Syrupe with as it is used in making the Conserve: for it is well known that the tough of the Rose of all sorts are more binding then the other parts of the Roses, and being put together will much abate of the purging qualitie in the rest of the Roses, so that the Syrupe made of Roses *cum Capitamentis rosarum* will be more strong in working then that which is made with them as the usuall manner is. There is likewise an other error of long continuance among Physicians and Apothecaries that call that kind of Briers *Rosa canina* groweth upon the Briers of both sorts as I sayd before, for *Hedegoar* is a kinde of Gallitea. That flowred Rose *Pliny* calleth it *Syngrafia* and were in *English* Briers balls. It is too lamentably knowne in this Land, that warre betweene the two brethren *Iohn* of *Gaunt* Duke of *Lancaster*, and *Edward* of *Lancaster* or *Yorke* the one making a red Rose his cognizance for them and their followers, the other a white: but that before this division, there was seene at *Langley* a white Rose tree to beare on the one side faire white and on the other side red, prognosticating as it were both the division and uniting of both the houses, may be resembled as this is when Rain with a shower of Raine in the moneth of *March* the Sunne shining forth comforteth the Empire to her profitable, and the body to wither when the blood of that Heart colour [illegible] nominations of these wilde sorts of Roses here expressed according to our Moderne writers [illegible] Rose hath not mentioned by *Bauhinus* in his *Pinax* among all his wilde Roses, although mee [illegible] Roses had in them any sweete sent, but *Lugdunensis* doth remember it in fol. 326. by the name [illegible] *Cynorrhodon* & *Plinio dictum*: the second is the *Rosa sylvestris* of *Matthiolus*, *Dodonæus* [illegible] *Dalechampius*,

under upon *Dioscorides* mentioneth in the first Booke and 24. Chapter of *Cynosbatos* and *Cynorrhodon*, being his kindes, saying it is the least and may be called *Chamerhodos* and is called by the *Germanes Erdrosen*. *Ruellius* calleth *Rosa campestris repens alba*: the last is taken by *Lugdunensis* to bee *Rosa Graca sive Lychnis Graecorum* flore, and if it be not so, yet it may fitly as he saith be called *Cynorrhodos laevis*. *Bauhinus* calleth it *Rosa Campestris prima vulgaris*. A Lecture of much moralitie might be read upon the Rose, the parts delivered by many auncient Grecians and Latines all which to insert in this place is not my minde, onely I will recite a few of many, to give a taste of the plenty and excellencie.

Ut Rosa nunc primo, tumens de matre, vesperi languet,
Sic modo qui fuimus, erat levis umbra fumus. And againe,
Vidi ego mane Rosam foliis cum lucidus esset,
Et vidi eandem foliis cadente mori.

The unreasonably infatuated Turkes will not suffer a Rose leafe to lye upon the ground, or any to tread on them, because of their Mahomet, from whose sweat they are perswaded the Rose sprang up; some what like unto the fable of Venus, who held the Rose which formerly was white to become red from the blood of *Venus*, falling thereon as shee ran among the bushes to helpe her *Adonis*. *Philostratus* dedicateth the Rose to *Cupid* whom it doth represent in every part. It is fresh young and delicate as *Cupid*, it is crowned with sundry yellow haires, it beareth thornes as darts and leaves as wings, the Celestiall beauty of the flowers as his glorie and dignitie, neither the Rose nor *Cupid* keepeth any time, and besides this he calleth the Rose the light of the eye, the sure bushie toppe of the sprig, the fire of love, the lightning of the Land. *Anacreon* his Greeke verse whereof *Stephanus* are sufficiently knowne being these.

Rosa Venus, decus que florum: *Rosa per Cythera.*
Rosa suave, omne que merum: *Caput implicat corona*
Rosa gratiae est voluptas. *Cherisum thorus frequentant.*

The Verses.

Seeing I have spoken so much of the manured Rose in shewing their denominations, I thinke it not impertinent also before I entreate of the qualities of the wild sorts, to let downe the properties and vertues of the same kinds somewhat more amply then I have delivered them in my former booke. Both the white and the red Rose are cooling and drying, yet the white is taken to exceede the red in both those properties, but is seldome used soundly in any medicine: the red as *Galen* saith hath a watery substance in it, and a waterie joyned with two other qualities, that is, an astringent and a bitter: the flowers there of (which wee call the seedes, but rather are yellow threads in the middle) doe binde more then the Rose it selfe and more drying also. *Mesues* sheweth that the Rose is cold in the first degree and dry in the second, compounded of divers parts or substances which may be separated, namely a watery moyst substance and an earthly drying, an syrie substance likewise sweet and smelling, and an hot also, whereof commeth the bitternesse, the rednesse, perfection and forme, and yet the heate of the heate is stronger, which hath caused the forme and rednesse then that which causeth the bitternesse, for being dryed that bitternesse vanisheth when the other two doe abide: the bitternesse therefore in the Rose when they are fresh, especially the juice purgeth choller and watery humours (which qualitie the Greeke author it seemeth knew not) but being dryed and that heate that caused the bitternesse being consumed they then have a stopping and astringent power. Those also that are not full blowen doe both coole and binde more then those that are full blowne and the white Roses more then the red. The decoction of red Roses made with wine and used is very good for the head-ache and paines in the eyes eares throate and gums, the fundament also the lower bowels and the matrix being bathed or put into them: the same decoction with the Roses remaining in them is profitably applyed to the region of the heart to ease the inflammation therein, as also Saint *Anthonies fire* and all other diseases of the stomacke: being dryed and beaten to powder and taken in sealed wine or water doe helpe to stay womens courses, they serve also for the eyes being mixed with such other medicines as are fitting for that purpose, and are sometimes put into those compositions that are called *Anthera* as is before said. The yellow threads in the middle of the red Roses especially (which as I said bee erroniously called the Rose seeds) being powdered and drunke in the distilled water of Quinces stayeth the abundance of womans courses, and doth wonderfully stay and helpe the defluxions of rheume upon the gummes and teeth, and preserveth them from corruption, and fasteneth them being loose if they bee washed and gargled therewith, and some powder of Quinces added thereto: the heads with seed being used in powder or in a decoction stayeth the Laske and the spitting of blood. Red Roses doe strengthen the heart, the Stomacke and Liver, and the retentive faculty, they mitigate the paines that arise of heate, asswage inflammations procure sleepe and rest, they women comes both white and red and the *Gonorrhea* the running of the reines and the fluxes of the belly: the juice of them doth purge and cleanse the body from choller and flegme: the huskes of the Roses with the beards and the threads of the Roses are binding and cooling and the distilled water of either of them is good for the heate and inflamation in the eyes, to stay and dry up the rheumes and watering of them. Of the red Roses are usually made many compositions all serving to sundry good uses which are these. Electuary of Roses Conserve both moist and dry of Roses is more usually called Sugar of Roses, Syrupe of dryed Roses and Honey of Roses: the cordiall confection called *Diarrhodon Abbatis* and *Aromaticum rosarum*: the distilled water of Roses, Vinegar of Roses oinoselle and oile of Roses: and the Rose leaves dryed which although no composition, yet is of very great use and almost last of all spoken. To entreate of them all exactly I doe not intend for so a pretty volume of it selfe might be compiled, I will therefore only give you a hint of every one of them and referre the more ample declaration of them to those that would entreat onely of them. The Electuary is purging, whereof two or three drams with white wine in some convenient liquor is a competent purgation for any of weake constitution, but may be increased unto six drammes, according to the qualitie and strength of the patient: this purgeth choller without troubling and is good in hot Fevers, in paines of the head arising from hot and cholericke humors and heate of the eyes, the laundies also and joynt aches proceeding from hot humors. The moyst conserve is of much use in binding and cordiall, for until it be about two yeare old it is more binding then cordiall. But afterwards it is more cordiall then binding: some of the younger conserve taken with *Mithridatum* mixed together is good for those that are troubled with the distillations of rheume from the braine into the nose, and defluxions of rheume into the

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

eyes, as also for ilsues and Lackes of the belly, and being mixed with the same powder of Mallowes is very good for the running of the reines, and for other looseneſſe of humors in the body: The old conſerue made of *Diarrhodon Abbatis* or *Aromaticum roſatum* is a very good cordiall againſt faintings, swownings and swoonings and trembings of the heart, it ſtrengthneth alſo both them and a weake ſtomacke, helpeth digeſtion, ſtayeth caſting, and is a very good preſervative in the time of infection. The dry Conſerve which is called *Sucrum Roſes* is a very good Cordiall to ſtrengthen the heart and ſpirits, as alſo to ſtay deſluxions. The Syrupe of red Roſes ſtrengthneth a relaxed ſtomacke given to caſting, cooleth an overheated Liver and the blood in it, comforteth the heart and reſiſteth putrefaction and infection, and helpeth to ſtay Lakes and fluxes. Red Roſes is much uſed in gargles and lotions to waſh ſores either in the mouth, throate, or other parts, both to clenſe and heale them, and ſtay the fluxes of humors falling upon them hindering their healing, as alſo in gliſters both to coole and clenſe. The cordiall powders called *Diarrhodon Abbatis* and *Aromaticum roſatum* doe comfort and ſtrengthen the heart and ſtomacke, procureth an appetite, helpeth digeſtion, ſtayeth caſting, and is very good for thoſe that have ſlippery bowels to ſtrengthen and conforme them, and to conſume and dry up moiſture and ſlipperineſſe. Red Roſe water is well knowne and of familiar uſe in all occaſions as one of the waters of better uſe then Damaſke Roſe water, being cooling and cordiall, refreſhing and quickning the weake faint ſpirits either uſed in meates or broches, to waſh the temples or to ſmell unto at the noſe, or ſweete vapours thereof out of a perfuming pot, or caſt on a hot fire ſhovell, it is alſo of much uſe againſt vehemency and inflammations in the eyes to bathe them therewith, and the temples of the head alſo againſt pain or ache therein: Vinegar of Roſes is of much uſe alſo for the ſame purpoſes of paine and ache, and diſtempers the head, as alſo to procure reſt and ſleepe, if ſome thereof and Roſe water together be uſed to ſmell unto at the noſe and temples moiſtned therewith, but more ſlowly to moiſten a piece of a red Roſe cake cuſtard for the purpoſe, and heated betweene a double ſpoone with a little beaten Nutmeg and Poppy ſeede, laying one ſide thereof cloſely next the forehead and temples, and ſo bound thereto for all night. The ointment of Roſes is uſed againſt heate and inflammations in the head to annoint the forehead and temples and being mixed with *Lapathum* to procure reſt, as alſo it is uſed for the heate of the Liver, of the backe and reines, and to coole and dry puſhes wheales and other red pimples riſing in the face or other parts. Oyle of Roſes is not only uſed by it ſelfe to coole any hot ſwellings or inflammations and to binde and ſtay fluxes of humors unto ſores, but is alſo in many other compoſitions both ointments and plaiſters that are cooling and binding, and reſtraining the ſharpe humors. The dryed leaves of the red Roſes are uſed both inwardly and outwardly both in meates, binding and cordiall for with them are made both *Aromaticum roſatum Diarrhodon Abbatis* and *Saccharum roſatum* of whoſe properties are before declared: Roſe leaves and Mints heated and applyed outwardly to the ſtomacke ſtrengthneth caſtings and ſtrengtheneth a weake ſtomacke very much, and applied as an Epithime or fomentation to the region of the Liver and Heart doth much coole and temper the diſtemperature in them, as alſo a red Roſe cake to the head and temples to quiet the over hot ſpirits, which will ſuffer no ſleepe of reſt to come unto the ſicke patient. Of the Damaſke Roſes are not made ſo many medicines or compoſitions, for beſide the Conſerue and Preſerve, the Syrupe and Hony of thoſe Roſes (each whereof is called *Solutive*) the water and the diſtilled oyle or ſpirit which ſerveth more for outward perfumes then inward Phyſicke, as the dryed leaves alſo to ſtuffe bagges and the like. I know not any other uſe made of them, and yet there is by many times cuſtomably ſpent and uſed then of red Roſes, ſo much hath pleaſure outſtripped neceſſary uſe. The Syrupe of Damaſke Roſes both ſimple and compound and made with *Agaricke*, the ſimple ſolutive Syrupe is a familiar and preſent medicine purging cholleriſh humors in one ounce or two or three or foure, yet this is remarkable and worthy full hereto, that the diſtilled water of this Syrupe ſhould notably binde the belly: the Syrupe of Roſes with *Agaricke* is more ſtrong and effectuall in working then the ſimple Syrupe, for one ounce thereof in a diſh will open the body more then of the other, and worketh as much on flegme as cholleric, the compound Syrupe is more forcible in working on melancholicke humors, and available againſt the Leprey, Iaſh, Tetters, &c. and the French diſeaſe alſo. Hony of Roſes ſolutive is made of the ſame infuſion that the Syrup is made of, and therefore worketh the ſame effect in opening and purging, but becauſe the hony is neither ſo familiar or ſo convenient to bee and waſh bodies as it is oftener given to flegmaticke then cholleriſh perſons, and is more offenſive in ſtuffes then pottage as the ſyrupe made with Sugar is. The Conſerve and Preſerved leaves of theſe Roſes are operative to the ſame effects in gently opening the belly. The ſimple water of the Damaſke Roſe is of familiar uſe for ſmells to ſweeten all things as alſo to put into meates and broths, &c. that it hath leſs almoſt of life then any Phyſicall quality, yet it hath been well obſerved by *College* in his commentary upon *Alexis*, that the ſame quantity of Damaſke Roſe water drunke in the morning doth open and purge the belly, the dryed leaves of the ſame Roſes ſerve more to make ſweete powders, and to fill ſweet bagges or the like, yet the ſame *College* in the ſame place ſhewes that the dryed leaves powdered and drunk in the whey of Goates milke worketh as the ſame ſyrup in purging. The Muſke Roſe both ſingle and double doe purge more forcibly then the Damaſke, and the ſingle hath ſeemed ſtronger then the double. For although none of the Greeke writers have made any mention thereof, *Avicen* eſpecially of the *Arabians* doth ſet it downe, twenty of the leaves of the ſingle Roſe and ſo many *Camamile* flowers, but more of the double kinde to open the belly, and purge the body. The white Roſes are leſſe of them uſed in Phyſicke, but yet are generally held to come neare into the nature of the muſked Roſes in the earthy and binding faculties. *Pliny* ſetteth downe in his eighth booke and fourth Chapter that the leaves of the white Roſe is ſingular good to allay the biting of a mad Dogge, which he ſaith, I have ſeene (the reaſon of the leave I know not) was found out by miracle: the fruit of the white Briar which are called Hippos, being thoroughly ripe and made into a Conſerve with ſugar according to the manner of divers other fruits is very pleaſant to the taſte, doth gently binde the belly, and ſtayeth fluxes from the bowels, ſtrengthneth the ſtomacke, and cheareth up the whole nature thereof, and helpeth digeſtion: the pulpe of the Hippes dryed to a conſiſtence like to the juice of Liquorice, or ſo dryed that it may bee made into powder and taken in drinke ſpeedily ſtayeth the whites in women. With the fruit Cookes and their Ladies and Miſtreſſes doe know (and many fine diſhes for their tables. The firſt ball is often uſed being made into powder and drunke againſt the Stone to provoke urine when it is ſtopped and to eaſe and helpe the collicke: ſome appoint it to be taken, which then taken for the ſame purpoſe: in the middle of theſe balles are often found certaine white wormes, being

some dryed and made into powder and some of it drunke, is found by long experience of many to kill and drive forth the Wormes of the belly.

Chap. XXVII.

Capparis. Capers.

The Caper tree or bush that was knowne to *Dioscorides*, and *Theophrastus* being but one sort was thorny, but there hath beene since some other sorts knowne, both that are and are not thorny, which for their affinitie sake I thinke meete to joyne together, and with the Capers another plant, which for some likenesse beareth also the name of *Capparis fabaria* or *leguminosa*, Beane Capers, not intending to joyne it to the pulses as some might thinke it should be.

1. *Capparis spinosa folio rotundo.* Round leafed thorny Capers.

The Caper tendeth forth divers long weake trayling wooddy stalkes lying round about upon the ground, set with crooked thornes like hookes or as the Bramble, at each joynt come forth two round leaves like unto *Asarum* standing one unto another, from whence springeth also a small round head upon a pretty long foote stalke, which being cut from the flower before it open (and is that small round Caper which wee doe usually eate at meate) when being then gathered and pickled up with great salt, are kept in barrells and brought into other countries, and be taken out of the salt afterwards and kept in Vinegar to be spent at the table as all know: but when it is growne it beareth of foure white sweete smelling leaves, with foure other greene ones as the huske wherein they stand, having many yellowish threads and a long stile or pestle in the middle, which afterwards groweth to bee the fruit, and is long and round like unto an Olive or Acorne when it is ripe (which also are brought pickled to vse as the long Capers which are used) wherein are contained divers hard brownish seede somewhat like unto the kernells of Grapes: the roote is great, white, long and somewhat wooddy covered with a thicke barke running and spreading much in the ground, so that it will quickely spread a whole field in the warme countries and make barren, and is somewhat sharpe and bitter: the stalkes perish in Winter every yeare, and arise againe fresh in the spring.

2. *Capparis spinosa folio acuto.* Thorny Capers with pointed leaves.

This other Caper differeth from the former neither in the thorny growing nor in the flowring, nor in any other thing then in the leaves, which with the roundnesse are pointed at the ends, and this is sufficient to know it by.

3. *Capparis non spinosa fructu majore.* *Egyptian* Capers without thornes.

The *Egyptian* Caper differeth not much in the manner of growing from the former, but that the stalkes grow

1. 2. *Capparis spinosa folio rotundo & acuto.*
Thorny Capers with round and pointed leaves.

4. *Capparis folacea fructu leguminosa.*
Beane Capers.

greater

greater and more upright without any thornes on them, the leaves are round and stand two at a joynt as the former, the buds are greater and so are the white flowers in like manner, and the fruit greater then in the former: she looseth not the leaves in Winter as the others doe, and herein consist the chiefe differences.

4. *Capparis Arabica non spinosa*, Great Capers of *Arabia*.

The *Arabian* Caper is a small shrubbe growing up with many upright stemmes without thornes, the leaves flowers and fruit are greater and larger then the last *Egyptian* kinde, the fruit being of the bigness of a Walnut with divers seeds therein, of a sharpe and biting taste as *Dioscorides* hath noted, and of others since of our later writers.

5. *Capparis fruticosa foetu leguminoso*, Beane Capers.

The Beane Caper riseth up with divers greene herby and not woody stalkes like the other, branching out from the very bottome, at the severall joynts whereof grow two leaves opposite one unto another which are always two together at the end of the footestalke, being somewhat like unto Purslane leaves both in the forme and colour resembling the leaves of Beanes: the flowers come forth singly one at a joynt with the leaves which before they are blowne open are very like unto Capers blossomes, being white standing in a greene huske and with many yellow threads in the middle, after which the fruit followeth somewhat long and round and opening into severall parts, wherein is contained small browne seede: the roote is long and woody sending forth long strings and branches under ground many wayes.

The Place.

The two first sorts grow naturally in the stony places of *Italy*, *Spaine* and some parts of *France* as also in the hot countries Eastward, yet that with pointed leaves not so frequent as the other. The second with us will abide no culture, yet *Pliny* sheweth that in his time they used to plant it in *Italy* upon rides cast up and the deepe trenches filled up with stones to keepe in the roots from overspreading the field or ground where they were planted, or else that the stones would make them fruitfull the better, the third *Belonius* saith growes *Egypt* in a loose sandy field not far from the Lake *Mareotis* which is about halfe a mile from *Alexandria*, where he also found as he saith in the clefts of the rockes on mount *Taurus* in *Arabia*.

The Place.

The two first sorts as I said before shoot forth their stalkes and leaves in the Spring, and their flowers after, when as their fruit is not ripe untill the end of *September*: the other two keepe the same times of budding and fructifying, but keeping their old leaves on and shooting fresh every Spring: the last withereth and perisheth the end of Summer.

The Names.

It is called of Greeke κάππαρις and *Capparis* also in Latine, *Graca Theophrasto* his interpreter calleth it *Ionia*, *Pliny* seemeth to thinke it was the *Cynosbatos* of *Dioscorides*, because among the ballard Greeke names of *Dioscorides*, *Cynosbatos* is one which he saith was given to the Caper in his time. The third is mentioned of most writers, but the second but by a few, *Alpinus* in his booke of *Egyptian* plants, and *Belonius* in his second booke of Observations and Chap. 21. maketh mention of the third by the name of *Capparis non spinosa* and whereunto the fourth is also remembred by *Belonius* in the said second booke and 66. Chapter, and by *Rauwolfius* in his *Itinerarie*: the last is called by all moderne writers *Capparis Leguminosa*, or *Capparis Bahaga*, by *Lugdunenses Hortus Belgarum*, by the *Syrians* as *Rauwolfius* saith *Morgsim*, and taketh it to be the *Asarum* of *Rhasis* and the *Asarum* of *Serapio*: *Columna* thinketh it most properly to agree unto the *Telephium* of *Dioscorides*, *Rauwolfius* calleth it *Capparis Porcularia folio*, and saith it was called *Pespa* at *Paris*, and therefore *Lugdunenses* called it *Pipra Parisiensium*, all nations call Capers according to the Greeke and Latine, varying but the accent according to their dialect.

The Vertues.

The Capers, such as come over to us pickled up in salt doe nourish nothing, yet doe a little move the belly, being washed from the salt and steeped in Vinegar and so eaten doe stirre up the appetite dejected and decayed and doe a little cleanse the bowells of flegme sticking to them and avoyd it, as also doe helpe to open the obstructions of the Spleene and Liver: *Galen* sheweth in *septimo simpl. med.* that the Barke of the roote of Capers consists of various qualities, namely first extreme bitter, next sharpe, then sower, by the bitterness it cleanseth, purgeth and cutteth, by the sharpenesse it heateth, cutteth, and digesteth, and by the sowernesse it contracteth, thickneth and bindeth, and thereupon saith it is a medicine above all other available for the hardnesse of the Spleene whether it be applied outwardly of it selfe, or mixed with other things to annoint the place, or the roots boyled in Vinegar or Oxymell and taken inwardly, or the powder of the roote mixed with the said decoction or taken, for it is certaine that it avoydeth grosse and viscous humors, not only by the stoole but by the belly also, for strengthens it bringeth away with it congealed and corrupted blood, and thereby easeth such pale as those are troubled with Gouts or Palsies, with the Spleene or paines in the Hippes or Sciatica, weakenesse of Nerves and Sinewes, and for women that have their courses stopped so procure them it doth wash from the Matrix and other parts their offensive humors that are the originall cause of Ruptures, Convulsions and Cramps, so thereby give them much ease: the barke of the roote of Capers is an especiall remedy to help sower Vlcers of the mouth being made into a Pultis and applied, for it cleanseth and mightily dryeth them, and it also good for hard swellings and kernells under the eares and the Kings Evill: the fruit is also effectuall for the said purposes as also the fresh leaves and stalkes, but all of them weaker then the roots: the seede bruised and heated in a little wine and held betweene the teeth easeth the tooth-ach: the same roote also boyled in oyle and dropped into the eares easeth the paines and killeth wormes breeding in them: the leaves and flowers, but especially the barke of the roote steeped or boyled in Vinegar cleanseth the skinne of all morphew, freckles, spots or any other deformities of the skinne whatsoever: the oyle that is made of Capers is of very good use against the paines of the Hippes or Spleene. The *Arabian* sort is much more sharpe and almost exulcerating, and therefore no *Europe* well advised will dare to use so violent a stranger, better it is to use our owne *European* kindes. The Beane Caper is used by the Arabians as *Rauwolfius* saith to kill the wormes in children and to drive them forth.

Caper

Chap. XXVIII.

Oxyacantha Dioscoridis quibusdam, Theophr. Spina acuta, Germanica Spina appendix Plinij.
The white Thorne or Hawthorne.

The Hawthorne hath not beene knowne formerly to be of any more sorts then one, but wee have in our time had the knowledge of two other which shall be presently shewed you.

1. *Spina appendix vulgaris.* The ordinary Hawthorne.

The common Hawthorne groweth up in some places to be a tree of a reasonable height if convenient staking, training and keeping helpe it forward, otherwise it groweth to be but a shrubbe or hedge bush, with many knots, armes and branches, whereon are set in divers places sharpe thornes and faire shining leaves, somewhat round, and cut in on the edges into divers parts, the leaves are many standing together, coming forth both at the ends of the branches and upper joynts with the leaves, consisting of five white leaves a peece with divers white threds in the middle, tipt with red, and of a very pleasant sweete sent, after which come berries somewhat long, not the roundnesse of a lively red colour when they are fully ripe and somewhat sweete in taste, conteining also within them divers white stones lying in a clocky or downy substance which make it harsh in eating, and if a man should swallow it, would sticke to the throate and hurt the same, especially the roote groweth farre and deepe.

1. *Spina appendix vulgaris.*
The ordinary Hawthorne tree.

2. *Spina appendix humilior.* The low Hawthorne.

The low Hawthorne never groweth to high or great as the former, the leaves are smaller but longer divided on the sides in the same manner: the flowers also are white and sweet and grow in tufts or clusters, but the fruit that followeth is yellow tending into a Saffron colour, in other things it differeth not from the other.

3. *Spina appendix biflora Britannica.*
English Hawthorne.

We have another sort of Hawthorne growing in divers places in our Land well knowne to those that dwell about the places where they grow, yet not greatly regarded or esteemed at by them nor yet by many of those that have seene them growing: but I doe not thinke it that it should be slightly passed over or so finally respected, for I suppose it a strange worke of nature, or of the God of nature rather, to cause such a tree being in all parts thereof like unto the common Hawthorne, to blossome twice every yeare, the one time usually in *May* as all others of the kinde, the other about Christmas, eyther somewhat before or somewhat after, according to the temperature of the Winter at that time, for if the Winter before bee milde without either great frosts or other hard weather, it will be in blossome white all over as in *May*, sometimes sooner, or else in *December*, but if it bee hard and sharpe weather it will not blossome untill *January*: that the hard weather be over: it beareth also after these flowers small spring berries even in the Winter before any greene leaves doe appeare or blossomes in *May*, so that you shall have both ripe fruit and greene at one and the same time upon the tree: there hath not beene observed any other difference betweene this kinde and the ordinary Hawthorne. Some might thinke as it hath beene diversly reported by divers that this happeneth by reason of some hot springes that take their course by the rootes of the tree, which reason I grant hath some appearance of likelihood, but wisely scanned and considered, is too grosse to make a stable weight, for how should one tree only blossome in a place, and none of all the other trees in the same soyle or compasse of the same springes running: and besides this there are of these trees in divers places planted, as in *Romney Marsh* in *Green street*, as it is vulgarly called, but should bee rather High street, where they stand in the open ground though upon a banke beaten with cold and Northerly blasts, and exposed to the view of every one that passeth by, having no shelter or defence, but standing in a flat and open soyle, where I thinke no hot springes or vapours are likely to be: let the wise and judicious search it throughly, for I imagine neither doth it seeme likely to breake forth or runne neare it

The Names.

Very many (as *Matthiolus, Lacuna, Turner, Bellonius, Lobel, Dodonæus, Cæsalpinus, Ruellius, Tabermontanus* and some other) doe take this Thorne to be *Oxyacantha* of *Dioscorides*, but he describeth to be like the Peare-tree but lesser, and very thorny, bearing a berry like unto those of the Myrtle, but red, full and easie to breake, having a stone or Kernell within it, some also thinke that it is a kinde of *Pyracantha*, others take it to be the *Oxyacantha* & *Oxyacanthus* of *Galen*, which he likewise saith is like unto the wilde Peare tree in forme, and not unlike it in qualitie, so that the ones masculine the others feminine are but one sort, as followeth by the judgement of many: the best Herbarists although some take them to bee divers, as *Cornarius* and *Gesner* make the Barbery bush to be the *Oxyacantha* of *Galen*, and not the *Oxyacantha* of *Dioscorides*, and so doe *Cordus* upon *Dioscorides* and *Tabermontanus*, *Hermolaus* and *Ruellius* likewise doe take the Barbery to be *Oxyacantha*, and so doe *Fuchsius, Tragus, Cornarius*, and some other whom *Matthiolus* justly reproveth, for their likenesse in the Barbery excepting the thornes (and yet in them there is a difference) unto *Oxyacantha*, neither in forme of body like the wilde Peare, nor in the fruit like unto a Myrtle, dry and fryable like to the Barbery being moyst and full of juice. *Tragus* saith that some tooke the Hawthorne to bee *Acacia*, but *Matthiolus* his *Oxyacantha* is neither Barbery nor Hawthorne, which in his first Booke and 15. Chapter we plainly prove among those trees that are ever greene, which cannot be said of either Barbery or Hawthorne in that countrey or country they are knowne to keepe their leaves, but to loose them in Winter, but by the judgement of the best and most expert Herbarists in our times, the *Pyracantha* as I have declared in my former booke is the true *Oxyacantha* both of *Dioscorides* although hee hath not mentioned any semperentie of leaves, and *Theophrastus* agreeing thereto in all things: Some there be also that would make the *Spina appendix Plinij* to bee the Barbery bush as *Lugdunensis*, but *Clusius* is against that opinion for that therein there are three reasons, but that *Plinij* if hee had meant the Barbery by his *Spina appendix* would not have forgotten the three thornes that grow together in the Barbery which is eminent enough therein: and next hee would not have forgotten the yellow colour, both in the barke of the branches and rootes: but the most judicious of these later times, among whom *Gesner* is best, and *Clusius in historia* have determined that *Spina Appendix Plinij*, which sometimes also is called *Spina* simply, can be no other thorne then this Hawthorne, which *Tragus* and *Lonicerus* tooke to bee *Cynosbatus Theophrasti*, and *Cordus in historia* calleth it *Sorbus aculeata*, *Angustifolia Spina alba vulgo*, and *Spina acuta Dodonæi* doth also. *Bauhinus* placeth it among the Medlars calling it *Mespilus spinosa folio sylvestris spinosa pyracantha*, and as a kinde thereof likewise putteth the *Pyracantha*, but in my opinion he had done better to have rightly, to have referred them both to the kinds of Services whereunto they better agree then unto Medlars, in that Services are smaller fruits as these are: the second here expressed is mentioned by *Dodonæus* under the name of *Spina acuta humilior*: the last as a kind peculiar to our owne countrey as I thinke, I have here set them out more exactly then *Gerard*, who onely had a superficiall notion or rather relation thereof. The Hawthorne is called by the *Arabians Anarberis*, by the *Italians* in some place *Bugnis*, and in others *Asperolo*, and *Pedrezo*, by the *Spaniards Piritero*, by the *French Aubespin* (*Ruellius* saith that the vulgar sort doe call it *Iessis*, as *Quercetanus* setteth a time downe in some of his receipes by the name of *fructus Sanctorum* in his *Pharmacopœia Iuncta* to be *Paliurus* unlesse hee thought the *Paliurus* to be the Hawthorne) by the *Germans Hagedorn*, by the *Dutch Hagendoren* and by us in *English* Hawthorne, or Hedgethorne, Whitethorne and *Maybush* or *Cuckowbush*, because our ordinary sort seldome or never flowreth before *May* and never after.

The Vertues.

The berries or the seedes in the berries are generally held to be a singular good remedy against the stone. If the powder of them be given to drinke in wine: the same is also reported to bee good for the Dropsie: but whereas divers have attributed hereunto a binding or astringent qualitie *Anguillara* his judgement was (whom *Matthiolus* confuteth) that *Tragus* who saith that the leaves, flowers & fruit are drying and binding, and that if the flowers be steeped three dayes in wine, and afterwards distilled in glasse, the water thereof drunke is a soveraigne remedy for the Plurisie, and for inward tormenting paines: the distilled water of the flowers by an ordinary way dayly vseth, saith he, the Flux or Laske of the belly: the seede cleared from the downe burned and styled in wine and drunke performeth also the same effect: the said distilled water of the flowers is not onely cooling but drawing also: for it is found by good experience that if clothes or sponges be wet in the sayd water and applyed to any place wherein thornes, splinters, &c. have entered and bee there abiding, it will notably draw them forth: the vertues given by *Galen* unto *Oxyacantha* doe not pertaine hereunto, for saith he the fruit thereof is not sowred harsh, especially when it is ripe, but sweet and therefore more fit to open then to binde the belly, and hurt to bring downe then to stay womens monethly courses but the last evinceth the contrary.

CHAP. XXIX.

Sabina. The Savine tree or bush.

AMong sorts of Savine I have expressed and set forth in my former Booke, the figure whereof I here shew you againe, the other sorts shall be exhibited in this Chapter.

1. *Sabina fœcifera major.* The greater bearing Savine tree.

The greater Savine tree that groweth with us spreadeth not so much as the former Savine tree, but riseth more upright to a mans height (but *Belonius* saith in *lib. de conifer.* that he saw it as high as an Almond tree on the mountaines *Amanus* and *Olympus* in *Phrygia*) spreading both armes and branches furnished with leaves, which at their first comming forth are somewhat like unto Tamarisk leaves, but when they are growen old they are more like unto the leaves of the Cypresse tree, hard and pricking, and of a darke greene colour with an eye of blew shadowing them of a scent lesse strong and nothing so sharpe as the ordinary Savine. I have not yet been observed to beare any flowers but small round berries like unto Juniper berries, but greater and of a pleasant taste, blacke when they are ripe with an eye of blew upon them like the Juniper or the ordinary Savine berries, which divers have held to be barren, taking their authority from *Pliny*, who also saith that Rosemary beareth no

Sabina vulgaris.
The ordinary Savine Tree.

3. Sabina baccifera maior.
The greater berried Savine Tree.

...which are found true by good experience, as Fuchsius, Cæsalpinus, Dodonæus and Lugdunensis doe testifie, yet Camerarius hath seene in one kind that it beareth no fruit, but not in the rest. But Lobel saith the ordinary doth beare berries although in a few places and but seldome, and both of them holding their fruit on the branches all the Winter, untill greene ones grow ripe, and never looling their leaves.

2. *Sabina baccata latifolia.* Greeke Savine with berries. This other Savine groweth somewhat higher then the tall as it is growth in Europe, and almost unto the height of the *Theme* or Cypresse like Cedar, spreading more slender and weake branches whereon are set small and long leaves, of a more gentle verdure then the rest: on the branches among the leaves come forth berries as the other, and very like unto Juniper, blacke when they are ripe, and but little bitter in taste, not altogether unpleasant.

The Place.

The first growth in *Candy*, *Millan*, and other those East countries: the second on the mountaine *Taurus*, *Amanus* and *Olympus*: the first upon the mountaines in *Apulia* and *Calabria* of *Naples*, and the plaines of the *Alpes* neere unto *Grationopolis*.

The Time.

They are ever greene, and shew their ripe berries not untill the Autumne.

The Names.

They are called in Greeke [illegible], *Brathus*, *Brathy* in Dutch, in Latine *Sabina* and *Savina* and of some *Sauinus*, who I say should call *Sabina* an herbe all doe much wonder, but all know and himselfe could not bee ignorant that both these were accounted by him were trees or shrubbes and not herbes. *Dodonæus* seemeth to allude unto the Greeke name, whereof such cause *Pliny* in his 16. booke and 19. Chapter mentioneth, and thinketh as divers others did, that *Brutia* is so called of *Brathus* by the transposition of a letter, and is *Pliny* that which he saith was called *Cupressus Creutica*: but

2. Sabina baccata altera.
Greeke Savine with berries.

Lugdunensis.

Lyebrosse denieth that *Bruta arbor Plinij* can be *Thuja prima Matthioli*, the *Oxycedrus* or *Cedrus Lycia Ionibi*, or *Cedrus Phœnicea altera* of *Plinie* and *Theophrastus* according to *Lobel*, and the *Sabina mas Dodonæi*, which shall be shewed in the thirteth Chapter. *Tragus* reporteth the wonderfull superstitious vse and before his time in his country, about the branches of the Savine tree on Palme Sunday, to be carried followed as they say by the Priests, and then powerfull to drive away divells, and to keepe them safe from lightning, and that those leaves that touched the Cradle or came neere it the Priest was in hallowing it, should preserve them that shall weare them (more then the rest of the that did not touch the Cradle) from charmes or witchcraft, and from the snares of the divell, and from the edges and points of swords and weapons, thus to draw their minder from trusting in God to vnto these conjured superstitious devises of men. *Matthiolus* much blameth *Belonius* that *Arabia* placed the great Iuniper tree, which he found on the mountaines *Taurus*, *Amanus* and *Olympus* resembleth trees, but I would faine know if the *Ferula* or *Gum Iuniper* be not to be accounted a *Matthioli* which is so accounted of all: but he is much more to be blamed as he saith also, for making the niper tree to be the *Arbor Plinij*. The fact is *Sabina baccifera* of *Matthiolus*, *Camerarius* and other *altera* by *Dodonæus*, *Sabina Cupressi similis* by *Gesner* upon *Dioscorides*, and *Lugdunensis*, the other *altera baccata* by *Lobel* and *Lugdunensis*, *Sabina altera alterajcon* by *Dodonæus*, and *Sabina Germanorum hermanorum*. The *Arabians* call it *Abiel* but not *Albaar*, the *Italians* and *Spaniards Sabina*, the *Germanes Seevenbaum* and *Sibenbaum*, the *Dutch Sevelbaum*, and we in *English* The Savine tree.

The Vertues.

Savine saith *Galen* is hot and dry in the third degree, and of very thin parts, by the strong drying and heating qualities it imparteth no consolidating or glewing propertie to be in it, but by reason of the great it digesteth the more, and hath lesse bitternesse then is in the Cypresse: it resisteth poyson as powerfully as Cypresse, especially if they be of long continuance, and not easie to be holpen, for mixed with some Honey and pulled, it cleanseth the filth of Vlcers, and taketh away their blacknesse, it breaketh also and driveth Carbuncles and Plague sores: *Matthiolus* saith that a dram in powder mixed with three drams of Nitre and vse of Honey doth wonderfully helpe those that are short winded: the decoction thereof drunke doth provoke the nesses, and draweth forth the birth and secondine, and destroyeth the living: the same outwardly applyed the fumes thereof taken underneath worketh to the same effect: the said decoction taken expelleth blood by vrine: is profitable for the Kings Evill: it killeth the wormes in children, but it is safer to vse it outwardly to annoint it to the Navell, or to annoint the belly with the oyle of Savine. The powder of the leaves of Savine made with Creame, or the greene leaves boyled in Creame and annointed on the heads of children, which have sores running sores or dry sores, cleanseth them throughly and healeth them, as also Saint *Anthonies* fire: the fresh leaves braised and layd upon running and fretting Cankers and the like, killeth and destroyeth them: the powder of the leaves mixed with some other things, or strewed upon doth helpe those blisters that rise on the privy members by immoderate luxury, after they have beene bathed with the decoction of the leaves. The distilled water hath singular good to cleanse the skinne from spots or markes therein, and other deformities, and helpeth those that have a giddinesse in their braine: the smoake thereof burned causeth Hens that have gotten the pippe, and is excellent for the Botches in Horses at carrell to give it in their drinke: but it must bee warily given for feare of dirges.

Chap. XXX.

Iuniperus. The Iuniper Tree.

THere are two or three sorts of Iuniper Trees to be greatest others lesser, whereof I meane to entreate in this Chapter and shew you their varieties.

1. *Iuniperus vulgaris sive minor.* The common Iuniper Tree.

The common Iuniper Tree (in some places groweth nothing so high as they doe at others) is to our clyme, and as well as in *Germany*, but of so exceeding great length as *Matthiolus* and *Lugdunensis* say, so that they doe there make Rafters and Beames for houses thereof, which being sometimes shrocke covered with a reddish barke which often cleaveth and falleth away, the wood vnder is somewhat yellow, hard and very durable (for as *Plinie* saith that *Diana's* temple at *Ephesus* and Rafters thereof for the more durability and very sweet when it is burned, the coales also the wood being burned and covered with its owne ashes, keepe fire in them a whole yeare) from whence spread divers branches set with very small and long narrow sharpe prickly leaves most part 3. in a rowe together which are almost like unto thornes, but not so hard or prickling: the flowers may be perceived like a little yellow dust falling round about in the Spring of the yeare, after which come greene berries, not ripening fully vntill the second yeare after their first coming forth which when they are ripe with an eye of blew thereon easily wiped away with touching, as it is in a ripe *Juniper*, some are as bigge of the bignesse of a Pepper corne, others as great as Sloes, and some a little long withall: so that there are alwayes upon the bearing trees both greene and ripe berries, wherein are contained small hard seedes somewhat reddish and spreadeth many branches: this doth alwayes abide greene, within the hotter countries of *France*, *Spaine*, *Italy*, &c. doth yeeld a certaine hard and dry gummie in small graines, somewhat like sticke and whitish while it is fresh and growing yellowish by age, not chewing together like *Mastick* but chewed but going to powder, and is of much vse as you shall heare by and by. There is also a Iuniper growing in sundry parts of this kingdome which bringeth only yellowish threads but not any berries succeeding.

2. *Iuniperus Alpina.* The low or mountaine Iuniper.

This low Iuniper seldome riseth to be two foote high, but groweth low spreading neare short and thicke armes and branches as the former, which yet are pliant and easie to bend but not these branches grow the like three leaves together, but they are shorter broader thicker and

Original from UNIVERSITY OF MICHIGAN

1. *Iuniperus vulgaris fœmina.*
The common Iuniper tree.

2. *Iuniperus maxima Illyrica.*
The great Sclavonian Iuniper.

are sharpe as they, and of the same blewish greene colour underneath but greene above: the fruit or berries are in like other like the other but a little longer, of a sweet sent and sweetish taste at the first but bitter afterwards in like manner like the other.

3. *Iuniperus maxima Illyrica.* The great *Sclavonian* Iuniper.

The great Iuniper Tree riseth to the height of a great tree, whose leaves are greater and harder more like unto Pine then the other: the berries likewise are much larger, of the bignesse of an Hasle nut in some places and in others somewhat long, with the roundnesse, and more blew when it is ripe then the other which is inclined away but abideth firmely thereon.

4. *Iuniperus major Americana.* *West Indian* Cedar or Iuniper.

The tree which they of our *English* colonies in the *Bermudas* and *Virginia*, &c. call Cedar groweth very great and high (for I have seene boards of above twentie foote long, and halfe a yard broad brought from the Islands) full of limbs spread with branches, and small short leaves like those of the greater Iuniper growing thereon: the fruit small and blewish not much bigger then our ordinary Iuniper berries: the wood is more red and of a more pleasant sent then our ordinary Iuniper.

The Place.

Iuniper groweth especially in Woods in *Kent* and sundry other places in the Land: the second groweth in the mountainy places of the *Alpes* as *Clusius* saith: the third groweth on mount *Taurus* in *Syria* as *Belonius*: the fourth on the sea shore in the *Venetian* Gulph and *Illyrium* as *Aquilinus* saith, and as some say also in *Italy*: the fift as is said in the *West Indies* in sundry places.

The Time.

Iuniper flowereth in March, the flowers fall over the ground being blowne from the branches, and as I said the berries are not ripe before they have growne on the bushes two Summers and a Winter.

The Names.

Iuniper is called in Greeke, *Arcenthis* and *Arcenthos*, in Latine *Iuniperus*, *Iuniperus*, *Iuniperus*,

apply to this gum, for *Vernix* is a made thing of *Amber* and Linseede oyle: for saith hee the name was derived from the *Germane* word *Vernissen* or *Bernissen*, which is with them the yellow *Amber* as it comes from the place where it is gotten, and tooke the name from the propertie therein, that as that is, this being kindled will burne like a Candle or Torch: *Vernix liquida*, in *English Varnish* is a certaine liquor that Painters and others doe use to lay upon their workes and Smithes upon their polished painted Iron worke, to keepe their colours the longer from fading, the best whereof for their use is made of this gumme of the Juniper and of Linseede oyle. *Pliny* in his eleventh Booke and seventh Chapter mentioneth another kinde of gum that is found in Bee-hives, being their foode whereon they live while they worke, and is called *Propolis* as *Pliny* doth: and *Cerumbus* but by divers others learned men *Vernix* and *Vernilago*, *Bauhinus* maketh two sorts of the ordinary Juniper tree, the one he calleth *Juniperus vulgaris fructu*, the other *Juniperus vulgaris minor*, which as *Clusius* saith that there is no other difference betweene them, then the largenesse of the growing of hotter climats, in the like manner as the Turpentine and the Storax trees, like Shrubbes in some places and tall trees in others. The second *Clusius* calleth *Juniperus Alpina* and *Gelnis in horto Juniperus nostras*: the third *Lobelius* and *Lobel* in his observations and *Icones*, *Juniperus maximus Illyrica cerulea bacca*, by *Lugdunensis Juniperus*, and by *Tabernamontanus Juniperus major Illyrica*: the last as I said is called Cedar by all our *Englishmen* in the *Bermudas*, &c. & with us from them who never learned it sufficiently, nor knew to give it the true denomination, for all the tree of Cedar doe much differ in sundry particulars from this, and therefore I have omitted to intitle it untill some other can give it a truer epithete. *Serapio* calleth it *Habhagar*, the *Arabians Archenna*, the *Italians Ginepro*, the *Spaniards Enebro*, the *French Genevre* and *Genevrier*, the *Germans Wacholder de Beam*, and the berries *Wacholder beer* and *Kramer beer*, of Blackebirds who are called in the summer time *Kramer vogell* because they feede upon the berries all the Winter long, the *Dutch Genever boom*, and the *English* the Juniper tree.

The Vertues.

No man saith *Fragus* can easily set downe all the Vertues of the Juniper tree, preferring the berries before the tree: the Juniper it selfe both leaves and wood as *Galen* saith are hot and dry in the third degree: but the berries although they be in the same degree of heate, yet are but in the full degree of drinesse: the gumme is hot and dry in the mid degree. The leaves and young tender branches of the Juniper tree, of the juice of them or of the berries or the berries themselves taken in wine, are very effectuall against the biting of a Viper or Adder, as also against the Plague or Pestilence or any other infection or poyson, the *Germanes* use it much, for their Treakle, and the confected juice of the berries, which they commend in all diseases almost, both for inward and outward medicines: the same also is profitable against the Strangury and stopping of the Urine, and so powerfull against the Dropsie, that as *Matthiolus* saith hee hath knowne divers to avoyd so much water by Urine by taking but five ounces at a time of the Lye made of Juniper ashes, that they have beene holpen thereby: it doth also procure women courses being stayed, and doth helpe the riving and other paines of the mother: the berries are good for the stomache and to dissolve the swellings and windinesse thereof: and are likewise profitable for the roughnesse of winde pipe, and other diseases of the Chest and Lungs and to ease the griping paines and torments of the belly, they are also prevailent to helpe Ruptures, Convulsions and Cramps: to procure a safe and speedie travell unto women with child, for which purpose *Matthiolus* adviseth to take seven Juniper, and seven Bay berries, halfe a dramme of *Castoreum*, and a dram of Cinamon, these being greatly bruised put them into the belly of a Turtle Dove to be roasted therewith, let it be basted with the fat of an Hen, whereof must be taken every other evening: The scraping of the wood saith *Dioscorides* being eaten doth kill men, which cause both *Matthiolus* and *Fragus* before him made much limit with, seeing it is contrary to the former part of the Text and thrust sacrifice by others, for as he saith neither the best apples have it therein, neither doe *Galen*, *Paulus Aegineta* nor *Serapio* who wrote wholly after *Dioscorides* the Text word for word make any mention of the properties of the wood, and more saith he it is found safe by oyle made thereof that *Scribonius* in his 15 Booke and 18. exercise, maintaineth the Text of *Dioscorides*, to that although the decoction of the wood be wholesome, yet the scraping or grosse powder by the dimension thereof sticking to the gorge doth suffocate in the same manner as *Galen* writes which to bee rightly prepared must bee beaten and finely sifted least it leave sores in the bowells and distill them: the berries are very comfortable to the braine and strengthen the memory and quicken and all the senses and the heart also being either drunke in wine or the decoction of them in wine or the same also is good against a quartane, and dissolveth the winde in the belly and in generall is effectuall to all the senses as well outward as inward proceeding of any cold cause, if they shall take of the berries two or three a weeke fiue or foure at a time in wine, which must bee gathered in the full time of the moone with and after fairely dryed upon a cloth: the Salt made of the ashes of the Juniper wood is a singular remedy for the Scurvey, the purified and spongy gume, and especially boiling all parts of the Cyprisall oyle drawne from the berries while they are greene: as also and it not much to all the premises aforesaid: there is an oyle also drawne out of the Juniper wood *per descensum* as they call it, which is very good against the rot touch and for the Goute, Sciatica and resolution of the Nerves or sinewes of cold. The gumme of Juniper is used like *as Amber* is to lay cold rheumatick distillations upon the eyes or Lungs &c. the fumes thereof upon the burning on coales being taken in the head also holden in the mouth time over the said fumes at night and to lie covered [illegible] thereof with other things fit for the purpose, strewed upon Flax and to be applied [illegible] the night chiefely, and in the day also as needs shall require: the said gumme [illegible] vomitings, inward bleedings and spitting of blood, swellings comfort also and all [illegible] and of the haemorrhoides or piles: the same also inlaied in the woosen in a bladder, and [illegible] Roses and Myrtle: he saith the chappes of the fundament, kibes also and chilblaines [illegible] der of the gumme mixed with the white of an Egge, and applyed to the forehead [illegible] nose: the fume also burned upon quicke coales, and the fumes thereof taken through a [illegible] tooth taketh away the paine: it is called all in mouth Vlcers and Fistulaes, and wasting [illegible] the moisture in them which hindereth their cure: the liquid Varnish is an especiall remedy [illegible] water or burnings with fire, and to helpe the paine full and bleeding Piles, and Palsie, Cramps [illegible] the Nerves and Sinewes: The smoake of Juniper wood being burned, besides that it reeleth [illegible] fame any house, it is of good use in the time of infection, and driveth away all noysome [illegible]

Cedar, all the effect of the wood or barke made into a Lye with water doth cure all inflam. tracbes pullulesor any eruptions in the skinne, yea and the Leprie also if the places be bathed therewith. The Germane Treakle Juniper verie is made in this manner. Take what quantitie you will of fresh but ripe Juniper berries, bruise them and boyle them in a reasonable quantitie of water until they be well boyled, straine and presse them hard in a presse, which presse and decoction set to the fire againe in a glased earthen vessell, and evaporate away so much of the moisture, stirring of it continually as until it become of the thicknesse of an electuary, which then put into pots or glasses to be kept for your use, whereof a small quantitie taken morning and evening doth wonderfully comfort the heate wrestled with the stone in the Reines or kidneyes, with the Cholicke, with the paines of the mother, and the suppressions of their courses, is good against Catarrhes and rheumes, the shortnesse of breath and wheesing, the straightnesse of the breast, the cough, the crudities, rawnesse and indigestion of the stomacke, smell the Plague and other infectious diseases, for it preserveth and defendeth the heart and vitall spirits from all venomes, and against Cowrungs and faintnesse, the paines, swimming and giddinesse in the head, moist rheume also and madnesse, for inflammations and rheumes into the eyes, and preserving the sight, weaknesse in hearing, and stench of the gums mouth or breath, helpeth the Dropsie, Jaundice, Falling sickenesse, Palsie and Gaute, healeth inward Impostumes: in briefe it not onely helpeth all diseases which the body is infected, but keepeth it in health and free from all diseases. This one thing is reported thereof, if it be credible that Virgil hath thereof in his tenth *Eclogue*, that the shadow of the Juniper tree is hurtfull both to man and the fruits those verses,

Durum, sylvestres soliti es pascere tauros,
Juniperi gravis umbra nocet, & frugibus imbres.

Chap. XXXI.

Oxycedrus minor, The prickly or small Cedar.

We doe not intend in this place to speake of the great Cedar, in that it neither hath thornes nor prickly leaves, but of some of the lower and lesser sorts, which are prickly as they follow.

1. *Oxycedrus.* The prickly Cedar.

This prickly Cedar groweth in some places to be a tall tree, but most usually not much above a mans height, whose body is crooked and berried covered with a scabbed or rugged reddish barke, upon the branches grow long and narrow, sharpe and prickly leaves like unto those of Juniper but longer and bigger, three for the most part set together, among the leaves come small yellow flowers, which turne into round berries greene at the first, yellowish after, but of an excellent red colour when they are thorough ripe, larger than Juniper berries

1. Oxycedrus. The prickly Cedar.

2. Cedrus Phœnicea folio Cupressi. Cypresselike Cedar.

Tree by

by reach: the other Cedars doe follow, sometimes growing as great as Hasell nuts, couched or wrapped with three or foure small uneven white seeds within them, greater then those in the Juniper tree. Which berries abide on the tree all the Winter, and fall not away untill young ones are budded and growne great.

2. *Cedrus Phœnicea folio Cupressi.* Cypresse-like Cedar.

This other Cedar hath likewise a crooked stemme, seldome growing above a mans height, spread into many small branches, covered with a rugged reddish barke, the lower leaves especially of a young tree before it be fit to beare fruit are long and sharpe pointed, like unto Juniper leaves but longer, but the upper leaves when the tree groweth elder, doe change their forme and become flat and plaited like unto Cypresse leaves, but sharpe or prickly withall, so as one would thinke verily that seeth them at several times, that they were leaves of sundry of different kindes, which being rubbed smell sweet and resinous: at the end cleerely in a hot soyle it yeeldeth yellow flowers, which afterwards turne into a round berry, greene at the first and reddish when it is ripe, being somewhat mellow, tasting more bitter but aromaticall, containing within it three or foure seeds.

3. *Cedrus Phœnicea minor.* The lesser Cypresse like Cedar.

This little Cedar is in all things like the tall, but lesser both in body and leaves, the fruit like wise is greene at the first, and reddish when it is ripe, but smaller, even no bigger then Juniper berries.

The Place.

All these sorts grow as well on the mountaines *Taurus*, *Amanus* and *Olympus*, as neare the sea shore and in mountaines not farre from *Sidon* in *Nouhne*, and in *Naples* also, and in *Mysia* at *Marmoda* also.

The Time.

They blossome in the Spring of the yeare which soone fall away, the fruit following that will not be ripe till the next yeare after the fifth spring time herein like unto the Iunipers.

The Names.

The first is called in Greeke Οξυκεδρος ἡ μικρα, *Oxycedrus* and *Cedrus Lycia*, of some *Cedrus mas*, and *Cedrus Phœnicea*, for a difference betweene it and the great *Cedrus*, which is called *Phœnicea altera*, *Cedrus Phœnicea* for such Cedar growth on the hills in *Phœnice*, some also call it *Cedrus Phœnicea folio Cupressi*. Dodonæus called it *Cedrus Libanotica*, and *Thalamus* in his French booke *Oxycedros*, but by him in his Latine booke *Oxycedrus Phœnicia*, by *Cordus* in his *Cedrus Phœnicea*, by *Gesner* in his *Cedrus mas* or *Cedrus Lycia*, by *Lobel* in his *Cedrus minor Phœnicea*, by *Bauhine* *Juniperi prima species Dodonæi*, by *Lobel* *Juniperus major Monspeliensium* and *Cupressi folio Juniperus secunda*, by *Cordus* in his *Juniperus prima species*, by *Lobel* *Juniperus minor Monspeliensium* and *Cupressi folio Juniperus tertia*, by *Cordus* in his *Juniperus minor*, by *Clusius* *Juniperus minor Italica sive Cupressi folio*. I doe not so much wonder at the variable opinions of sundry late writers (who not knowing or not observing the differences betweene the trees bearing the fruits following) have set downe the figures of the one for the other, as I doe at the ancient writers, who not in one age but in the beginning of the knowledge of herbes was not in every mans knowledge, then living but in the observation of the learned or knowledge: have some of them as I take it not considered, and that a Iuniper which others afterwards have more truly referred to the Cedars, as *Theophrastus*, who also as I said before called it *Cedrus Lycia* as *Plinie* also did; as I doe at present in a worke of further yeares gathering, a true definition of every plant, that her flowes and fruits doe expect

Cedar and is almost as strong and powerfull to condite or enbaulme the bodies of the dead, to preserve them from putrefaction as it is the *baile de cedr* or abhominable stinking Tarre, is used not onely of the Shepherds to cure their Sheepe and Dogges of the mangy, scabbes, lice, &c. but helpeth also to kill lice, and cure the scabbes in childrens heads, and is used either of it selfe alone, or with a little Vinegar to an aking tooth to ease the paine, or else to breake or cause it to fall out: the same also is effectuall to clense and dry up watering, corrhoding or creeping Ulcers: it is also used to bee laid upon wood to preserve it from Wormes, and the smell thereof driveth away Mise and other noysome Flies.

Chap. XXXII.

Prunus sylvestris. The blacke Thorne or Sloe bush.

For the blacke thorne or Sloe bush here take up a place, because it is so thicke stored with thornes. It never groweth to the greatnesse of a tree but alwayes abideth as an hedge bush, in some places rising higher then in others, having usually divers stemmes rising from the rootes, branched forth into greater armes and smaller sprayes, stored with strong short and sharpe thornes, set with and beliden small darke greene leaves finely denred about the edges: the flowers are very white, many set on the branches in divers places and not wholly at the toppes, consisting of five leaves as all other Plummes and Cherries have, and divers white threads tipt with yellow in the middle, after which follow the fruit, which are as all know, blacke and small when they are ripe, and with the harshnesse a little sweete, but before that time to harsh that none can indure to taste them: they are all of one forme, that is round, and of one size or bignesse in a manner, but to be much bigger or else as big as a Bullets, or to be long with the roundnesse as a Dampion or other larger Plum I did never see: the roote is great and woodily, spreading under ground and throwing forth againe in divers places, if it be not cut and grubbed.

Prunus sylvestris.
The Blacke Thoorne or Sloe bush.

The Place.

It groweth in every place and country in the hedges and borders of fields, and is for their devision a sure defence.

The Time.

It floureth early, that is, alwayes in *April* and sometimes in *March*, so strong and hardy it is against all the injuries of the weather, but ripeneth the fruit after all other Plummes whatsoever, for it is not fully ripe and soft before it be eaten and used until the Autumne frosts have mellowed it.

The Names.

It is called in Greeke καρυόμηλα ἄγρια *Coccymelea agria* and ἄγρια κοκκυμηλέα *agria coccymelea*, *a good magnitude & rotundity* ἀγριοκοκκυμηλέα *agriococcymelea*: but in Latine they call it in *Spina Prunus Pruneum*, in Latine *Prunus sylvestris* and *Prunellus*. *Virgill quarto Georgicorum* calling it *Spinus* in the marcolme geodes in these words,

Et Spinus jam pruna ferentes,

and so doth *Serenus* and divers other authors since their times. The *Spina* is accounted a kind of wild Plumme, of the kinds whereof I have spoken in my former booke. The *Italians* call it *Spina salvatica*, the *French Prunier sauvage*, *Prunelier* and *Epinelle*, the *Low Germans Schlenboom* and *Haberscleken*, the *Dutch Slee* and wee in *English* blacke Thorne or Sloe tree, or bush.

The Vertues.

The parts of the Sloe bush are binding, cooling and drying, and therefore good to stay bleedings at the nose or mouth or any other part, the laske of the belly or stomack or the Bloody flixe, the immoderate course of women courses, and helpeth to ease the paine in the sides, bowells and guts, if the same be fomented or bathed, to drinke the decoction of the barke of the roote, or more usually the decoction of the fruit either fresh or dryed. The Conserve likewise is of very great use and most familiarly taken for the purposes aforesaid, but the distilled water of the flowers first steeped in Sacke for a night, and drawne thereout in a Limbeck, is a most certaine remedy tryed and approved, to ease all manner of gnawings in the stomacke, the sides, heart or bowells, or any other griping paines in any of them, to drinke a small quantitie when paine are upon them: the leaves also are good to make lotions, to gargle and wash the mouth withall, which is swellings, sores or kernells, and to stay the defluxions of rheume to the eyes or other parts, to coole the heate and inflammations in them, and to ease the hot paines of the head to bathe the sore places therewith. The simple distilled water of the flowers is very effectuall also for the said purposes, as the condensate or thickned juice of the Sloes: the distilled water of the greene berries before they be ripe is used for the said effects of cooling binding and staying the flux of blood and humours, and some use it for the *Jaundise* preserves. The juice of the fruit of Sloes is taken as a Substitute for the juice of *Acacia* in many Apothecaries shoppes, which substitution although it bee not much to be misliked, as having one and

but one qualitie of the *Acacia* in it which is the binding, yet is it deeper in the degree of [illegible] learned men in sundry places and namely the Phisitians of *Padua* and *Naples* have accounted the [illegible] juyce of *Samach* or of *Mirrhe*, to be a better substitute answering to the qualities of the *Acacia* [illegible] juyce of Sloes doth: for substitutes had neede of much consideration and judgement, not onely [illegible] the full qualities, that is a roote for a roote, a *seede* for a seede, a juyce or gum, for a juyce or a gum to be added a juyce or gumme in steede of a roote or seede, or contrariwise: but in the second qualities also [illegible] that is in heate and cold, that contraries be not admitted, either of cold for hot, or hot for cold yea and of the [illegible] quality likewise, that they may answere as neere as may be possible, the same degrees that they neither want nor abound in any degree. And although *Galen* did appoint the double quantity of *Cassia* in the stead of *Cinnamon*, which made *Quintus* to call into his dish, that by the same rule he might take double the quantity of cinnamon in the stead of *Cassia* so much fine, as was appointed to make a medicine, yet *Galene* answere to him plainly, that the respect of substitutes, standeth not in taking twise so much, of that which is worse in stead of that which is good, but as in the actions of men, when as the strength of one man is not sufficient to beare, lift, or drive, stone or engine, we put two or more to doe it: but there are other substitutes admitted among our Apothecaries, into these two great Antidotes of *Mithridatium* and *Theriaca Andromachi*, which are no way to be allowed, collerated, nor ever would be in any of the famous Cities of *Italy*, which is to usher the *Canella alba* (called *Corteo winteran*) which is the barke of a tree, to be the substitute for *Cassia* which is a roote, moreover dispensation, when as the like was never seene before, and to deny a genuine and right Simple to be put into other mens composition, because the thing was scant, and not for every one easily to obtaine, nor the price that every one might have cheape, and therefore in steede of an aromaticall colure, use an unctious or hurtfull, more contrary to the rules of Art, the rule of substitutes, and the course of other famous and worthy professors in other Countries, who by sparing no cost to obtaine such genuine drugges as are rare, fearfully to be had, or of especiall use, have made themselves and their compositions famous through the whole world: who else by being too greedy of gaine, and too envious of any others better proceedings than their owne have also, as I doe, farre meaner things than they should: but *heia*, what hath all anger against the enemie my pen drawne me to utter? It is rather in hope that all will amend being forewarned, than to touch any in particular, that will hereby take himselfe to be taxed, for thereby he shall shew himselfe guilty of the crime, although I doe accuse him.

CHAP. XXXIII.

Tragia sive Tragum Matthioli. The Sea prickely plant.

THis straggling fellow I have followed to the Sea side to bring to your view, and have therefore [illegible] in the end of this Classis, being neerest to this tribe of prickly plants, although it selfe be somwhat gentle or lesse offensive, whose description is in this manner. It spreadeth divers crooked greene stalkes, variously branched, and the branches moulded one within another, thicke set with small short, and somewhat sharpe, pale greene leaves, three or foure set together, thicke and closing the stalke at the bottome, forming as it were a great joynt, resembling the fruite of the *Caltrope*, in some plants and places the leaves will be twise as long, but in gardens are never so sharpe or prickly, as in the naturall places; at the joynts upwards stand severall small yellowish greene flowers, which afterwards turne into small flat seedes, within a three square prickly huske: the roote is small and long, perishing every yeare utterly, so that if it sowe not it selfe, as in the naturall places it doth, it must be new sowne every yeare: the whole plant is almost without any taste, either of heate, or cold, or drying, yet more enclining to heate than cold, as many Sea plants doe.

The Place.

This plant groweth neere the Sea side, not onely in other hot Countries where by the heate of the climate, the branches are harder, and the leaves more sharpe and pricking, but on our owne coasts also in divers places, although nothing so sharpe yet somewhat prickly.

The Time.

It flowreth not usually untill the middle of *July*, and the seede is ripe in the end of *August*.

The Names.

Tragus is [illegible] *dictus*, a word of many significations, for this is neither the [illegible] *Tragus* of *Dioscorides*, which he saith some also called *Scorpius*, nor yet of *Pliny* which hee maketh the *Scorpius* of *Theophrastus*, nor yet the *Tragos Cerealis*, whereof you shall heare further in his place, nor yet the *Tragum* or *Tragum vulgare* of *Clusius*, which is our *Distander*: but a prickly Sea plant adjudged by *Lobel* and others, to be a kinde of *Kali*, and call it *Kali spinosum*, which *Mat-*

...forth for the right *Tragus* or *Scorpius* of *Dioscorides*, but confounderh it with the *Scorpius* (or *Nepeta*...) of *Theophrastus*: and therefore all others since his time call it *Tragus*, or *Tragus Matthioli*, and [illegible] in *Pedro Matthiolo*. *Angularis* calleth it *Dryps* and saith *Tragon non est Lobel* hath set forth ...with longer leaves, and *Camerarius* also saith it did grow with him, then *Matthiolus* or *Lugdunensis* hath this, yet *Lugdunensis* in his Booke of Sea plants giveth a figure differing from the former, viz. standing with leaves in rowels like *Gallium* or *Rubia*; but the true *Tragus* of *Dioscorides* I have shewed you before by the name of *Polygonum baccifera minus* or *Fuci marina minor*, which by the judgement of most the exercited in herbarie doth best agree with *Dioscorides* text in all points. *Bauhinus* in this as he doth in many other places ...divideth herein to as if they were two plants, calling it *Kali spinosum echinatum* and *Kali spinosa affinis*, ...appropriateth authors unto each, when as himselfe acknowledgeth they doe all...e that make them to bee the one, howsoever the figures doe vary. I have called it in *English* the Sea prickly plant untill a fitter can bee ...ven.

The Vertues.

I cannot finde or learne of any property physicall whereunto this plant is serviceable, (onely *Camerarius* saith, ...ooked as young Asparagus for a sallet herbe to be eaten) but serveth to contemplate the Creator in his creatures as many other the herbs and plants that grow out of the ground, whereof although we know no use in many of them at all, the use is most, yet he hath not made the least in vaine, and if we would be as industrious to search out ...r faculties as our forefathers have beene in their times we should know much more then we doe; and surely if we did not enjoy their labours, in what a world of darkenesse and ignorance should we abide? Let therefore ...ould ...age worke effectually in all *Nemo sibi natus* and let every one endeavour to augment the talent that ...hath beene lent him, not for his owne particular onely, but for the benefit of others, so shall the savour of such ...ious opinions spread farre, whereof others receiving the fruit as well farre off as neare at hand, perpetuall odour ...praise will rise from them and glory will crowne them from whom it commeth.

FELICES

FILICES ET HERBÆ CAPILLARES.

FERNES AND CAPILLARIE HERBES.

CLASSIS DECIMA. *THE TENTH TRIBE.*

CHAP. I.

1. *Filix mas vulgaris.* The common Male Ferne.

OF the Male Ferne there is some diversitie as shall be shewed. The Male Ferne sendeth forth divers hard rough unbranched stalkes of winged leaves, naked or bare at the lower end, consisting of many leaves up to the toppes, with one at the end, set on both sides thereof, not fully opposite but as it were in the middle betweene two on the one side, each leafe not fully devided but deepely notched in on the edges, all of them of a pale greene colour, hard and dry or without sappe, brouded at the bottome and smaller toward the toppe, on the backe side of whom there are certaine browne small spots which are the seeds, for by the falling of them young ones are encreased: this and all other sorts of Ferne and Capillaris herbes in this Classis mentioned, have no flowers nor other seeds then such spots, or scales whereby they as I said are encreased, although many have denyed that any of them have either flowers or seede, and some have beene reclaimed upon my instance of the place in *Genesis* 1. 11. 12. and so have declared it: the roote hereof is made of many thicke blacke threads descending from a browne scaly thicke head.

1. *Filix mas vulgaris.* The common Male Ferne.

2. *Filix mas aculeata.* The prickly Male Ferne.

This other Ferne differeth not from the former, but onely that the winged leaves are not dented in, but whole, having a small pricke at the end of each of them and growing not so high.

The Place.

The first groweth as well on Heathes and open places of hills, as in shadowy places by the sides of fields, reasonable frequent in all countries, but the second groweth very few yet in the like places also.

The Time.

These seldome hold their stalkes with leaves greene in the Winter: but shoote out new from the roote in the Spring which at their first rising are browneish and foulded in rounde: The time when those heads on the backe of them are ripe and doe fall is Midsomer, and falling on the ground doe spring, for whereby else should it be encreased, seeing God in the beginning appointed every herbe and tree, to have the seede of their kinde (and not of another) within them.

The Flower.

[illegible] simple [illegible] stems and *pinnæ*; for as the leaves are like unto the wings of [illegible] which is the reason why in Latine *Filix* one of the ancient authors, yea *Angelius Gale-* [illegible] and with us generally *Feathers*, not onely contrary also to [illegible] the opinion of him who saith the weed is become the male and female, in his fourth booke and twen- [illegible] in these words, *Filix famina filix a mas folia, quod folium maculosa parte longa latet, &c.* that [illegible] *Filix* the male and is the third sort of the male kind, for his second *species* is but a small difference [illegible] *Bauhine* in the *Prodromus* as I said, calleth it by the name of *Filix mas dentata minor*, and [illegible] *Lobel* describeth it with little difference. The male Ferne is called by the *Dutchmen Lan-* [illegible] by the *Spaniard Helecho yerua*, by the *French Fougere* and *Fougiere masle*, by [illegible] by the *Dutch Varen boome*.

The Nature.

[illegible] all authors have appropriated the same vertues to the male Ferne that they have to the female, and [illegible] no vulgar knowledge in the first of the same kinde apparent; I will referre you to the next Chapter for [illegible] Litter of Ferne is made a bonde of cheape or dark coloured greene glasse in laundry places in [illegible] the Dutchy of *Cleve*, &c. (and in *England* also as I have beene told by some) out of which they [illegible] water. The seede which this and the female Ferne doe beare, and to be gathered onely on Midsom- [illegible] night with I know not what conjuring words is superstitiously held by divers, not onely Monte- [illegible] banks alone by other learned men; yet it cannot be said but by those that are too superstitiously [illegible] of some secret hidden vertue, but I cannot finde it expresly what it should be: for *Bauhine* in [illegible] upon *Matthiolus* saith, these tales are neither fabulous nor superstitious, which he there saith he will [illegible] where; but *Matthiolus, Lonitzerus* and others declaime against such opinion: experience also shew- [illegible] the same to be false; although *Theophrastus, Galen, Dioscorides* and *Pliny* following him, say they neither beare [illegible] seede for to sow in Midsommer (for then usually it is ripe) you gather the stalkes of Ferne and hang [illegible] them with some faire white Paper or cloth under them, you shall finde a small dust to fall from [illegible] the seede, and from them doe spring plants of the same kindes and such young plants often from [illegible] the old have beene seene growing about the old plants, for as I said before no herbe growing on the [illegible] earth except some with double flowers which are encreased by the roote but the seede, &c. [illegible] hath a great contrariety in nature betweene the Ferne and the Reede, that each one will perish [illegible] where it is planted, as if it were by a naturall instinct, which thing I thinke happeneth rather from the [illegible] not drying the dry ground nor the Ferne in a wet. *Pliny* in his 22. booke and 21. Chapter saith, [illegible] the Reede laid to the Ferne driveth it forth, as the roote of the Ferne in like manner doth the [illegible] also before him sheweth that each of them is a remedy against the other, and *Theophrastus* that [illegible] Ferne and other herbes doe delight and are furthered by dung, the Ferne onely perisheth

Chap. II.

1. Filix famina vulgaris. The common female Ferne.

The female Ferne likewise there is some diversi- [illegible] more then formerly hath beene observed by [illegible] as you may here see

1. Filix famina vulgaris.

The common female Ferne.

[illegible] step with one or two, and sometimes more [illegible] stalkes from the roote some what higher then the [illegible] couched with such like winged leaves growing on [illegible] usually for the most part one against another, [illegible] fuller then the male, and more divided or [illegible] not sharpe but round pointed, of as strong a smell [illegible] having the like spots on the backside of [illegible] stalkes is of a shape some what long, will [illegible] with the next shew some matter of a splayed Eagles [illegible] long and broader then the former, of about [illegible] and thick with for the most part creeping un-

2. Filix famina pinnulis dentatis.

Crested female Ferne.

[illegible] Ferne hath the small winged leaves which [illegible] the middle ribbe, some what sharpe poin- [illegible] smaller colour and narrower then the formers [illegible] but the maine stalke is fuller of [illegible] standing up to straight nor so high, and [illegible] not standing thick.

3. Filix famina pinnulis acutis pinnata.

Pointed female Ferne.

[illegible] pointed female Ferne hath the maine stalkes [illegible] long, branching out into wings each whereof is [illegible] but whole, ending in a small pricke or point.

1. Filix famina vulgaris. The common female Ferne.

Fee

The Place.

The first groweth more frequently than the male on barren heaths, and shady hedge sides, but they grow rather on moist rockes and in the shaded hills.

The Time.

They flourish at the same time and perish in Winter, I meane the leaves.

The Names.

It is called in Greeke [illegible] and *aspidium* in Latine *Filix femina*, which is generally by most Authors called *Filix femina*, yet *Gesner in horto* calleth it *Mas*, and *Fuchsius* in his *Filix vulgaris tenuifolia altera non aculeata*: the second is called by *Thalius*, *Filix femina altera tenuifolia*, called by *Bauhine* in his *Pinax*, *Filix ramosa minor pennis dentatis*, which *Cordus* in *Historia Plantarum*, in *Tragus* passeth it likewise, it is called in *Italian Felce femmina*, in *Spanish Helecho*, and *Feto femenil* in high *Dutch Grosse Farrenkraut*, in low *Dutch Varen kruyt*, and we in *English* brake or female fearne.

The Vertues.

The roote of both these sorts of Ferne are somewhat bitter, with some astriction, being boyled and drunke in Meade it voyded water, and wormes, killeth both the broade and long wormes in the body, the juice abateth the swelling and hardnesse of the spleene: the greene leaves eaten, are layd to open the belly, and remedy downewards, yet troubleth the stomacke, and purgeth choller vpwards and waterish humours: they are very vertuous to women with childe, by destroying the birth, and provoking abortement, yet is it but a wilie beast danger unto them to goe or ride over it: for *Lonicer* the weth that the greene root is fatley in meat and drinke brait that ere long yet the use of it procureth barrennesse in them: the rootes being bruised and boyled in Hogs grease, maketh an oyntment very profitable to heale wounds punctures or prickes in any part, and ingendereth of them aged in fowle Vlcers, dryeth up their malignant moisture, and causeth them speedily to incarne: hereof with other things that goe into the oyntment, called *Agrippa* are appointed to helpe vp ingle persons: the fume of Ferne being burned driveth away Serpents, Gnats, and other noysome Creatures: in the Fenny Countries much moled both strangers and inhabitants, that lye in bed in the night time with their faces vncovered. They use in *Warwick* shire, above any other Country in this Land, in stead of sope to wash their clothes, to gather the female Ferne (for that is most frequent with them) about midsommer and to make it in good big balls, which when they will use them they burne them in the fire, vntill it become blewish, which being teen layd by, will dissolve into powder, of it selfe, like vnto Lime: fowre of these balles being boyled in a tunne water is sufficient to wash a whole bucke full of cloathes.

CAP. III.

Osmunda regalis sive Filix florida. Osmund or Water Ferne.

Although this Ferne, doth never grow naturally but in Bogs, wet Moores, and the like wette places, and therefore may litly challenge to be placed with those of the like nature: yet I could not tranpose it alone, from the rest of the Tribe, lest it take his place here with the rest of the Ferne: it shooteth forth in the spring time (for in the winter the leaves perish) divers rough hard stalkes, fulle round and hollowish or flat on the other side, two foote high, having many branches

1. *Osmunda regalis sive Filix florida*, Osmund or water Ferne.

Osmunda regalis foemina sive Filix.

...green leaves on all sides, each leafe standing one against another, are longer, narrower and ...on both sides, as this leafe are, which may accounte as the flower and seede: the roote is rough ... with a white pith in the middest, which is called the heart thereof.

The Place.

...Pastures, and the Mountes, Bogges, and watery places, in many places of this Land. I tooke a ... my garden from the hedge on *Hampstead* Heath, not farre from a small cottage there.

The Time.

... all the summer, and the roote onely abideth in winter, to floure forth a new in the Spring.

The Names.

... in Latine (it hath no Greeke name) *Osmunda regalis* of the singular properties therein: it is also ... *Filix Tenuifolia*, or *Filix Tenuifolia*, or *Filix palustris* or *aquatica*, and in *Gesner* saith, *Filix Tenuifolia* ... by *Cordus* by *Lobelius Stoechas Altera*, by *Anguillara Filix Mas*, and by *Cordus in Historia Plantarum*, it is called in *Italian Osmunda*, in *French Osmonde* and *Fougere aquatique*, in high *Dutch Hasser* ... and *Engle Farn*, in low *Dutch Groote Varen*, and *Wilt Varen*, some in *English Osmund Ferne*, *Osmond Royall* and *S. Christophers herbe*.

The Vertues.

... most particularly remembred by the ancients, although it is probable enough they knew it, and commended it under the male Ferne, for *Galen* commendeth the roote of Ferne to be very profitable, and *Dioscorides* ... added a Royall title unto it, in that it had rather more effectuall vertues than others, and ... and old griefes, as is mentioned in the foregoing Ferne, and is accounted by most to be ... wounds, bruises and the like, the decoction to be drunke or boyled into an ointment, or oyle, as a ... Balme, as also singular good against brasles and broken bones, or out of joynt, and giveth much ease ... and Splene sicke difeases, as also for ruptures and bruisings.

Cap. 4111.

1. *Polypodium vulgare*. Common Pollipodie of the Oake.

The Pollipody is a small herbe consisting of nothing but roote and leaves, having neither stalke nor flower, ... nor seede, as it is thought. It hath three or foure leaves, rising from the roote, every one singly by ... stalke, of about an hand length, which are winged, consisting of many small narrow leaves, cut ... into the middle ribbe, standing on each side of the stalke, each being large below and smaller up to ... the toppe, very like unto the Osmund Ferne, not having any dents or notches at all on the edges,

1. *Polypodium vulgare*. Common Pollipody of the Oake. 2. *Polypodium Dactyles*. Hand Pollipody.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

as the Male Ferne hath, of a fad greene colour on the upper side and smooth, but on the inner side rough, by reason of certaine yellowish spots, are set thereon: the roote is smaller, creeping after the manner of the other, and of a fad colour on the outside and greenish within, with certaine fweetish barkinesse in the taste, set with certaine rough knags or excrescences on each side (as in the other) having also much mossinesse or yellow haryinesse upon it, and some fibres underneath it, wherewith it is nourished.

2. *Polypodium aliud tenuius folijs minus.* Small Polipody.

This small Polypody differeth not from the former, neither in roote or taste, or marke on the backside of the leaves, but onely that the roote is smaller, and slenderer, and the leaves also not so long or large, and smallnesse as I suppose, from the place where it groweth, than from a diversity of kinde: for the leaves in some places do seeme to be a little waved on the edges, yet it is but accidentall.

3. *Polypodium Manuse.* Hand Polypodie.

The Hand Polypodie is rather differing from the other, by the nature of the place (as it is supposed) than of kinde, being set forth many times plants, differing in the forme from those of other places, sometimes greater, sometimes lesse, sometimes with two or three leaves at a joynt or place, and some times with more, with a long stalke of a foote long, which (middle most) is of a reddish browne colour, the leaves (either the divisions or parts of the leafe, are more seperate one from another, not standing close together as in the former, but distant one equally on both sides, each part also being longer and denter on the edges, of a greene colour, and smooth on the upper side, and speckled with a yellowish dust on the under side as the former are, the roote is like the other.

4. *Polypodium Indicum.* Indian Polypody.

Clusius setteth forth this in the fourth booke of his *Exotics*, being brought out of the East Indies, the certaine place not knowne, by an Dutch Clerk, who dying in coming home, his Papers broke or broken came to Clusius hands, where he found this among the other without name. The roote he saith was halfe a foote long and an inch thicke thereof, rugged browne and long like other Polipody, and three large leaves rising together from it, two of them bigger than the other, and of eleven inches a peece, with a great middle ribbe and each side of it couched (or set) like an herdh, the edges much divided, and many veines therein. This I thought good to mention here although it is likely it will never be seene in our Countries, and so shew the diversities of others.

The Place.

Polypodie groweth upon the old rotten trunkes or stumps of trees both Oake, Beech, Hazell, Willow, or any other, as in the woods under them, and upon old mudde walls, as also in moist, stony, and gravelly places, even in gardens also (as I have proved) where it hath stood undone many yeares, springing up, and flourisheth where the place is dry and not disturbed: is accounted that which groweth upon Oakes onely, but the quantity thereof is scarce sufficient for the generall use, the other is as good, given also to the like *Vses* which is in the Countries (as I heare) to be had in *India*.

The Time.

Is being alwayes greene, and bearing neither flower nor seede, as it is thought, it may be gathered for use at any time, yet it shooteth forth greene leaves onely in the spring.

The Names.

It is called in Greeke [illegible] *Polypodium* so called *a polyporma corticis* (saith *Dioscorides*) [illegible] *corticis* (saith *Plinie*) *vel cutis quasi parva filix* and in Latine *Filicula* a herb [illegible] the *Arabians Bifolia* (which *Serapio* and *Dodoens* & *Badens* by *Error*, yet others let it down [illegible] of the *Dalians Polypodie*, of the *Spaniards Polipodio*, and *Polipoio* of the *French Polipode* of the *Dutch* men *Rommerwort*: in *English* Oake Fearne, and Wall Fearne, [illegible] growth but generally Polypodie. The first is generally called *Polypodium* [illegible] thought by *Fuchsius* to be the *Thelypteris* of *Dioscorides*: the second *Matthiolus* calleth *Dodonæus Polypodium minus*: the third *Lugdunensis* setteth forth, with the name *Polypodium* [illegible] thinketh to be the same, which he setteth forth under the name of *Lonchitis aspera* [illegible] with description of the *Polypodium Manus*, saith that the Hand of *Iuno* bringing [illegible] plants, as this Polypody, a *Lonchitis aspera*, and an *Hemionitis* that doe differ from others [illegible] and set them forth, saith that they are diverse plants, and that it hath the same qualities that [illegible] both, but *Lonchitis aspera* hath no purging quality, but *Bauhinus* in so saying shewes that he [illegible] places, but the effigies onely, and I thinke the figure of the more it is to be onely set forth, [illegible] matter, for that the one is long and thicke like unto other Polypodies, and the roote of the [illegible]

Original from UNIVERSITY OF MICHIGAN

The Vertues.

Polypodie is generally used with other opening and mollifying things, to purge the body, for it is held by most of our later Physitions to be very weake of it selfe. *Matthiolus* who is called the Phisitions Evangelist for the certainty of his Medicines and the truth of his opinions saith, that it dryeth up thinne humours, digesteth the grosse and tough, and purgeth blacke or burnt choller, and especially tough and thicke flegme, and thinne flegme also even from the joynts, which the inhabitants about the Rivers of *Rhene* and *Mosa* doe finde to be true, as *Dodonæus* saith it, who by using the decoction of Polypody a good while together, are freed from those tumors in their hands, feete, knees and joynts wherewith they are much troubled; and is therefore good for those are troubled with Melancholy or Quartaine Agues, especially if it be taken in Whey or Meade, that is honied water, or in fairy water, or the broth of a Chicken with *Epithymum* or with Beetes and Mallowes, it is also good for the obstructions of the Spleene, and for those prickings or stitches that happen in the sides, as also for the choller when any manner of wayes, some use also to put to it some seedes of Fennell, and Anise or Ginger, to correct the sicke, or loathing that he saith it bringeth to the stomacke, and to strengthen it the better, yet some hold it is in fact needlesse that it bringeth no trouble to the stomacke, but is a safe and gentle medicine, fit for all seasons and persons, which daily experience confirmeth, and yet a greater quantitie may be given in a decoction then in powder, even an ounce or more, if there be not Sene or some other strong purger put with it; a dramme or two of the powder of the dryed roores taken fasting in a cup full of honyed water, worketh gently to the same purpose afore said. The distilled water both of roores and leaves is much commended for the quartane Ague, to be taken many dayes together, as also against Melancholy, and fearefull or troublesome sights and dreames; and with some Sugar Candy dissolved therein against all the ill affects of the Lungs, as the cough, trouble of breath and wheesings, and those thinne distillations of rheume upon the Lungs, which oftentimes is a Consumption or Tisicke: Some commend the salt made thereof to be mixed with the water; some with that a decoction of the Polypody made with wine, or the roores themselves rather as I thinke given into Hungary preserveth them from the Plague or Pestilence, whereunto they are subject by purging them therewith, which there without doubt is effected as hee saith, by the purging of flegme, wherewith they are most troubled: the fresh roores beaten small or some in the head thereof take them dry in powder, mixed with honey and applyed to the joynts of any member or part out of his place doth much helpe it: applyed also to the sole with the disease called *Pelypus*, which is a peece of flesh growing therein, that by time and inflexance hyndreth the passage of breath through that nostrill: it helpeth also those clefts or chappes that happen to come between the fingers of the hands or toes of the feete.

Chap. V.

Dryopteris. Oake Ferne.

Of the Oake Fernes there are two sorts, one set forth by *Lobel*, the other by *Dodonæus*, whereof I meane to entreate in this Chapter.

1. *Dryopteris repens.* Creeping Oake Ferne.

This small Ferne sendeth forth divers slender blackish stalkes little more then halfe a foote high, bearing many small winged leaves each against the other, some what like unto those of the female Ferne but much smaller and finer, and of a darkish greene colour, the backeside of whom have not browne but white spots on them set in a double row, as *Lobel* saith which I cannot mention nor: the roote is small and blackish creeping under the upper stuff of the earth, with divers small blacke strings growing from them, and are some what like unto the roores of Polypody but much smaller, and slenderer, of a more austere harsh and unpleasant taste then Polypody.

2. *Dryopteris alba.* White Oake Ferne.

This other Ferne groweth not much higher then the former, but the leaves are broader shorter & more deeply cut in on the edges, of a paler greene colour, spotted also on the backside of them like unto the male Ferne, the roote is compased of many blackish threads or strings issuing from a thicke roote.

The Place.

These sorts of Ferne grow in the shadowey thicke woods on the mountaines and sometimes in the open valleyes neere them, and sometimes also out of the mosse of old bushes and other trees.

1. *Dryopteris hæc vulgo repens.* Creeping Oake Ferne.

2. *Dryopteris alba.* White Oake Ferne.

The Tree.

They both loose their leaves in Winter and spring up a fresh late in the Spring.

The Names.

It is called in Greeke Ἀσπλήνιον ἄγρωστις, that is *Filix agrestis*, yet *Oribasius* calleth it Πολυπόδιον ἄγριον, *Filix muscosa*, Mosse Ferne of the growing among the Mosse on trees, the first is simply called *Asplenium* by *Matthiol*, *Matthiolus*, *Gesner* and others; *Dryopteris sive Filix arborea* by *Tragus*, and *Pteris tertia* by *Cordus* in the first Booke and eighteenth Chapter, and so also by *Thalius* in *Hercynia sylva*; but it is not the *Filix pennularia prima* of *Cæsalpinus* as I shall shew you in the next Chapter save one, although it seeme to bee like it for the more shew their difference. The other is called *Dryopteris candida* by *Dodonæus*, and as *Lobel* saith it is also called *alburn filicula*, and of the Shoppes also: by *Bauhinus Filicula foemina major sive Adianthum fusci folio.*

The Vertues.

The first as *Lobel* saith was in former times used by the Apothecaries beyond Sea, in stead of Polypody not knowing a righter, neyther were they shewed by their Physitions to forbeare it and use any other, but rather appointed by them so to do which as he saith some affirmed *Rondeletius* to say, that in stead of a purging quality proper to Polypody it had a pernicious operation in some of his sicke patients: it is a remedy to make away long haires. *Dioscorides* saith, if the rootes and leaves bee bruised together and applyed after sweating. *Matthiolus* saith, the rootes in powder with a little salt and Braune is given to Horses for the wormes. The other sorte is nothing in taste, somewhat drying, and therefore may safely be used in stead of the true *Adianthum* or Maydenhaire, as is usuall now a dayes. *Lobel* saith that the last sorte was safely used in the Apothecaries shoppes of divers countries for *Adianthum album* and *nigrum*.

Chap. VI.

Lonchitis aspera. Rough Spleneworte.

OF the sixe Spleneworts there are divers sorts described by divers authors as shall be shewed, and first of the greater kinde of *Matthiolus*.

1. *Lonchitis aspera major Matthioli.* The greater rough Spleneworte.

This greater Spleneworte hath divers stalkes of leaves somewhat like unto Milkwall but neyther Polypody, about a spanne long set on both sides with uneven divisions, dented about the edges with sharpe points, and rough on both sides without such spots on the backes of them as Polypody and Milkwalke and the roote is compoſed of many reddish strings or fibres like as Harts tongue is.

2. *Lonchitis aspera minor.* The smaller rough Spleneworte.

The lesser Spleeneworte is somewhat like unto the former, but that the divided leaves set on each side of the soft browne stalkes are narrower and longer, each separated from other, but not fully to the middle ribbe or

the middle of those outer leaves, rise up other bigger and braver stalkes of narrower leaves, like unto them, but fully spurated, and so finely dented about the edges that they seeme curled with browne spots, or scales on the backes of them as in other Fernes: the roote hath a thicke head covered with scales, lying one upon another, with diverse stalkes at them. There is another of this sort lesser than this, found about *Colchester* in *Essex*, and in other places, growing in the wet borders of fields, and by the hedge sides.

3. *Lonchitis aspera Matthæi.* Ballard rough Spleneworte.

This ballard Spleneworte hath browne rough stalkes a span long, with winged leaves on them, somewhat like unto the male Ferne, but thicker and greater, by much greene on the upperside, and spotted with browne rough scales on the other, like Milt-worst, the roote is small, compact of many long fibres.

4. *Lonchitis aspera Ilvensis.* Iland rough Splene worte.

This small Spleneworte hath browne stalkes, little above halfe a foote long with leaves set oppolite one to another, indented or dented on the edges, but not so deeply as the last, greene on the upperside, and rough with browne scales or chaffe on the under: the roote is a small bush of blackish fibres.

The Place and Time.

The first groweth in the moist Moores of *Italy*, the second and third, in moyst groves both there and in *Germany*, and divers places with us, if my memory faile me not: the last in the Iland of *Ilva* which is in the *Thrahenne* sea, and flourisheth when others doe.

The Names.

The Greeke name from *Dioscorides* is λογχίτις ἑτέρα ἡ τραχεῖα, and in Latine *Lonchitis altera sive aspera*, for his first sorte is very well knowne. The first is the *Lonchitis aspera* vera of *Matthiolus* and others, or *Lonchitis aspera* minor of *Matthiolus*, by *Fragus Asplenium sylvestre*, *Cordus* and *Tabernæmontanus*, as if you would say the *Estridges* lance for the fine wings of the middle leaves, by *Clusius Lonchitis altera Neotericorum*, this is called Fouë [illegible] in many places of this Land: the third is the *Lonchitis Matthæi*, or *altera Matthæi* by *Clusius* and others, the *Matthiolus Pseudolonchites Matthæi*: the last is remembred by *Lugdunensis*, but *Bauhinus* as I sayd before in the Chapter of *Polipodes*, first confounded the *Polypodium Ilvense* of *Lugdunensis*, with his *Lonchitis aspera Pannonica*, making them to be both one plant, and againe maketh the *Lonchitis Matthæi* to be one with the *Lonchitis aspera Ilvensis* and differing but in greatnesse which I am verily perswaded, differeth from it, although it have some what to resemble it.

The Vertues.

The dryed leaves of this taken in Vinegar, is held to be good to dissolve the hardnesse of the Spleene, and the green leaves are singular good for wounds, and to keepe them from inflammations.

3. *Lonchitis aspera Matthæi.*
Ballard rough Spleneworte.

Chap. VII.

Filix Saxatilis. Small or Stone Ferne.

The small or Stone *Ferne* also have some diversities as here shall be shewed.

1. *Filix pumila saxatilis prima Clusij.* The first small Stone Ferne of *Clusius*.

This first small Ferne hath a long blacke and slender roote, creeping and spreading a loft, under ground, with a few slender hairy fibres thereat, from whence spring divers stalkes a foote high, branched with finely divided leaves, like unto Female Ferne, but much lesse, more finely divided, and farre rendered asunder, thicker, and spotted on the backe of them like other Fernes.

2. *Filix pumila saxatilis altera Clusij.* The second Stone Ferne of *Clusius*.

This second Stone Ferne hath divers straight round stalkes, greene at the first, but blackish being full growne, a span long and lesse, shooting forth leaves from the middle upwards, with divisions on both sides, like unto the male Ferne, but much lesse and finer, spotted on the backe of them as the former: the roote from a head like the male Ferne hath, sendeth forth many blacke heads, threads, or fibres.

3. *Filix saxatilis foliis non serratis.* Small Stone Ferne with whole leaves.

This is small and groweth somewhat like the Male Ferne, but the leaves are not dented, but whole like unto the water Ferne.

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

4. *Filix saxatilis crispa.* Small curled Stone Ferne.

This small curld Ferne hath a roote compoſed of many blackiſh threds or fibres, growing from cleave, whence ſpring up ſmall ſtalkes, ſcarce an hand breadth high, ſet on both ſides with tender ſoft leaves of very ſmall leaves ſo finely divided and dented, that they ſeeme curld, of a darke greene colour upwards, and pale below towards the bottome, having reddiſh or brownish duſt-like ſpots on the backeſides as the Male wilt hath, the figure hereof is by chance left out, you ſhall finde it in the Appendix.

5. *Filix saxatilis baccifera.* Berry bearing Ferne of *America*.

This Ferne of *America* ſtandeth up with ſundry long, round, hard ſtalkes of winged leaves, each leafe conſiſting of many parts as it were, of cut in deepely on both edges into many diviſions, and of a freſh greene colour, growing in ſundry places, all along of the middle rib on the backe ſide of them, ſmall round ſeeds like berries of greene at the firſt, but blacke and ſweetiſh being ripe, which they are ſo eaſily gathered that a ſmall touch of the hand, or the ſhaking of the ſtalkes with the winde, will cauſe them to fall on the ground, where they ſoone take roote and grow; the roote is compoſed of many browne fibres, ſomewhat hard to ſtalke: the leaves dye downe at the end of *Autumne*, and ſpring up new in *April*, the berries being ripe about that time.

6. *Filicula ſaxatilis.* Small rocke Ferne.

This ſmall Ferne groweth low, buſhing with many very ſmall and darke greene leaves, reſembling the common ſort, but much leſſe than any of thoſe before.

7. *Chamæ filix marina Anglica.* The ſmall *Engliſh* Sea Ferne.

This ſmall Sea Ferne hath a thicke brownish roote, compoſed of a multitude of threads, riſe divers ſlender ſhining blackiſh ſtalkes, two or three inches high, whereon are placed many rough, thicke, ſhining, ſmall greene leaves, after the manner of the Male Ferne, finely ſnipt about the edges, and with brownish duſt-like ſpots on the backe of them as other Ferns have.

8. *Filix saxatilis Tragi.* Naked ſtone Ferne.

This ſtone Ferne hath a thicke matted roote, ſending forth many hard and rough ſtalkes, [illegible] leaves, with ſome ſpots on them as other Ferns have, and onely forked at the toppes, [illegible] parts, bowing or bending downe their heads, it agreeth, ſaith *Tragus*, with Ferne in [illegible]

The Place.

[illegible] all doe grow in rockey and ſtony places, and the firſt, ſeventh, and eighth [illegible] ſeen in *Cornewall*, in moyſt rockie places.

The Time.

They flower with the reſt of the Ferns.

Original from UNIVERSITY OF MICHIGAN

1. Filix saxatilis Anglica.
The small English Rock Fern.

2. Filix saxatilis Trag.
Tragus Rock Fern.

The Names.

The first here set downe, is the first *Filix pumila saxatilis* of *Clusius*, according to his description, but the second figure doth answere thereunto, and not the first, as you may obserue by the creeping roots in the second figure, which he that onely regardeth the figure, and doth not compare the description therewith, may soone be deceiued, and this transposition *Bauhinus* obserued well, although he doth not speake of it, but onely coupleth *Filix saxatilis rotunda nigris maculis punctis*, and questioneth if it be not the *Filicula candida* of *Gesner* in *appendice*; the second is the second of *Clusius* by the former name, and by *Bauhinus Filix saxatilis non rotunda nigris maculis notata*, and questioneth if it be not the *Filicula saxatilis* of *Camerarius*; but the last figure in *Clusius* is set forth for the tender branched Ferne: the third is the third *Filix petræa fœmina* of *Tabernæmontanus*, and called by *Bauhinus* as it is in the title: the fourth is the *Filix saxatilis crispa* of *Pona*, in the description of Mount *Baldus*: she first is mentioned by *Cornutus* among his *Canadæ* plants, which Mr. *John Tradescant* the younger, brought home with him from *Virginia*, this present yeare, 1628. presently after the death of his father: the last is the *Filicula* figured of *Tabernæmontanus*: the seuenth is the *Chamæ filix minor dentata Anglica* of *Lobel*: and the last is the *Filix petræa* of *Lobel*, and the *Filix fœmina petræa* of *Tabernæmontanus*. *Tragus* calleth it *Filix minor sive saxatilis*, and *Bauhinus* *Filix saxatilis furcata*, and *Bauhinus* thereupon *Filix saxatilis cornicularis*: but why he should confound also the *Filix Majus cornicularis* of *Tabernæmontanus* and *Gerard*, being different plants I know not.

The Vertues.

The vertues of these Ferns may be referred to the former.

CHAP. VIII.

Asplenium siue Ceterach. Smooth Spleene-Worte, or Mile-waste.

The smooth Spleene-wort (I so call it in regard of the former, which is rough) from a blacke threddy and bushy roote, sendeth forth many long single leaues, cut in on both sides, into round dents, euen almost to the middle ribbe, which is not so hard as that of *Pollypody*, each diuision being not alwayes set opposite vnto the other, but betweene each, smooth and of a light greene on the vpper side, and with a darke yellowish roughnesse on the backe, folding or rowling it selfe inward, at the first springing vp, as many other Ferns doe, and therein resembleth that deare Worme that anglers vse.

The Place and Time.

It groweth as well vpon stone walls, as moyst and shadowie places, in many places of this Land, as about *Colnor* and other the Welsh parts plentifully, as also on *Framingham* Castle, on *Beckensfield* Church in *Barkeshire*, at *Douer* in *Kent*, and else where, and like Pollipody, abideth greene in the winter.

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

The Names.

It is called in Greeke ... and *Splenium quod splenem juvat*, which it holdeth also in Latine, in Greeke also ... *Scolopendrium* & *Scolopendra* in Latine from the likeneſſe of the Worme ſo called as I ſayd before: *Theophraſtus* calleth it ... and not ... as it is in the vulgar copies, as alſo ... *Hemionum* which *Galen* tranſlateth *Adiantha herba* in the Apothecaries ſhoppes *Ceterach* from the *Arabians*, in the *Antidotarium Bononiense* it is called *Digiti virginei*: the Apotheoaries and Phyſitians in former times held the Harts-tongue to be the true *Scolopendrium* of the ancients, but that errour is now ſufficiently manifeſted and left, as theirs alſo who held formerly that *Aſplenum* was not *Ceterach*: it is called of the Iaues *Arabians* and *Moores Scolopendrium*, of the *Italians Aſplene* and *Scolopendria*, and *herba fodorata*, of the *Spaniards Doradilla*, of the *French Ceterac*, of the *Germanes Steynfaren*, of the *Dutch Steenvaren* and *Muſcruyt*, in *English* Spleenewort, Miltwaſt and Scale-Ferne.

The Vertues.

It was and is generally uſed againſt the infirmities of the Spleene, and as *Pliny* ſaith the Swine in *Candy* where it grew by feeding thereon were found to be ſpeene-out Spleenes, when as others that did not eate thereof had them as the reſt: it helpeth the ſtrangury or pulling by droppes, and waſteth the Stone in the Bladder, and is good againſt the Yellow Iaundies and the lickes: but the uſe of it in women hindereth conception. *Matthiolus* ſaith that if a dramme of the duſt that is on the backe of the leaves, be mixed with halfe a dram of Amber in powder, and taken with the juice of Purſlane or Plantaine it will helpe the ſtanting of the Raines ſpeedily, and that the herbe and roote being boyled and taken helpeth all melancholicke diſeaſes, and thoſe eſpecially which riſe from the *French* diſeaſe. *Camerarius* ſaith that the diſtilled water thereof being drunke is very effectuall againſt the Stone both in the Reines and Bladder; and that the Eye that is made of the aſhes thereof being drunke for ſome time together helpeth Splenetricke perſons: it is uſefull in other remedies alſo for the ſame purpoſe.

Cap. IX.

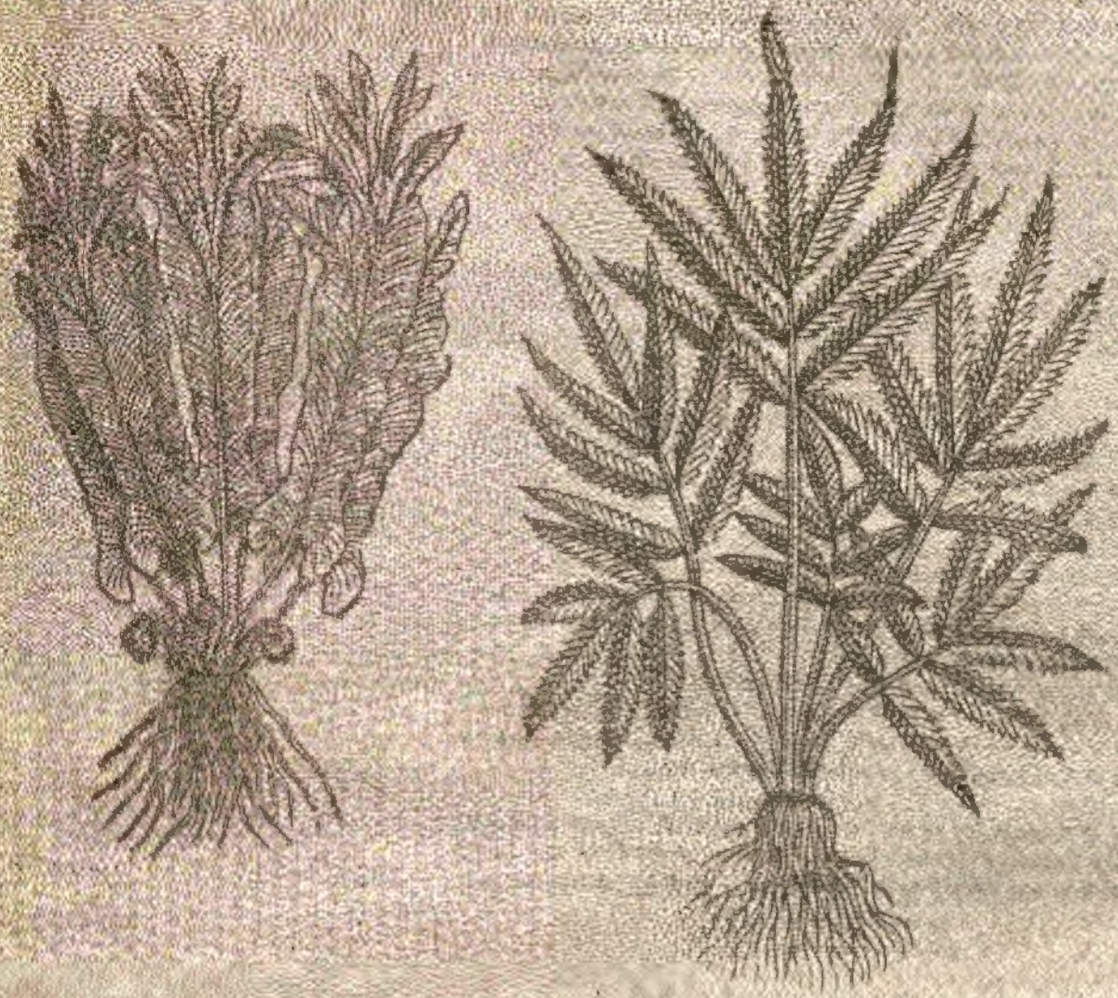
1. *Phyllitis ſive Lingua Cervina vulgaris.*
Ordinary Harts-tongue.

THe ordinary Harts-tongue hath divers leaves riſing from the roote, every one ſeverall, which as the laſt and other Fernes fold themſelves in the firſt ſpringing and ſpreading, when they are full growne are about a foote long, ſmooth and greene above but hard or with little ſoppe in them, and ſtraked on the backe a-crofwart, on both ſides of the middle ribbe, with ſmall and ſomewhat long brownish markes, the bottomes of the leaves are a little fowed on each ſide of the middle ribbe, ſomewhat narrow with the length, and ſomewhat ſmall at the end: the roote is of many blacke threads folded or interlaced together. Some doe make two ſorts hereof, and diſtinguiſh them into *latifolia* and *anguſtifolia*.

2. *Phyllitis laciniata.* Iagged Harts-tongue.

This Herb differeth in no other thing from the former then in the diviſion of the toppes of the leaves which are divedly as it were torne or iagged, ſome leaves much and ſome little, according to the place of growing and time of abiding.

3. *Phyllitis ramoſa Alpina.*
Branched Harts-tongue according to *Alpinus*.



The rootes hereof are ſomewhat woodily with the blacke fibres thereat, ſhooting forth many ſlender broad ſtalkes, of leaves two cubits long, a little downy at the bottome, divided into many long and narrow leaves, dented about the edges, ſet one againſt another with an odde one at the end, each reſembling the heads of a Iaveling, marked thicke with ſtraight lines

Phyllitis latifolia.
Broad Harts tongue or Finger-Fearn.

Phyllitis ramosa & pinn.
Branched Harts tongue according to *Lobel.*

on both sides unto the middle ribbe: the whole plant is without sent, but of an austere taste, conteining some fatt which is not presently felt but continueth long.

The Place and *Time.*

They are greene all the Winter but spring new leaves every yeare.

The Names.

It is called in Greeke properly *Phyllitis quasi foliosa*, in Latine also *Phyllitis* and *Lingua cervina*, and in former times in the Apothecaries shoppes *Scolopendrium*, as I said in the foregoing Chapter: to all other European Dialects they follow the Latine name; wee in *English* call the former Harts-tongue, and the latter Jagged Harts-tongue and Finger Ferne, in some places *Gerarde* calleth it Finger Harts-tongue; the last is only remembred by *Matthiolus de Castro* by the name of *Phyllitis ramosa.*

The Vertues.

Harts-tongue is much commended against the hardnesse and stoppings of the Spleene and Liver also, and against the heate of the Liver and Stomacke, it is very good likewise against Lasks and the Bloody flixe: divers also commend the distilled water thereof to bee taken against the pallions of the heart, and withall the Feaver, and to helpe the falling of the Pallate, to stay the bleeding of the gumes if the mouthes be gargled therewith, likewise saith it is good against the stings or bitings of Serpents.

Chap. X.

Hemionitis. Mules Ferne.

Theophrastus is more warie in this plant as in the former, and although some doe conjoyne them, yet for the divers forme of their formes I have thought good to separate them.

1. *Hemionitis major.* The greater Mules Ferne.

The herbe doth much resemble Harts-tongue both in forme and colour but that it is somewhat broader or larger, and that the leaves being broadest below have a large hollow bowing like unto an Oare, standing on each side of the middle ribbe, and the strakes on the backe of them are more allope.

2. *Hemionitis altera seu minor.* The lesser Mules Ferne.

Such as I have found on Saint *Vincents* Rocke not farre from *Bristow* in a hollow cave or hole, a smaller kinde hereof whose leaves exceeded not the breadth of three fingers, not hard nor rough but smooth and gentle,

and

and, without any markes on the backside of them, yet with a hollow roundnesse at the bottome of them as the former, and besides somewhat unevenly dented about the edges: the roots were very small and threaddy quickly withering. *Clusius* saith that *Lobel* having sent him some of those plants, after hee had kept them in a pot because of their tendernesse, two yeares they changed their forme into the jagged Harts-horne, whereof he much marvailed, for afterwards as he saith, when he came into *England*, hee gathered with his owne hands in the same place the like plants, which there held the forme of *Hemionitis*.

3. *Hemionitis peregrina Clusii.*
Strange Mules Feme.

This differeth from the first in no other thing but in the bottomes of the leaves, which have a small eare or peece of lease set on each side at the arched or hollowed bottomes.

4. *Hemionitis Hirsuta Dalechampij malus folio.*
Mules Feme with divided leaves.

This kinde of *Hemionitis* (if it pertaine thereto) hath sundry stalkes of leaves, rising from a tuft of blacke short haires or fibres, each whereof is about a foote long, divided into seven or nine parts, two or three couple standing jowell, one set against another, and the three uppermost a little rising above them, each of these leaves are long narrow and pointed, and somewhat dented about the edges with an eminent middle ribbe: these have no markes on the backes of them as the others of this kinde have.

The Place and Time.

The naturall places of all these are shadowy rockes and moist hollow places where little heate of Sunne commeth, and are greene all the yeare as the former Harts-tongue.

The Names.

It is called in Greek *Scolopendrion Hemionitis & Asplenion Splenium*, the former *quasi malacia* and *Splenium veluti quod ejus folium medicorum splene, similitudine plantæ figuræ imitetur.* The

4. *Hemionitis Hirsuta Dalechampij malus folio.*
Mules Feme with divided leaves.

3. *Hemionitis peregrina Clusij.*
Strange Mules Feme.

will bridle the heat by Dioscorides and cure by Cleyne, the second is called in Lobel Hemionitis sive Ruta muraria, and of Lugdunensis Hemionitis minor Pena: the third is the Hemionitis perennis of Clusius, Lobel Dodonæus and others like them: the last as Lugdunensis saith growing in the Iland called Ivica, was called of certaine Herbarists Hemionitis Dioscoridis Polychamps.

The Vertues.

It is wonderfully good for the Spleene, and may fitly be used in the head of the Harts-tongue going before as all experience doth teach us.

Chap. XI.

Adiantum. Maidenhaire.

There be diverse herbes accounted to be Maidenhaires by diverse authors, one whereof I have set forth unto you before by the name of *Dryopteris pedibus Equinis*, which is much used in the higher and lower Germany and within: some others I shall shew you in this Chapter and the rest in the following.

1. *Adiantum verum seu Capillus Veneris verus.* The true Maidenhaire.

The true Maidenhaire according to *Dioscorides* his description is a fine small low herbe not above a span high, whose stalke is smaller, finer, redder and more shining then those of *Trichomanes* or our common *English* Maidenhaire, whereon are placed delicate fine leaves without order on both sides one above another, somewhat like unto the lower leaves of *Coriander*, or like the leaves of Anise but larger, cut in unequally on the edges and somewhat on the backe with very small browne markes scarse to bee discerned, the roote is a number of blackish browne strings.

2. *Adiantum nigrum vulgare.* Common Blacke Maidenhaire.

This Maidenhaire differeth little or nothing from the *Dryopteris* (or rather *Cryopteris*) *pedibus Delonci*, set down in the Chapter of *Dryopteris* before, but that the stalkes of this are blacker, and the leaves of a ladder greene, whereas those is greener and paler, so that eyther that might fitly be joyned to this or this or that, the rest of the description needeth not againe to be repeated.

3. *Adiantum fruticosum Americanum.* Forraine or strange Maidenhaire.

This strange Maiden haire groweth up like unto a Ferne, with a slender blackish browne stalke branched forth another, where about on each side stand from 12. to 20. fresh greene leaves, small and somewhat long joyned together by their small footestalke, somewhat like unto the first true Maidenhaire, but cut in on the outside as

1. *Adiantum verum seu Capillus Veneris verus.*
The true Maidenhaire.

4. *Adiantum nigrum vulgare.*
Common blacke Maidenhaire.

the

3. *Adiantum fruticosum Americanum.*
Forraigne or strange Maidenhaire.

4. *Ruta muraria sive Salvia vita.*
Wall Rue.

the toppes of the leaves onely and not at the bottome. One very like unto this if it be not the same hath Mr. *Iohn Tradescant* the younger brought out of *Virginia* presently upon the death of his father, whose long stalkes have many fine frefh greene leaves a little dented or cut in on the one side and plaine on the other, spotted underneath with browne specks.

4. *Ruta muraria sive Salvia vita.* Wall-Rue, or ordinary white Maidenhaire.

This small herbe is generally accounted one of the Capillaric herbes or Maidenhaires, and that not of the least account, I must therefore joyne it unto them with this description: it hath very fine pale greene stalkes slender as haires, set confusedly with divers pale greene leaves on very short footestalkes, somewhat neare unto the colour of garden Rue, and not differing much in forme but somewhat more like unto the true *Adiantum* being more and more diversly cut in on the edges and thicker, smooth on the upper part and spotted on the under.

The Place and Time.

All these sorts grow both upon stone walls and by the sides of Rockes or gravelly springs, and other shadie and moist places: the first in no place so plentifully as *Pena* and *Lobel* say they about *Montpelier* in *Narbon France*, some have reported that it is found in *Glocestershire*: the last is found in many places of this Land, as at *Dartford* and the bridge at *Rochford* in *Kent*, at *Beckonsfield* in *Buckinghamshire*, at *Woolly* in *Huntingtonshire*, *Framingham* Castle in *Suffolke*, on the Church walls at *Mayfield* in *Sussex*, and on the Rockes neare unto *Cheder mere* in *Somersetshire*, and are greene in Winter as well as Summer.

The Names.

It is called in Greeke *Μαλλωτον Adiantum, quasi Βαιρεται το υδωρ απο εαυτου*, the leafe is not wetted with water (which by tryall is found naught) but *Nicander* his Greeke verses doth shew rather, that the name returnes on them which rendred it Latine are thus,

Inquinatum Adiantum quod denso umbret calente,
Deflua aut tenuis folia non infudet humor.

Dioscorides calleth it also *καλλιτριχον Polytrichum, quasi πολυτριχον, quod capillos molliat & crispos facit. Galli vocant Cheveux de nostre Dame, quod capillos tingit pulchrime atque reddit*: it is called also *Capillus Veneris a specioso reddendo capillo*: and by divers other names as *Cincinnalis, Terræ capillus, Sweet fern*, &c. The first is called *Adiantum* by *Matthiolus* and many others, and although some give unto these figures as it *Syriacum*, yet it is but one and the same herbe, and *species*, though somewhat larger, in that *Lobel* calleth it *Capillus veneris verus*, and *Cordus* on *Dioscorides*, *Adiantum nigrum*: the second is the *Polytrichum dence* and *Adiantum pulchrum Lugdunensi simile* of *Thalius*: the third *Bauhinus* hath mentioned to be the last *Tragus* calleth *Capillus Veneris*, and *Brunfelsius Saxifraga major* and so doth *Fuchsius*, *Matthiolus* called it *Ruta muraria*, and afterwards tooke it to bee *Parsenchia Dioscoridis*, *Cordus* calleth it *Adiantum*

Thalius

Dalechamp Ruta muraria, and *Lobel* and *Lugdunensis Salix nigra*, and many call it *Adiantum album*, white Maidenhaire.

The Vertues.

Maidenhaire is of singular good use against the diseases of the Breast the Liver and Reines especially, yet much resembling to others: the decoction of the herbe drunke helpeth those that are troubled with the Cough, thorough fall of breath, the yellow Jaundice the diseases of the Spleene, stopping of urine, helpeth exceedingly to breake the stone, provoketh womens courses and stayeth both bleedings and fluxes of the stomacke and belly, especially when the herbe is dry for being greene by the thinnesse of the parts, it loosneth the belly, and causeth choller and fleame to be voyded both from the Stomacke and Liver, and by freeing the stomacke by spitting it out wonderfully cleareth the Lungs, and by rectifying the Liver and blood causeth a good colour to the whole body, and expelleth those diseases that breede by the obstructions of the Liver or Spleene: it is also said to resist and to cure the stings of venemous creatures: the herbe boiled in oyle of Camomill dissolveth knots, allayeth swellings and dryeth up moist Vlcers, the Eye made thereof is singular good to clense the head from scurfe, and cyther dry running sores, stayeth the falling or shedding of the haire, and causeth them to grow thicke, faire, and well coloured, for which purpose some boyle it in wine, putting some smallage seede thereto, and afterwards some oyle. The Wall Rue is held by those of judgement and experience to bee as effectuall a Capillarie herbe as any whatsoever, being of the same temperature, and therefore both boldly and safely use it in the stead of any of the other that is not at hand: For experience hath shewed that it is very effectuall for the cough and diseases of the lungs, for the stopping of the Vrine and to breake and expell the stone and therefore divers have placed it among the Vulnararies, and briefely as available as the former Maidenhaire for all the uses there expressed, and besides helpeth the convulsions in children, for *Matthiolus* saith that he hath knowne divers holpen by taking the powder of the herbe in drinke for fortie dayes together.

CHAP. XII.

Trichomanes. *English* Maidenhaire.

The common Maidenhaire doth from a number of hard blacke fibres send forth a great many blackish thrumming brittle stalkes hardly a spanne long, in many not halfe so long, on each side set very thicke with small round darke greene leaves and spotted on the backe of them like *Ceterach* and other small Fernes.

Trichomanes. *English* Maidenhaire.

The Place and Time.

It groweth much upon old stone walls in the West parts and *Wales*, in *Kent* and divers other places of this Land, it loveth likewise to grow by springs and Wells, and other Rocky moist and shadowy places, and is greene alwayes.

The Names.

It is called in Greeke Τριχομανὲς *Trichomanes quod crines fluentem capillum excitet*, for τρὶξ is *crines* and μανὸω *capillum*, *Gaza* translateth it *Filicula*, *Fronds* some have it; the Apothecaries beyond the Sea did use to call it *Polytricum* and *Capillaris*, but usually call it in Latine *Trichomanes*, and in English common Maidenhaire.

The Vertues.

This Maidenhaire in our Land being more plentifull than the rest, is of more use and of as good efficacie as the former, and serveth well for all the said purposes, but especially against the stopping and dropping of Vrine and those that have the stone in the Kidneyes, and both stayeth the shedding of the haire and causeth it to grow thicke.

CHAP. XIII.

Polytrichum aureum. Golden Maidenhaire.

Although there be divers authors that reckon these herbes amongst the Mosses, and so call them, yet there bee against them as authentically all that put them among the Capillaceus herbes, and so doe I at this time also.

1. *Polytrichum aureum majus.* The greater Golden Maidenhaire.

This small herbe hath a company of small brownish red haires to make up the forme of leaves, growing about a ground from the roote, and in the middle of them in Summer rise small stalkes of the same colour, set with very

very fine yellow with greene haires on them, and bearing a small greene yellow head lesser then a Wheate Corne, standing in a great husk, the roote is very small and threaddy.

2. *Polytrichum minus & minimum.*

The two lesser sorts of Golden Maidenhaire.

These two other sorts are very like the former, but that the stalkes grow not to much more then halfe the height, the one of them being lesser then the other.

The Place and Time.

The first groweth usually on bogges and moorish places, and also on dry places that are shadowy, where the second growes likewise on *Hampstead Heath*.

The Names.

The two first are called by many *Polytrichum aureum*, of some *Adiantum aureum*, of *Thalius Adiantum Aureum*, of others *Muscus capillaris*, and *Bauhinus Polytrichum aureum*, making three sorts *magnum, medium & minus* as *Thalius* doth, but I thinke that difference rather riseth from the place then nature of the plant. *Fuchsius* taketh it to bee *Polytrichum Apulei*.

The Vertues.

The Golden Maidenhaire is of a temperature betweene heate and cold yet it dryeth rarefieth and digesteth: it helpeth to expectorate rough Flegme from the Chest and Lungs little therein the other Maidenhaires being boyled and drunke: it also provoketh urine, and helpeth to expell the stone, is profitable for Splenetick persons and those that have the Falling sicknesse, the herbe boyled in water or Lye, and the head washed therewith strengthneth the rootes of the haire, stayeth it from shedding, and causeth them to grow thicke where they are thin: briefely it is held to be as effectuall as any of the maidenhaires, many other incredible things are reported hereof which are rather superstitious and therefore I forbeare to relate them.

Polytrichum aureum maius & minus.
Golden Maidenhaire the greater and the lesse.

Chap. XIIII.

1. *Ros solis sive Rorella vel Rosa solis.*
Sundew or Herbe Solis.

Et mee place this plant with the rest being usually reckoned among the number of the Capillaire herbes for the nearenesse unto them, being of high esteeme formerly, and tell you that it hath diverse small round hollow leaves, somewhat greenish but full of certaine red haires that make them seeme red, every one standing upon its owne footstalke reddish hairy likewise. the leaves have this wonderfull propertie that they are continually moist in the hottest

2. *Ros solis grandior. Long leaved Sundew.*

1. *Ros solis sive Rorella vel Rosa solis minor & minor.*
Sundew or Rose Heaths greater and the lesser.

...yer the leaves the Sunne shineth on them the moister they are, with a certaine thinnesse that will rise ...ed or rope as wee mainly say, the small leaves alwayes holding two moisture: among these leaves rise ...ender stalkes a cubit high, three or foure fingers high, bearing divers small white knoppes one above ...ther with the flowers, after which is the heads the certaine small seede: the roote is a few small haires ...ommonly a yeere and lesse but I thinke it no better, yet I have expressed the varietie it selfe by any.

2. *Ros Solis fylvestris longifolius.* Long leaved Rosa Solis.

This was sent me by Mr. *Rooke Stillard* an Apothecarie of *Dublin* in *Ireland*, which sort wee have growing ...n *Yorkeshire* by the way side (the report of Mr. Doctor *Coare*) whose longnesse and roundnesse of ...ave, is the difference.

The Place and Time.

They grow usually on bogs and wet places, and sometimes in moist woods, and flower in *June*, the leaves be...ect then to be gathered.

The Names.

...s of our later writers called *Ros solis* and *Rorella*, and *Renida* by *Lobel*, and by some *Saliforea*, and corruptly ...ow as wee in *English* doe: the *Germans* call it *Sunder*, the *Dutch Sonderdouw*, that is, Lilywort, because ...e feede thereon they will goe to Ramge: yet in the Plorin of our Land they call it the red rutte, be...e as they thinke their sheepe feeding thereon rumne to rotte, some call it also Moore-grasse.

The Vertues.

...e tast sharpe and quicke, yet a little acide drying and binding: it is accounted good to helpe those that are ...oubled with tar rheume distilling on their Lungs, which by wasting them breedeth a Consumption, and ...ewise the distilled water thereof in wine is held profitable for such to drinke, which water will bee of a gold ...ow colour: the same water also is held to be good for all other diseases of the Lungs whether it bee Tisicke, ...ching, shortnesse of breath, or the Cough, as also to heale the Vlcers that happen in the Lungs, the same wa...e is accounted to comfort the heart and fainting spirits: divers have much controvered these opinions, because ...e herbe being applyed to the out ward skinne will raise blisters, but so will many other things, and yet are not ...ings to be taken inwardly so to be with discretion. Wee have an usuall drinke made hereof by many with ...ne ale, and sundry spices frequently used in medicines and potions of the heart, without any offence or danger ...ver heard of, but rather to good effect and purpose.

LEGVMINA PVLSES.

CLASSIS VNDECIMA. THE ELEVENTH TRIBE.

CHAP. I.

According to the new yet Artificiall world of Pulses, let me for your better apprehension of my more methodicall declaration, divide them into two principall generalties: that is, first into such kindes, as either have claspers, wherby to cleave unto stake, tree, &c. standeth next it, or without claspers, twine or winde themselves about stakes, &c. or any other standeth neare them by. And secondly, into such as have no claspers, but either stand more upright of themselves, or send branches or the upon the ground, whereunto I will adjoyne the kindes of Trefoile, which grow in neighbour hood unto them, with some Cytisus and Serpyllum.

1. *Faba vulgaris.* The common wilde Beane.

This common wilde beane groweth upright like the Garden beane, and hath broad leaves, set long thicke

...ing the ſmall cendrelle at the ends of the ſtalkes and branches ſuſtaine them the better: it hath leaves like unto the Garden Beane, without any dents on the edges, but ſmaller, more at a joynt, and growing cloſer: the flowers ſtand alſo more at a joynt, more purpliſh and leſſer: the cods ſucceeding them, are long and round, ſmaller than the garden kinde, ſtanding upright, within which are ſmall round beanes, ſome paler or blacker than others when they are ripe: the roote periſheth yearely. Of this kinde there are ſome bigger or leſſer than others.

2. *Faba ſylveſtris Græcorum ſive Faba veterum.* The old Greekiſh Beane.

This Greekiſh Beane ſhooteth forth two or three long flat ſtalkes, with two edges, lying or running on the ground, if it have nothing whereon it may rampe or riſe, which branch out on every ſide into ſtalkes of ſeven ſquinſily ſet thereon by two and two, with a diſtance betweene them, like unto the Garden Beane, and each branch ending in a long claſper: the flowers are ſet ſingly at the joynts of the branches under the leaves, and are of a faint or fallen purple colour, with ſome paleneſſe at the bottome of them: after which ſucceede long and narrow flat pods, with two ſharpe edges and dented about, a little hooked or bowing, greene at the firſt, but black and hard when they are ripe, wherein are contained foure or five or more round ſeede as bigge as Peaſe, and as blacke, ſo that one may well ſay they are rather Peaſe than Beanes: the roote groweth not deepe, nor ſpreadeth many ſtrings or long fibres thereat, dying yearely.

3. *Faba veterum ſerratis foliis.* The Greeke Beane with dented leaves.

We have had another difference hereof ſent us by this name, which onely ſetteth forth the diſtinction between them little differing in any thing elſe.

The Place.

Hemſt (where ſoever it is in wilde we know not) we ſow it generally through the Land, to ſerve horſes for their food, the other groweth naturally in *Spaine* from whence *Guilliam Boel* ſent me ſeedes.

The Time.

They flower in *July*, and their fruit is ripe a moneth or more after.

The Names.

The Beane is called κύαμος ἥμερος in Greeke, and *Faba ſylveſtris* in Latine, and βόειος in Greeke is added to diſtinguiſh it, and *Faba Græca* in Latine to diſtinguiſh it from the *Ægyptia, a ſeruitute dicta*, ſay ſome. There hath beene much diſputation and altercation among our later Writers concerning the *Faba veterum* or *Græcorum*, ſome referring the delineations thereof to our Garden Beane, but with more words than reaſon, for it is ancients comparſon of the ſeede unto that of *Lotus, Terebinthus*, and the berries of Ivy doth convince all their words and reaſons, whereof I doe not intend to ſay any more here; for *Lobel* and *Lugdunenſis* have ſhewed the errours and miſtakings: the firſt here ſet downe, is the *Bona ſive Phaſelus minor* by *Dodonæus*, *Faba minor* by *Lobel*, and *Faba ſylveſtris* by *Matthiolus, Camerarius, Lugdunenſis*, and others: the other is the *Bona ſive Faſelus ſylveſtris* by *Dodonæus*, *Faba Græcorum ſylveſtris* by *Lobel*, *Piſa nigra* by *Camerarius*, and *Fabæ Romanæ* by him alſo: Our later Herbariſts call it uſually *Faba veterum*, or *Græcorum*; or *Lugdunenſis Phaſiolus ſylveſtris*. Many worthy families among the ancient *Romanes* had their names from Beane and Peaſe, and no doubt firſt roſe from their predeceſſours, ſowing and ſelling of them, as *Fabius Porcius*, and *Fabius Maximus*, or from other accidents, as *Piſo, Cicero*, and divers others; and the uſe to number with Beanes doth continue among the *Venetians* to this day: it was alſo an uſuall cuſtome in former times in *Italy*, and other places adjacent to chuſe their Governours by calling Beanes into a Baſon, the affirming party calling in a white Beane, thoſe denying a blacke one, and from hence came the manner of choiſe of officers in many places by caſting bals to put in certaine buſſets, the greater number in a partition carrying the choiſe.

The Vertues.

The Garden Beanes are with us more uſed for foode than for Phyſicke, yet the leſſer alſo in many other countries ſerve with a little Wheate and Rie to make them bread, and being greene nouriſh more than when they are dry, but are more windy, and even after they have beene dried or fried engender leſſe winde, but are then of harder digeſtion: the diſtilled water of the flowers of garden Beanes is uſed of many to cleanſe the face and ſkinne, and to take away both ſpots and wrinckles, the ſame doth the meale or flower of it, as well as of the huſk: the water diſtilled from the greene huſkes, is held to be very effectuall againſt the ſtone, and to provoke urine: Beane-flower is uſed in pultiſſes that do aſſwage inflammations riſing upon woundes, as alſo the ſwelling of breſts or of women's breaſts cauſed by the curding of their milke, or by inflammations, and repreſſeth their milke, and keepeth backe children from growing too forward being laid to the ſhare: if the flower of Beanes be mixed with honey, and applied to felons, biles, blew markes by blowes or bruiſes, and the inflammations of the kernells of the eares, it helpeth them all, and with Roſe leaves, Frankinſenſe, and the white of an egge laid to the eyes that ſwell or grow out helpeth them, as alſo the watering of them, or ſtripes upon them, waſhed with wine: if a Beane be parted into two, the skinne being taken away, and then laid on the place where bloud hath beene ſet that bleedeth too much, it ſtaieth the bleeding: Beane-flower boiled to a pultiſſe with wheaten vineger, and ſome oyle put thereto, ceaſeth both paine and ſwelling of the cods: if fried Beanes be eaten with ſalt, and daily taken in meate, it helpeth inveterate coughes almoſt paſt cure, the hoarſeneſſe of the throat, and the impoſtumes in the breaſt: the huſkes of them boiled a good while in water, that is to the third part, and the aſhes of the huſkes made up with old hogges greaſe, helpeth the old paines, contuſions and ſwellings of the ſinewes, the ſciatica alſo and the Gout. What hath beene ſpoken of the greater, is alſo effectuall of the leſſer Beane without more repetition. The *Faba veterum* is without doubt that true Beane which *Diſcorides*, and other Greeke authors intended when they ſet downe all the remedies they ſet downe of it; although although we uſe our ordinary Beane-flower for all the purpoſes, and to good effect, yet theirs is more proper, which vertues every one may uſe as they ſee cauſe.

CHAP. II.

Phaſeolus. The *French* or Kedney-Beane.

I Have in my former Booke giving you the knowledge of the ordinary *Phaſeolus*, or Garden *French* Beanes of divers colours, but there are ſundrie other ſorts, ſome mentioned by *Cluſius*, and ſome by o- thers, whereof with thoſe wee have ſeene our ſelves, wee entend to give you in this Chapter a briefe view.

3. *Phaſeolus ſtore rectineo.* The Scarlet flowred French-Beane.

The Scarlet Beane riſeth up with ſundry branches twining about ſtakes that are ſet for it to runne therein, ſtill turning contrary to the Sunne, having three leaves on a foote ſtalke, as in other of the ſame kinde: the flowres are for faſhion like unto the reſt, but are many more ſet together, and of a moſt orient ſcarlet colour: the Beane is larger than the ordinary kinde, and of a deepe purple turning to be blacke when it is ripe and drie: the roote periſheth like the reſt in Winter with us.

4. *Phaſeolus ſiliqua hirſuta.* The hairy Kidney-Beane called in *Zurrate* where it groweth *Cobbar*.

We have had an other of this kinde brought us out of the *Eaſt Indies*, which being planted, was in shew like the former, but came not to perfection, the unkindly ſeaſon not ſuffering it to ſhew the flower, but the cods which were brought, ſome were ſmaller, ſhorter, and rounder than our garden kinde, others much longer and many growing together as it were in cluſters, and covered all over with a browne ſhort haire ſoft, ſo fine, that if any of it be rubbed or fall on the backe of ones hand, or other tender parts of the skin, it will cauſe a kind of itching, but not ſtrong nor long enduring, but paſſing quickly away without either danger or harme, the Beanes were ſmaller then the ordinary, and of a ſtaining blacke colour. There are ſundry other ſtrange ſorts of Kidney-Beanes, whereof *Cluſius* maketh mention: the firſt, (as moſt of the reſt) groweth up with winding ſtalkes and branches, and with three leaves ſet together on long foote ſtalkes, and many white flowers in cluſters, after which ſucceede much broader and ſhorter cods: with white Kidney-like Beanes in them, ſpotted with blacke lines. His ſecond ſort is not much differing in forme or colour of flower from the former, but that ſomewhat paler, and the Beanes are very white, ſmaller, and more full or ſwelling than the ordinary white kinde. A third ſort is ſomewhat reddiſh at the end of the foote ſtalkes, the flowers ſtand by [illegible] and larger, pale on the outſide, and of a blewiſh purple within, ſucceeded by reddiſh Beanes, thicke and [illegible] ſomewhat full and round. A fifte ſort hath reddiſh greene ſtalkes, and ſmaller darke greene leaves, the flowers were great and many, of a yellowiſh colour, the Beanes were ſmaller, contained in ſhorter and [illegible] cods.

1. *Phaſeolus Indicus flore coccineo.* The Scarlet flowred *French* Beane.

Phaſeolus ſiliqua diverſo rum partu & diverſi coloris. *French* or Kidney Beanes of divers kinds.

1. Phaseolus vulgaris. Vpright Kidney Beanes.

2. Phaseolus americanus Peregrinus. 2. Tetragonolobus.
3. Argyreus. 4. Braziliensis.
Foure sorts of Forreine Beanes.

Phaseolus peruvianus Scandens,
Small Climing Beanes of Peru.

Phaseolus Braſilianus maximus. A great Braſill Beane.

and ſhort, and ſomewhat full and round. A fift ſort hath reddiſh greene ſtalkes, and ſmaller darke greene leaves, the flowers were great, and many of a yellowiſh colour, the Beanes were ſmaller, contained in ſhorter and narrower cods, and of a darker colour. A ſixt had narrower leaves, with ſmaller reddiſh Beanes, & later than the other. A ſeventh grew not ſo high as the ordinary, or his firſt, the leaves were as narrow as the laſt, and the flowers white, the cods ſhort and yellowiſh being ripe, with white Beanes in them ſpotted or ſtriped, to the length or athwart, more great or leſſe in ſome than in others, and in ſome all blacke, with a few white lines in them, or elſe parted halfe white and halfe blacke. An eight in leaves and white flowers was like his firſt, and the Beanes not ſo white as the ordinary, and ſometimes ſpotted either directly or confuſedly, or becomming blacke wholly. A ninth had great white Beanes ſpotted with reddiſh veines. A tenth had purpliſh flowers, whoſe hoods were darker, and variable coloured Beanes turning blacke in broad flat and browniſh cods. An eleventh had blacke lines or veines running in the reddiſh Beanes diverſly marked. The Beanes of the twelfth were of a paler red, with blacke ſtripes on them. The thirteenth wee have had from *Braſill* the leaſt ſort that ever was ſeene; for although it hath the ſame forme of three leaves, & twining ſtelke, yet are the Beanes blacke ſhining, and leſſer than Tares by the halfe. Another had large white flowers, ſlender cods, and white Beanes with blacke ſpots. Another, the leaſt of many whoſe Beanes were ſmaller than Peaſe and round. Divers others might be ſet forth, but that divers of them came not to maturitie, moſt of them that ſprang had twining branches: yet ſome grew upright, whereof the fourth ſort had ſhort and firme ſtalkes, not needing any

Original from UNIVERSITY OF MICHIGAN

doing tenfold as, and not above a foote high, whose trefoile leaves had shorter foote stalkes, the flowers were white, and the fruit either white, with a black spot, or reddish or pale, or else of a shining hazelish colour, which kind, as it is most likely, is the *Phaseolus Cordi*, which he describeth in the 3. Booke of his notations upon *Dioscorides*, and in the 1197. folio of this History of Plants, although he doth not particularly describe in one of these two places. There hath come likewise unto us and others, both from *Africa*, *Brasill*, *Peru*, and *West Indies*, *Virginia*, &c. sundry other sorts and varieties which were credibly reported, or written of, but only to behold and contemplate the wonderfull workes of the Creator in those his creatures: as I do make mention in the 395. page of his *Adversaria* of many rare varieties of these kindes of beanes that the Lady *Killegrew* shewed him, which were taken up, and yearely gathered on the sea coasts of *Cornwall*, where is not knowne that ever any shippe was wracked: but as it is thought were driven thither by the winde from the coasts of *America*; for the inhabitants thereabouts doe yearely gather new sorts, some floating as they were, others raked from under the sandes of the shoare.

The Place and Time.

The first here described grew in the *West Indies*, and first grew with Mr. *Tradescant*, yeerely flowering with us in a shadi Season, and giving ripe fruit: the second here described came from the *Azores* unripe in the Ear, and only I raised up with us, but continued not.

The Names.

Dioscorides calleth this *quidam vocant Smilax hortensis quod Smilacis modo conscendat*, *Theophrastus* καλάμους, *Asinius*, or as some write it *Asinius*, *Phaselus*, or *Dolichus*, which many Latine Authours follow: some also and *ἀπὸ τοῦ πλάτους propter siliquarum longitudinem*. Some also take it to be *Dioscorides* his *Cnecos*, or as *Galen* writes *Cnecos*, where of there hath beene much contrariety among former Writers, as *Matthiolus* against *Manardus* that thought the *Phaselus* of *Dioscorides* to be *Erebinthus*, and the *Smilax hortensis* to be the ordinary *Phaselus* now adayes so called, which opinion, how soever *Matthiolus* contradicteth, and would force his owne, which was *Cordus* his also for the truth; that the ordinary white Kidney Beanes were the *Phaseoli* of *Dioscorides*, I can no wayes stand with reason, seeing *Dioscorides* setteth his *Phaseolus* among those Pulses that grow wild, he besides saith, that they are hard of digestion, and move vomiting, which is not proper to these kindes, there many wilde sorts of Pulses, and in the Chapter of *Spartium frutex*, compareth the seedes thereof to those of *Phaseolus*, and that his *Smilax hortensis* was the other discoloured sorts of Kidney Beanes, but they are as will to me as in effect in my judgement the same. Another doubt there is with some, whether *Theophrastus* his *Dolichus* and *Dioscorides* his *Smilax hortensis* be but one or divers; but *Galen in primo Alimentorum* hath decided long agoe, where he saith, that because *Theophrastus* saith his *Dolichus* needeth long poles or stakes to hold it that it may prosper, he surely delineateth these *Phaseoli*, or *Dioscorides* his *Smilax hortensis* to that purpose as without doubt that *Smilax hortensis*, *Dolichus*, and our ordinary *Phaseolus* to creepe all one: also this first Booke saith the same, for plainely *Dioscorides* his *Phaselus* is the same with *Galens* his *Phaseolus*, which in the same Booke he joyneth with *Ocimum* speaking of *Phaseolus* afterwards, and *Lobel* taketh it to be that Pulse, which is called by *Lugdunensis Phaselus sylvarum*, and by *Clusius Oculus Pannonicus*: *Cordus* in the places before mentioned maketh *Phaselus* and *Phaseolus* to be but one kinde of plant, and differing from *Phaselus*, which groweth upon poles, the *Phaselus* not rising: *Virgil* and *Columella* doe both make mention of *Phaseolus* as of a plant and wilde Pulse: *Virgil* in *Georg. secundo*, in these words, *Seu pinguem Vticam feret, seu Thracia Pharsalon Dominis*: maketh our ordinary garden Beane to be *Phaselus major*, and the white kinde to be *Phaselus minor*, and last without doubt they are the right: but by his leave they are not right, wherein I referre me to others judgement, considering what I have here before written, and especially in that the seed like seedes of *Spartium frutex*, are by *Dioscorides* compared to those of *Phaselus*, when as the leaves of these Beanes are farre bigger than any *Spanish* broome leede, or the pods comparable.

The Vertues.

The Kidney Beanes that are raised up with us of all sorts, and come to maturity, being of easie digestion, and hot and moist in the first degree, doe move the belly, provoke urine, enlarge the breast that is straightened with shortnesse of breath, engender lecture, move venery, especially if Sugar, Pepper, Ginger and Cloves be added thereto: for they are well knowne to mollifie the harsh drie humours of meate taken while they are young, boyled and stewed, or fried, & some Verjuice put to them, and spices thrown thereon: *Matthiolus* said, that if the green Pulse be chewed in one mouth, and applied to any place that is bitten by a Serpent, it helpeth the same: with it the Indian dames made a water or *succus* for their faces of the pods and seedes of these Beanes, with both yolke, crummes of bread, and Goates milke, &c. distilled. The fish called *Scarus* or *Parrot* is familiar like a *Wrasse*; to *Rellonius* doth see & downe in the eight Chapter of his first Booke of Outlandish fishes: much to be noted to see the leaves of this *Phaseolus* or French Beanes, and that doe change the colour of the water where they dwell neare *Alexandria* and *Cyprus*, where this fish doth abundantly breede being as the report there is put the leaves of this Beane into their Weeres, or Bow-nets, as a baite for this fish, knowing that they can not be taken by line or hooke but onely with this herbe, and therefore in their Language they call it *Bayonia*.

Chap. III.

Pisum. Pease.

Of all the sorts of Garden Pease, I have spoken sufficiently in my former Booke, there remaineth now that I should shew you here the wilde kindes which are these.

1. *Pisum sylvestre primum.* The first wilde Pease.

This wilde Pease doth little differ from the manured, either in ramping *contorted* climbers, or in the leaves, with greene leaves, two always being set at a joynt, and five or more lesser ones on the branches, with tendrils at the end in a clasper, the flowers are white, many standing on a foote stalke together, which turne into cods very like, but each much smaller than the manured, and the seede within, farre lesse also, and of no pleasant taste, the more it

as bigge as ones finger, and long, with many small fibres thereat.

2. *Pisum sylvestre alterum.* The other wilde Peate.

The branches of this other are scarce halfe a foote long, with broader and thicker leaves on them, but like the former, but more pale, the Pease and cods, likewise not differing in forme but much lesse, the roote abiding many yeares. Of this kinde there is another found to grow somewhat larger.

3. *Pisum sylvestre nigrum maculosum Hispanicum.* Spanish blacke spotted wilde Peate.

This Peate is in many things like the last, but that it is lesser, and the flowers are of a pale yellowish, greenish colour, the Peate being of a darkes colour, spotted with very blacke spots like velvet: the roote perisheth every yeare.

4. *Pisum spontaneum maritimum Anglicum,* Wilde *English* Sea Peate.

This Sea Peate differeth not much from the second sort of wilde Peate, but is somewhat greater, and bearing many flowers together on a vault, mixt of purple and ash colour: the succeeding huskes are small and long, the roote living.

5. *Pisum aliud maritimum Britannicum,* *Suffolke* Sea Peate.

The stalke of Sea Peate hath a fashion of a triangular forme full of joynts, bending to the ground, with two leaves at every joynt, branched forth in divers places with winged leaves at them, consisting of some or twelve leaves, set by couples on a middle ribbe, with a small cleaper at the end, each leafe being not much unlike the Sea Purslane: the flowers grow towards the toppes of the branches, three or more set together at the foot, upon a small long stalke, which both for forme and colour are very like to the wilde Peate, but with a little more in the middle when it is full blowen, the fruit that followeth is lesser than the common field Peate, containing three or foure Peate in a cod, each whereof hath the white eye compelling halfe the Peate by a semicircle, which being ripe and drie, are of a darkish colour: the roote runneth downe indented deepe into the ground, and spreading infinitely thereon, even two fathome deepe, at the least, within the very flowes and waich of the Sea (yet about a yard or more deepe, there is found some) and whereon it spreadeth: it is not great but slender plant and flexible, not sweete, but bitter as the whole plant is, and the Peate also: it commeth and fadeth the every yeare, and from the old head will shoote many long whits resembling like the roote of the small Birdeweede whereby it encreaseth wonderfully, and not by the seede, as I am perswaded, for that the sharpe saltishness thereof forbidden their growth falling thereon, in not having any nourishment or moisture at all, before they be two or three foote deepe, and the birds for the most part devoure them up. I have also put some of the Peate into the ground of my Garden, but none would spring.

4. *Pisum Sylvestre primum.*
The first wilde Peate.

5. *Pisum sylvestre nigrum Hispanicum maculosum.*
The Spanish blacke spotted wilde Peate.

Original from UNIVERSITY OF MICHIGAN

4. *Pisum sativum vulgare Anglicum.*
Wilde English Sea peaſe.

5. *Pisum silvestre vel maritimum Britannicum.*
Another English Sea Peaſe.

The Place.

The firſt is often found in ſundry places of this Land: the ſecond on the chalkie hills at *Kings Hay* in *Kent*, not farre from the *Thames*, and the larger ſort hereof in ſome barren fields in *Eſſex*: the third in *Spaine*: the fourth in *Kent* alſo neere *Sumery*: the laſt was firſt made knowne in the yeare 1555 being the third yeare of Queene Mary to the Country dwelling thereabouts, that is betweene *Orford* & *Aldborough*, where it grew upon the bank of the ſea, where nothing, no not graſſe was ever ſeene to grow, and by the dearth of that yeare the people in neceſſitie of foode, ſearching every where to take what came next to hand: for as it is ſaid many were forced at that time to make their bread of Acornes) gathered many quarters full of theſe Peaſe to ſerve them uſe, yea did the neighbouring people acknowledge that they had obſerved and knowne them to grow there of long time before the deare yeare. Mr. *Stow* in his Cronicle, and Mr. *Camden* in his *Britannica*, pag. 354. make mention of theſe Peaſe but both ſtumble at one ſtone, that theſe might come thither by ſome ſhipwracke, which cannot be: I will ſay *Stow* more eſpecially in ſaying the rootes are great and ſweete, for that it is *ſingularis*, eſpecially blode differing from all other of this kinde, and as it is probable naturall only to thoſe places about the Sea the are, for it alſo at Rie at *Pemſie* in *Suſſex*, at *Gilford* in *Kent* over againſt the *Cymber*, and at *Dengier Hedge* by *Lydde* in Mr. *John Aegers* Dr. of Phyſicke, of the Colledge in *London*, brought from thence alſo the whole plant, the very ſame as here is figured, which he gave to Dr. *Lobel* in his life time, to be inſerted in his Workes, but he (the) death failing to performe it, I have by purchaſing his Workes with my money here ſupplied.

The Time.

Theſe flower and beare their fruit with the later kinde of Field Peaſe, but the laſt flowereth in the end of May and hath both blowne flowers, and ripe cods in the end of *Auguſt*, and ſometimes alſo out of time blow.

The Names.

Peaſe are called in Greeke πίσον, in Latine *Piſum*; the names in their tribes are ſufficient to diſtinguiſh all ſorts, for except the firſt, none of theſe have beene mentioned by any former Author: the *Italians* call them *Piſelli*, the *French Pois*, the *Germans Erbſe*.

The Vertues.

Peaſe are leſſe windy than Beanes, but paſſe not forth of the body ſo ſoone as they: if the whole ſeede be boyled in Lye, and the head waſhed therewith, it cleanſeth it from ſcurfe and ſcabbes, the ſame doth the meale of ſpots: the meale of them, and Barley mixed with honey and uſed, healeth fouls ulcers, and waſhed in water with Vetches, breaketh tumours, and eaſeth their paines being applied. *Cenerus* ye Italian ſtarre ſeeme, they call it *Darine des braue*, and uſe to take ſome of the Peaſe againſt the colliche, and apply the meale outwardly and give it their cattle alſo for the ſame purpoſe, that is, if they vent much.

Cuſt

Chap. IIII.

Lathyrus. The great wilde Cicheling or Peafe everlalting.

Of this kind of Pulſe called *Cathyrus* there are two ſpecificall differences, the one that continue in their roote, and periſheth not, the other annuall periſhing continually after ſeede time: many of the living ſorts I will intreat in this Chapter, and of the annualls in the next.

1. *Lathyrus major perennis.* The greater Peaſe everlalting.

This kind of Peaſe ſendeth forth many long flat trayling ſtalkes, winged on both ſides which muſt be ſtaked, divided into ſundry branches with two leaves at the joynts which are long whit long and not very broad, with ſome claſpers at the ends of the branches, at the joynts likewiſe come forth pretty long ſtalkes with five or ſix or more Peaſe-like bloſſomes of a fine pale purpliſh red colour, and of a fine ſmell, after which ſucceede ſmall long and hard whitiſh cods, with ſmall round blackiſh ſeede in them, the roote groweth perſiſtible and rugged on the outſide and runneth downe deepe into the ground. This is that which *Lobel* calleth *Lathyrus latiore folio*, and hath beene found wilde in divers places with us.

2. *Lathyrus anguſtifolius.* Narrow leaſed wilde Cicheling.

This differeth not in durability, forme of growing, or colour of flowers from the former, but in having ſomewhat paler flowers and in the greene leaves which are narrower then they.

3. *Lathyrus ſylveſtris Dodonæi.* The wilde Cicheling of *Dodonæus*.

This hath longer winged ſtalkes and ſomewhat larger leaves, but ſhorter claſpers then the laſt, the flowers are of a deepe purple, and the cods are long and ſlender, with ſmall hard round ſeede within them: the roote long and abideth.

4. *Lathyrus arvenſis ſive Terræ glandes.* Peaſe Earth-nuts.

Peaſe Earth-nuts have divers weake and ſmall ſquare ſtalkes running upon the ground foure or five foote long, the leaves are ſmall uſually two ſet together upon a branch with a claſper at the end of each, taking hold of whatſoeuer ſtandeth next to it: the flowers come forth from the joynts towards the toppes of the ſtalkes upon long foote ſtalkes, many growing together being narrow, and of a deepe reddiſh purple, ſomewhat bright, the cods that ſucceede them are ſmall and long with ſmall round ſeedes in them, the rootes are tuberous, ſmoke and ſmall faſtned to long ſtrings, which ſpread much under ground, in taſte ſomewhat like to a dry Cheſtnut, *Matthiolus* maketh it and the next to be both one plant.

5. *Lathyrus ſylveſtris lignoſior.* Our Wood Earth-nuts.

This creeping wilde Peaſe-nut hath not onely greater, longer and harder rootes almoſt wooddy then the

1. *Lathyrus maior perennis.*
The greater Peaſe everlalting.

4. *Lathyrus arvenſis ſive Terræ glandes.*
Peaſe Earth-nuts.

former

5. *Lathyrus sylvestris tuberosus.* Our Wood Earth-nut.

6. *Tetraglandes Americanæ sive Virginianæ.* Virginia Earth-nuts.

former, but the creſted ſtalkes alſo are harder and lye on the ground with ſome ſmooth long and ſlender leaves ſtanding, and ſometimes five on a branch, ſmalleſt at both ends, and one claſper at the end: the flowers are purple or crimſon, and the cods are narrow long and ſomewhat browne in the beginning, and pale as they grow older, within which are ſmall round ſeede no bigger then a Vetch or rather leſſe, and of a wan colour: this is the *Aſtragalus Siliquoſus* of *Tabernæmontanus*.

6. *Tetraglandes Americanæ ſive Virginianæ,* Virginia Earth-nuts.

Let me adjoyne this place to theſe two latter ſorts for the roots ſake, whereunto in form they are moſt like although differing in the greene long leaves which are many ſet on both ſides of a middle ſtalke the reſt of the ſtalke is leſſe, winding it ſelfe upon any thing ſtanding neare unto it, and riſing from a tuberous browne roote, which multiplyeth it ſelfe into ſundry others: at the joynts of the ſtalkes with the leaves and in other places of the ſtalke it ſelfe come forth the flowers many ſtanding together ſpike-faſhion, of a yellow bluſh colour made almoſt like hoods, which fall away within not bearing any fruit, and the leaves and ſtalkes periſhing before Winter, not reſting the moſt part of the Spring.

7. *Lathyrus ſylveſtris flore luteo.* Tare everlaſting.

This ramping wilde Vetch or Tare as the country people call it, becauſe it is the moſt pernicious herbe that doth grow on the earth, for corne or any other good herbe that it ſhall grow by, killing and ſtrangling them for food: it hath ſomewhat like unto the firſt but the leaves are ſmaller, the flowers are yellow many upon a ſtalke and alſo ſmall round cods with blackiſh ſmall ſeede in them: the roote is ſmall and rough running commonly under ground not to be deſtroyed.

The Place and Time.

The firſt and ſecond are uſually cheriſhed in Gardens for the beauty of the flowers as I ſaid in my former booke, and the wife hath beene found wilde within us as is before ſaid, if it be not the child which is counted of *Dodonæus*, the fourth is ſaid by *Gerard* to grow in many places within us as *Hamſted, Counſel* [illegible] but we rather think it was the next, for the rootes of thoſe wee have hitherto found in our woods and hedgeſides have [illegible] woodie then the other ſorts, which growing in our Gardens wee have ſeene to be more tender, and cauſe [illegible] from hey and ſeare the laſt is found oftener then men would have it, being a plague to Field or Orchard where it once getteth it, they all flower from the end of *July* to the end of *Auguſt*.

The Names.

This Pulſe the Greekes call [illegible] *Lathyros*, but is diverſly called by divers moderne writers in ſeveral [illegible] ſome call it *Lathyrus ſive Cicercula* and by *Ruellius Cicercula*, by others *Lathyris* or *Lathyrus* [illegible] *Lathyris* is generally taken for Spurge, againſt *Aracus* or *Cicera* as *Dodonæus*, yet *Tabernæmontanus* [illegible] rence betweene them calleth them *Lathyris leguminoſa*: *Matthiolus* calleth the firſt *Cyprianum* [illegible] *lium*, *Tragus Piſum Græcorum*, *Fuchſius Ervum ſylveſtre*: The fourth is called *Apios* by *Dodonæus*, *Pſeudoapios* by *Matthiolus*, *Chamæbalanus* by *Dodonæus* and *Tabernæmontanus*, *Terra glandes* by *Lobelius*, [illegible]

Original from UNIVERSITY OF MICHIGAN

Lobel from *Cordus*, and *Arcadius Theophrasti* by *Columna*, who saith hee can finde none come so neere it as this: the last is called by *Dodonæus* in the Chapter of *Terra glandes Leguminosæ* and by *Tabern. Lathyrus sylvestris floribus luteis*, and *Ruellius* addeth thereunto *Folgi Picis*, the rest as before with their severall epithets.

The Former.

Wherein that *Lathyrus* is of substance much like to *Cicilia* and *Chaselus*, and that the country people in his time did dresse them in sort onely as they of *Alexandria* and other Cities did their *Phaseli* and *Cicerilia*, by adding into a sallade as they did Lentills, but saith hee it is of a thicker substance then they and therefore of smaller use.

Chap. V.

Lathyrus annuus. Yearely or Annuall Cichelings.

THe other sorts of *Lathyrus* which are annuall as I said before in the devision of *Lathyrus* in the former Chapter, I referred to be treated together distinct from the former.

1. *Lathyrus annuus major Ratisb.* The great *Spanish* annuall Cichelling.

This hath a weake three flat stalke a yard long or more welted as it were with skinnes or filmes on both edges, having two small leaves at each joynt where shoote forth the branches, bearing two more one and broad leaves about the middle thereof one against another, with a twining claspar running among them, the flowers stand singly upon long foodstalkes, of a deeper purple colour but lesser then the former made first described in the last Chapter, after which succeede long pale coloured cods very like vnto *Pease*, the seede within them is likewise the roote is small not running deepe nor growing great but perishing every yeare.

2. *Lathyrus Pisiformis elegans folijs ovatis.* *Spanish* parsie coloured Cichelings.

This groweth up into slender branches a fadom long, with such like wyers or skinny membranes on both sides every joyne whereof come forth long leaves divided at the toppe into two other smaller leaves, and those againe, set with six leaves on both sides, and on the middle betweene them commeth forth a small claspar tendrill whereby it catcheth hold of every thing standeth next vnto it, at the joynts likewise come forth flowers, either one or two at the most upon long foodstalkes like unto the other of his kind the upper part of a fine Crimson or Orenge colour, and the other in the middle of a perfect white: after the flower is past there succeede long pods, every seede bunching out like the pods of *Fenum* and as bigge although as the smallest *Pease*.

3. *Lathyrus major siliqua brevi.* The greater short codded Cichelling.

The manner of growing differeth little from the former, onely the flower hath the inner leaves white

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

and the outer somewhat purplish: the cods that follow are thicke and short, with small round blackish Pease within them.

4. *Lathyrus minor siliqua brevi.*
The lesser short codded Cicheling.

The difference betweene this and the last consisteth more in the smallnesse then in any other thing saving that the cods hereof have a little roughnesse on them. We have another smaller then the last agreeing in most things else saving the cod which is longer and smaller.

Lathyrus parvus alter.

3. *Lathyrus minor angustissimo folio.*
Grasse leafed Cichelings.

The stalke hereof is slender and weake, the leaves long and narrower then grasse, sometimes two and sometimes three together: the flowers stand each upon a stalke of a blewish purple and sometimes reddish, the fruit is small and blackish contained in small short codden, crooked at the end.

6. *Lathyrus minor angustissimo folio.*
Fennell like leafed Cichelings.

This is smaller, weaker and tenderer in all parts then the last, the leaves are as small thin and long as Fennell, the coddes and seede are like the last onely the flowers are of a pale reddish colour.

7. *Lathyrus palustris Lusitanicus.*
Spanish Marsh Cichelings.

This in the beginning differeth little from the last but that the flowers stand usually two together, the outer leafe of a bright purple and the middlemost of a pale purple: the cods are slenderer and as long as the first, of a pale colour with small speckled Pease within them turning blacke when they are dry.

8. *Lathyrus Baticus flore luteo.* Yellow Spanish Cichelings.

This Spanish kind is in bignesse, forme of stalkes and leaves like the first of these here set downe, only the flowers are all yellow with purple veines in them, after which follow cods very like, and of the same bignesse with the first, but the Pease are smaller and rougher, or as it were netted.

The Place and Time.

All these sorts except the first (which I found in clensing of Annesseede at me) grow in Spaine, and from thence were brought with a number of other rare seedes besides by *Guillame Boel* and imparted to his Cosen *Scrobbes* in *Essex*: in whose, as a lover of rare plants, but to me of debt, for going into Spaine almost double on my charge hee brought mee little else for my money, but while I beare the bush another catcheth and carrieth the bird so while I with care and toil sowed them yearely hoping first to publish them, another that never bestowed any labour in my Garden, nor knew of them but by a collateral friend, prevents me whom they knew had their descriptions ready for the Presse.

The Names.

Their severall names are expressed in their titles, none of them being published before, except you may referre the first unto *Ruellius* his *Lathyrus major angustissimo folio*, described in his *Prædecessors* whereunto it is most like.

The Vertues.

I have not understood that they serve for meate or medicines to any of the people where they are naturall, but utterly neglected and should never have beene further known, as it is like manner falleth out in all strange rare plants, unlesse a cunning curious searcher, such as this *Boel* was happen to pry carefully over the coasts of them.

Chap. VI.

Cicercula. Winged or cornered Cichelings.

Although I have for the divided this Chapter from the two former, (although they may bee and are also by many good authors) upon good grounds as I take it: for although in growing they are like, yet some of them have their cods winged, and others not winged, and all have [illegible] Pease within them: I thinke therefore these formes doe argue a specificall difference, being all knowne alike.

1. *Cicercula sive Lathyrus sativus flore albo.* White flowred winged Cichelings.

This Cichelings hath weake winged stalkes trayling on the ground if they be not helped like the former, with two small leaves at the joynts and two other narrower leaves likewise on the branches ending in divided claspers, the flowers are white that stand on long foote stalkes, and after them [illegible] flat cods with two little narrow fines all along the backe of them, the seede within them is somewhat longer then the wild sorts, flat white and cornered: the roote is small and fibrous perishing every yeare.

2. *Cicercula flore purpureo.* Blackish purple winged Cichelings.

This other is in manner of growing like the former, the flowers onely and the fruit declare the difference, as

...The manner of the trayling herbe is in all things like ...the rest, but that the greene leaues are narrower and ...more deepe cut, and the flowers are of a kind of dead ...colour after which follow the cods that stand round ...with brownish cornered seede.

...

Spanish bush Cachelinge.

...Of these kinds of Cachelings let me adde this as common ...vnto them then vnto Vetches, for this hath ...long weake stalkes with fiues on the edges, at the ...two small leaues, and from betweene them ...with the branches, hauing diuers small darke greene ...set on them, somewhat round at the ends, ...one vpon a tree and sometimes but two, yet not al-...the stalke commeth forth vsually two flowers on a ...like the vpper leafe being reddish and the ...purple, after which come long smooth cods with-...my thing at the backe bas ing within them round but ...what flat seede of a brownish colour.

The Place and Time.

All these sorts were brought us out of *Spaine* although they grow in other countries also, they have not beene ripe fruit when the former doe.

The Names.

The three first are remembred by our moderne writers, *Dodonæus* calling the former *Aristolochia fœtida minor* and *Clusius*, *Label Lathyris semine grossiore folio, Lonicerus Lathyris foetidis, Lobel Lathyris foetidis, Lacuna Lathyris sylvestribus, Fuchsius Cyparissias alteras, Tragus Tithymalus Cyparissias sativus*, and by *Cordus* in *Dioscoridem Cyparissias minor, Aristolochiæ semine latiore*; the second *Dodonæus* calleth *Cyparissias quinta Clusij*, and *Lonicerus Lathyris prima*; the third *Clusius* calleth *Cyparissias septima*, and *Lonicerus Aristolochiæ semine Lathyridis crassiore*: the fourth was called by *Lobel Euphorbium Plinij sive minimum*, and the last by him also *Lathyris Theophrasti minima*.

The Temperature.

All of them in *Lobel* saith are eaten by the poore people in *Spaine* in the want of bread, for where they are plentifull they seldome doe they raise of any bread or corne, they are all of a corrupt substance, and therefore nourish not, but are hardly concocted.

Chap. VII.

Orobus fructu alato. Winged wilde Peale.

1. *Orobus fructu alato flore albo.* The white winged wild Peale.

The head of Peele from two or three stalkes at the most, which are broad and flat, welled or wised at the sides with some what long leaves shooting from them small at the setting to the stalke, and broade in the end, as it were growing from the middle ribbe of the other, at the toppe whereof standeth two or three cluming clapers: this never (though) forth any branches that ever I could see, but the leaves from almost the bottomes of the stalkes upwards are paired as it were at the toppe of them into one or two smaller leaves, or rather one or two smaller leaves grow at the toppe of them with the claspes between them, at the toppe of these leaves come forth single flowers, like the former *Orobus*, wholly white which turne into small round and long cods, with small crooked points at the ends, and filled with peason, wherein are contained small round whitish peale, tasting like butter, the roote is small and long, with some few threds, which wholly perish yearely.

2. *Orobus niger.* The blackish winged wilde Peale.

The other differeth not from the former, but in the flowers which are tending to a reddish purple, and the Peale in the Cods, which are more blacke then the former or blacke.

The Place and Time.

These we onely nurse up in our Gardens, having received them from friends that are lovers of rarities, yet I doubt not but they grow naturally in *England*: they flower and give ripe fruite from the middle of *July* to the end of *August*.

The Names.

That which *Theophrastus* and *Dioscorides* call *Orobus* is called *Orobus Græcis* and with us but by *Mistake*, as I said before, *Ervilia*, by which name it is usually called in these later times by most Herbarists. *Lobel* saith it is much to be so called *quasi ervorum* or *ervilia*. *Matthiolus* calleth it *Aracus niger* but erroniously, *Dodonæus* calleth it *Ervilia sylvestris*, *Lobel Orobus sylvestris*, *Lacuna Ervilia*, and *Lugdunensis* saith the Herbarists in his time called it *Cicercula*, the other hath not beene mentioned by any before.

The Nature.

We finde that *Galen* writeth that *Orobus* is *alimentosum* but *Ochrus* hath a scante or middle property, between whole that be of good and nourishment, and yet were both that are of colde and hard digestion, breeding and not breeding wind, and nourishing much or little, and not of any speciall quality: in these later times, it is held to have a drawing, digesting, cutting and cleansing faculty, for it is moderately hot and moyst and a little [illegible] wood, [illegible] to purge the Liver, Spleene and Reines, and to cleanse the skinne from morphew, [illegible] it dissolveth hard humors in the eyes, and beside Impostumes and soule sores [illegible]

Chap. VIII.

Aphaca. The yellow wilde Vetch.

There thought it fittest to place this Pulse alone by it selfe, and before the Lentills, as pertaining thereto, not finding any other of the former or following Pulses, to be anywise thereunto, and therefore take the description thereof here in this manner. It riseth up higher then Lentills, with many weake slender and cornered stalkes full of leaves, with small leaves at them set by couples together untill they be well growne, which are small more sequestrate in order, each whereof is like the wings of a Bee, as it were closing the stalke, and about the end, somewhat like unto the small kinde of Vetches bearing upwards, and every one ending in a small clasper, the flowers come forth at the joynts of the leaves, and cleaves with them, from the middle upwards, of a pale yellowish colour, and after them small flat cods, longer then those of Lentills, wherein are three or five hard blackish round flattish seede, the roote is small and long, with many fibres or strings, perishing every yeare.

The Place and Time.

It groweth in divers corne fields in Kent, and elsewhere, flowreth in July, and the seede is ripe in August.

The Names.

This herbe is held to be the Vetch *Aphaca* of *Dioscorides*, and *Pliny*, the name being derived from the Greeke word the Lentill, both which it doth in some parts resemble, but not that of *Theophrastus*, which is described to have small leaves, and that in 8. *Hist. Plant. c.* 5. among Pulse, and other Pulse, it is taken also of *Dodonæus* to be his *Orobanche sub. 5. Cordus*, that groweth among *Orobus* and *Pisum agreste*, *Matthiolus* and *Camerarius* take it to be his *Vicia sylvestris Dioscoridis*, *Lobel* call it *Aphaca Dioscoridis*, *Lugdunensis Orobanche Belgarum*, because he knew it growing in divers places *Orobanche, Tabernæmontanus Lathyrus sylvestris*, and *Gerard Vicia sylvestris Lobelij cum aliorum synonymis.*

The Vertues.

The herbe with that is such an astringent propertie, that before being parched, broken and boiled, after the manner of Lentills, they stay the flixe, loosenesse of the stomacke and belly. *Galen* saith it is binding as the Lentill, & used to be eaten as the Lentille but it is hardlier digested: yet it eateth more powerfully, and healeth moderately, which astringent qualitie, saith *Dodonæus*, was found true by our owne experience in this *Aphaca*.

Aphaca. The yellow wilde Vetch.

Chap. IX.

Lens Lentills.

There are three sorts hereof, a greater, a lesser, and a spotted one, as shall be declared.

1. *Lens major.* The greater Lentill.

The greater Lentill hath sundry slender weake branches somewhat hard, two foote long, from the roote whereof shoote forth at severall places long stalkes, of small winged leaves, that is, many on each side of a middle rib, without any odde one at the end, for the middle ribbe of each stalk endeth in a small clasper: the flowers are small, and rise from between the leaves and the stalkes, two for the most part at the end of the same stalke, of a sad reddish purple colour, somewhat like to those of Vetches, after which come small flat cods, within which are contained two or three flat round smooth seede, of a darke ash colour, the roote is fibrous, and perisheth yearely.

2. *Lens minor.* The lesser Lentill.

The lesser doth in stalke, leaves, and seede, the flowers are more pale, and the seede in the cods is lesse, which onely doth make the whole difference.

3. *Lens maculata.* Spotted Lentills.

This doth not much differ from the last in any thing, but the seede which is blackish, spotted with small spots.

The Place and Time.

They are sowne even beyond the seas, are onely sowne in the fields as other manured Pulses are, and so are they in

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

Lens maior cultorum. The greater of the Lentil.

some countries in our land, especially the smaller sort, which is every where, the more pleasant and acceptable, but the greater doth very hardly come to maturitie with us, if the season be not kindly and drie: the last is wilde in *Portugall*.

The Names.

It is called in Greeke φακὸς and φακὴ, *Phacos*, and in Latine *Lens* and *Lenticula*. *Pliny* saith, *lib.* 18. *cap.* 12. that the *Egyptians* thereof seemeth to be taken, *quasi lenticula dicta sit, lenitatis, ferunt quidam, causa, ac æquanimitatem fere vestantibus ea*. The *Arabians* call it *Hades*; the *Italians Lenticchia*, the *Spaniards Lenteias*, the *French Lentille*, the *Germanes Linsen*, and so doe the *Dutch* also, and wee in *English* Lentils, but the country people in *Hampshire*, and other countries, where they sow it in their fields for their cattle foode, call it Tills, leaving out the Lent, as thinking that word agreeth not with the matter, *Ratio Alimentum*.

The Vertues.

Galen saith, that Lentils hold a meane betweene heate and cold, yet doe they drie in the second degree, the outer skinne being binding, and the inner meate also, yet a little hath and bindeth the body, but the outer skinne much more; it is, saith he, of contrary qualities, for the decoction thereof doth not binde, but loose the body, and therefore they that would have it to binde, cast away the first water, and use the second, which loseth lasker, and strengthereth the stomacke and all the inward parts. Lentills lasked, saith he, lose with their shells, the strength of binding, and the other qualities that follow it, and then nourish more than those that are not lasked, yet to grosse thicke and evill nourishment, and slowly passe away, neither doe they stay fluxes and disenteries as those that are not lasked. *Galen* further setteth forth the qualities hereof: largely to eate the broth of Lentills, saith he, breedeth the Leprose and cankers, for grosse thicke matter, and for breede the melancholike humour, and therefore are to be sparingly given to those that are of a watery disposition, and evill affected thereby; but is utterly forbidden to those that have dry constitutions: it is also hurtfull to the sight dulling it by drying up the moisture, and is not convenient for women that want their courses, but rather for them that have them in too much abundance. *Dioscorides* further addeth, it breedeth troublesome dreames, and is hurtfull to the head, the lungs, and the sinewes: with other binding herbes, as Plantaine, red Beetes, Myrtles, dried Roses, Pomegranat rindes, Medlers, Services, &c. taken with vinegar, it is more powerfull to binde and stay laskes and fluxes: the decoction thereof with wheate flower applied eateth the paine, mixed with hony it closeth up the lippes of woundes, and cleanseth foule sores: being boyled in vinegar it dissolveth knots and kernells; and being boiled with Quinces, Mellilot, and a little Rosewater put thereto, it helpeth the inflammations of the eyes and fundament, but for the chappes thereof which needs a stronger medicine, it is boiled with dried Roses and Pomegranate rindes, adding a little hony to it: it likewise stayeth those creeping cankers that are ready to turne to a gangreene, putting thereto some lee-water, and is a good for wheales, and running or watering sores, &c. *Anthimius* saith, lice, lobes, &c. being used with vinegar is good also for Womens breasts, that by abundance of milke have it curdled within them, if it be boyled in lee-water and applied to them: the decoction thereof is a good lotion for ulcers, either in the mouth, privie parts, or fundament, with a few Rose-leaves and Quinces.

CHAP. X.

Aracus sive Cicera. Wilde Cichling Pease.

HAve two sorts of Pulses to bring to your consideration, better agreeing with that title of *Virgil*, *Georg.* 1. judgement than any other, let them of better learning and knowledge judge of them.

1. *Aracus major Bellonij.* The greater Spanish wilde Cichling Pease.

This greater Pease spreadeth on the ground, with divers square stalkes, and winged leaves, like unto those of the Vetches, but greater, three times as long or more, at the severall joynts whereof grow many smaller leaves, one by another, on each side of a middle ribbe, which endeth in a claspet like the former: the flowers of the leaves come forth single flowers on very short foote stalkes, of a double whitish purple colour, with deeper purple veines therein, and of a deeper purple at the bottome of the upper leaves next to the stalke, which when they are past, there come in their places short, thicke, and almost round thrumb cods, of a yellowish colour, smooth without hairinesse thereon, within which lie three or foure round blackish flat seeds or Pease, almost like unto those of Vetches, but not cornered: the roote is small and fibrous, and perishes yearely.

2. *Aracus minor Lusitanicus.* The lesser wilde Cicheling Pease.

This other agreeth much with the former, but lesser in all parts, and nothing hairy; the flowers are of a pale

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

white in my Garden, or whitish yellow colour in others, and the cods smooth, smaller, not hairy, with smaller and blackish coloured Peafe within them: the roote cereof perisheth likewise.

The Place and Time.

Both these Pulses were brought and sent one among others sent by *Boel* before mentioned: the first out of *Spaine*, and the other out of *Portugall*, and flowred in the end of *July*, giving their seede in *August* and *September*: but in the yard, he gathered the ripe seede in *April* and *May*, in the naturall places.

The Names.

Galen in putting a difference betweene *Lens* and *Faba*, and *Ervum*, and *Arachus*, the one with x, the other with s, and saith that *Arachus* is a wild weede or grasse in Greece, and that they picke it out of the corne, and cast it away as they doe *Fecnugreca*, the lowliest Fetch: *Dioscorides* & *Hesychius* doe saith also that it is a hard and stubborne growing among Lentills; but of *Arachus* hee speaketh, *lib. de alimentorum facultatibus*, in an other place) gave occasion to refer it thereunto especially, because judicious Authors have retained it among Latine: and *Columella* saith that *Cicera* differeth not from *Cicercula* in taste, but in colour, because *Cicera* is darker or blacker than *Cicercula* and *Fallacina* also in name from the same thing: but *Arachus* which is rendred *Cicera* in Latine, is more like a Vetch, both in growing and in bearing many flowers in a spike at the toppe, which this doth not: thus have I endeavoured to distinguish these plants, which I finde to many learned Writers before me have confounded, but *Dioscorides* his *Arachus sativus*, as I have shewed you before, pertaineth to an other kinde: the first of these came to me from *Boel*, by the name as in the title, to whose opinion I wholly encline, having often found him in our naturall search for simples in sundry places to be one of singular judgement and experience; the other was sent me out of *Portugall*, where he had the knowledge of it by *Nunnez Brandon*, a lover of rare plants, and therefore according to his title of *Lagi idem pallidum*, he added *Nany Brandony*, by which name it hath beene knowne to others. and I now thinke fit to referre it to the other.

The Vertues.

We have yet learned nothing concerning their faculties.

Arachus sive Lathyrus.
The Earth-nutte Cicheling Peafe.

Chap. XI.

1. *Arachidna Cretica.* Vnder ground *Candy* Cicheling Peafe.

This pulse (which for the wonderfull growing thereof hath amazed some, and made them search if it were not mentioned in any former author (as I shall shew you by and by) riseth up with divers stalkes, about a foote high, having on them both winged leaves, that is, eight or nine set on both sides, of a middle sadde colour, ending in a clasper, very like unto Lentills or Vetches, very variable or differing one from another, for some of them are small and pointed, others a little round, and some stalkes will have but two leaves, others round pointed, and others will have foure: the flowers are of a reddish purple, standing singly at the joynts, which afterwards yeeld small long cods bigger than those of Vetches, wherein be some or three hard round and very blacke seedes: the roote is compoted of many small pods, as it were like unto Lentill cods, hanging by small strings, wherein is contained in some one seede, in others two, in some very blacke, in others red, and in others of differing colours, or partly coloured; each whereof being planted a new will bring forth bearing a plant like the mother.

2. *Arachus sub terra siliquosus Lusitanicus.* *Portugall* underground Peafe or Cichelings.

Somewhat like unto the former have we received from *Portugall* another sort hereof, whose slender branches creep not much above a foote high, lying for the most part upon the ground, had many small narrow leaves set orderly one by another up to the toppes, where and with the leaves also come forth small reddish flowers which after many stand, contayning small round seede within them: the roote groweth downe right with many strings thereat, and at the head of the roote, as also at the other parts spring thicke and short white pods, especially while they are under ground, but changing darker afterwards, containing within them one or two seedes of a round, bigger by much than those in the pods above ground, and somewhat speckled.

3. *Arachus subterraneus & Americanus.* Vnderground Cicheling of *America* or *Indian* Earthnuts.

The *Indian* Earth-nuts (the figure whereof I give you, together as they are framed to us by them that have brought them to us) are very likely to grow from such like plants as are formerly described, not onely by the name, the figure and taste of the thing it selfe, for we have not yet seene the fare thereof above ground, yet the cods or Peafe-cods (as I may so call it) is farre larger, whose outer huske is thicke and somewhat long, round

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

at both ends, of a little hooked at the lower end, of a fullen whitish colour on the outside, striped, and as it were wrinckled, bunching out into two parts, where the two nuts (for they are bigger than any Filberd kernell) or Peafe doe lie joyning close one unto another, being somewhat long, with the roundnesse firme and solide, and of a darke reddish colour on the out side, and white within tasting sweet like a Nut, but more oily.

The Place and Time.

The first was sent out of *Candy* by *Honorius Bellus*, who found it growing there among corne & Pulse, unto *Iacobus Dodo* of *Verona*, who set it forth in the description of *Mount Baldus*, and flowred in the end of Summer, as the second did that was sent us from *Lisbone* by *Bauhin*, and the last groweth in most places of *America*, as well to the South, as West parts thereof, both on the maine and Iles.

The Names.

The first is truely taken by *Bellus* aforesaid, to be the *Arachidna* (or *Arachidna* as *Columna* hath it) or *Arachidna Theophrasti*, or *Aracoides*, or *Araco similis* of *Theophrastus* mentioned in his first Booke and eleventh Chapter, no other plant yet knowne, agreeing so rightly thereunto, and describeth it, but the fruit groweth as much neere under the ground joyning to the small fibres thereof as above: and yet he there saith also, that neither of them beare any leafe, nor any thing like leaves: which how this can stand with sense and reason I know not, and therefore many doe suspect the text to be false, or else he is contrary to himselfe, for he saith they beare no lesse fruit under ground than above, and then they must beare fruit above ground, which how it can be without leaves I see not, for I never read, heard, or saw, that any plant bore fruit above ground without stalkes and leaves; the comparison unto *Aracus* also carrying the more probability: but surely he was misinformed by those that gathered the rootes with the fruit on them when the stalke and leaves was withered and gone, he never seeing the plant, as it is likely, or gathering it himselfe: the etimologie also of the name being compofed of *Ἀρὰξ* and *ὑπὸ*, *Aracus* and *sub*, which is *under*, sufficiently argueth as much, but he meane this underground fruit was like the fruit of the foregoing *Aracus* above ground, and such like is the under-ground fruit hereof in cods with peafe in them: but *Columna* maketh the *Terra glandes* before declared to be rather this *Arachidna*, both from the solid rootes under ground, and the likenesse of the plant unto *Aracus*: and surely it may be that both these were meant by *Theophrastus*, for he maketh two sorts, and both alike to bearing fruit under ground, that is, *Arachidna* and *Araco similis*, or *Aracoides*: and we have also two plants, as I have shewn, *Aracus* beare this, and *Arachus* after it, unto which they may be referred: the other two sorts are intituled as I thinke it fitteth for them: the *Candians*, as *Bellus* saith, call the first *χοιροφάγος ἀγριόφαγος*, the second was sent me by the name of *Cubyrea sub terra filiquifera*: the last is generally called by our *English* sea-men the *Potato* roote, those parts Earth-nuts, strongly enough, as they doe smell other things that they there meete with.

The Vertues.

There is no propertie found out wherewith this is invested that we can understand of as yet.

1. 2. 3. *Arachidna Cretica Honorij Bellini, sive magnitudine Lupinum, & Arachidna minor.*
Vnder ground Peafe of Candy like Lupines, & Arachidna minor.

CHAP. XII.

Arachus sive Cracca. Wild Vetches or Tares.

OF these wilde Vetche there is a greater and a lesser knowne differing from the manured kinde: which referred thereunto, whereunto I adjoyne another stranger.

1. *Arachus sive Cracca major.* The greater wilde Vetch or Tare.

This greater kind of wilde Vetch hath a few slender creeping stalkes lying on the ground, [illegible] cling whereon to ramp, or take hold of; at the joynts come forth winged leaves, that is, many [illegible] sides of a middle ribbe ending in a clasper, but lesser than those of Lentille, or the manured Vetch, the flowers purple like the Vetch, and grow usually but one at a joynt, after which come small long blacke cods like to Vetches, and so is the seede within them, but round, and not flat as Vetches are: the roote is small [illegible] risheth.

2. *Arachus sive Cracca minor.* The lesser wilde Vetch or Tare.

This other wild Vetch differeth in no other thing from the former but in smalnesse, except that the [illegible] rish flowers standing in tufts at the toppes of the stalkes, and the cods that follow are thorter and [illegible] and the seede within whitish: the roote hereof hath small whitish kernells hanging among the fibres.

3. *Arachus*

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

3. *Arachus Indicus sive Africanus.* Corall beades of *Guinny.*

This tender plant too tender for our climate groweth like the former but with more store of leaves and flowers at the joints, ten or twelve growing together in thicke, short and rough brownish red cods, the Pease within being smooth and as red shining as if they were polished Corall beads, but with a blacke spot on the one side as hard almost as stone, and enduring being strung for bracelets a long time. *Lobel* long before *Clusius* set out this plant, whose pod with the seede being smaller is in the next Chapter.

The Place and Time.

Both these sorts are often found in the fields among Corne, where they will in a rainy time quickly overspread whatsoever the Corne or any other herbe it groweth by, they flower in *July* and giveth seede presently after, the last come out of *Africa* towards the *Indies*.

The Names.

This is rightly adjudged to be *Ervum Arabicum* of *Galen* and the other old *Greeke* writers, and hath his name according to his nature, for as *Lobel* describeth it *ervilia quasi pisces permixtique leguminosis frutis medio generis*: The two sorts generally called by all authors *Ervum* or *Cracca* except *Tragus* who calleth them *Vicia major* and *minor*, *Matthiolus* and *Gesner*, and *Dodonæus* that thinketh it may be that kind of Pulse growing among Corne which the ancient called *Ervum Arabicum*, and conceiteth against *Fuchsius* and others that called it *Cracca* the especiall note of difference from the other sorts of *Vicia* is that this seede is squidge round and all other sorts of *Fitches* somewhat flat: the last is mentioned by *Clusius* in his fourth booke of Exotickes and 15. Chapter by the name of *Vicia Africana*, and *Lobel Pisum Coccineum Americanum*.

The Vertues.

The properties of these are referred to the other sorts of Fetches and therefore I shall put you over to the end of the next Chapter to be informed thereof to avoyd a double recitall of one and the same thing, onely this is a certaine knowne Pulse to Doves wherewith they are much delighted, and although they be wilde yet where the large Tares are sowed herewith they also will resort and become tame with the rest, and therefore some countries are growing to sow some fields therewith to serve to that use.

Chap. XIII.

Vicia, Vetches or Tares.

The Vetches are of divers sorts, some manured or sowen, others wild growing in woods or hedges before those before specified which shall be declared in this Chapter.

1. *Vicia vulgaris sativa.* The manured Vetch of Tare.

The manured Vetch or Tare hath divers square stalkes rising sometimes two foote high, entangling themselves one with another that they stand in the field without needs of any other proppe, the leaves

leaves are winged thicker set together then the former wild kind or set on both sides of the middle rib be, the end whereof runneth out into a divided clasper and are larger also then they: the flowers stand two together and are long and narrow of a darke purple colour, and the cods that succeede them are long and somewhat broad, wherein lye five or six flat blackish seede and in some grayish: the roote is stringy and perisheth every yeare.

Siliqua cum semine. Small Indian kidny. The pod and seede of the wild Vetch or Corall beade.

7. *Vicia sativa alba.* The white manured Vetch.

This other differeth not from the former in growing but is tenderer, the leaves not so thicke and the flowers and fruit more white.

3. *Vicia maxima sylvestris.*

The great wilde Vetch of the hedges.

This great Vetch groweth like the former, but is larger both in stalke and bigger and fatter of the leaves: the flowers likewise are somewhat large but fairer and more wan or pale, the cods succeeding are shorter also and blacke and so are the seedes within them.

4. *Vicia sylvestris alba.* White wild Vetches.

The white Vetch groweth in forme like the other but the winged leaves have a hoary downe upon them, the flowers are white with darke purple veines running through them, the seede is flat as the other but the roote hereof liveth as many of the wild kindes doe.

5. *Vicia multiflora sive spicata.* Tufted Vetches.

The tufted Vetches hath such like creeping branches as the other have but weaker, the winged leaves stand in number 12. 20. or more on a ribbe, longer and narrower then the former, and standing more upright, and are alwayes set opposite one to another but unequally, the flowers like wise that stood upon the long naked footstalke are more in number sometimes twentie together but smaller, somewhat like to the flowers of *Orobus* or Cuckow bread, and of a bright blewish purple colour, and sometimes of a darke purple with some white in them, the cods succeeding are long and the seede blacke within them: the roote creepeth under ground farre abroad, shooting new branches every yeare for the old ones perish.

6. *Vicia sylvestris vulgaris.* Strangle Tare or Tyne.

The Strangle Tare groweth like the former Tares but is rougher both in leaves and stalkes it is smaller and not so high, the flowers are purple and the cods blacke, small and long with many small seedes within them: it riseth every yeare of it owne sowing, and choketh the Corne or any other herbe it groweth neare.

c. *Vicia vulgaris sativa.*
The manured Vetche or Tare.

5. *Vicia sylvestris flore dilute.*
Wilde wild Vetches.

2. a Place and Time.

The first two sorts are sowen in fields as Beanes and Peale to serve for cattells foode, both in our owne land and others, where of necessitie the poore are forced to make their bread, and are sowen and reaped when the other pulses are; some of the other wilde kinds are also found in woods and moist ground with us, among hedges and bushes; but the *Indian* kind as Mr. *Gerard* tooke it to be in *Germany* as it is likely.

The Names.

The Latine or Roman name of the *Faba* his countrey people is generally taken to be *Vicia* of the Latines, a word made as they have it a note of *diuision* called it *Faba* and *vicia*: *Theophrastus* and *Dioscorides* call it *Cyamos*: the first is called *Aphake* by *Galen*, and both it and the second specially were formerly taken for *Orobus* by the Apothecaries, and the rather learned and Doctors both in the upper and lower *Germany* as *Brunfelsius* and *Tragus* doe shew, and *Matthiolus* also as well they being deformed beyond Sea by getting the true *Orobus*, or at least that which is now called with us so with them are to be like the old errour and lost by the true; the white one being most like the Pulse which *Gerard* had by the name of *Faba Indica*, & is set forth by the name of *Vicia Indica frutex* [illegible] second, & the third is called by *Bauhinus Vicia maxima Theophrasti*, and I doe so too, but others *Crocea* and *Cyamus*, and because *Galen* joyneth *Aphaca* with *Vicia*, divers did follow him and call it *Aphaca*: for *Dioscorides* calleth it *Vicia altera*: the fourth is that which *Clusius* calleth *Faba fructu subrotundo*, & the fift he also calleth *Faba fructu subrotundo flore purpureo*, and is the same both with *Dodonæus* his *Vicia alterа*, and *Fabis* is *Germanica*, which *Bauhinus* calleth *Mediterranea*, and the same also with his *Vicia Orobrychidis facie*, as any that shall take their severall descriptions and compare them may see, it may also be called *Vicia gravis*, *ponderosa*, the great wood Vetch: the last is called by *Matthiolus Faba* as it is indeede the worst of all, but not the great or rankest one. The *Dutch* call it *Vetche*, the *French Veſce*, and the wild kindes *Veſce ſauvage* and *Veſſeron*, the *Germans Wicken* and the wild kinds *Wilde Wicken*, and the greatest S. *Christofels Kraut*, the *Dutch Writers*, and wee English Vetches, Fetches, Tyes, and the wilde kind Tine.

The Vertues.

The beanes eaten by men (as I have saith in time of dearth as some did when they were greene) they yeeld a thicke gummy nourishment, are hard of digestion, and bind the belly, and therefore breede melancholy, because thereof is filled with raw humors so fast running Vlcers and Cankers that are ready to Gangrene: and boiled as a Pultis and layd on the belly they binde a loske.

Chap. XIIII.

Lupinus. The flat Beane or Lupine.

Having finished the number of climing or rampling Pulses, it remaineth to shew you the rest which have no claspers and first to begin with the Lupine or flat Beane, for the great Garden Beane which should stand in the fore front I have shewed you in my former Worke with the greater and smaller blew and yellow Lupine, yet I thinke it not amisse to give you some of their Figures here.

Fabis *magnæ hortenſis.* Our ordinary Garden Beane.

1. *Lupinus ſatiuus albus.* The great white Lupine.

The great white Lupine riseth up with a strong upright round hollow stalke or woolly stalke set confusedly with diuers hoary woolly leaves upon long footstalkes, each being diuided into five, seaven or nine severall parts, narrow long and sharpe, greenish on the upper side and woolly underneath: the same stalke diuideth it selfe into two parts, after the flowers are growen from the uppermost joynt, and are like the same great Garden Beane but wholly white without any spot, the branches flowring after the first flowers have ripened under long soft or woolly cods, lesser then of the garden Beane, containing within them foure or five flat white seeds somewhat yellowish within and very bitter in taste, the roote is somewhat long and hard with divers strings annexed thereto perishing yearely.

2. *Lupinus albus albus.* The spotted white Lupine.

The spotted Lupine differeth from the former in the greatnesse of the flower which is spotted with blew, as is also the woolly leaves, and the hollow of the uppermost.

3. *Lupinus minimus cæruleus.*
The smallest blew Lupine.

The small Lupine is very like unto the former blew Lupine as I told you in my former Booke, in the manner of growing stale or nothing woolly also that smaller both stalke and leaves, the flowers likewise are wholly blew, white or very seldome with a white spot in it: the seede is like white and a little spotted.

Original from UNIVERSITY OF MICHIGAN

1. Lupinus flore luteo. The yellow Lupine.

2. Lupinus flore ceruleo. The great blue Lupine.

3. Lupinus minor ceruleus.
The smallest blue Lupine.

4. Lupinus medius ceruleus.
A middle sort of the great blue Lupine.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

4. *Lupinus Caruleus marinus flore cæruleo.* The blew Sea Lupine.

This Lupine is farre like unto the smaller blew Lupine described in my former Booke, but lesser, or rather I find the smallest blew full of all described: the flower is of a most excellent blew colour, with some white in the middle: the leade is small and round.

5. *Lupinus Arabicus.* The Arabian Lupine.

In the well considered of this Lupine, I finde that I have described it among the Cicephicles, because the leaves are very like unto Cicephicle, and commonly so called by that name, but since that having readie Bauhinus his description of this Lupine in the *Italian* tongue, I finde it there described by the name of *Lupino Arabico*, or Lupine of Arabia, and therefore I have so entituled it here, yet referre you to the description thereof in that place, because I have not that same set downe, being as I tooke it growing in my owne Garden, but referre you to Bauhinus his description, as in the ende &c. and might be removed. I will from *Rome* supply it: the leafe is like a Lupine leafe, the flowers are more purple than they showed with me, and the middle somewhat white: the pods are long and pointed at the ends, full of small blacke seede and little ethes: thought to be a perrie, as in truth it is but one plant, although it hath two titles.

6. *Lupinus Caruleus medius cæruleus.* A middle sort of the great blew Lupine.

This Lupine is very like the greatest blew Lupine described in my former Booke, both for the stalke, leaves and woolinesse of the leaves, as a little lesser in all as the flower is also, and of a more delicate blew colour, almost white upon in the middle, which changeth to be reddish before the flower decayeth: the pods are woolly, and almost as large, and so is the seede also, but full smaller, and a little discoloured, with a little blewnesse in the middle.

7. *Lupinus flore cæruleo,* Blush-flowered Lupines.

This differeth little from the Lupine also, but lesser and lesse woolly: the flowers which make the chiefest difference are of a kinde of declared reddish colour, which we usually call a blush: the pods also are lesse woolly than the other, and the seede likewise.

8. *Lupinus flore albescente.*

We have had another sort of *Lupinus* sent us from *Italy* by this name, but perishing in an intemperate yeare, we cannot say further.

The Place and Time.

These Lupines grow naturally wilde, but were doe nourish them all in Gardens, and doe flower in the end of June and July, in which time, or quickly after the seede will be ripe.

The Names.

The Lupine is called in Greeke *Thermos*, in Latine *Lupinus*, *Plinie* thinking it tooke the name and qualitie from *Lupus* the Wolfe: but I see no likelihoode in that supposition, and therefore forbeare to expresse it any further, there was mentioned by the Authors that have written of them: the third was brought me by *Master Gerrard*, and called it *Lupinus*, but were both to tender, that I onely saved a little seede the first yeare I had them, and therefore since, the life is declared in the description: the three last have not beene remembred by any: the Arabians call it *Termus* or *Turmus*, the *Italians Lupini*, the *Spaniards Garramanes*, the *French Lupin*, the *Germans Feygboen*, the *Dutch Vinkboonen* and *Lupiser*, from whence came the *Faba fenilica Germanis* by *Dodonæus*, and we *English* Lupine or the Beene.

The Vertues.

The decoction of their bitternesse, doe open, digest, dissolve, & clense being steeped some daies in water, until they have left their bitternesse, they may be eaten, & so are, as *Galen* saith, for nevertheles tho they breede grosse and melancholy, are very hard to digest, and slowly passe through the body, yet doe they not hinder any thing: the meale steeped, and afterwards dried, beaten, and taken with some vinegar, taketh away the hardning of the spleene, mundifieth and provoketh the appetite: the decoction or infusion of Lupines taken with honey and oyle killeth the wormes in the belly, but if you mixe Rue and pepper therewith, you shall make it the more effectuall: the meale or powder taken with honey and vinegar, or in drinke doth the same: the said decoction taken openeth obstructions of the liver and spleene, provoketh urine and womens courses, if it be taken with Saffron it killeth the dead childe: the decoction of them cleanseth all soldes, morphew, canker, tetters, and all running sores and fores, and boyled in lye it clenseth the head from ulcers, scabs, &c. breeding nits: it also cleanseth the face, and taketh away the marks that the pose doe leave after their healing, and all spots, and blacke and blew specks in the skinne: and to cleare the face, and make it cleare and faire, many use the meale of Lupines annointed with the gall of a Goate, some juice of Lemons, and a little Camphire made into a forme of a lotion or ointment: the meale there of being boyled in vinegar and applied, taketh away pimples, and scatereth the scabs or kernells that rise in the body, and breaketh carbuncles and sores running or the hollow ulcers: it driveth away Gnats, Flies, &c. whatsoever. The white Lupines are stronger and more effectuall to all purposes.

Chap. XV.

Cicer sativum. Garden Cich Peafe, or Rammes Cicches.

The Cicches called *Cicer*, there are two sorts, the Garden and the wilde, but although I gave you the description of foure sorts of the garden kind, in my former Booke: yet I thinke it not amisse to give you the descriptions of them here againe, with their properties more amply.

Cicer sativum flore ruber, albo, purpureo nigroque sæpissime.

Garden red, blacke or white, Cich Peafe, Rammes Cicches, or Cicers.

The tame or Rammes Cicches, bring forth stalkes a yard long, whereon doe grow winged leaves that be many

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

many small and almost round leaves dented about the edges, set on both sides of a middle rib: at the joynts come forth one or two flowers upon those tender stalkes, Peale fashion, either white, or whitish, or else purplish red, lighter or deeper, according as the Peale that followes will be, that are contained in small thicke and short pods, wherein lie one or two seeds more usually, a little pointed at the lower end, and almost round at the head, yet a little cornered or sharpe: the roote is small, and perisheth yearely.

The Place and Time.

They are sowne in Gardens, or the Fields, as Pease, both in our owne and other countries, being sowne later than Peale, and are gathered at the same time with them, or somewhat after.

Their Names.

It is called in Greeke ἐρέβινθος *Erebinthos* and ἔρυς is added of some female ἐρεβίνθη *Erebinthe*: in latine *Cicer* of the *Arietinum*, *Romane Hordei*, or *Ramme*, of the *Italian Cece*, of the *Spaniards Garvanços*, of the *French Pois Chiches*, or *pois Chiche*, of the *Germans Kichern* and *Kichererbs* of the *Dutch*; and we in *English* Cicers, Cicies, Rammes Cicher, and Ciche Peale: *Dioscorides*, *Theophrastus* and *Pliny* doe much stray one from another in setting downe the sorts of these *Cicers*, *Dioscorides* deviden it into two *sorts*, *Sativum* or *satine*, *sive hortense*, the *sativum* he nameth *arietinum* to be the other sort; *Theophrastus* saith it hath many differences, as in greatnesse, rattle, colour and forme, as *Arietinum* and *Columbinum*, &c. *Pliny* doth somewhat follow *Theophrastus*, and maketh more sorts; but to avoid long discourses and controversies, wee doe now generally hold onely two sorts of the manured Cicers, white and red, or three, at the most as *Matthiolus* saith white, red, and blacke: but the red changeth blacke with rotting, and therefore is not differing; *Columbinum* and *Venereum* are all one with the white; and the *Cicer Cubeum* of *Theophrastus* & *Pliny*, is another plant, as shall be shewed hereafter: *Matthiolus* saith, that the *Germans* heretofore erred much in taking Pease to be *Cicer Corinthiacum*, wee have shewed before that *Tragus* and others take Vetches to be *Cicers*.

The Vertues.

Cicers, as *Galen* saith, are no little windy meate more than Beanes, but yet nourish more, they provoke venery and is thought to increase seede, and therefore they give it their stallion horses. *Cicers* have in them a more scouring facultie than beanes, wherefore they breake the stones gathered in the kidneyes: to make the decoction of them being boyled in water, is the best way; it moveth the belly downeward, provoketh urine, and womens courses, and increaseth both milke and seede: the decoction of either of them with *Rosemary*, is good for the Dropsie and the yellow Iaundise, and to ease the paines in the sides, for which purpose this medicine is very powerfull: an ounce of *Cicers*, two ounces of *French* barley, and a small handfull of *Marsh Mallow* roots, cleane washed and cut, being boyled in the broath of a chicken, and some ounces taken in the morning, and fasting two houres after: the white *Cicers* are used more as meate than medicine, yet they have some facultie, and are thought more powerfull to increase milke and seede: they are knowne to have given good increase to women that were barren through an over hot constitution, an orderly course proceeding the following of taking thereof. *Dioscorides* saith that *Cicers* are hurtfull to those that have ulcers in their reines, kidneyes, or in the bladder. *Theophrastus* giveth this note, that no wormes breede in these *Cicers*, when as other pulses are subject to them, and therefore in their nuptiall ceremonies, theirs were given as allegoricall notes of their manifold incorruptible affections.

Chap. XVI.

Cicer sylvestre. Wilde Cicers.

There are wilde Cicers are of three or foure sundry sorts, as shall be shewed in the Chapter.

1. *Cicer sylvestre majus.* The greatest wilde *Cicer*.

The greatest *sort* hath very long winged leaves set on the stalkes, compassed of many *[illegible]* of them being small, and longer than of the former garden kinde, not dented at the edges, *[illegible]* and of a red greene colour: at the toppes of the stalkes come forth many *[illegible]* set together, of a pale yellow tile colour, almost white, after which follow rough skinne cods *[illegible]* of them small pointed at the end, within which are contained other small smooth huskes, *[illegible]* small flat yellow round seede, so saith *Thalius*, but *Anglicus* maketh the first of *Dalechampius* to have small flat seede, and not like unto the manured Cicers, and yet I take them to be both one, and that of *Matthiolus* also

Original from UNIVERSITY OF MICHIGAN

Cicer sylvestre majus.
The greater wilde Cicer.

Cicer sylvestre tripbyllum.
Three leafed wilde Cicer.

stone is hard and woodily, yet spreadeth forre abone and living long. There is another sort in all things like the former, but much lesser in every part.

2. *Cicer montanum Lanuginosum.* The woolly mountaine Cicer.

The woolly mountaine *Cicer* hath upright round stalkes a foote high, and soft or woolly, branching forth into small leaves set thereon stand winged leaves, tenne or twelve on a side of the middle ribbe, with an odde one at the end: each leafelet is soft or woolly and long like unto the Vetches, some broader and narrower then others: from the wings of the branches stand a spike of rough pale coloured flowers, and the cods that follow are somewhat hard and woolly, with a crooked thread at the end of them, and have small blackish seede in them.

3. *Cicer montanum sine caule.* Another mountaine Cicer without stalke.

This third mountaine *Cicer* hath a root growing deepe in the rocky ground where it groweth hinder it not, from whence many hairy foot stalkes of leaves which are set, at some what more on a side, somewhat thicke together, longer then those of the Garden *Cicer*, the edges of them being hairy, some of them being equally, others unequally set, and another one at the ende: the flowers grow hard above the roote, being some what long and hairy, whereof come swollen cods, having two partitions, full of small yellow seede like unto those of the Garden *Cicer* in a Kidney fashion.

4. *Cicer Alpinum.* Mountaine Cicke Pease.

This hath a long roote parted below hath the leaves on the stalkes like the true *Cicer*, but rounder and denseder set together: are hoary with and the cods smaller then of the former, being some what hairy and groweth on mount Baldus.

5. *Cicer sylvestre tripbyllum.* Three leafed wild *Cicer*.

The three leaved wilde *Cicer* hath stalkes about two foote high divided into some branches spreading abroad, set at the joynts with foot stalkes one above another leaves divided into three parts like the wild Trefoile or Cicer vetch, thicker and rounder then those of the Garden *Cicer*, a little dented also about the edges: flowers grow two or three together from a long foot stalke at the joynts with the leaves, which are like the Garden *Cicer* flowers but larger: the cods that follow are small like unto the Garden kinde, but some what flat: wherein some small leaves at the bottome of them, within which lye much smaller seede and more flat, and of the shape of Cow-wheate.

6. *Cicer sylvestre alterum tripbyllum.* Another three leafed wilde *Cicer*.

The other wild *Cicer* hath a thicke long branched roote, blackish without and white within: the stalkes are full of branches with leaves like unto *Cicer*, but three alwayes set together and no more: the flowers are red and the cods are like unto the other wilde *Cicer* but hairy and spotted with red spots.

The Place and Time.

All these sorts grow upon hills and in the woods, and sometimes by the hedges in fields, and bring their fruit in *July, August* and *September*.

The Names.

The first is the *Cicer sylvestre* of *Matthiolus*, and so called by *Dodonæus, Lugdunensis* and others, being the *Cicer sylvestre herbariorum* of *Lobel*, and is also the sixth *Cicer sylvestre* of *Valerius Cordus*, and the *Cicer sylvestre minus Thalium* of *Lobel* and *Dalechampius*: the second and third are *Thalia* out of his *Pemptades*: the fourth is not mentioned by any before: the fift is the *Cicer sylvestre secundum Dalechampio* by *Lugdunensis* and called by others *Cicer sylvestre alterum*: the last is the *Cicer sylvestre secundum Dalechampio* by *Lugdunensis*.

The Vertues.

The wild *Cicers* are of much more powerfull then those of the Garden, by how much they exceed them in heate and dryness, perceived by their sharper and more bitter taste, whereby they doe the more effectually provoke urine, breake the stone, and all those other properties of cutting, opening, digesting and drying that are attributed to the former, and that both more speedily and more certainly: yet saith *Pliny* if they be too largely taken they loosen the belly and cause torments and breed wind.

Chap. XVII.

Orobus. The bitter Vetch.

Although the wild Vetches are properly in my judgement but three sorts which shall be declared in order, yet for that I have been willed I will adjoyne that small wild pulse for the manner sake that is called *Orobus* or *Ervum Cornucopiæ*.

1. *Orobus vulgaris.* The ordinary bitter Vetch.

The small pulse shooteth forth divers weake slender branches leaning to the ground, not rising up above a foote high, beset on all sides with many winged leaves, each whereof is very little, and no longer then round set one against another as the Tares, Vetches and divers other Pulses are, the flowers small and whitish (for I never saw any purple) standing singly every one by it selfe at the joynts with the leaves, after which come small round long pods no bigger then the ragge of a point, bunched out in three or foure places where the seede lyeth, which is almost full round small and of a pale colour: the roote is small and perishing every yeare.

2. *Orobus Creticus.* The better Vetch of Candy.

This *Orobus* in the manner of growing is altogether like the former, but whereas *Matthiolus* and others

1. *Orobus vulgaris herbariorum.* The ordinary bitter Vetch.

3. *Cicer Cordum. Cordus* Tares.

Original from UNIVERSITY OF MICHIGAN

some tume say it is lesser. I have alwayes found them to bee rather larger then lesser, yet there is so little difference betweene them that but for the names take of Cow I would make them both but one kind without diversitie of species.

4. *Cicer Orobeum.* Cornered *Orobus.*

Them would rather make this a *Cicer* than an *Orobus*, and indeede *Lobel* and *Pena* much doubted whether they should call it the kinde of *Dioscorides* his *Cicers*, although they were confident that it was *Plinie* his *Cicer* that was the sweetest and likest to *Orobus*: but I rather adde it to the kinds of *Orobus* from the forme of the seed most like to *Orobus* whose description is thus. It doth spring with a crooked or leaning hollow stalke halfe a yard high and full of joynts set with many leaves on both sides of a middle ribbe which are somewhat long like to those of the Lentill: at the joynts towards the toppe forth long foodstalkes with many flowers set orderly close together which after give long and small cods, pointed out and dented in betweene where the seedes lye, while as bigge as those of *Orobus* a little cornered and not so round, of a pale or yellowish colour and differing little from them but in the darke colour.

4. *Ervum sylvestre sive Catanance.*
Wilde grasse leated *Orobus.*

The wilde Pulse hath a stalke two foote high dividing it selfe into sundry branches, especially if it grow in any fatte soile, better unorderly with many long and narrowe like greene leaves smaller then divers grasses at the toppes of the stalke and branches grow pretty little Pease blossomd flowers of an orient shining Carnation colour, after which come small slender long and almost round cods, conteining within them divers hard blackish seede: the roote is long and slender, with some fibres thereat, and perisheth every yeare as I gheesse by those that grew in my Garden from the seede sowen whereof some bore white flowers and then perished towards Winter.

4. *Ervum sylvestre sive Catanance.*
Wilde grasse leated *Orobus.*

The Place and Time.

The two first are onely nourished up in Gardens with us, the second being naturall of *Candy*: the third as *Lobel* affirmes with wild in *Narbone* and *Provence* in *France*: the last is usually growing in the fields about the hedges as you goe towards *High-gate*, *Pancras* Church, &c. and are all flowring and seeding in the end of Summer.

The Names.

The first called in Greeke ὄροβος ἀγρίος, *Orobus agrestis*, vide Ἐρέβινθος, *quod brevis ea fagopyrum* as *Galen* saith, in Latine *Ervum* and *Orobus* also: the first is called *Orobus sive Ervum* by *Matthiolus* (who saith it was but lately in his time made knowne in *Italy*) and by most other writers, onely *Dodonæus* calleth it *Cicer sativum* and *Matthiolus* as *Mizaldus* and yet in this *Orobus* but not *Cicer*. *Lobel* calleth it *Orobus sativus hortensium*, because he found not of these later times doth so call it not having found or knowne any other: the second is called *Ervum Creticum* by *Matthiolus*, as if it differed from the former, but is not so as I have shewed in the description. The third is called by *Lobel Cicer Orobeum Theophrasti*, & by *Bauhinus Orobus semine obtuse triangulo*. The fourth *Catanance* by *Gesner* in *horto*, by *Dodonæus* in his *French* Herball and *Lugdunensis*: but *Ervum sylvestre* by *Matthiolus* to his Latine *Pemptades* and *Ervum sylvestre herbariorum* by *Lobel*: but why *Bauhinus* should call *Lobels Sylvestris minor* I see no cause seeing it is not like any of the other nor hath no claspers as all the rest of this kinde he there expresseth have, and besides breaketh that order he had proposed to follow, namely to set all such Pulses as had claspers in the first place, and then those that had none, and yet this having none he placeth among those that have, because he would vary the title if he could by any meanes: It is called by the *Spaniards Yeros* or *Kezoles*, by the *Italians Ervo*, by the *Spaniards Ieros*, by the *French Gesse* and wee in some places call it the Tares Vetch, for *Pliny* confounds this with *Vicia* the Vetch, and from the quality of bitternesse which the ancients say is in it, although ours have little that can be perceived: or *Orobus* after the Latine name.

The Vertues.

They are dry in the second degree and hot in the first, and by the bitternesse cutteth cleanseth and openeth obstructions, and was called in *Galens* time as hee saith to be steeped like Lupines (and that was to take out the bitternesse before they were eaten by men or given to their beasts, and that but in a dearth and great necessitie, for they are not onely very unpleasant to the taste but be of bad nourishment. Wee use saith *Galen* the *Orobus* with Honey as a medicine to cleanse the breast and Lungs of thicke humors that offend them, the manner of whose preparation of the meale thereof was in this manner: being steeped in water a good while they after parched them untill the rindes broke which then being ground and passed through a boulter they keepe to make a pap of great use, both to move the belly downewards and to provoke urine, and to cause them that be of a good colour, yet if it be too largely taken it causeth headach and paines in the belly, and causeth

Original from UNIVERSITY OF MICHIGAN

bloody urines. *Pliny* saith it is recorded in the Emperour *Augustus* Edicts that he was cured by [illegible] griefe it is probable was tough flegme condentate in the lungs and hard to be avoyded are cast forth thereby. *Pliny* saith that good authors doe affirme that if any take *Orobus* falling every morning it will consume up Spleene: the meale hereof mingled with hony cleanseth foule ulcers, and taketh away the spots blacke and other discolourings of the face or other parts of the body: it suffereth no Cankers, Gangrenes or spreading sores to breede in the body: it enableth the hardnesse of the breath, and taken in the morning fasting as *Pliny* saith it helpeth the biting of serpents and mad dogges and men, and taken with vinegar it helpeth the quinsy, and that disease where one doth oft desire to goe to the stoole but can doe nothing, the bad corruption mixed with hony and taken helpeth those that relish not their meate, and are brokenly disposed, that are apt to fall into the fluxe: *Orobus* leaves or Coniumption: a creame made of the meale of them & the juyce of [illegible] that is troubled with an itch or scab it throughout the whole body, and made into a plaister with wine will heale Carbuncles if it be laid thereon: the greene cods stalkes and all before they grow hard, being bruised and juiced and applied to the skinne doth colour it blacke.

CHAP. XVIII.

Orobus Sylvaticus. Wood or wild *Orobus.*

NExt to the true *Orobus* I thinke good to joyne the wild or wood kinde for the names sake, although [illegible] hath expressed divers differences as he found them.

1. *Orobus Sylvaticus major purpureus.* The greater purple Wood *Orobus.*

This first kinde here growth not much above a foote high, bearing many [illegible] stalkes and (lying) all along: the leaves that are set one by another on each side of a middle rib being six, eight or ten in number are a great deale larger then any *Orobus* namely two or three inches long and [illegible] inch or two broad, with three veines or sinewes running through them: the flowers grow at the toppe standing together in fashion of a spike or bush being larger then those of the Vetch, and of a fairer purple colour, and when they begin to fade they will change their colour a little and become more pale, small low small long slender browne cods with small round seede within them yet sometimes they will be without. Then round and variably coloured: the roote is long blacke and hard, bunching forth in some places with [illegible] small long strings and fibres fastned thereunto, and liveth many yeares.

2. *Orobus Sylvaticus minor flore albo.* The annuall white wild or wood *Orobus.*

The other wood *Orobus* hath divers straight and straked stalkes a cubit high bearing (stalkes of leaves set

1. *Orobus Sylvaticus major purpureus.*
The greater purple Wood *Orobus.*

above another but not oppoite, each stalke having foure and [illegible] foure leaves on them readeable large and pointed at the end with veines running in them: the flowers grow at the toppe from the uppermost joynts, five or six standing together on a short stalke which looke all one way of a whitish colour: when they are past rise long slender cods like the former, with smooth but larger seede in them: the roote liveth not but perisheth after seede time.

3. *Orobus Sylvaticus angustifolius.*
Narrow leafed Wood *Orobus.*

This narrow leafed hath slender but straight crested stalkes a foote high, the leaves stand foure on a stalke by couples and are long and narrow: the flowers grow above on long stalkes many together of a pure white colour: the cods that follow are long and blacke with [illegible] large blacke seede in them: the roote consisteth of five or six long slender tuberous clogge like [illegible] of the *Aphodill* of *Pena* but smaller, blackish on the outside and white within.

4. *Orobus Sylvaticus Fourth.*
The *Fourth* wood *Orobus.*

This *Fourth Orobus* is very like unto the first Wood *Orobus* here described growing in height and foure of leaves thereunto, not having any end leafe on the stalke but of a paler greene colour: the flowers are small and purple like unto them also: the cods are reddish, long and full with round whitish seede in them: the roote is [illegible] and woodly with many fibres that eate and endureth. There is another of this whole stalkes and leaves are paler and the flowers wholly white nor differing else.

5. *Orobus Alpinus latifolius.*
Mountaine Wood *Orobus.*

This also is very like unto the first here, but the leaves are broader and have their end not so sharpe, the flowers being downe and are an inch long, of a pale yellowish colour, the uppermost being somewhat reddish.

Original from UNIVERSITY OF MICHIGAN

Orobus sylvaticus angustifolius.
Narrow leaved Wood Orobus.

Orobus Pannonicus Clusij.
The Pannonian Wood Orobus.

The Place and Time.

The three first sorts grow as *Clusius* saith in *Hungary*, *Austria* and the parts neare thereunto: onely the fourth is sent unto *Clusius* as he saith from *Venice*, the fift *Bauhinus* saith hee had from the *Pyrenean* and *Helvetian* hills: they all flower in *April* or *May* and their seede is ripe in *June*.

The Names.

All these sorts are referred to the *Orobus*, both from their manner of growing and some of the seed being found, and therefore *Clusius* called them *Orobus Pannonicus*, and *Bauhinus Orobus sylvaticus*, which I have followed. The first is the first *Orobus Pannonicus* of *Clusius*, which *Thalius* calleth *Orobus sylvestris vernus*, *Lobel* as I take it ascribeth this by his *Phaselus*, *Lugdunensis* calleth it *Phaselus sylvarum*, as is before said, *Dodonaus* reacheth unto it, and *Columna Astragalus*: the second is the fourth of *Clusius* which hee saith may well bee referred to some kind of *Phaselus*, or else some kind of Vetch: the third is *Clusius* his third sort of *Orobus*: the fourth is his *Orobus Venetus*. I doe verily trouble that the fifth which is *Bauhinus* his *Orobus Alpinus latifolius*, and *Lugdunensis* his *Phaselus montanus* be all one, the colour of the flowers in each being like, and the rest agreeing or not farre disagreeing, each to other.

The Vertues.

Clusius made no mention that he heard of any properne did belong unto any of these Pulses among the people where they grew, but were wholly neglected, yet *Lugdunensis* saith of his *Galega montana* that it is esteemed available against poysons and the Plague no lesse then the other *Galega*, and that it was good also against Worms to bee eaten, and would kill the Wormes.

Chap. XIII.

Onobrychis. Cockes-head.

Upon this title of *Onobrychis* are referred divers plants by many good authors, the most likely whereof I will comprehend in this Chapter.

1. *Onobrychis vulgaris.* The ordinary Cockes-head.

The ordinary Cockes-head hath divers weake but rough stalkes leaning downewards halfe a yard long, set with winged leaves, each being longer and more pointed then those of Lentils and whitish underneath, from the toppes of these stalkes rise up other slender stalkes naked without leaves unto the toppes, where they grow many small flowers in manner of a spike, of a pale reddish colour with some blewnesse among them, after which rise up in their places, round, rough and somewhat flat heads: the root is tough & somewhat wooddy.

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

Minor. yet liveth and shooteth a new every yeare. Of this sort *Bauhinus* setteth forth a leafe differing but little from the former, but in the smallnesse thereof.

2. *Orobrychis spicata flore purpureo.* Spiked Cockes-head with purple flowers.

This Cockes-head hath such like weake stalkes lying or leaning to the ground, whereon grow winged leaves very like the former, but hairy or hoary: from the joynts rise other branches with the like leaves on them: and above them rise up the flowers in a longer spike or tuft at the toppe of a naked stalke, like in some sort unto the *Colutea*, but of an excellent shining purple colour, with many small leaves set among them, which turne into flat, broad and hard heads parted in the middle: the roote liveth as the former.

3. *Orobrychis flosculis caruleis.* Blew flowred Cockes-head.

This third Cockes-head riseth somewhat higher than the former, the leaves are smaller and thicker set and more red: the flowers are fewer, and of a pale blew, and in some of a blew with purple colour, and brown withall: slender long cods fashioned like unto those of *Medica*.

4. *Orobrychis folijs Vicia longioribus.* Cockes-head with long Tetch leaves.

This Fetchling hath longer and narrower leaves somewhat woolly or hoary, and more store set on either side of the middle ribbe: the flowers stand in a large spiked head, being more long than others, and somewhat resembling the flowers of three leaved grasse, of a pale colour, with darke veines in them: the cods doe follow and are folded like the tail, but the seede which is blacke is cornered or square like Fenegreeke: the roote is woody and living.

5. *Orobrychis quæ in Clusij.* Mountaine Cockes-head.

This fifth sort hath likewise many winged leaves growing from the stalkes, but smaller than the rest, and the stalkes and leaves though greene, yet covered with an hoarinesse: the flowers grow at the tops of the stalkes as the others doe, but fewer in number, and of a purplish blew colour: the cods are long and fashioned like those of the tail: the roote is great, thicke and long.

6. *Orobrychis globoso capite.* Round headed Cocks-head.

This strange Cockes-head which *Clusius* saith, hee first saw in *Mr. Richel* Garden, Queene *Elizabeth* her apothecarie in his time, was very like the last, for the smallnesse and hoarinesse of stalkes and leaves, yet the stalkes were longer, tough and blackish, which lay bare on the ground before it had leaves, and then branched it selfe, shooting forth at the toppes short stalkes an inch long, bearing at the toppe a round head of many flowers set together, of a whitish colour, somewhat like unto those of *Tragacantha floribus*, after which followed small cods, not bigger than those of *Orobus*, containing one seede within like Fenugreeke.

7. *Orobrychis clypeata alpina minor.* The lesser buckler Fetchling.

The greater sort hereof is set forth in my former Booke, under the title of *Hedysarum clypeatum*. There also

1. *Orobrychis vulgaris.*
The ordinary Cockes-head.

2. *Orobrychis flore purpureo & spicato Clus.*
Spiked Cockes-head with purple flowers, and manifestly differing from

8. *Onobrychis floribus carneis.*
Flesh-flowred Cockes head.

9. *Onobrychis minima.*
The leaſt Cockes-head.

flowers but this leſſer groweth very low, not above an hand breadth high; the leaves likewiſe are ſmall and narrow, the flowers are ſmall, and of an excellent crimſon colour, the ſeede veſſells that follow are flat and rough, containing ſmall ſeede within them, the roote is thicke and threaddy.

8. *Onobrychis clypeata lævis.*
Small buckler Fetchling.

This ſmooth Fetchling riſeth up but with one ſtalke, or two at the moſt a foote high, ſet with joynts, where ſtand winged leaves, conſiſting of many ſmooth long leaves, and an odde one at the end: from the joynts of the leaves, ſpring up ſmall and long ſtalkes, whereon the flowers ſtand in a ſpike faſhion, of a blewiſh purple colour, and have afterwards flat and ſmooth huſkes buckler faſhion, three for the moſt part ſtanding one above another, with ſmall ſeede within them.

9. *Onobrychis minima.* The leaſt Cockes-head.

This ſmall plant, *Pona* ſaith he found on the hills of *Provence*, with a ſmall roote downeward, but thicke at the head, and a thicke barke, having many hairy ſtalkes, two or three inches long, with ſmall leaves on them like unto ſmalls of *Aſtragalus*, hoary, hard, and here towards the toppes, and many ſmall pale yellowiſh white flowers ſet together in a tuft of a dryving taſte, like Birds foote. *Lobel* in *Adverſaria* calleth it *Aſtragalus perſonatus palmatus minimus.*

The Place and Time.

The firſt growth under hedges, and ſometimes in the open fields, in divers places of our Land, but all the reſt are ſtrangers and kept in Gardens with us, by them onely that are curious contervers of rare plants: and flower from the end of *June* to the end of *Auguſt*, and the ſeede ripeneth in the meane time.

The Names.

The firſt generally taken now adayes by all thoſe that are judicious Herbariſts to be the *Onobrychis* of *Dioſcorides* and *Caput gallinaceum* in Latine: the firſt is called *Onobrychis* by *Dodonæus*, *Cluſius*, *Taberna*, and many others, *Caput gallinaceum* it is called of *Cæſalpinus*, *Crista ſive Onobrychis*, *Lobel Caput gallinaceum Belgarum*, *Legumineſis* ſaith it was called *Polygonifolia* many, the leſſer hereof is called by *Bauhinus* in *Prodromus Caput gallinaceum minus*: the ſecond here is the firſt *Onobrychis Pannonica* with *Cluſius*, which *Pona* in the deſcription of *Mount Baldus* calleth *Veſcer Aſtragalus*, the third is the ſecond with him: the fourth is his third: the fifth is his fourth *Onobrychis*, and the firſt his fifth *Onobrychis*, as I ſaid before. The leſſer ſort of that *Hedyſarum clypeatum* of *Lobel*, that I have ſet forth in my former Booke, being generally ſo called now adayes with moſt; and which *Dodonæus* calleth *Onobrychis altera*, and *Cornuta*, *Serratula clypeata*, but *Bauhinus* calleth it *Onobrychis clypeata aſperis minor*, as he doth the next. The ſecond is *Pona*'s: the laſt is called by *Lobel*, as I ſaid, *Aſtragalo planta perſonifera*. The *Italians* call it *Pane ſanto*, *Herba*: the *Provens Saint foin*: and we in *English* Cockes-head or Medicke Fetchling.

The Vertues.

Some hold opinion that it hath a power to rarefie and digeſt, and therefore the greene leaves bruiſed and laid as a plaiſter to ſtay ſome rodes, or kernells in the fleſh, and if when it is drie it be taken in wine, it helpeth the ſtone, the wearing accompanied with oyle it provoketh ſweate. *Dioſcorides* and *Pliny* ſaith, the ſame things, and that the leaves are not to be neglected: it is knowne generally to be a ſingular foode for cattle to cauſe them to give much milke.

Chap.

CHAP. XX.

Astragalus. The milke Vetch.

THE knowledge of the true *Astragalus* hath troubled most of our moderne Writers, insomuch them having set forth divers plants for it, which others have mislisted, and therefore in such a confusion it is hard to determine of any certaintie, yet the most likely I will endeavour to set you here.

1. *Astragalus Hispanicus Clusij.* The *Spanish* milke Vetch of *Clusius.*

This *Spanish* plant hath sundry stalkes afoote high, of the bignesse of ones little finger being five cornered or crested all the length of them, hard, somewhat reddish, and hoary with all; the leaves are woolly or hoary many set oneach side of a middle ribbe, of an ashie green colour at the first, and afterwards not: the flowers stand at the tops of long foote stalkes that shoot out from the joynts, and grow into very long spikes of large flowers, each as large as of the Beane or *Lupine*, wholly, of a white colour when they are blowen open, but of a brownish yellow being in the bud ere they are past, there follow full swollen long cods, of two inches and a halfe long, and one thicke like unto those of the wilde Peafe, which being shaken when they are dry, the round seede in them will make a noise, and being tasted doe inflame the mouth and tongue mightily: the roote for the smallnesse of the plant is very great, about the length of ones hand, of the thickne of ones arme, and three branching forth into sundry other smaller ones, rugged and blacke on the out side, and whitish within and not wooddy, which when it is dryed is harder than an horne.

2. *Astragalus marinus Boetici.* The Sea *Spanish* milke Vetch.

This Sea *Spanish* milke Vetch (which *Boetius* brought me, with very many other things at my being in *Spaine*) groweth stalked upright, and sometimes leaning downe with one or two round reddish stalkes, a little hoary, set with sundry winged leaves on both sides of the stalkes, one above another, consisting of some six or seven small fresh greene leaves, fome what like to those of the lesser Sicklewort, from between the stalke & the leafe, and at the tops of them also come forth branches of the like leaves in some places, and at others many small one coloured flowers, which turne into so many three square cleare skinned whitish cods, the inner edge being thinner, and a little bowing, the other two forming, as it were a backe, dividing it selfe into two parts, with divers small hard yellowish seede within them, almost like Fenugreeke seede: the roote is small, long, and divided, perishing yearely with us. I had from *Boetius*, above named, another sort hereof which he named *Astragalus marinus Boetici luteus*, but what other chiefe difference it had from the other, but the leaning to the ground-ward, I know not, for the plant dying with me that rose from the seede, I could not so exactly observe the varietie, and since then could never get of the same seede againe.

Astra. lapsus.

1. *Astragalus Hispanicus Clusij.*
The Spanish milke Vetch of *Clusius.*

2. *Astragalus marinus Boetici.*
Spanish Sea milke Vetch.

3. *Astragalus spinosus.*
Mike Vetch of Syria.

4. *Astragalus Alpinus.*
Mountaine Milke Vetch.

5. *Astragalus Hispanicus, Clusij magno flore.*
Great flowred Spanish Milke Vetch.

6. *Astragalus*

7. *Astragalus purpureo-ochraceus.* The purple-ochreous Milke Vetch.

8. *Astragaloides herbarum.*
Base Milke Vetch.

9. *Astragaloides Germanica.*
German base Milke Vetch.

6. *Astragalus purpureus montanus Hispanicus.*
Purple Spanish Milke Vetch.

The *Spaniards*, saith *Clusius*, yield another plant to be *Astragalus* which answered thereto in the fashion, but differing in the colour of the roote. It had many fibrous hard hoarie stalkes growing neere the ground, with many winged leaves like unto Cicers or Lentils, all hoary moreover, and of an astringent taste: the flowers are small, growing in thicke tufted heads, of a blewish purple colours the roote, saith *Clusius* is usually but single, and no way agreeing with the roote of *Astragalus*.

7. *Astragalus purpureus montanus.*
The purple mountaine milke Vetch.

This milke Vetch hath a great long woody roote, with some fibres set thereat, blackish without and white within, from whence ride many hard stalkes, some lying as it were upon the ground, and others standing upright about halfe a foote high the winged leaves that grow thereon are many, small and hoary, still keeping an equall number, upon every foote stalke, somewhat resembling the *Astragalus Syriacus* but longer, the stalkes are naked or bare of leaves from the middle upward, having a few, that under the tuft of flowers at the toppes are round, and are like unto other Pulses, of an excellent purple colour, and the seede follow in small cods: it flowreth in *May* and *June* on the high hills of *Sevena*, but most plentifully neere a small towne called *Vilmes* in the grove of wood next unto it, *in herbidis*, and the hills neere it thereto about *Mompelier*: it is utterly without any sharpe taste, and but onely a little saltish that can be felt.

8. *Astragaloides herbarum.* Base milke Vetch.

The base milke Vetch riseth up with sundry upright hard erected stalkes, a yard high set on all sides with winged leaves foure or five couple against the middle ribbe, with an odde one at the end, of a very fair greene colour, no bigger than those of the Lentills: the flowers stand at the toppes of the stalkes and branches many set together which are small and of a dead purplish colour turning warme with standing, and change into small blackish cods almost round: but pointed within, which are foure or five small blackish seedes: the roote groweth crooked and thicke at the head, rough and woodily, discending deepe, and abiding many yeares, but all the stalkes perish every yeare, fresh rising in the Spring.

9. *Astragaloides, Helvetica. Germanæ* base milke Vetch.

The slender stalkes of this plant that beare many Peasе blossom'd flowers, at the toppes of them are not above three inches high without any leaves upon them, the leaves themselves standing singly upon long slender stalkes, being somewhat long, broad, and round pointed: as the figure doth plainely delineate forth.

The Place and Time.

None of these grow wilde in our Land, that ever I could understand, but are nursed up with double care as rare lovers of rare plants: they flower in *July*, and their seede is ripe in *August* or *September*.

The Names.

It is called [illegible] in Greeke, and *Astragalus* in Latine: the first is called by *Clusius Astragalus Belgicus* and by *Lobel* and others *Astragalus Lusitanicus Clusij*, by *Belius* that sent it out [illegible] his first figure *Phaseoli montani genus*, as *Clusius* in his *Stirpes* under it thinketh, which I can no [illegible] having seene either of them (if they be divers as I thinke they be) growing: for *Belius* there reporteth that the roote was flat like unto a Kidney Beane, and that the Mattrices did este them while they were greene: but *Clusius* of his that the cods are long, and the seede round within them, burning and enflaming the mouth, for which cause it is probable that *Dioscorides Lesbiacus* called it *Apocynum*: & the *Spanish* or *Arramonian* [illegible] so that these controversies doe rather argue them to be divers plants: the second was brought me out of *Switzerland* by the name expressed in the title, but came to us also from *Leyden* by the name of *Astragalus* & [illegible] *Basil*, by the name expressed in the title, but came to us also from *Leyden* by the name of *Astragalus* & [illegible] gathered it: & is also very likely to be the plant that *Bauhinus* in his *Prodromus* calleth *Vicia* [illegible]

Original from UNIVERSITY OF MICHIGAN

...ed it is also very likely to be the plant, that *Bauhinus* in his *Prodromus* calleth *Glaux Lysimachia affinis* ...tion from *Veronica*, *Clus.* who called it *Veronica Austriaca*, as by comparing may be seen. And likewise whether I think is the *Lysimachia Aphylla* of *Columna*; the third is called by *Lobel* *Astragalus Dioscoridis*, and ...ther of *Anguillara* and *Cæsalpinus*, and very probable also is the *Astragalus Theophrasti* that *Ruellius* ...ed, as it is set forth by *Lugdunensis*, and is as he saith called *Cicer sylvestre* by the *Grecians*: the fourth, ...second *Astragalus* of *Clusius* and called also *Alpinus*, which *Bauhinus* calleth *Cicer Astragaloides*. *Bauhinus* also ...ith the *Polygala* of *Camerarius* in his Epitome, but surely his figure doth truly expresse the *Glaux* ...there taken by *Bauhinus* to be the *Ambrosia elegantissima* of *Lugdunensis*, and calleth it *Astragalus Alpinus* ...for sooth *Clusius* there saith the first is the third *Astragalus* of *Clusius*, which name as we said called *Ombrosa*, ...in many, and grew for a specimen with him in the Low countries from *Bononia*, with the *Astragalus* ...*Neapolitanus* (which we shall call *Hedysarum minus*) but perished before he got out of the country, and therefore ...before *Clusius* his judgement herein I could not be the surer, although I am wholly like as *Bauhinus* thinketh, ...as the *Astragalus purpureus* of *Lugdunensis* is *Bauhinus* also thought, for that is my seventh here set downe, ...last the *Spanish* called it *Tragacantha Cauda Leonis*: the eight is the second *Cicer Pannonicum* of *Clusius* ...called by *Bauhinus Astragaloides*, and by *Lobel* *Astragaloides altera herbarorum*, but *Bauhinus* not only maketh ...it not *Cicer*, but calleth it also *Polygala minor Matthioli*, and besides referreth it to the *Polygala* of *Matthiolus*, ...which is formerly last and called *Astragalus*, as also to the *Polygala Valentina Clusii*, but surely *Clusius* would ...not so easily *Bauhinus* thereth himself in many places) to call one herbe both *Polygala* and *Orobus*, the ...which name was not mentioned by any before: the sixth *Lobelius* called as it is the title cleer. *Bauhinus* maketh it to bee like ...*Cicer Pannonicum* and calleth it *Cicer equinum Gallice effusum*.

The Vertues.

The true *Astragalus* is as *Dioscorides* and *Galen* say astringent, and that the roote taken in wine stayeth the laske ...and also provoketh urine, it dryeth and closeth up old Ulcers if the powder bee strewed or cast upon them, it ...soldereth by incarnating. *Pliny* adderh that it is very profitably laid against the fistulous of the gummes. But ...*Matthiolus* saith that the *Portugalls* doe familiarly use the sixt sort here set forth, being first dryed in an Oven and ...then beaten to powder to cast it into Wounds and Ulcers.

Chap. XXI.

Hedysarum five Securidaca. Hatchet Vetch.

The ancient writers exhibited but one sort hereof which is the greater, our later have added divers more ...as shall be declared: that which is usually called *Hedysarum elypeatum* I have described in my former ...Booke, yet I thought good to give you the figure of it here.

1. *Hedysarum maius five Securidaca vera major.* The greater Hatchet Vetch.

The true Hatchet Vetch (which is the truest the rest being but supposed from the likenesse) groweth not s-

Hedysarum vesicarium magnum.
Great Hatchet Vetch.

1. *Hedysarum maius five Securidaca major vera.*
The greater Hatchet Vetch or Sicklewort.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

bove a foote high, with divers winged leaves growing on the ſtalkes, which are weake and not ſtanding upright, each of the leaves is ſmall not very long and round at the end, at the coppe ſtand many ſmall yellow flowers (*Matthiolus* ſaith reddiſh but I thinke he was therein miſtaken as he was alſo in the pode to ſay the ends were blunt) which turne into ſo many long flat thin cods and reddiſh, with a ſmall crooked point: the ſeede is flat and reddiſh within them, ſo lying in them that they may be diſcerned in the cod where they lye, but not like an Hatchet as many have ſet it downe, thinking it therein to agree with *Dioſcorides* his deſcription, for he doth compare the whole cod and not the ſeede therein: the roote is ſmall and periſheth yearely.

2. *Hedyſarum minus ſive Securidaca minor.*

The leſſer Hatcher Vetch or Sickle-wort.

The leſſer Hatcher Vetch is like unto the former but ſomewhat leſſer, yet not much lower if it grow in any good ground, the flowers grow many together of a pale yellow colour, and after them come ſmall crooked cods bowed as it were plaine together, wherein lie pale browne ſeedes not fully round but ſquare and leſſer, the roote hereof likewiſe periſheth yearely withus.

3. *Securidaca major articulata.*

The greater joynted Hatchet Vetch.

This Plant groweth greater and higher then the two former, and ſo are the winged leaves more in number and ſomewhat larger: from the joynts riſe long ſtalkes with a great many flowers at the toppes of them, ſmelling ſomewhat ſtrongly of pale and white mixed together, after which follow long round and not flat cods, a little hooked with divers joynts and wrie, or bunched places like the true *Orobus*, wherein lye red ſeede ſomewhat long: the raine cod is not broad and periſheth not.

4. *Securidaca articulata minor.* The leſſer joynted Hatchet Vetch.

This leſſer is like the former, but lower and leſſer in ſtalkes, and fewer alſo in leaves upon the middle ſtalke: the flowers alſo are ſmaller, but as many or more growing together at the toppes of the ſtalkes: the riſe from the joynts of the leaves and are of a pale red or bluſh colour, in their places grow ſmall round heads with croſſed toppes much reſembling a Billhooke, ſuch as labouring countrey men doe uſe to cut their hedges withall, wherein lyeth but one ſeede as having but one bunch: the roote is hard and woody ſpreading under ground and endureth long.

5. *Securidaca peregrina Cluſii.* Strange Hatcher Vetch.

This ſtranger groweth lower then any of the former being not a foote high with divers winged ſmall brownish leaves bearing ſome ſuch like leaves on them but ſmaller, and at the toppe tender ſmall whitiſh flowers, and after them long broad thin and flat cods waved in on both edges, wherein lye divers flat browne ſeedes: the roote is ſmall and ſtringy periſhing yearely.

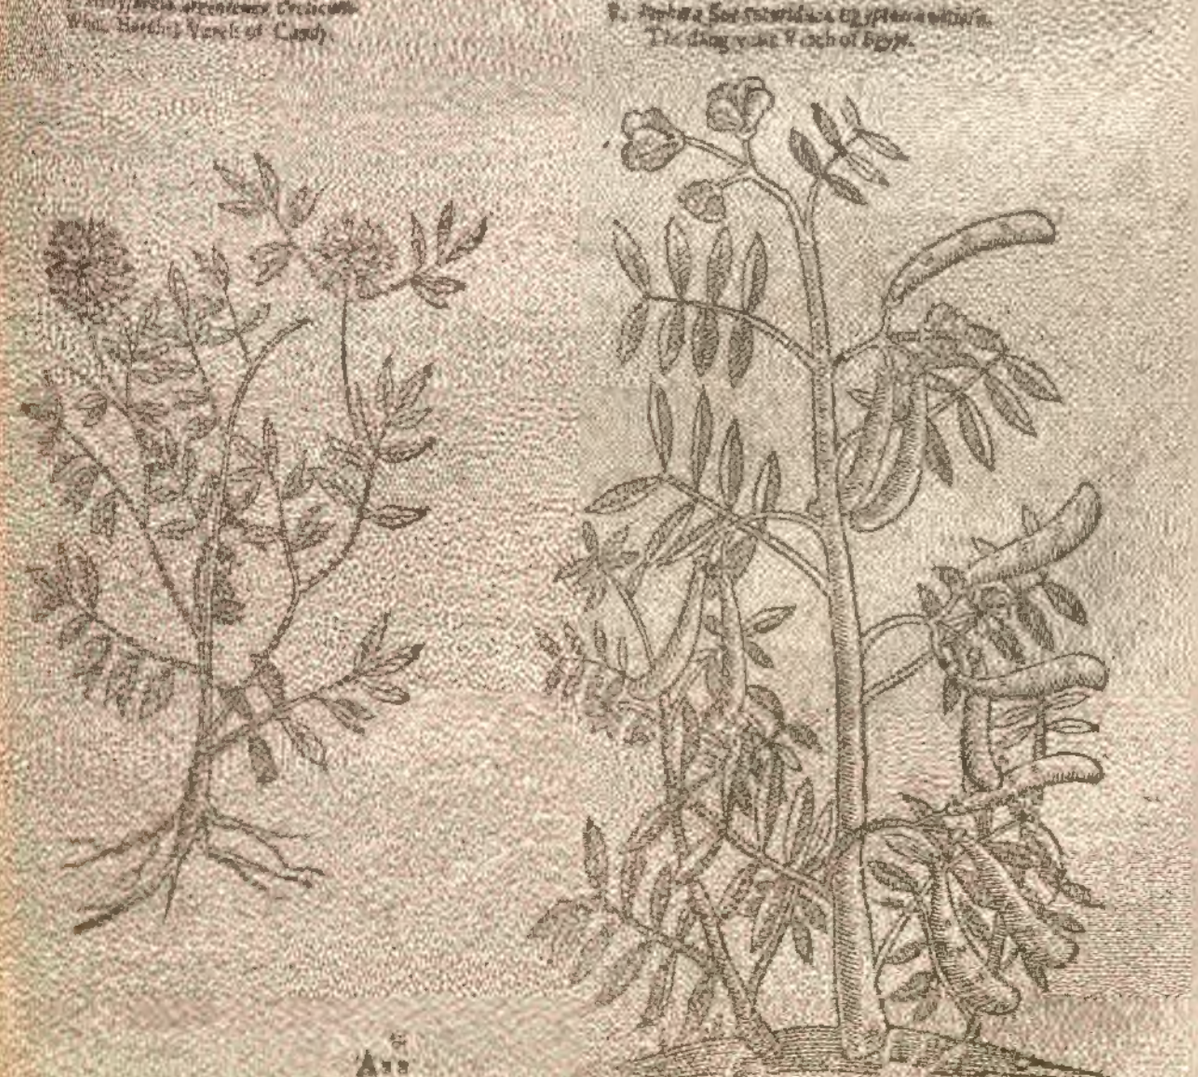
6. *Securidaca minima.* The leaſt Hatchet Vetch.

This leaſt ſort hath ſtalkes a foote long ſpread on the ground, having divers leaves ſet on a ſtalke, but not as hath alwayes three ſtanding together. It hath many flowers on a ſtalke: the ſeede is reddiſh and inclined, lying in very ſmall hooked pleated cods ſtriped overthwart, this groweth by *Mompelier*.

7. *Hedyſarum argenteum Creticum.* White Hatchet Vetch of Candy.

This *Candian* riſeth up with a ſlender ſtalke, branching forth on all ſides and winged ſtalkes of leaves thereon ſomewhat like unto thoſe of the Cicher Peaſe: the flowers grow at the toppes many on a ſtalke of a roundiſh faſhion, neere reſembling thoſe of the meadow Trefoile, of a white ſilver like colour of a reaſonable good ſmell: the flowers are paſſed there ſucceed in their places ſmall ſlender cods, wherein are contained the ſeede which is ſmall and round: the roote conſiſteth of many ſtringes and fibres which abideth many yeeres and holding green leaves all the Winter.

8. *Sophera ſive Ægyptiaca vitioſa.* The dangerous Hatchet Vetch of Egypt.



Honorius Bellus in his fourth Epiſtle to *Cluſius* which is ſet at the end of his *Rariorum plantarum hiſtoria*, and *Proſper Alpinus* hath erred in ſetting forth the Figure of this plant (which yet in want of a better I have done to ſhew the leaves on every ſtalke are even without any odde one at the end, and that the pods do grow upright and not hang downe): It is (ſaith he) a goodly ſhrubby plant, riſing two or three cubits high, ſpreading ſundry branches of winged leaves ſet one againſt another, and cloſing themſelves every night, opening with every riſing of the Sunne: the flowers are yellow and the pods long and ſlender ſtanding upright and of a fingers length: the roote is woodily, divers wayes diſperſed under ground but abideth with greene leaves all the Winter, and abounding with the flowers thereon.

One very like hereunto we have received from *Virginia*, by the name of *Lentils of Virginia*, but that the leafe at every joynt with the leaves a ſmall harmeleſſe pricke, which quickly falleth away from the lower and elder parts, abiding onely a while on the upper and more tender ſtalkes.

9. *Aeſchan ſive Securidaca Ægyptiaca articulata.* Hatchet Vetch of Egypt with long ſquared cods.

This kinde of Pulſe groweth ſomewhat like a ſhrubbe in the hotter countries, with ſundry hard knottie ſtalkes

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

2. *Trifolium roseum erectum, flore violaceo.* Erect Rose Trefoile, of a gray ash colour, long jointed cods.

2. *Hedysarum triphyllum Americanum.* American Trefoile Hatchet Vetch.

slender stalkes, and many long stalkes of winged leaves like unto a *Securidaca*, yet each of them somewhat lesser and narrower: the flowers come forth from the bottome of the stalkes and leaves many standing together in a long spike of a deepe yellow colour, and succeeded by long jointed cods, containing many kidney-like seedes therein: the roote spreadeth well under ground, and abideth many yeares. This is that Plant which *Garcias* compared his *Anil* unto, or rather was mistaken, the title *Anil* being imposed for *Nil* as a true aliment, by sight of the true seede of *Anil* received from the *East Indies* to like unto Fenugreeke seede: and the growing thereof is like unto this *Scythe* with many winged leaves, compared by *Garcias* unto those to *Vetches*, or to those of *Sesaby*. Mr. *Finch*, as it is before set downe where I spake of *Sesaby*, affirmeth *Anil* to be *Arabian*, this seeme either a *species* of that *Nil Anil* or *Indico*, or that a *species* of this.

2. *Hedysarum triphyllum Americanum.* *American* Trefoile Hatchet Vetch.

This kinde of Vetch groweth higher in shadowy theets in sunny places, with many stalkes a foote or more and leaves set thereon three usually at a place, which are larger then those of *Trifolium luteum odoratum* of a dusky greene colour: at the toppes stand the flowers in a long spike, like, but much larger then the ordinary Hatchet Vetch, whose uppermost leaves are much redder then the edges and ridges which are pale: after which come rough crooked pods with reddish veines both above and below, set as it were with kidneys containing smooth seedes within like those of Broome: the roote is a bush of blackish threads or fibres, the seede sent to mee dried, and it yeelds it selfe every Winter rising new in the Spring: the vertues of the greene herbe not fully perceived as yet, but the dried is in the first degree as it is in the dry, having a little astringent clearing facultie: of an ounce of the dryed leaves boyled in a purging decoction is further hable to purge, cleansing not only the stomach and whitish humors to be avoided, but those that are tough and clammy more then the *Trifolium* doth, much helpe, like unto digesting cold humors.

The Place and Time.

None of these doe grow naturally but onely in curious Gardens with us, yet the third may be well enough to be set in some sunny corner where their running rootes may doe no injury to other herbes: they flower in *July* and *August*.

The Names.

It is called in Greeke ὑδύσαρον, *Hedysarum*, and *minimus pelecinum* as *Dioscorides* saith, and in Latin *Securidaca* for *minor*, or *Securidaca minor* as I said from thence the name role, *Turnebus* thinketh it should rather be *Securidaca silua*. The first is generally of all writers held to be the true *Hedysarum* of *Dioscorides*, for more I know not, and *Clusius* saith that hee saw Hatchets at *Madrill* in *Spaine* made after the fashion of these cods, that is, thick in the middle where the handle was put in, and thin at both edges: the second also is *Hedysarum minus*, or *Securidaca minor*, yet *Clusius* as I shewed you in the former Chapter giveth the Hatchet to

as we, and calleth it *Hippocrepis minor*: the third *Clusius* referreth to the greater kind, yet differing in the bignesse of the cods, and because it is greater then the fourth I have given it the title of greater, it somewhat resembleth the greater *Ornithopodium* of *Dodonæus*, *Lonicerus* calleth it *Hedysarum Scorpioides*, and as *Ruellius* thinketh it is not much unlike the *Lotus coronopodia* of *Theophrastus*: the fourth *Clusius* saith hee had from Dr. Power, Physition of late *London* Colledge, who gathered it neare unto *Genoa* and imparted it to him, thinking it to be the true *Hedysarum* of *Dioscorides*. *Ruellius* nameth it *Securidaca dumetorum minor publicè crudelis*, when as the flower is plaine and not blew: the fift *Clusius* set forth having received it from *Cortusius* by the name of *Scorpioides insularis*, *Hedysarum peregrinum* which last title hee kept as fitteth, and I have retained the same in his description, for if in my former dayes I had thought to have published the fruits of my Garden, I had then beene more curious to have taken the descriptions of a number of Plants, which have perished since and now I want: the first is called *Hedysarum montanum* by *Lugdunensis*: the seventh is mentioned by *Alpinus* de *Exoticis*: the eighth and ninth by him *lib. de plantis Ægypti*: the last is mentioned by *Lonicerus* under his *Cnaden* plants by the name here expressed, onely the eighth and ninth I have rather referred to the *Securidacas* then to the *Coronopus* as *Ruellius* doth, although I acknowledge that not they onely but divers others doubt here to do same; and entituled *Hedysarum* or *Scorpioides* have little conformitie in their pod or seede unto *Scorpium* or Bucket but more unto a Vetch. It is called in *English* Hatchet Vetch, Axe seede and Axe wort.

The Vertues.

All the sorts of *Hedysarum* especially the seedes are bitter, and thereby as *Dioscorides* saith of the true or first sort, that it is profitable to the stomacke, and is put into those medicines that expell poyson or venome, and purge the obstructions of the intralls and so doe the leaves and stalkes of the greene herbe. *Matthiolus* saith the seede of both sorts helpe the biting of venemous creatures, and that they helpe to expectorate both rough and thicke flegme, being taken with a little honey or new wine, and openeth the obstructions of the Liver and Spleene being boyled and drunke, it killeth likewise the wormes in the belly if it be so eaten with some sweete lye, or in wine with a little Salt: on put thereon: the meale of them cleanseth foule Vlcers, and taketh away freckles, spots and like markes in the skinne. If the said meale bee made up into an ointment with the hell honey and often annointed. *Alpinus* saith that the seedes of *Sephen* or the eight were accounted poysonous to men and that the seede of the *Sesban* or ninth were used by the *Egyptians* to strengthen and dry up the over moisture of the stomach, also to binde any laske and womens immoderate courses: the *Egyptians* hee saith doe plant hedges round to defend their grounds.

Chap. XXII.

Ferrum equinum. Horse shoe Vetch.

There are a few small plants that some have referred to those in the foregoing Chapter but for their formes sake being different, I thought good to sever them and set them by themselves.

1. *Ferrum equinum majus.* The greater Horse shoe Vetch.

1. *Ferrum equinum majus.*
The greater Horse shoe Vetch.

The greater Horse shoe Vetch hath divers small winged leaves set on small weake stalkes not a span high, leaning or rather lying on the ground, each standing a little long and almost round at the end, and of a whitish greene colour: at the joynts with the leaves come forth flowers single, that is one at a place on every foot stalke, being small and yellow, after which followeth a long flat cod a little bowed but parted at the edge into foure, five or six divisions, each being turned, somewhat like the Letter C, or as it crooke the forme of a Horse shoe, wherein lye foure or five seedes, as there are parts betweene the cuts or divisions, which are small, somewhat long and crooked: the root is slender, three or foure inches long, white and set with divers fibres.

2. *Ferrum equinum minus.*
The smaller Horse shoe Vetch.

This is in all things like the former, but lesser by much, the stalkes being not above three or foure inches long lying also upon the ground, and is a little more tender.

3. *Ferrum equinum polyceratos.*
The manifolded Horse shoe Vetch.

This differeth in the growing from the last, which is but small, but hereon closely cuddleth the seede vessels each of them, that this beareth foure or five times as many cods also together upon a long stalke at the joynts, which are a little browner

4. *Ferrum equinum crassum.*
The broad leafed Horse shoe Vetch.

This broad leafed Horse shoe Vetch groweth as great as the

first both in stalkes and leaves, and full of branches from the toppes of the stalkes and branches onely, and not from the joynts with the leaves as to the former, some long naked stalkes almost halfe a foote long, bearing and hanging downe about their toppes a bush of flowers, of a yellowish greene at the first & of a deeper yellow colour after, with some greene veines in them after they are past there follow such crooked and mooned cods as the other, but not very deepely cut in, wherein lye seedes like the other. the roote hereof is somewhat blackish, but as hard and great as the first.

2. *Ferrum equinum Gallicum.*
The *French* Horse shoe Vetch.

This hath a small thorne blacke threddy roote and divers weake stalkes lying on the ground, with nine leaves usually set together on a foot stalke: the flowers are yellow many growing at the head, which give small seede in small crooked hornes.

The Place and Time.

The first and second are naturall to our owne Land, being often found upon dry heathie as beyond *Detford* and *Swanescombe* in *Kent* and sundry other places, the other three in *Italy, France*, &c. flowring in *June* and seeding in *July* and *August*.

The Names.

It hath no Greeke author to speake for it, but being of later invention it is generally called *Ferrum equinum*, agree the manner or forme of the cods, in *Italian Sferra cauallo*, and of the Chimicks there and in *Germany, Lunaria siliquosa*. *Matthiolus* calleth the first *Securidaca monspessulana* as well as *Ferrum equinum*. *Lobel* to forte tooke it to be a kinde of *Medica*. *Lugdunensis* calleth it *Solea equina* and *Tabernamontanus Hedysarum sive Ferrum equinum*: the second as a lesser sort thereof hath his name in his title, *Fabius Columna* calleth the third *Ferrum equinum polyceraton*, and the fourth *Ferrum equinum Cornu* or *Lapidosum*, which *Bauhinus* calleth *Germanicum siliquis in summitate*: the last *Bauhinus* calleth *Ferrum equinum Gallicum*, and as he saith is the *Lotus corniculata* of *Dalechampius*, differing but in the smallnesse from the *Germanicum* of *Lonicerius*.

The Vertues.

It is wholly bitter to the Hatcher Vetch is, and therefore somewhat partaketh of the properties thereof: it is also used by some in wound drinkes, and the juice thereof to make salves for wounds.

CHAP. XXIII.

Ornithopodium. Birdes foote.

Here are two or three sorts of small naturall Birdes foote, unto which I thinke it good to joyne some other small plants agreeing in vertues to the former: & now the manner of them in this Chapter together.

1. *Ornithopodium majus.* The greater Birdes foote.

This small herbe (although it bee greatly spoken of) groweth not above a spanne high, with many

2. *Ornithopodium minus.*
The lesser Birdes foote.

2. *Ornithopodium minus*, The leſſer Birds foote.

This is in all things like the former, but leſſe, growing with the branches and leaves in a more comely manner, and this maketh the difference.

3. *Ornithopodium nodoſa radice*. Knotted Birds foote.

This other groweth in all things like the firſt, but a little larger, the flowers are of a pale whitiſh red colour, and the cods diſtinct by ſoyntes as the other, but a little more crooked, and the roots doe carry many ſmall white knots of kernells among the fibres.

The Place and Time.

They grow on Heathes and open untilled places in many places of our Land; and flower and ſeede in the end of Summer.

The Names.

They have their names of *Ornithopodium Feſcue*, according to the forme of their ſmall cods, being like unto ſmall birds feete, as I ſaid before, and in that one groweth greater than the other, they are made two ſorts: the laſt *Lugdunenſis* calleth *Ornithopodium tuberoſum Dalechampij*, and ſome, as he ſaith, *Hermiria* from the Proverbe.

The Vertues.

The birds feete have a little drying and binding qualitie in them, and thereby good to be uſed in wound drinks, & alſo to apply outwardly for the ſame purpoſe; but the laſt, as *Lugdunenſis* ſaith, is found by daily experience to breake the ſtones in the backe or kidneyes, and drive them forth, if the decoction thereof be taken: and that it wonderfully helpeth the rupture, to be uſed both inwardly and outwardly to the place.

CHAP. XXIV.

Plantæ Leguminoſæ aliæ parvæ, Some other ſmall Pulſes.

There are yet a few other Pulſe-like Plants, which can not well be referred to any other kinde of plant, and therefore thinke fit to ſet them promiſcuouſly in a Chapter together, leaving every one to their owne judgements, into what *genus* they will referre them.

1. *Anthyllis leguminoſa vulgaris*. The ordinary Kidney Vetch.

This ſmall plant which groweth ſcarce a foote high, hath many leaves comming from the roote, that are ſomewhat ſmall and long, lobe pointed and ſappy, greene on the upperſide, and woolly underneath,

1. *Anthyllis leguminoſa vulgaris.*
The Ordinary Kidney Vetch.

2. *Anthyllis leguminoſa marina. Barba Jovis Anthyllis maris Cæſarienſis.*
Sea Kidney Vetch or Aſpalt or Cassy.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

4. 3. *Vermicularis leguminosa siliquata Cretica, & Telephium Hispanicum.*
Creeping Kidney Vetch of Candy, and the bladder Pease

5. *Securidaca Cretica.*
The Scarce coddled Pulse or Bird's foote.

not alwayes lie orderly one over against another, but confusedly, the greatest and longest being at the end: some have compared to Lentils leaves, but bigger (which comparison pleaseth me as little as the rule at Aungier among the leaves rise stalkes diuided into branches, with the like leaves on them, at the tops of three or four of many small yellowish pretty sweete flowers, and sometimes white or pale purple, which *Clusius* saith he received from *Lyonius Pena* out of *Provence* formed like those of the meddow Trefoile standing in white hairy huskes after the flowers are past come in their said huskes small round and a little flat seede, very like to the meddow Trefoile, but a little greater, and usually but one in a cod within that huske: the roote is blackish on the outside white within, parted sometimes into two or three, or more long parts.

3. *Anthyllis leguminosa marina Betica vel Cretica, sive Anthyllis minor Camerarij.*
Sea Kidney Vetch of *Spaine* or *Candy*.

Having well recollected this small plant, whose seed *Bauhine* brought one out of *Spaine* called it *Anthyllis minor Camerarij* called *Anthyllis minor Lobelij*, I find it necessary to agree to that which *Camerarius* called *Anthyllis minor foliorum forma*, that I deny it is the same: for the leaves are very like the former *Anthyllis*, both for the forme, like little leaves of woolly, and yellow flowers, within a flat round huske, a little pricke about the edges, with kidney like seede within them: the roote is small as it is likely, for it perished yearely with us.

4. *Anthyllis leguminosa vesicaria Hispanica.* Bladder Pease or Kidney Vetch of *Spaine*.

This small plant groweth low and leaning downe to the ground, with a few leaves set upon the stalke, like unto those of the former leaves, but usually of five, the lowest whereof are smaller than the rest, of a whitish green colour, and is somewhat hoary and round pointed, and a little hairie withall: on the stalkes upon the top and at the joynts with leaves come forth three or foure somewhat hairy stalkes, with small yellow flowers on them whilst flowers seede appearing, which being past, the seede growes in little bladders, which are round and swollen and seeme like bladders, wherein usually are contained two small round seede like those of the former, the roote is long, slender, and annuall: *Lobelius in suis* calleth it *Trifolium Hallerum*, but how improperly a *Lobelius Reader* knowes: in his Booke *De Plantis exoticis*, called it *Trifolium leguminosum*, but how improperly I had it: *Anthyllis Betica* &c.

5. *Securidaca falcata Cretica*, Crooked Kidney Vetch of *Candy*.

This Kidney Vetch of *Candy* hath sundry leaves spread upon the ground, every one standing upon a long pett or foot stalke of the last, from among which rise up the stalkes, beset at the joynts with leaves set by couples, bore two at a place, otherwhiles three, foure, or five, standing some places close together, resembling the leaves of Cinquefoile leafe, without any foote stalke to them; and some also will have the leaves separate on either side of the stalke, one above and against the other: the flowers stand three or foure together at the top of the stalke, of a yellow colour, like those of the horned Claver, after which come crooked cods of a skinny substance with

Glaux Hispanica Clusii.
Clusius his Spanish Milkewort.

Scorpioides leguminosa.
The Scorpion like Pulse.

within them: the roote consisteth of small strings and fibres: *Alpinus* calleth it *Trifolium falcatum*, but because I finde both this and the last better to agree in face with *Anthyllis*, have therefore put them together.

5. *Stella Leguminosa.* The Starre codded Pulse or Birds foote.

The Starre fashioned Pulse groweth also about halfe a foote high with upright stalkes, whereon are many winged leaves set, consisting of very small leaves like unto the Birds foote, from the joynts of the stalkes with the leaves come a tuft of small pale yellow flowers at the toppes of small prickly fading stalkes, which turne into five or six small, long, crooked, pointed cods, standing one against another, like unto a Starre, from whence take the name, but not joyned as the Birds foote, having within them small brownish seede, of the taste of other Pulse, but a little clammy withall: the roote is small and yellowish.

6. *Glaux Hispanica Clusii.* *Clusius* his *Spanish* Milkewort.

The Spanish Milkewort of *Clusius* riseth up with three or foure weake stalkes not a foote high, whereon grow many soft leaves, made of many small ones set together on both sides of a middle rib, like as doe the other Pulse-like herbes, of a greene colour above, and hoary white underneath, and a little bitter in taste: the stalkes are set towards the toppes, where they beare a short spike of flowers set close together, each rising out of a hoary huske, and are of pale blewish purple colour, after which come short round pods, with 4. or 5. small round seedes within them: the roote is small and threddy.

7. *Scorpioides Leguminosa.* The Scorpion like Pulse.

The last is a small Pulse with winged leaves like the last, but rounder: the flowers also are small and yellow, standing on long naked stalkes, one or two together, which turne into long and flat joynted cods, crooking in a manner like a crooked peake, somewhat like a Scorpions taile: some have taken it to be a *Securidaca*.

The Place and *Time.*

The last is found in many places in this Land, and so is the first, if I be not much deceived, the rather strangers, for all do reckon it in moist: they flower towards the end of Summer, and seede also.

The Names.

These Plants have not beene known to any of the ancient Greeke or Latine Authors that we know. The first is described by diverse of our moderne Writers: *Dodonæus* calleth it *Anthyllis prima*, and *Anthyllis Lobelii*; *Lobel*, *Cordus* and others *Anthyllis leguminosa*, by *Tabernamontanus*, *Lagopodium*, by *Thalius Arthritica*, by *Gesner* in *Turner*, *Vulneraria rustica* because his Country husbandmen called it *Kanckpoot* or *Kicks foot*, and those *at Berne Cunobeli*, and *Bauhinus Lotus affinis Cretica minor folio strigoso*: the second *Cornucopiæ*, by *Lobel* called *Securidaca minor*, and *Bock* that brought it out, as it is in the title, and to the title the third, *Lobel Cornucopiæ* as I said, although hee called it *Trifolium Halicacabum*, as *Alpinus* did *Trifolium stellatum*; the fourth another *Lobel*: the fourth is onely mentioned by *Alpinus*, *lib. de exoticis*, by the title of *Trifolium* which with the former I have rather thought fit to referre hither: the fift is called by *Lobel Scorpioides*, and *Bauhinus* thinketh the *Vicia Sefamoides* of *Columna*: but very much mistaken therein, as I have showed before in the Chapter of *Astragalus*: the first is called by *Clusius Glaux Hispanica*, and thinketh that it is called, same to neare that of *Dioscorides* as this: it is very likely to be the *Glaux maritima* of *Alpinus*, but called *Dodonæus* calleth it *Anthyllis altera lentifimilis*; *Bauhinus* maketh it to be the *Cicer sylvestre minus* *Dioscoridis* or very like it: the seventh is called by *Lobel Scorpioides leguminosa*; but both this and the *Stella leguminosa* are referred by *Bauhinus* to the *Ornithopodia*, calling them *Ornithopodio affines*: *Bauhinus* among the *Polygalas* doubteth whether *Angullara* his *Polygala* should not be the *Polygala Valentina prima Clusii*, which he saith hath leaves like Lentills, but larger, a yellow flower and seede in pods, which I thinke more likely to be this *Scorpioides* than any kinde of *Polygala*,

The Vertues.

The first is of much use among the *Germans* for their wounds and hurts, inward and outward, and in divers wayes apply them, whence came their name: *Thalius* also sheweth by his name imposed thereon, that it was used for the gout.

CHAP. XXV.

Fœnum Græcum, Fenugreeke.

THe ancient Writers made but one sort of Fenugreeke, the latter have added some others unto it, and although some have set them among the Trefoiles, whereunto they are somewhat like, yet because *Galen* and others say, that they were eaten as Lupines, and the *Egyptians* and others eat the seedes yet to this day as Pulse or meate, and that *Bauhinus* thereupon, as I guesse placed them among the Pulse, I am content to doe so likewise.

1. *Fœnum Græcum sativum.* Manured Fenugreeke.

The same Fenugreeke riseth up sometimes but with one, & sometimes with two or three hollow greene stalkes, parted into divers branches, whereon grow at severall spaces, many leaves, but three alwayes set together on a foote stalke, almost round at the ends, & a little dented about the sides greene above, and grayish underneath, at the joynts with the leaves come forth white flowers, and after them crooked flattish long hornes, full of seed with yellowish cornered seedes within them, smelling somewhat strong and loathsome; the roote is stalked many fibres perishing still before Winter.

2. *Fœnumgræcum sylvestre.* Wild Fenugreeke.

This wilde Fenugreeke hath the like one or more stalkes branched, the leaves stand three together, and are some what like the former, dented about the edges, the flowers likewise are whitish, but stand more together at the end, and so doe the long cods, somewhat like unto them, with smaller and darker seede within them.

3. *Fœnumgræcum alterum sylvestre.* Another wilde Fenugreeke.

This other Fenugreeke hath but one slender stalke, seldome branched, of a foote high, and sodden as were the bottome, whereon grow such like leaves as the former, and at the joynts flowers like unto the greene standing single and lesser, but broader hornes afterwards, more flat, and ending in a small thread, the seede within is likewise lesse.

The Place and Time.

The first is manured every where that I can heare of: the others grow wilde in *Spaine* and other countries: they flower with us in the beginning of *July*, and give their seede in the end of *August* and *September*.

1. *Fœnumgræcum latifolium.* Broad-leaved Fenugreeke.

2. *Fœnum Græcum sylvestre.* Wilde Fenugreeke.

Original from UNIVERSITY OF MICHIGAN

The Names.

It is called in Greeke by *Dioscorides* τρίγωνος and by other Greekes τρίγωνον and τρίγωνος, but *Theophrastus* calleth it κερατίτης, *quia siliquæ sint ad capri vel hirci*, the crooked seede vessells being so like unto hornes; in Latine *Fenugræcum*, because that, as *Columella* saith, it had two times of sowing, the one before Winter to be fodder withall, the other in *February* for seede, and simply calleth it *Siliqua*. *Varro* calleth it *Silicula*; and *Pliny* following all other now adayes call the first *Fenugræcum* or *faltivum*, and the second *Fenugræcum sylvestre*, and *Apuleius Fenugræcum sylvestre alterum polyceration*, and thinketh it is the *Hexafarion minimum* of *Dioscorides*; the Arabians call it *Olba Hebbe*, and *Helbe*, the Italians *Fiengreco*, the Spaniards *Alforvas*, the Germanes *Beckshorn*, the French, Dutch, and English, Fenugreeke.

The Vertues.

The seede of Fenugreeke is onely in use with us, the herbe it selfe never used that I know, because it is seldome seene growing with us: and as *Galen* saith, is but in the second degree, and dry in the first, it cleanseth, digesteth, softneth and mollifieth: the powder of the seede taken with a little honey driveth forth many noysome humors of the body, mollifieth inward Impostumes and Vlcers in the Lungs and breasts, and easeth the griping paines of the intralls, but it doth overturne and breede a loathing in some stomackes, especially if they bee tender, but are very seruiceable to rebellious and countrey people inured to strong labour, for I know no Physitions in our dayes use it inwardly, yet *Alpinus* saith that the *Egyptian* women doe use to eate the seed, which *Galen* and divers others did vse in their times (being buried a little in earth to make them lustie, whereof many Sacke fulls are sold in the markets daily) to make them grow fat. But outwardly applyed it hath many good vses of familiar daily experience, for the meale thereof heated with Vinegar and applyed outwardly to the Region of the spleene, doth mollifie and waste the hardnesse thereof, as also other hard tumors and swellings, the decoction thereof mollifieth like wise the hardnesse, and other paines of the mother, and openeth the obstructions of it, if they sit therein as in a bathe, or receive the hot fumes by sitting over it: the decoction thereof cleanseth the head and haire from scurfe, dandraffe and the running sores thereof: it helpeth the disease called *tenasmus*, or an vnable desire to the stoole without doing any thing, as also the Bloody flux when the excrements (mixed with a Poltis made with the meale thereof and Linseede, and the decoction of Mallowes, and a little oyle of *Roses* put thereto) allwageth the swelling and paines of the cods or privy parts of women, and generally all other swellings and tumors: the same also helpeth the Gowte and other joynt aches that come of cold: the Mucilage of the bruised seede steeped in water and strayned forth, boyled in oyle of *Roses* is of much good use for many of the forenamed griefes: the decoction of the mucilage applyed to the forehead with clothes dipped therein, stayeth the flux of humors to the eyes, and easeth the paines and inflammations in them: vsed also in Glisters it easeth all in the Stone by entering and mollifying the inward parts. *Lobel* saith, that of the seede is made an oile of more vertue then would be beleeved, to dissolve scirrhous swellings in the intralls, and other hard knots and kernells.

Chap. XXVI.

Tribulus terrestris. Land Caltrops.

THe Land Caltrops (for that of the water shall bee spoken of in another Classis or Title) riseth up with divers small hard woody branches, with divers winged leaves on them made of many small leaves set on either side of a middle rib like *Orobus*: at the joynts among the leaves stand pale whitish yellow flowers which turne to small rough prickly heads, of five or six cornes, wherein lieth a small kernell or seede: the roote groweth downewards with many long fibres thereat.

Tribulus terrestris. Land Caltrops.

The Place and Time.

It groweth in the sandy fields among Corne beyond the Mote among rubbish, and the ruines of buildings and walles, were finde it many times in our owne fields: it flowreth in *July* and ripeneth in *August*.

The Names.

It is called in Greeke τρίβολος χερσαία, and in Latine *Tribulus terrestris quinquefolius aculeatus est*, the Italians call it *Rastel* or *Tenarck*, the *Italians* Inhabiting *Apulia* and *Abruzzo* call it *Abrolhos*, and *Abrolhos*, the Spaniards *Abrojos terrestres*, the Germanes *Wald Klettlen*, the Low Dutch, and here in English Land Caltrops, because the forme of the fruit like those instruments of yron were cast in the enemies way to annoy their horses withall. Many should account *Tribulus*, *Lobel*, *Cornutus* and *Lugdunensis* to little then *Rabbis*, to bee the true Locusts, the Plagues and fruits of the curse for our sinnes: but it is certainly a generall opinion growen strong by tradition in those elder ages, that many other things were about the Metamorphosis of

herbes &c.

herbes, &c. and *Virgil* seemeth to expresse the same of *Pliny* in these verses,

Lappaque Tribulique, infestaque inamia cultis,
Infelix Lolium, & steriles dominantur Avenæ.

For the Corne was no way otherwise hindered or spoyled, then as other Weedes would doe by their strange growing, to hinder the growth of the Corne, in sucking away the nourishment from the earth that should feede it, but by tearing the Legs of the Reapers; which faults or plagues rose from the earth wherein the seede of them lay hid, ready upon occasion to spring, and not in the Corne, which if it were sowen in a ground exactly tilled, weeded Garden cleare of such weedes, would have none of them among it.

The Vertues.

The Land Caltrops are of an earthly cold qualitie and thereby astringent and hindering the breeding of inflammations and Impostumes, and against the flux of humors: moreover being of thinne parts it doth exceedingly breake and waste the Stone in the Kidneyes: a Lotion made therewith healeth all sores and Vlcers in the mouth, and all corruptions that breede in the gummes and throate: the juice doth cleanse the inflammations and other rheumes in the eyes: it likewise cureth the venome of the Viper and other poysons, if a dram thereof be taken in wine. The *Thracians* saith *Pliny* and *Galen* that dwell neare the River *Strymon* did feede their Horses with the greene herbes, and lived themselves of the fruit or kernells, making them into sweete bread which loosed the belly: *Pliny* addeth that the roote being gathered by a cleane persons doth consume Nodes that breede or feede bound to the sinnewie veines in the Legs, or other parts of the body taketh the swellings away, and eases the paines.

CHAP. XXVII.

Glaux leguminosa sive Glycyrrhiza spinosa. Licoris Vetch.

IF this kinde of wild Licoris we have two or three sorts to set forth unto you, and next unto them I will adjoyne the other two sorts of manured Licoris, which some good authors have likewise reckoned among the Pulses as I doe here.

1. *Glaux vulgaris leguminosa.* The most common Licoris Vetch.

This kind of Licoris Vetch tendeth forth many weake round hard stalkes, trayling on the ground, branched upwards, set somewhat thicke with winged leaves made of many, six or eight sides a peece, somewhat like as the Vetch hath, but much larger and pointed: the flowers come forth at the joynts orderly along stalke rough together, of a bleake white colour tending to yellow. Which turne into crooked, cor-

1. *Glaux vulgaris leguminosa.*
The most common Licoris Vetch.

3. 4. *Glycyrrhiza vulgaris spinosa & glabra.*
Cockes and rough prickt Licoris.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

rowes of seede, covered and grayish, of the taste of other Pulses: the roote is thicke and long, dividing it selfe into two or three long strings running very deepe into the ground, sweete to taste like unto Liquoris, which dyeth not but abideth long, shooting forth new branches every yeare in the Spring.

3. *Glaux altera leguminosa.* Another Liquoris Vetch.

This other wilde Liquoris hath such like stalkes and leaves as the former, but not spreading so farre, nor leaning downe so much, the winged leaves also are not so large, of a darker greene on the upper side, and gray underneath, the flowers are of a purplish colour, the cods are brownish long and round, and the seede within them also round: the roote is like the former growing deepe and spreading, and as sweete as the other. *Thalius* affirmeth this very like true Liquoris except in some few things.

3. *Glycyrrhiza vulgaris glabra*, Common Liquoris.

The Liquoris riseth up with many round woodily stalkes, set at severall distances with many winged leaves, made of many small long ones set on both sides of a middle ribbe, very well resembling a young ash tree from the ground: the flowers appeare at the joynts, after it hath stood divers yeares in a place without removing, set upon long stalkes, as many set together one above another spike fashion, of a pale blew colour, which turne into long cods, and some what flat cods, with three or foure small, round hard, seedes in them: the roote groweth very deepe under ground, as great as a mans thumbe or more at the head, spreading divers long rootes from it, both downewards, and likewise sackers from the sides, whereby it will quickly encrease, browne without, and yellow within of a sweete taste.

4. *Glycyrrhiza echinata*, Rough headed Liquoris.

This other Liquoris groweth in the same manner that the former doth, with the like leaves and flowers, but of a deeper blew colour, and growing for the most part at the toppes of the branches, which are followed by rough browne heads, like to the burres of the *Platanus* Plane tree, as *Dioscorides* compareth them, being many rough cods like those of Lentills, set together in a bunch, with one browne flat seede in every cod: the roote groweth as deepe as the other, but buncheth not under ground like it, and is of a stronger or more bitterish sweete taste.

The Place and Time.

The first groweth in many places about *Cambridge*, in *Clarkenden* Parke by *Salisbury*, and *Thrapston* in *Northampton shire* and many other places of our Land, the other I have not heard hath beene yet found with us, but in *Germany* &c. The first sort of Liquoris is said to grow chiefely in *Germany* about *Norenberg*, the other in *France*, *Italy*, *Italy* &c. and flowers with us late, and seedes as late, if at all. *Gerarde* in his *Herbarie* saith, that Liquoris groweth wilde at *Worsop* in *Nottinghamshire*, but I believe he was mistaken therein, for that they of that country have great store in their fields, and thereof make good profit, as we doe in many other places in Gardens.

The Names.

The first is called *Glycyrrhiza sylvestris* by *Gesner in horto*; by *Camerarius*, and by *Lugdunensis*, *Polygala* by *Cordus* on *Dioscorides*, and in his Historie *Polygalon Cordi* by *Thalius*, *Glaux*, and *Glaux vulgaris* by *Lobel* and *Tabernæmontanus*, *Tunimpeccum sylvestre* by *Tragus* and *Dodonæus* & *Heaslarum glycyrrhizatum* by *Gerard*, and many Herbarists and by *Bauhinus Glycyrrhiza sylvestris floribus luteo purpurascentibus*: the second is the *Glycyrrhiza sylvestris* of *Tragus*, and also of *Camerarius in horto*, by *Lobel Glaux vel Glaux quædam leguminosa herbariorum* & by *Bauhinus Lagopodium sylvestris alterum floribus punicei fulgoris Anobii*: the third is called *Glycyrrhiza Germanica* by some, & *Leontodon Echinata* by others, and *filiquosa* by *Lobel* and others, *Dulcis radix* by *Tragus* and *Cordus* and *Lagneris* in the Apothecaries shops: the last is called *Glycyrrhiza echinata Dioscoridis* by *Lobel* and *Lugdunensis*: *Glycyrrhiza Italica* by *Gesner* and *Dodonæus*, and simply *Glycyrrhiza* by *Matthiolus* and others: *Theophrastus* calleth it *Scythica*, the Greekes *γλυκυρριζα*, and in the Latines *Glycyrrhiza*, that is, *dulcis radix*, and of some *Glycyphillon*: of the *Arabians Sus*, of the *Italians Regolitia*, of the *Spaniards Regolicia*, of the *French Reglisse*, and *Regalisse*, of the *Germanes Sussholtz*, of the *Dutch Soethout*; and we in *English* Liquoris.

The Vertues.

The two sorts of wilde Liquoris are not knowne to be used in Physicke by any, but are wholly neglected; for the other two sorts of true Liquoris, their properties being both alike, I shall not needs to entreate distinctly as if the one had some other faculties that the other had not, for they are therein both alike, and as *Galen* saith, is very familiar to our temperature in that it is sweete, and having a little attriction joyned with it, making it temperate in heate and attriction, that it is the nearest unto our temper, and by both these qualities, as he saith, it doth loose the hoarsenesse of the throate, and is helpefull for the ulcers in the bladder; it hath also some moisture therein by reason of the sweetenesse, and thereby good to quench the thirst: Liquoris is often boyled in faire water with some Maidenhaire and Figges, which maketh a good pisane drinke, for those that have any dry cough, to loosen the flegme, and to expectorate it, or hoarsenesse, wheezing, and shortnesse of breath, and all other griefes of the breast and lungs, the phthisicke or consumptions caused by the distillations of salt humours on them, it doth also waste and consume them: it is good also in all the paines of the ranes, the straungury, and heate of urine, for Seamen are said by chewing this in their mouthes, that it keepeth them from thirst in their long journies which are costome for some or twelve dayes, and staieth hunger also: Liquoris boiled in water, with a little Fennell added to it, serveth instead of drinke in many places, especially if it be set to worke with barme as beere is, it is reasoned up, and will grow cleere, strong and heady by time as beare will doe: the fine powder of it blowne through a quill into the eyes that have a pinne and webbe, as they call it, or rheumaticke distillations into them, doth cleanse them and helpe them: the juyce of Liquoris is as effectuall in all the diseases of the breast and lungs, the reines and bladder as the decoction: the juyce dissolved in Rosewater with some Penidies Tragacanth, is a fine lohoc or licking medicine for hoarsenesse, wheezings, and all other coughs, to cleanse the throat, and to expectorate tough flegme, it also to condenseate thinne rheumes falling on the lungs: the juyce of Liquoris is more pleasant to the taste, wanting much of that attriction is in that which commeth from the sea.

The Vertues of Roote: Rue should have taken up his place here, as being proper to this Classis, but as you may see, I have drawne it and others into another Classis, for the reasons there specified. There yet remaines a number of Herbes to be spoken of, as being nearest to the Pulses, especially those that are properly called *Lomentaceæ*

siliquosæ.

filiquosi; because their long cods are more eminent to be seene, which shall next follow, and the rest in their order.

CHAP. XXVIII.

1. *Lotus edulis Creticus.* Trefoile Pease of *Candy*.

This Trefoile Pulse or Pease shooteth forth divers slender stalkes set with brownish greene leaves at several distances thereon, three alwayes standing on a foote stalke, which are sappy, a little thicke and pointed: the flowers are yellow, but like unto small Pease blossomes, which are followed by round cods, somewhat crooked, and great in comparison of the smallnesse of the plant, wherein lie round Pease of a sweete taste, like unto our ordinary Pease, and while they are young and greene usually sold in their markets, and so much desired of them, as our Pease with us: the whole Plant with stalkes and leaves are a little hairy: the roote is small, thready and annuall growing among their corne, and in the borders of their fields.

2. *Lotus quadrigonatis siliquis.* Square codded Pease.

This kinde of Pulse or Pease I have shewed you in my former booke, that it hath a crimson blossome, and long round cods, with foure rimes, two at one side, and two at another.

3. *Arbor seu Lotus Ægyptia.* The *Egyptian* foure leafed *Lotus*.

This small herbe growing not much above an hand breadth high, hath divers round Trefoile-like leaves growing on the hairy stalke foure and foure together, at the toppe whereof standeth sundry white flowers, after whom the seede followeth that is like unto Peare kernells in the huskes.

4. *Lotus sylvestris Cretica.* Candy wilde Trefoile.

This wilde Trefoile riseth up with stalkes a foote high, having at each joynt two small leaves, and from thence three other small darke greene leaves, upon very short or no foote stalkes at all; the flowers are small and yellow, comming forth both at the joynes and toppes of the stalkes, usually two together, and so many cods likewise come up in their places, being very small, and long, with seede in them as small as Mustard-seede: the roote is small and hard, yearely perishing, the whole plant vilefieth somewhat like a Pulse, yet with a little bitternesse and sourenesse therein which quickly vanish away.

5. *Lotus pratensis Monspeliensium.* Smooth codded Trefoile of *Monspelier*.

This riseth up with cornered and fourted stalkes a foote high, with leaves, usually three together, more long than round; the flowers are yellow, growing both at the joynts and toppes of the stalkes, after which come large and long cods, with seedes like Fenugreeke in them: the roote is small and long.

6. *Lotus superior frutescens.*
Rough Trefoile of *Monspelier*.

This is like the last, but that the stalkes grow bigger, harder, and rougher, the leaves are narrower and hoary: the flowers are yellow set in hoary huskes smaller than the former, and the seede lesser also.

7. *Lotus frutescens Granatensis.*
Spanish hoary hard Trefoile.

This Trefoile found by *Clusius* in *Granado* & *Valentia* in *Spaine*, and referred by him to the *Oxytryphyllum* of *Scribonius Largus* riseth a cubite high, with many branches, and three leaves alwayes set together, hath *Clusius*, (but sometimes foure saith *Lobel*, if not be the same:) the flowers are small & whitish, many growing in a round tuft together, with small seede, after them contained in small long cods; the roote is somewhat great and thicke, and astringent: Of this he maketh two sorts, one whose stalke is greene and the roote white, growing in moist places; the other with reddish stalkes and branches, and the roote somewhat reddish, wherewith, as he saith, they use in those places to make a syrope of good effect against the bloody flixe.

alter.

8. *Lotus hamorrhoidalis major sive Trifolium hamorrhoidale majus.*
The greater Pile Trefoile.

The greater of these pile Trefoiles, hath a long straight roote, somewhat woodily, with very few fibres at it, from whence riseth up usually but one stalke a cubite or two high, branched into divers hard weake flexible twiggie, and they againe into other small branches, bearing at every joynt five leaves, two whereof stand close to the stalke, each upon a small foote stalke, and the other three rise betweene them, and higher than they upon another foote stalke like a Trefoile, the leaves and stalkes being all hoary, yet in the younger plants, onely the three leave stand together on a stalke

1. *Lotus edulis Creticus.*
Trefoile Pease of *Candy*.

where do stand two at the bottome of them, the flowers grow many together in a tuft, of a whitish red or ... their cups somewhat large, which turne into long and round cods, greater and thicker than the next that fol... of a faint dimmed colour, somewhat swollen, and very well representing the hemorrhoidall veine, as it ... and fallen downe, from whence it in part tooke the name, and partly also from the singular ... it hath. Roots fibrous. The whole plant perisheth after it hath perfected ripe seeds, within which are diverse small round blacke seede.

2. *Trifolium pratense luteum sive minus seu Lotus Dalechampi.* The lesser pale Trefoile.

This lesser pale Trefoile hath a tall stalke, two or three foote high, parted into long branches, with saw ... large leaves both set to the foote of every branch, and to the joynts where the leaves grow ... which come other leaves, as large as the ordinary Trefoile leaves, three standing together upon a long

foote-

foote ftalke: the flowers grow in tufts at the end of the braunches of a light purple colour, which are followed by small round and shorter pods than the former, with such like seede in them: the roote is somewhat thicke and woodily, full of strings, yet yearely dying within, and hardly, but in a kind yeare giving ripe seede.

16. Lotus corniculatus pratensis.

Yellow horned trefoile.

This Trefoile hath small smooth and greene stalkes, foote high or more, spreading many short braunches, with three leaves on their foote stalkes, being long and very narrow: the flowers are yellow, that grow at the toppes two or three together, and sometimes more, after which come thicker and shorter cods than the same, ending in a sharp point, wherein are contained small seede, like to round kidneys, to have broader ends, and ending in a shorter point, of a greenish colour, *Stampe*-like and in *Iuly* ripe, and with us also to have flowers.

17. Lotus siliquosus procumbens.

Procumbent podded Trefoile, or Bishop weed.

C. Lotus siliquosus procumbens.
Procumbent podded Trefoile, or Bishop weed.

18. Lotus siliquosus erectus.

Vpright podded Trefoile.

19. Trifolium luteum humile capitulis minus.
The leffer pale Trefoile.

11. *Lotus cornicularis minor pilosus.* The lesser hairy horned Trefoile.

The other hath slender stalkes, covered with very small reddish haires, the leaves likewise are hairy, small, and sharpe pointed, three on a foote stalke, and two at each ioynt, from whence spring the flowers, one or two at the most on a small stalke like an haire, of a deepe yellow, tending to a saffron colour, unto each whereof succeedeth a very slender long cod, with very small seede therein: this likewise is found in the woods and medowes about *Montpelier*, and the hills adjacent, and as frequent with us.

12. *Lotus Cornicularis tertius.* Hoary horned Trefoile.

Though with low but with a little larger leaves and flowers, of as deepe a saffrony yellow colour as the other, sometimes with a shadow of crimson on them, growing three or foure together and small long crooked heads following, and very round seede in them: this is found also in divers medowes.

13. *Trifolium cornicularum Lusitanicum flore rubro.* Horned Trefoile of *Portugall* with red flowers.

This horned trefoile of *Portugall* hath divers long and narrow leaves, three set together lying on the ground, and so likewise are the lowest upon the stalke that riseth about a cubit high, with others upwards standing, either single or two at a place very narrow and long: the flowers grow at the toppes of the stalkes and stand but one or two together, each of them like unto a little flowerdeluce, compiled of five leaves of a deepe red colour, with the shew of a little horne in the middle, which growing greater the flower oftentimes abideth still at the foote of the horne for a good while, withering away at the last, and the pod growing ripe containeth within it very small brownish seede: the root is slender and perisheth, but by the seede that is shed it yearely springeth againe.

The Place and Time.

The first of these are described by their titles, or after their descriptions where they grow, their times of flowering and seeding are in the summer seasons.

The Names.

Τρίφυλλον in Greeke and *Lotus* in Latine is of two kindes, for there is *Lotus arbor*, the Lote tree, and there is *Lotus herba*, the herbe Lotus, which as *Dioscorides Galen* and *Pliny* doe all agree is a Trefoile or like a Trefoile (and namely the trefoile *Trifolium* whereof he had made mention before) and whereof *Dioscorides* and *Galen* make two kindes, *Lotus arbor sativa Lotus* and *Lotus sylvestris*, of the *Lotus arbor* as it is generally taken to be there spoken before in the end of the fifth Chapter of this Worke: but this kinde of *Sylvestris* is more controverted, divers writers imagining that which they bring and shew forth to be the right. The first here comprised was sent by *Honerius* to *Lobel* from *Candy* where the people call it *Hieromeni*, & *Pona* in his *Italian Dialect* calleth it *Loto spinoso* and by *Italians Loto crestato*: the second is called *Lotus siliquosa rubro flore* by *Clusius*, and *Lotus tetragonoloba* by *Camerarius*, and *Trifolium Creticum* and usually with us *Pisum quadratum*: the third is mentioned by *Alpinus lib. de plantis Aegypti* by the name of *Abiar*, which *Bauhinus* calleth *Lotus affinis Aegyptiaca*: the fourth the *Italian Pona* calleth *Loto siciliano Dioscoridis*, and was sent out of *Candy* for a Melilote, but as he thinketh is the true *Lotus sativa* of *Dioscorides* and is called by *Camerarius Lotus peregrina siliquosa*, and as he saith by some *Cicer sylvestre* and *Dorycnium*: but both erroniously: the fift is the *Lotus praecox siliquosa* of *Clusius*, called by *Lobel Lotus Italica praecox siliquosa Monspelliensium*, and *Lotus trifolia cornicularis* by *Gerard*: the last is so called by *Lobel* and *Lugdunensis* as is in the title: the seaventh *Clusius* saith he found in the kingdomes of *Granada* and *Valentia*, and in the time of very like unto that *Lobel* and they of *Montpelier* called *Lotus sylvestris*, and by some thought to be the *Dorycnium Serbonij Lugd.* but *Lobel* thinketh the *Trifolium biumbellatum* to bee the true *Dorycnium* and that this may be the *Dorycnium alterum Serbonij Lugd.* *Clusius* also saith hee received this out of *Italy* by the name of *Lotus frutescens* and that *Pisa* tooke it to bee *Perennis sana Arabum*, whereof hee saith there are two sorts, the one with a white and whiter branches, the other with a red roote and reddish branches, which the Moores at *Granada* called in their language *Enzina*, and of the roots of both which were some what great and stringent but especially of the red, they made a Syrupe singular good for the dissenterie or bloody flux: the eight is called *Trifolium Hamatum* of *Lobel* by those of *Montpelier* for the causes mentioned in the description, who called I have added *nono* by the same authority, for they doe account the ninth which is the *Lotus Lybica* of *Matthiolus*, to be the lesser sort of the former: the tenth and eleventh is the 12. and 13. *Trifolium* of *Bauhine* in his *Prodromus*: the twelfth is usually called with us *Trifolium Corniculatum vulgatissimum*: the last we had from *Spain* in Portugall by the name of *Trifolium siliquosum rubrum Lusitanicum*.

The Vertues.

The *Lotus* of *Dioscorides* and *Galen* is of an heating and drying quality, and thereby effectuall against the poyson of a Spider if it be taken of it selfe or with Mallow seede drunke in wine: the powder of the same Plant, Honey and annointed taketh away the markes and blemishes in the face, &c. the cicle here before set forth is held about *Montpelier* to be of singular good effect against the biles or Hemorhoides, if it be eaten fasting with some stringent herbe without any manifest heate or sharpenesse: the oyle of the dryed herbe reduced to much better I made into powder, and the quantitie of a dram or halfe a dram according to the age and disposition of the Patient taken in red wine which effect the learned there knowing have much praised the same for the cure of Feavers, whether it worketh this effect by any hidden properties, or by the stringent qualitie to which common Pulse have inclined: the *Lotus Lybica* of *Galen* saith is in the second degree of heate, and the last dryed, yet neither have any especiall properties recorded by any or known to us.

Chap. XXIX.

Trifolia montana. Mountaine Trefoiles.

The next Trefoiles that are to bee entreated of are those that grow on hills and the dryed grounds, whereof there are sundry varieties.

1. *Trifolium montanum majus purpureum.* The greater purple Mountaine Trefoile.

This greater Trefoile groweth fearce a foote high, with divers leaves thereon which are large and three inches long sometimes, three alwayes together on long foote stalkes, sharpe pointed and a little dented about the edges, at the toppes stand large and some what long heads of gallant purple flowers, like unto the lesser Trefoile but greater: This is also found with longer and narrower leaves, and a longer spiked head of flowers.

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

2. *Trifolium montanum majus album flore.* The great white mountaine Trefoile.

The ſtalke hereof is not ſo great or high, the leaves are ſmaller yet longer then long and dented about the edges growing many below, and few and ſmaller on the ſtalke, at the toppe whereof grow one or two thorn cruſhes with each a tofted head of ſmall white flowers ſomewhat (were it not the roote is long and ſhowes a ſingle knobby nedle, knoppish on the outſide and white within) without doubt like the former.

3. *Trifolium montanum rubens flore purpureo.* The bluſh coloured Trefoile.

This Trefoile is fuller of leaves on the ſtalkes then the laſt, which are long and narrow, ſharpe at the ends, and dented round about, but not higher then the ſtalkes they are very narrow, the flowers ſtand at the toppes, and of a pale purple colour.

4. *Trifolium montanum Alpinum.* Narrow leafed Trefoile of the Alpes.

This mountaine Trefoile hath a long roote, ſomewhat hairy or leafy towards the toppe, and ruſhie in the middle, whilſt on the outſide and ſides what hard and woodily, of a ſweete bitter taſte like unto Liquoriſh (from whence ſome have called it *Spaniſh Liquoris*) not farre unlike as muſt of the reſt of the kindes that whereof we have theſe long ſmall ſlender ſtalkes of leaves bowing downe to the ground, with two of theſe narrow threads of leaves on them towards the bottome, and three long narrow leaves at the end of them, all ſmall downy at the edges ſcarcely to be felt, from among theſe leaves ſtande one or two naked ſtemme ſtalkes ſix or foure inches high, bearing three flowers as it were in a round ſpike, of an excellent purple colour, foure ſtanding in five cathered huskes.

5. *Trifolium Alpinum argenteum.* Silver leafed Trefoile of the Alpes.

This ſilver Trefoile hath a ſtarre long reddiſh woodily roote, flooring forth divers ſtrong branches ſpringing out of ſmall narrow leaves, three together at the toppes of them near the ground, ſtanding as ſtarres, which are ſoft, and of a Silver-like hoarineſſe all over, from among which riſe ſhort ſtalkes not above three fingers breadth in height, naked untill a little under the flowers they have three ſeller leaves that incompaſſe each ſtalke bearing but one flower, which is not after the faſhion of all other Trefoiles, but like unto a bloſſome (and therefore I the more ſuſpect that this cannot properly be reckoned in the catalogue of Trefoiles) rather to the *Scammonie Bermudie* or ſome other according as the ſeede ſhall ſhew it to be which was of the ſame ſtarre ſhaped faſhion like unto a Crowe-toote or Cranes bill, and of a Roſe or peach colour, with many ſlender red threds in the middle tipt with blackiſh pendents ſtanding about a ſmall hoary head.

6. *Trifolium montanum lupulinum.* Hoppe-like Trefoile.

The Hoppe Trefoile riſeth with ſmooth ſlender ſtraite ſtalkes a cubit high, ſet with few leaves at joints, that are ſmall and round pointed for the moſt part, like the common meadow trefoile, ſtanding ſeverally on the ſtalkes, the flowers ſtand at the toppes, made as it were of brownish yellow ſcales laid one upon another, very well reſembling the head of an hoppe, whereof it tooke the name, and from whence ſome have called it *Veratrum* a white Hoppe, and groweth as *Lobelius* ſaith on the hilles above *Ida* in Germany, where *Theodorus Tharſius* alſo found it.

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

7. *Trifolium fan ætile hirsutissimum.* The hairy rocke Trefoile.

The roote of this Trefoile is woodily and creepeth under ground, with a reddish barke, and is but as it were the stocke of many heads or plants set together, being not above two or three inches high: the leaves are small, soft, woolly, and as it were Silver-like, in forme like a Trefoile, dented about the edges, and standing on short but very hairy footstalkes, among which rise small round heads standing on long stalkes, in the middle of whose tuft grow and very fair yellow flowers: wee have not yet seene any other flowers it beareth nor seede: it was gathered on the toppes of the highest of the *Helvetian* mountaines.

8. *Trifolium Scorpioides.* Scorpion like Trefoile.

The leaves of this Trefoile are not much unlike the soft Trefoile, but narrow and corled, the flowers are yellow and grow in a small tuft three or foure together which afterwards bearе small crooked cods like a Scorpion, whereof this *Scorpioides leguminosa* This *Bock* gathered in *Spaine* and with it another like *Mercurialis*, but *flore pallidiore*, whose leaves were of a paler colour.

9. *Trifolium Glycyrrhizites.* Liquorish Trefoile.

The roote of Liquorish Trefoile hath a great and long deepe spread roote, very like unto Liquorish, from the head whereof rise out sundry short stalkes a foot long, and divers leaves rising out from thence, three always together upon one foote stalke, long and narrow, plaine on the edges, and each standing on a short footstalke. The stalkes which rise from the head are somewhat long and narrow, plaine on the edges, and each standing on a short footstalke, bearing at the toppe a tuft or bush of purplish flowers, of the forme of a Pease flower but lesse, not unlike that of *Vicia* or *Galpinus* yet very like.

The Place and Time.

They grow on hills and mountaines, some in *Spaine* others in *Germany*, and the last on a hill by *Montpelier* in the beginning of May, flower and seede in the time that the others doe.

The Names.

The Ancients have made mention of the last and second by the names of *Trifolium nigrum* and *montanum*: *Fuchsius* in his *Italian Italian* mentioneth the fourth, and is so called by *Fuchs* as it is in the Apothecaries shops which have *magnæ radicis dulcis*, and by some *Glycyrrhiza Astragaloides*: the fift by that name is also so called by *Thalius Lupulus sylvaticus*, and *Bauhinus Trifolium montanum lupuliferum*, for I cannot be perswaded that *Fuchsius* mentioneth in his *Prodromus*: the eight of both sorts is not mentioned by any before *Bauhinus*, but they call the last *Trifolium dulce montanum*.

The Vertues.

The vertues of none of these are recorded by any that have written of them, but it is likely they much resemble the qualities of the former.

CHAP. XXX.

Lagopus. Hares foote.

THe next sort of Trefoiles that are to bee handled is of those whose flowers grow in close spiked heads, called *Lagopus* Hares foote, whereof there are halfe a dozen,

1. *Lagopus maxima flore rubro.* The greatest Hares foote.

This great Hares foote hath divers trefoile leaves rising from a small long threddy root, each standing on a long footstalke being almost round and dented about the edges very like the medow trefoile as well in the bigneſſe as forme, very soft, and of a pale greene colour, among these rise up weake bending stalkes a foot high or more, branched and bearing the like but somewhat longer leaves as they, and at their toppes close spiked heads, with many small flowers round about them, each in a five cornered husk of an excellent crimson colour, in which husks after the flowers are past grow small yellowish round seeds, one only in a husk, whose brims or corners then stand displayed somewhat like unto a starre.

2. *Lagopus major folio pinnato.* The longer headed Hares foote.

The Leaves of this Hares foote are hoary, large, and longer then the former, with divers couples of small ones set on them making them shew like wings, the middle ribbe on the backe of them being somewhat great also, the flowers are like the former both in forme and colour, but the whole head is longer.

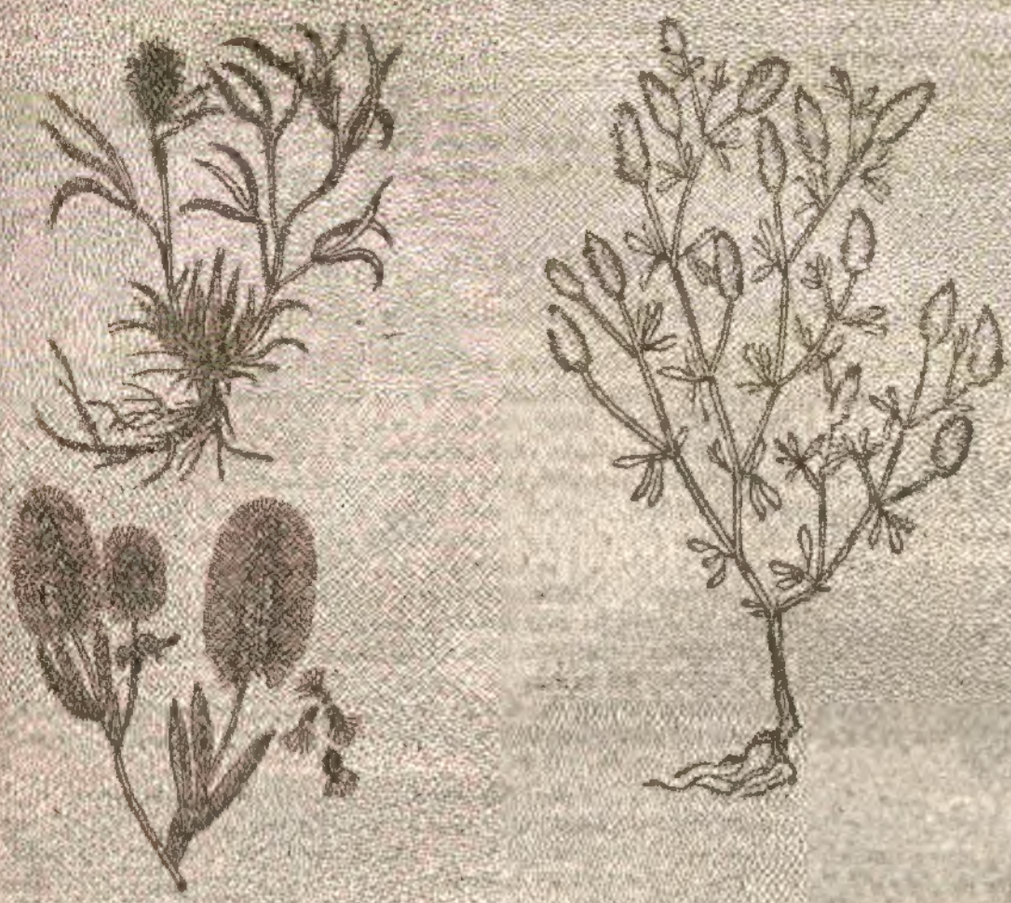
3. *Lagopus major angustifolius.* Great Hares foote with very narrow leaves.

This Hares foote hath stalkes a foote high, set with very narrow leaves almost like grasse, yet in some plants they are found to be larger, but still long and narrow, three set together, at the toppes whereof grow oblong spiked head of flowers as the first, but the colour of them are paler, and the ends or cornered shape divisions of the husks are hard and almost prickly if not wholly. *Lugdunensis* calleth this *Aspergens foliis minus Dactylon.*

4. *Lagopus angustifolius Hispanicus.* Spanish narrow leafed Hares foote.

The *Spanish* Hares foote is one likewise of the greater kind, having a tender straight stalke set with divers branches thereon, with three somewhat long, narrow and pointed hoary leaves, with great leaves at the backes upon long footstalkes set at each joynt, which are somewhat broad at the bottome of them, compassing the stalke and branches with a little eare there at likewise, the flowers are of a pale red colour set in a long spiked head, but more loose and not so compact as the former; this I had by *Teel* out of *Spain* by the name of *Trifolium.*

1. *Lagopus maxima flore rubro.*
The greatest Hares foote.



2. *Lagopus major folio pinnato.*
The longer headed Hares foote.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

5. *Lagopus minor flore rubentino.* Bright red small Hares foote.

6. *Lagopus vulgaris.* Common Hares foote.

5. *Lagopus minor flore rubentino.* Bright red small Hares foote.

This small Hares foote hath small woolly or soft leaves as small but nothing so long or narrow as the last and groweth little more then halfe a foote high, the spiked head is small but larger then the wilde kind, and the flowers on them are of a most excellent crimson colour, the corners of whose woolly huskes standeth out like starres the seede within them are ripe: this is but annuall perishing yearely as the former: this also came to me out of *Spaine* by the name of *Lagopus pratensis Betica.*

6. *Lagopus vulgaris.* Common Hares foote.

The common Hares foote is well knowne to be a small plant growing greater and higher in some places and smaller in others, with whitish woolly small trefoile leaves set upon the stalkes, and many branches it hath, the heads at the toppes are small and somewhat long with the roundnesse, compoted as it were all of a hairy hoary downinesse, whose flowers in some are of a white in others of a bluish colour: it is annuall as the rest, and this is the lowest of all more of this family of Hares foote, or that beare spiked heads of flowers that they perish yearely, then is the other sorte of trefoiles that are to follow or that were before are not so: This also is read from *Ruel.* sapinus. but is greater, and another that stood not upright, with many other sorts out of *Spaine* which are perished with the hote moistie yeares have happened.

The Place and Time.

They have beene all found, some in *Italy*, others in *Spaine*, some in *France* and others in *Germany*, but are preserved only in the Gardens of such as are curious: and the last almost every where in dry grounds in our owne Land, and flourish in the summer moneths onely.

The Names.

It is called Lagopus or Hare-stocke, and so likewise *Lagopus* in Latine a *Lepore* is *hirsuta pedis* of the hairy foote of an Hare, and *Pes Leporis* and *Pes Leporinus*, and *Trifolium humile Hispanicum* called it *Lagopyron quasi* Trifolium Lepori simile, because it grew among Corne: the last is called by most Writers *Lagopus minimus*, & *Lobelij* by some, and *Lagopus maximus* or *major folio Trifolij* by *Lobel* himselfe and *Dodonæus*: the second is called by *Lobel Lagopus altera trifolio minore*, which *Clusius* maketh the other sort of his third *Trifolium majus Tragi* calthæ *Cordi* and *Fuchsij*, and *Cornucopiæ*, *Lonicero* and *Cordus Trifolium magnum* the commentors on *Matthiolus* in their Annotations for the most: and *Trifolium spicatum* the third is called by *Lobel Lagopus altera angustifolia*, and to by others, for it is read by *Lugdunensis Alopecurus graminea Dalechampij*: the fourth *Clusius* so called it as it is in his Spanish: the fifth is not remembered by any before: the last is generally called *Lagopus* or with little variation, *Pes Leporis* usually called by *Lonicerus campestris.*

The Vertues.

All the parts of these Hares foote, that is, leaves, stalkes, &c. but especially the spiked heads doe dry and binde,

and

and of the first saith *Lobel* wee have had moſt certaine experience to ſtay Fluxes and Laskes of the belly, being drunke in wine or in vineger if the patient be feverish, and being bound to the share it taketh away the inflammations thereof, it is profitable saith *Matthiolus* besides the aforesaid qualities, to ſtay choller like vomitings of the ſtomacke and paines of the belly, if the heads and ſeede in powder be taken in red wine; the herbe boiled with Mallowes in wine is very good for the paines of the bladder, the heate of urine and ſcalding. The ſeede drunken helpeth the ſpitting of blood; the aſhes of the heads lying burnt is good to apply to the piles to ſtay the bleedings, and ſome alſo thinke that if the fundament bee but wiped with the herbe it will stay your laske. *Pena* ſaith that the facultie of drying is ſo powerfull beſides the binding that it wonderfully stayeth the vomit of the Reines: it is alſo profitably uſed in ill foule and hollow Vlcers, being firſt cleanſed to raiſe up fleſh and to cicatrize them, and is of great good uſe to helpe burſtings.

Chap. XXXI.

Trifolia capitata ſtellata globoſa, &c. Starry headed, and round headed Trefoiles.

These ſorts of Trefoiles are likeſt to the laſt in their heads chiefely, but they are not ſo finely compacted, but ſtand ſomewhat looſer one flower from another.

1. *Trifolium ſtellatum Monſpelienſium.* Starry headed Trefoile of *Montpelier*.

This Trefoile of *Montpelier*, hath a ſmall white long & downe-right roote, with ſome fibres thereat, from whence riſe divers leaves upon long weake hoary foote ſtalkes not ſtanding upright, made of three ſolit hairy and hoary parts, formed ſomewhat like unto an heart, (whereof *Lobel* hath raſhly taken it to be *Trifolium cordatum*) and a little dented about the edges, from among which come up three foure or more low ſtalkes ſeldome a ſpanne high or branched, but naked up to the toppe, where there onely grow three ſuch like leaves as the lower are, ſet under the head, which is a ſmall round ſpike or umbell, with many long flowers appearing, of a whitiſh red, or fleſh colour, out of woolly or hairy and hoary huſkes, every one by it ſelfe, which when they beginne to fade, the whole head becommeth more round, and the huſkes ſhew their fine long ſharpe points, whereinto the toppes of them were divided, more appearing like an oulſter ſtarre, in each whereof is contained one blackiſh flat ſeede: in the place about *Montpelier* where it growth naturally, it flowreth in *May*, and the ſeede is ripe in *June*, but with us it will neither flower nor ſeede a moneth after.

2. *Trifolium clypeatum argenteum.* Buckler Trefoile with ſilver-like flowers.

This ſmall plant ſpreadeth many branches upon the ground ſet with Trefoile leaves like the common moſſe Trefoile, every branch bearing at the end divers ſilver like flowers, and long round huſkes and flat ſeede like unto the old *Venerian* Bucklers, which are hot and dric in taſte, for which cauſe I ſhould rather make it a Thlaſpi: but in that I have not ſeene the plant, I can ſay no further of it, but give it you as my author deſcribed hath ſet it downe.

3. *Trifolium globoſo capite.* Globe or round headed Trefoile.

This round headed Trefoile hath a long white fibrous and hairy roote, ſendeth forth divers ſlender round ſtalkes a hand breadth high, and ſometimes a foote long, divided into branches, ſomewhat hairy bearing white tripartite leaves, a little hairy, with two ſmall leaves at every joynt, and dented about the edges: the flowers are ſmall and yellow that grow at the toppes out of the browne ſharpe huſkes of the round head.

4. *Trifolium globoſum repens.* The creeping Globe Trefoile.

This other globe Trefoile, whoſe roote is ſmall, creeping, reddiſh and hairy, hath ſundry weak branches lying upon the ground, three or foure inches long, being ſoft, woolly and ſomewhat reddiſh, which but few ſmall Trefoile leaves ſet on them, a little waved about the brimmes: the toppes of the ſtalkes and branches are garniſhed with faire round heads, whoſe flowers are of a reddiſh yellow colour, ſtanding in hairy huſkes, wherein a ſmall ſeede is contained.

5. *Trifolium fragiferum Peruſinum.* Strawberry headed Trefoile of *Peruſium*.

This Trefoile groweth up with divers ſtalkes, and broad pointed Trefoile leaves upon them, dented in the middle like a heart, ſet on long roote ſtalkes, bare towards the tops, and bearing a ſmall round head, with long blush flowers, rising out of the huſkes, which are like ſmall bladders made of thin ſkinne, which after the flowers are paſt ſwell ſomewhat bigger, and turne downe their brimmes, forming a head like a ſtrawberry, wherein lie graines ſet together, but greater, in each huſke wherein is contained a few ſmall yellowiſh ſeedes, the roote ſpreadeth themſelves with many long fibres at them. There is another ſort hereof whoſe head is of a deeper or darker colour; but I never ſaw any of a paler colour, as *Clusius* ſaith; and to ſee the flowers alſo in other things little differing from the former: both theſe ſorts *Bord* brought with him out of *Spaine*, in the yeare 1608, and entituled them *Trifolium Peruſianum*, which he gathered there with above two hundred other ſorts of ſeedes, beſides divers other rare plants, dried and laid betweene papers, whereof the ſeedes were not ripe, of all which ſeedes I had my part, and by ſowing them ſaw the faces of a great many excellent plants, but many of them

6. *Trifolium fragiferum ſtellatum, &c.* Starry headed Trefoile of *Montpelier*, &c.

came not to maturitie with me, and most of the other whereof I gathered ripe seede one yeere, by unkindly yeeres that fell afterwards have perished likewise.

6. *Trifolium fragiferum Lusitanicum maximum.*
Strawberry headed Trefoile of Portugall.

This other hath somewhat larger leaves than the last, and pointed at the ends: the heads likewise at the toppes of the stalkes were somewhat large and round like the last, but all woolly, as it were or hoary: this perisheth yearely, with mee, and Mr. *Tradescant*, who had it from *Rose* at *Lisbone*, without bearing us ripe seede, and have not since procured it from him againe.

7. *Trifolium vilposum laeve.*
Smooth skinny headed Trefoile.

This small Trefoile riseth little above halfe a foote high, with three or foure stalkes with small leaves thereon, very sharply dented about the edges, with long foote stalkes under them, the heades are made of small smooth hoary skinnes in fashion of little bladders, set one by another, and out of each a small yellow flower, having small round flat seede afterwards in them: the root is small, long white, and fibrous.

8. *Trifolium vesicarium asperum majus.* The greater rough skinny headed Trefoile.

The leaves hereof are somewhat round like the meddow Trefoile growing from the roote among which come up stalkes two cubits high, upheld by the bushes that it groweth among here or naked on the toppes, bearing round about a small round head, covered over with rough threads, made of many small round skinnes like the former, and deeper yellow flowers rising out of them.

9. *Trifolium vesicarium asperum minus.* The lesser skinny headed Trefoile.

The roote hereof groweth aslope under the ground fastened therein by many threads: the branches likewise creeping on the ground with slender stalkes, two or three inches long growing from them, bearing on the top of all a round head made in the like manner of many small round greenish rough skinnes, out of which the flowers appeare of a reddish yellow colour, set within which a small browne seede lieth.

10. *Trifolium capitulo thymi.* Time headed Trefoile.

This Trefoile from a small long white threddy roote sendeth forth stalkes halfe a handfull long, set with small and round pointed leaves dented about the edges, and small round heades on the toppes of the stalkes like the heades of time, whose flowers are of a deepe yellow, euchoning red, and long time held containing reddish seede within them.

11. *Trifolium capitulo oblongo aspero.* Long rough headed Trefoile.

This Trefoile hath also a long white threddy roote, and from them many stalkes of a foote long, somewhat round, and jaynted, stored with but few round leaves; from the severall joynts grow forth many small stalkes, three together, and after these rise somewhat long and round heades, as thicke as a finger, with sharpe prickes, which grow hard and rough being ripe, under each whereof is set a small seede, parted into three cels: the seede also is small as the former.

12. *Duo Trifolia spicata rariora & altera.* The rare spiked yellow Trefoiles.

These rare Trefoiles are like one unto another in nature, but a little differing in face and outward forme. Each of them hath a long slender long roote, from whence rise sundry reddish spiked heades, out of which come many small yellow flowers, and from among them, in the one a very few small Trefoile leaves, upon very small long foote stalkes, as fine as haires; in the other a great number of the like small greene Trefoile-like leaves, on small threddy long haire-like stalkes, a little dented about the edges: from among which rise sundry flowers on small slender foote stalkes, being somewhat long, and white, like unto those of the former: the cuppe being while they are fresh, standing in huskes, wherein afterwards grow small, white, round seede. I have placed

placed the figures of them both together, that the diversitie may the better be observed: they are of a daring nature, as by the taste may be judged.

The Place and Time.

The most of these grow about *Mompelier* in *France*, others in *Spaine*, as hath beene shewed in their descriptions, and some in *Germany* and *Candy* also, which flower and seede when the rest doe.

The Names.

The first is called by *Bauhinus Trifolium stellatum*, and I have added *Montpellensium*, and the figure not unlike before: the second by *Alpinus Trifolium Hypericum aureum*: the third is *Bauhinus* the *Trifolium rubrum sive capitulo Lagopi rotundiore*: the fourth is so called by him, as it is in the title: the fift is mentioned by *Clusius* his *Curæ posteriores*: the sixt comming among other seedes from *Basil*, I have so entituled, as it is to be understood it may be is a kinde of the seventh which *Bauhinus* termeth *Trifolium flumosis capitulis*: the eighth and ninth *Bauhinus* calleth *Trifolium Capitulo plumoso aspero majus & minus*: but I have entituled the *Hyacinthum asperum majus & minus*: the tenth and eleventh are so called by *Bauhinus* as they are in their titles: the last two sorts of Rushie spiked Trefoiles are mentioned by *Alpinus* in his Booke of strange plants, by the name here exhibited.

The Vertues.

I doe not finde any other propertie in Physicke that these are applied unto, than hath beene before spoken, being all of late invention have had no further triall made of them.

CHAP. XXXII.

Trifolia pratensia. Meadow Trefoiles.

OF the Trefoiles that usually grow in meadowes, besides those that grow in our owne land, there are others that grow not with us, which are fit to be set together.

1. *Trifolium pratense vulgare purpureum.*

Common purple meadow Trefoile called beld Hony-suckles.

The meadow Trefoile hath many leaves, rising from the roote, three set together, and notched round, among which rise up short stalkes of flowers, not much higher than the leaves, bearing many deepe purplish crimson flowers together in a tuft rising trailer upto the croppe, which turne into little cods with small seede in them, the roote spreadeth much, and endureth long. Sometimes this is found with holes round spots of white in the leaves.

1. *Trifolium pratense vulgare purpureum,*
Common purple meadow Trefoile, called beld Hony-suckles.

2. *Trifolium pratense album.*
White flowred meadow Trefoile.

ground and from the joynts vpon the small stalkes that beare many crimson red flowers smaller then ours, and after set together, the small red seede is conteined in thin huskes.

4. *Trifolium pratense minus purpureum.* Small purple medow Trefoile.

This small Trefoile hath small hard stalkes a foote high full of branches bearing on some three leaves, on others branches and joynts, foure small leaves like a *Lune*, the flowers grow many together at the toppes of the stalkes being very small and in a foote vnder all of a purplish red colour; the roote is slender white and threddy.

5. *Trefolium luteum minimum.* The smallest yellow Trefoile.

This small Trefoile hath a few slender weake stalkes, little bigger then small strawes lying on the ground where grow small Trefoile leaves sometimes more then three on a short footestalke, a little dented from the edges: the flowers are small and yellowish set close and round together, after which follow small vessels and crooked seedes almost like a *Medica* in the huskes: the roote is small and threddy.

6. *Quadrifolium fylvestre.* Flower headed or purple grasse.

The purple grasse spreadeth on the ground, the leaves are sometime three in others foure or five on a stalke of a sad green colour, with a shadow of darke purple all over them, the flowers are white. I never saw this in any Garden where it grew, (keepe it with confidence to be good for the Purples in children or others.

The Place and Time.

The two first sorts grow every where in our owne Land, the third in *Spaine, Portugall, &c.* the fourth in some of the medowes in *France*, the fifth in divers of our medowes here: the last onely in Gardens as I take it, for so wilde that is thought by some to be the same is not it, and flower and seede in the Summer.

The Names.

It is properly called τριφύλλιον in Greeke, and *Trifolium* in Latine because three leaves are alwayes joyned together, and it is probable that although *Dioscorides* doth not peculiarly make a Chapter thereof as he doth of other, yet hee knew it and made mention thereof, both in describing the *Latus fylvestris*, which as we shall hereafter called *Lupus*, as also the *Medica* whose leaves were like unto the *Lotus trifolia pratensis*, which likewise he knew it by comparing other herbes unto it. There needeth no great explanation of these Trefoiles, for all authors call them by this peculiar name of *pratense* as being most common therein: the third is remembred by *Lobel*, the fourth by *Lugdunensis*: the fifth *Dodonæus* calleth *Trifolium agrarium*, and *Lobel Trifolium luteum minimum*: and the laſt by *Lobel* in his *Adversaria*. It is called in *Italian Trifolio*, in *Spanish Trebol de prado*, in *French Trefle aux prez*, in high *Dutch Weyde klaver*, in low *Dutch Clavergras*, and in *English* Clover or Clover grasse and Medow Trefoile or Three leafed grasse, and of many also Hony suckles, because Bees sucke much in the flowers.

The Vertues.

Medow Trefoile both leaves and flowers are thought to be cooling and binding: but others write them to be of a digesting and suppurating qualitie: but *Dodoneus* who holdeth with the first opinion saith that they are good to ease the griping paines of the guts and to expell those flimie humours that flow into them: the herbe boyled and dried in a chaffe, which I thinke it cannot doe by any cooling or binding vertue as is here made mention, and applyed to inflammations it will ease them: the juice of it dropped into sore eyes is a singular medicine with many drawing people to cleare them of any filme that beginneth to grow over them, and to take away the pin and webbs they call it growne to them: it also helpeth the biting and stinging of an Adder, and having boiled the herbe in wine they first wash the place with the decoction, and drinke some of the wine to the sore place: the herbe also boyled in Swines greese and so made into an ointment is good to spread on lasting of any venemous creature: the herbe also bruised and heated betweene two Tiles and applyed hot to the Share causeth them to make water who had it stopped before: it is said likewise to be good for wounds, and to take away warres: the decoction of the herbe and flowers with the seede and roote eaten for some time helpeth women that are troubled with the whites: the seede and flowers boyled in water, and after made into a Pap with some oyle and applied helpeth hard swellings and Impostumes.

Chap. XXXIII.

Trifolia alia. Other sorts of Trefoiles.

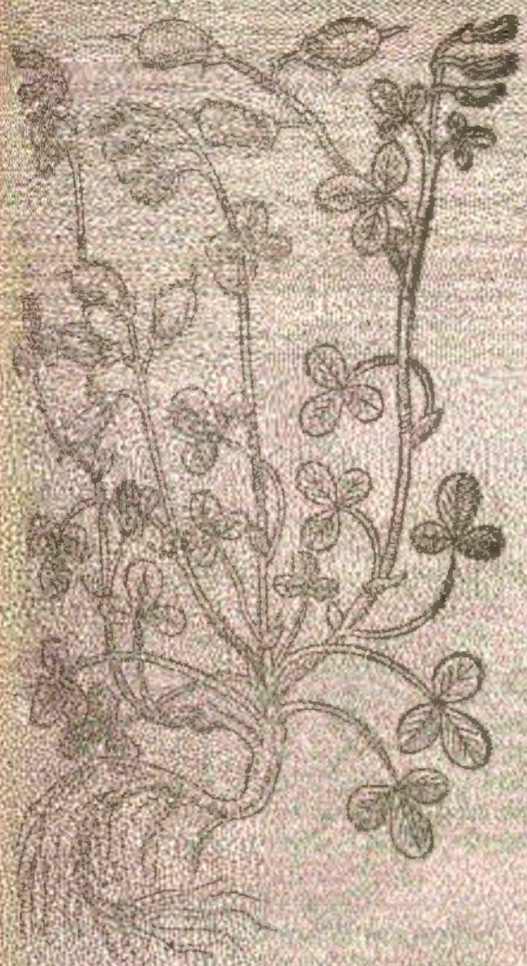
There are some other sorts of Trefoiles which could not well be placed in any of the former titles, for that which must follow, and therefore I thought good to place them together in this

1. *Trefolium falcatum.* Hooked Trefoile.

The leaves here are fashioned like a Trefoile growing on weake stalkes [illegible] the joints with a few leaves on all sides of the stalkes and to [illegible] flowers set upon short footstalkes, which turne into small crooked cods with very small seede in them.

2. *Trifolium odoratum pilosum Cornicum.* Sweete buckler Trefoile. [illegible]

This Trefoile hath a long slender roote full of fibres from which sprout small stalkes [illegible] leaves having but few below and fewer on them, yet made into three round pieces a little dented about the edges, and standing on long footestalkes: at the toppes of the stalkes grow foure or five small [illegible] standing one above another on short stalkes, after which succeede yellowish flat [illegible] with a prick or pearle at the end, with one or two small flat seedes within them: which seede [illegible] and greene very sweete, and eaten by many people, but when they are full growen and hard are [illegible]



3. *Trefolium Cretticum spinosum.* The tiny Trefoile of Candy.

The whole plant hereof lyeth spread round above the ground, sending forth divers [illegible] long or more, full of joynts and branched out from them, where they are of a greenish purple [illegible] ches, having fours small crooked thornes standing at each joynt, two above and two below, at the joynts [illegible]

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

1. Trifolium pratense Creticum.
Cretan Meadow Trefoile or Cassy.

2. Trifolium pratense Cretense.
Cretan Meadow Trefoile or Cassy.

[illegible] hole have two small stalkes of small and long greene leaves of three parts, each ending in a small [illegible] which doe shoote forth the small stalkes with flowers, each one singly by it selfe, made of five [illegible] with purple tawny leaves standing open like unto the flowers of Pimpernell but greater, with divers threads [illegible] yellow and a long stile in the middle, after which succeede small round heads pointed at the ends, which [illegible] the cuppe, and hideth it selfe under the leaves, and openeth into five parts, in each wherein lyeth [illegible] and reddish seede, the roote is long with many fibres thereat.

The Place and Time.

The Cretan faith was sent him by *Gregorius de Reggio* from *Sorona*, where hee found it growing: the [illegible] there in Cassy, their time of flowring being in the end of Summer.

The Names.

The names of these Trefoiles are expressed in their titles, as their severall authors have called them, for *Cæsius* [illegible] made mention of the first in the *Appendix* adjoyned to his History, and in his *Corna pastoralis*, and *Lobel* [illegible] stile and in his *Prodromus* of the last, but *Cæsius* in his History, and *Lobel* in his *Icones*, *Matthiolus* and *Penitus* make mention, and by us is called *Trifolium Cretense* in Cassy. *Cæsius* is much perswaded that it [illegible] *Dioscorides*.

The Vertues.

There is nothing particularly recounted of these Trefoiles what physicall properties they have, but [illegible] at the [illegible] ascribed unto them.

Chap. XXXIV.

Trifolium Creticum sive Medicum. Snaile Clover or Trefoile.

The Snaile Trefoile (Reader) I have given you many names in my former Booke, but there are some other [illegible] which shall be shewed in a Table together with those formerly exprest, and there are others [illegible] of in this place which were not fit for that, and first with the Snaile, and then of those [illegible] are prickly.

1. *Trifolium Burgundicum sive Medicum hispidum Creticum Cochleatum.*
Snaile Trefoile of *Burgoyne*.

The Snaile Trefoile or Clover hath divers weake greene stalkes, with divers small and greene Trefoile leaves [illegible] without order: the flowers grow upon long stalkes comming from the joynts and toppes of the [illegible] many clustering in a thicke short tuft of a blewish purple in those that grow in cleere parts, but in others

Cccc

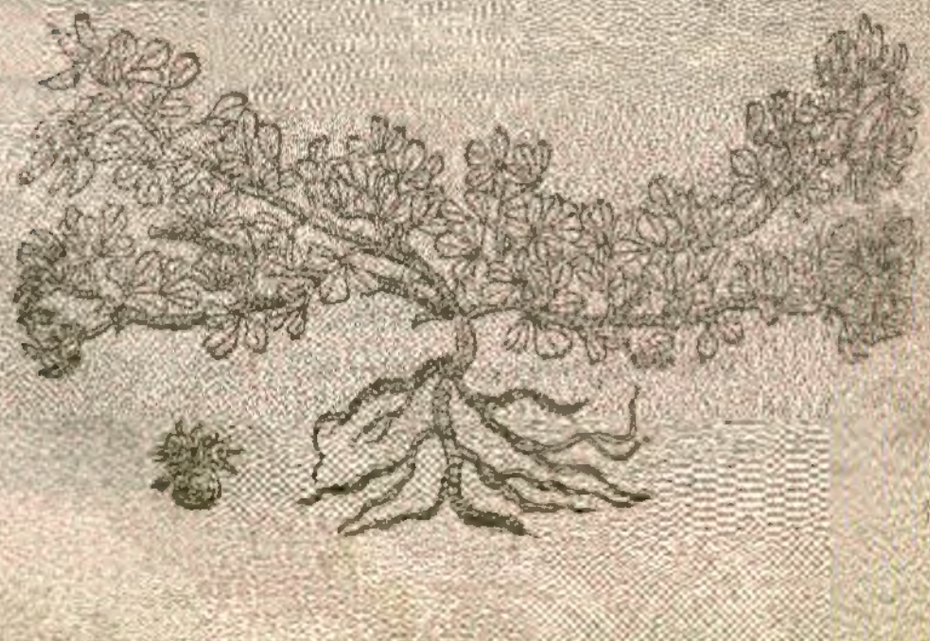
of divers and severall colours as more purple neare a violet, or paler blew, or of a brownish blew, or of blew and yellow colours, parted, and in some places of *Spaine* and *Narbone* in *France* with yellow flowers, after which come divers small snaile-like round cods set togethet not so much twined as many other are wherein lye small pale seedes: the roote groweth somewhat deepe with some strings and dieth long.

2. *Trifolium Cochleatum polycarpon sive Medica racemosa.* Clustering Snaile Trefoile.

This hath branches lying on the ground a foote long and more, set with small round Trefoile leaves, on long large foothalkes, the flowers come forth at the joynts upon long foothalkes, small and many clustering together and after them small snaile-like shells a little rough. There is another hereof whose leaves are dented, where the former is not, and differeth not else.

Alectum.

3. *Medica fruticans, flore flavo sive Clusii.* Wooddy Snaile Clover.



This Snaile Clover hath sundry hard, round and flexible weake stalkes not able to stand upright but lying on the ground, a foote long, divided into many branches, whereon grow small long and narrow leaves by three on a long foothalke, with a thicke middle ribbe on the backe of each, the flowers are small and many together

1. *Trifolium luteum sive Medica lupulina.* Trefoile or Burgundy Snaile with yellow flowers.

3. *Medica fruticans flore flavo sive Clusii.* Wooddy Snaile Clover.

4. *Medica marina.* Sea Clover.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

yellow colour and somewhat sweete, which are followed with other small but twined cods like unto those of the first kinde, with smaller seede likewise in them: the roote is long consisting of long strings which abideth long, thoough the stalkes every yeare.

4. *Medica marina.* Sea Claver.

The Sea Claver hath sundry hoary trailing branches spread on the ground a foote or two long, with many small but very hoary round trefoile leaves on short foote stalkes: the flowers are many small and yellow standing at the ends of the branches and many small wrished shells doe follow after of the smalll Snaile Clavers: the roote is somewhat thicke and abideth long.

5. *Medica marina major spinosa.*
Hard and thorny shield Sea Claver.

This Claver groweth bigger and greener then the last, the flowers are small and yellow comming from the joynts of the branches, and but one at a place which are followed by small hard and round prickly heads, whose windings are easily to be discerned, this perisheth yearely. There is another sort hereof that differeth onely in the smalnesse, which is the third and last figure in the generall table of *Medica*.

6. *Medica Arabica Cameracy sive Trifolia cordatum.*
Hart Claver of *Arabia*.

This home Claver hath very slender and small weake branches full of joynts, and round greenish Trefoile leaves opposing foorstalkes at them, broad at the end and dented in, making the fashion of a Hart as it is usually expressed, with red spots in each of them: the flowers grow two or three together at the end of a stalke comming from the joynts small and yellow, which turne into small prickly twining heads like unto other small *Medicæ*: the roote is small.

6. *Medica arabica cameracy sive Trifolium cordatum luteum.*
Hart Claver of *Arabia*.

Medica volubilis parva rotunda & rubicunda rotunda spicata.
Englished the creeping round prickly Claver of two sorts.

7. *Medicæ Lunata & aurita spinosa.*
Moone Clavers and Amulet Thorny one.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

7. *Medica rubra rotunda sive Tribulus terrestris minor repens Lugdunensis.*
Creeping round prickly Claver.

This round prickly Claver hath very long branches trayling on the ground, with very small yellow leaues on them, the flower are yellow, two or three at the most standing together, which turne into round rough seed vessels, with small or no shew of twining to be seene on them, the roote is small white and threed. There is another growing more upright and with foure or five such small huskes set together, else not differing from it.

Alsa rubra.

8. *Medica lanuginosa.* Moone Claves.

The leaues hereof are small somewhat like unto the fruit true Claver, and dented about the edges, the flowers are yellow, and the pods very like to those of *Hippocrepis*, but yet is not the same, this being an herb and that a shrubbe or bush growing high. Other sorts of Medica or Claver are set downe in my former Booke of flowers, which together with all the other sorts are not there exactly, but once mentioned, I have thought good to treate more fully of them, there are not formerly mentioned but these, which I finde growing

9. *Medica prima vulgaris sive Germanica.*
The greater and leile smooth *Medica*, formed like a Tun.

These two sorts differ not in their growing from the other, but onely in their frame, the pods whereof standeth thickly one at a place, formed like to a Tun, and the seed of both many together, smaller, which two are compressed the two first in the generall Table.

10. *Medica tuncata spinosa.*
The Thorny Tun like *Medica*.

This also hath the seede diuersly in the fruit, which is somewhat like a Tun, but a little thorny or more like unto a fine wrought hare buttons, many together which is the first figure in the Table.

The Place and Time.

The first groweth naturally both in many places of *Spaine* and in *France* neare *Marseilles*, yet it loueth many places to be there sowed in other countries, to serue for Hay for their Cattell and Horses and for it alone, for in *Spaine* they haue no other Hay which feedeth their Horses and maketh them exceeding fat, and so doe they in the Low countries, whereby their Kine giue the more abundance of Milke; the others grow some in *France* others in *Spaine* or *Germany*, and some of them all are found in our fields and meadowes, as at *Woburne*, *Dipford*, &c.

The Names.

The first is taken by the most iudicious of our later writers to be the *Medica* of *Dioscorides*, which as *Pliny* saith was brought the *Medes* into *Greece* by the *Persian Darius* his warres there from whence came the name *Medica* as the *Arabian* name the *Persian* vassalls: but now from *Italy* being brought and sowen for the benefite thereof in the fields of *Italy* and their ordering places, and hath altered the old name into *Fenum Burgundicum* and *Medica* regained the old name, and called *Medica legitima*, contrary to said better agreeing with *Dioscorides* his description in all things then those *Germane* was much deceiued in that their Label *Fenum Burgundicum* was the *Trifolium cochleatum primum* of *Dodonæus* in his 4. booke 4. chapter the other following, as any that will compare them shall soone make good proofe of. Some in this *Province* also are hauing it growing plentifully in our land doe usually call it *Medica* reuerse the third Table called *Medica altera*, and *Medicago Trifolium fœtidum sive Lupulinum* all one with *Medica* before, and *Cytisus* or *Lotus arborea* reuerse as he saith: the fourth *Clusius* hath called *Medica maxima siliquis Lunatis Cornutis* and the fifth the seede of the mother of *Bun* his *Spanish Medica*, whereof we had a shrubby kinde from *Spaine*. The last *Cornutus* calleth *Medica Arabica* and is generally called *Medica cornuta* or *Medica* as the *Englishmen*, his *Tribulus terrestris minor repens* and *rotundus*, which *Clusius* calleth *Medica* the second as he saith truely I know not. The first of these is by *Avicen* and the *Arabians* called *Isc* and *Alfaisa* commonly by the *Spaniards* and *Italians*, but by these of *Castile Alfalfa* as by the *Portugals Herua de Bourgo* [illegible] Fodder and Stable Claver, or Trefoile.

The Vertues.

The vse of the first herbe was in former times more to feede Cattell then to medicine, for it was held of powerfull to fatten their Horses and other beasts that they would soone [illegible] thereby growing sleeke and faire, the greene herbe [illegible] boyled [illegible] pods thereof eaten greene, yet *Avicen* commendeth the oyle made of Cole or [illegible] against the [illegible] the heart, giues such that a liquor drawen by fire out of the shauings of the *Spanish* [illegible] I suppose he meaneth an oyle drawen out of the seede, as the oyle from Almonds. *Fuchsius* reciteth a strong [illegible] taken from this *Medica*. Even as (saith he) the seed [illegible] tione by reason of his many winding branches creeping on the ground, and by his [illegible] greese having faltened his crooked rootes in ones body, cleaueth thereto not for a day or a night, [illegible] yeares, and is hardly expelled but by other greeses as by stronger nailes. The rest here mentioned [illegible] are not vsed against any disease that I know.

Last

Chap. XXXV.

Scorpioides. Scorpion grasse or Caterpillers.

THese plants (one excepted) are like unto the *Alsines*, both in their flowers, pods, & seedes, although differing in their leaves, yet I thinke I doe not greatly erre (as for them at the tayle of the rest of the Pulses, but I have given you the knowledge of two sorts of these Scorpion Grasses in my former Booke, there remaine three more to be remembred in this Chapter to finish the Classis of the Pulses.

1. *Scorpioides Anglica folio glastri corniculato asperi.* Rough or hairy Caterpillers with many cods.

This small Caterpiller also groweth in the same manner with trailing long branches as the first, smaller & rough to touch, the leaves are like unto a fresh greene colour, and of the same fashion, but somewhat lesser: the flowers also are small, and of a deepe yellow, three or five oftentimes standing together, which are of the same greene and fashion with the other, but that it hath as many rough crooked cods together as there were flowers, the roote is very little, but small.

2. *Scorpioides Anglica folio glabro laciniato*, Smooth codded small Caterpillers.

This differeth in all things like this former sort, but that it hath seldome two flowers together on a stalke, and the whole plant is smooth, & few, being crooked and winding in the very same manner, are small and smooth, & not rough-hairie at all, & of the same pale browne colour that it is, the figure whereof is with the leaves.

3. *Scorpioides Matthioli foe Portulacæ folio*, *Matthiolus* his Scorpion Grasse, or with Purslane leaves.

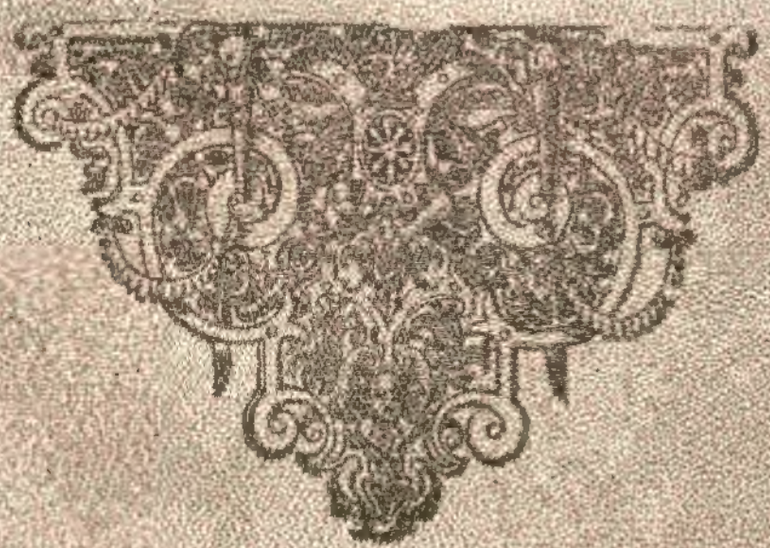
This Scorpion Grasse of *Matthiolus* hath divers upright pale greene stalkes, and pale greene leaves set thereon, and whereof is somewhat long, broad and round pointed like a Purslane leafe, sometimes having small leaves joyned at the bottome of the greater, and oftentimes in many without them, at the toppes of the stalkes, and out at the joynts likewise stand small pale yellow flowers, much resembling those of *Alsine* that follow small long slender and crooked horne, small at the end, joynted or parted, as it were, all the said fashion somewhat resembling the long crooked cod of the *Cochlea* or *Scorpioides*, but this is more conspicuously parted and of a pale colour, within which lie small long whitish yellow seede: the roote is long and thrown, perishing yearely.

The Place and Time.

The first were brought me out of *Spaine* by *Lobel*, as the great one was also expressed in my former Booke: the fourth groweth neere unto *Montpelier*, as well in their manured fields, as in their Vineyards plentifully.

1. *Scorpioides asperrima major & minor.*
The greater and smaller rough Caterpillers or Scorpion Grasse.

3. *Scorpioides Matthioli sive Portulacæ folio.*
Matthiolus his Scorpion Grasse or Caterpillers with Purslane like leaves.



The Names.

No author hath made any mention before now of these, except the first by *Lobel*, who called it *Scorpioides Buplevri folio repens*, & the last by *Matthiolus* by the name of *Scorpioides*, & the bare figure without any description, and referred it himselfe unto the *Scorpioides*, yet as he saith, it was controverted in his time by learned men, that from the authoritie of *Nicander* his *Scholiaste* would have it to be *Telephium Dioscoridis*. *Dodonæus* refuseth that opinion, saying, it neither pleased him, nor many other learned, yet *Cæsalpinus*, *Acoptiara*, and *Columna*, and with them *Bauhinus* hold it to be the true *Telephium* of *Dioscorides*. *Lobel* putteth it to the question whether it be that *Telephium* of *Cratevas* or no, and seemeth to leane to their opinion, saying they are moved thereunto by weake reasons; yet because *Dioscorides* giveth to his *Telephium*, and *Galen* ascribeth to it a drying and clensing qualitie, yet not very hot, and thereby conducing to heale foule ulcers, and the taste of this taken rather like the medow Trefoiles, I may, as I thinke yet continue it in suspence; but that it should be the *Clymenum* of *Dioscorides*, as *Columna* seemeth to thinke, being in my judgement mistaken, in making the leaves of this to be like the small Ribwort Plantane, when as the other *Buplevri folio* commeth neere thereunto, then that not having three ribbes to be seene in the leaves, I see lesse reason, for *Dioscorides* saith *Clymenum* hath a taste like the Beane, foure square, but so hath not this, nor hath it those *Polygonum circles*; but that *Buplevri folio*, hath undecde some resemblance of their rough prickles, but not this which is smooth: *Bauhinus* also seemeth to make two sorts of this, the other which he referreth to this which is usually called *Scorpioides Matthioli*, the other he calleth *Scorpioides Portulacæ folio*; but I thinke he can finde no other *Scorpioides Portulacæ folio*, but the other *Buplevri folio*, I have given my reason, let others correct with better if they can.

The Vertues.

The two first sorts being plants lately made knowne to us, we know of no properties they have, but that is said of the taste of the Medow Trefoiles, and cannot therefore but be neare of the same effects. If it were the *Telephium* of *Dioscorides*, it should have a propertie in it to clense the body from the foule sanie & matter so must after five houres that it hath beene annointed, be washed away with fairy water, but the texts have no such clensing facultie therein, nor yet to heale up foule ulcers, as is spoken before, that the propertie should be in *Telephium* by *Galens* judgement.

CEREALIA. CORNES.

CLASSIS DVADECIMA.

THE TWELFTH TRIBE.

CHAP. I.

Triticum. Wheare.

Having finished the Classis of the Pulses, the next to follow in order unto them is of the *Cerealia*, that is, all the diversities of graine and Corne, whereunto I will adjoyne with all the severall Vsages and orderings of them, as the old *Romans* and *Greekes* used them in their times for their foode, as meate or drinke, or for medicine which are *Alica* or *Chondros Crimnon, Tragus, Ptisana Zythum Cervisia*, and the rest: after which must follow the Grasses (for that all the sorts of Cornes are the most noble and usefull kindes of Grasses, and therefore preferred before them) Rushes, and Reedes.

To beginne then with the most noble Graine of all others, namely Wheare, it is of divers sorts, some with beardes or awnes, others without, some of a white colour, with a blacke and eare, others with a redder, called red Wheare, and some blew or of other colours, some flat, others square, some with single heads, others with many, some with single rowes, others with double, and some to sowne before Winter, and therefore called Winter corne, others onely in the Spring, called Summer corne, to give you simple descriptions of every one particularly, were to enlarge this Volume, and yet to small purpose: I will therefore give you a description of one that may serve for a generall explication of all the rest, without such differences as may not be omitted, and yet in as compendious a manner as may be.

1. *Triticum spica nuda.* Bare or naked eare Wheare.

The white Wheare riseth up from the creeping joynted roote, with three or foure or more stalkes, with faire broad and long greene glasse-like leaves, at every joynt one, & at the forth joynt it lustily commeth forth the long faire spired head, one like wise on a stalke without any branches, which while the head standeth upright is couered with yellow agles, and when it is full ripe, boweth downe the head a little with the weight thereof, and is set with double rowes of seede or corne, wrapped up in divers chaffie skins or cases, and is when it is cleered of the same compact full corne, fine white yellowish and cleare withall, and is the perfect Wheare of all making the finest white bread. We have in some countries of this Land another sort of bearded Wheare, which the common people call a red coated Lammas; because the stalkes are redder, & else little difference in the eare.

2. *Triticum aristatum.* Bearded or red Wheare.

This doth differ not in the manner of growing in any respects from the other, onely the head hereof is larger and wider than the former, with foure sides seeming to be foure square, and bended also: the meare whereof makes no fine white bread. *Lobel* calleth this *Triticum Leve*, from the *Dutch* appellation, and peradventure it may be the *Siligo Autumnalis* of *Pliny*, &c.

3. *Triticum Lucidum.* Bright eared Wheare.

The bright eared wheare (as namely the differences) which is somewhat longer and greater of a right browne blew-ish colour, long and rough, with beardes and awnes, and the graine harder, and of a browner colour: this kinde is more durable, yet bring much more graine than the former, making also a heavier and blacker bread. *Lobel* calleth this *Triticum Leve Alterum*. *Lugdunensis* seemeth to call it *Tragus*, and called, as he saith by the *French* Blewe.

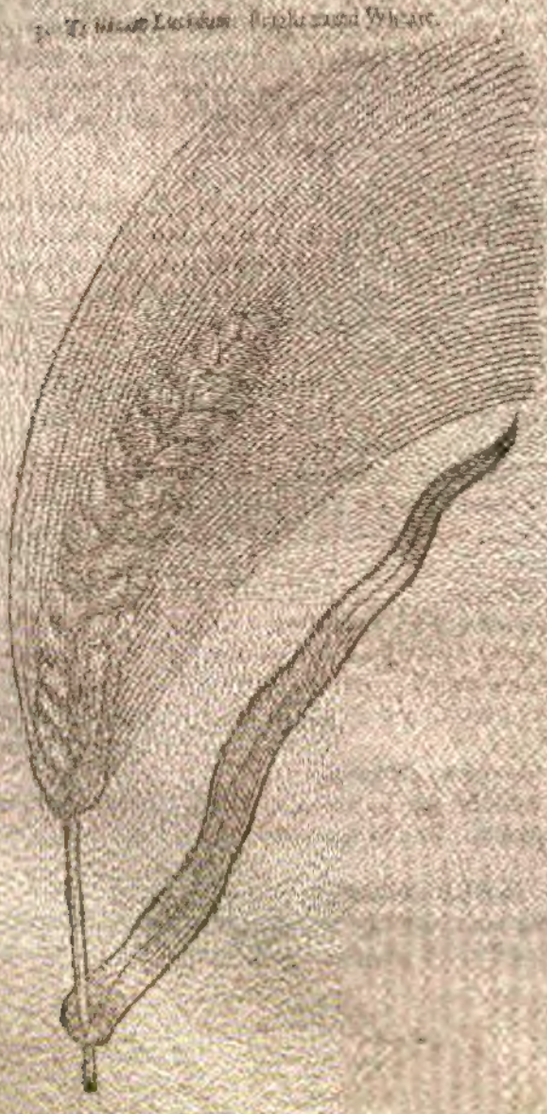
4. *Triticum multiplici spica.* Double eared Wheare.

The double eared wheare is likewise unto the second sort, and differeth in the eare, chiefely which is shorter, and hath divers other small eares rising from the sides of the greater, the beards or awnes are shorter, and so is the straw: the graine is fatter and lesse compact.

5. *Triticum Creticum.* The wilde Wheare of *Candy*.

The wilde Wheare or *Candy* groweth in stalke and leafe like unto ordinary Wheare, the eares are somewhat shorter and blacker, the beardes also shorter, and the cornes lesser and blunt at one end, more like to Rie than Wheare.

A. Triticum



1. Triticum spica dentata.
Bearded or bristled Wheate.

2. Triticum [illegible]
Bearded or red Wheate.

3. Triticum Lucidum. Purple eared Wheate.

4. Triticum multiplex spica.
Double eared Wheate.

4. *Triticum Cretense.*
The wilde Wheate of Candy.

5. *Triticum Tripolitanum.*
Tripoly Wheate.

6. *Triticum Tripolitanum.*
Tripoly Wheate.

This Wheate being brought into *England* from *Tripoly*, we sowed for experience only to see what it would prove: it had stalkes two cubits high, with broader leaves then our Wheate, and eares an handfull long, with very long beards, and blackish graines like it the within them. Whether this may be the *Zea Theophrasti*.

7. *Triticum trimestre,*
Summer Wheate.

This kinde hath narrower eares, longer beards, and smaller graines, and is onely to be sowne and reaped as Barley, with which, perhaps it is earlier sowne in the warmer countries, it will be the sooner ripe, but will not endure the cold of our Winters. We have other seeming diversities of wheate growing in our owne Land, well known in divers countries, which they call by several names, as Cracker-tail Wheate, and Cone Wheate, &c. but I will not bring which of the Genus, either of the Species or Varieties they may agree: And I finde that *Lobelius* hath some other kindes also mixed wheate growing in the several parts of *France* and *Italy*, as naming the one growing about *Lyons*, which they call *Triticum Siligo*, whose eares have no beardes, and whose graine is very small and fullish of all others, yet not so profitable nor great as others, and therefore they there use it not, but when they have boiled it, they make a kinde of pottage with milk (as our furmenty pottage is) which they highly affect, and he there saith also, that some would have it to be the *Far* or *Adoreum* of the old Romans, whereof when it was hulled and boyled they lived many yeares in the beginning of the citie, as *Pliny* saith: *Pulsa Romulei Quirites, rasuro argenteo in Ad. reti ferreum, polita ærea non prius quàm se longo semper usu defuit, &c.* for they liv ed on Pultage

7. *Triticum trimestre.*
Summer Wheate.

and

and not bread for a long time, thus saith *Pliny*: an other is called *Far Clusinum* brought out of Italy, which is sowne in fat ground, bare a stalke as high as a man, or higher, with fixe joyets, and as many leaves betweene the eare an handfull long, the beardes very long and rough, the huskes many thicke and great, the corne of a slender graine, with a deepe furrow, & hard to be thrashed forth, wherof *Pliny* thus saith: it is not so light as Wheate and Barly, but must be parched as Millet and Panicke is, to be cleansed, and therefore doth it keepe with the huskes on it. There is another also which they there call *Triticum a fex quarum*, there it groweth with fixe rowes of corne in an eare, and that in some places of *Savoy* they call it *Rivergues*, because the eare is thereof and rough beh, and hath fixe rowes, when others have but foure: there is also another kinde of red Wheate about *Mantua* in the moist grounds: whose corne is slender and long, and therefore they call it *Lyra* grasse whereof for necessitie they make bread, but else they feede their Swine and Pullen therewith, and the meale seeme like to *Galen* his *Bryza* of *Thracia*. There are also divers other varieties of Wheate, as *Lugdunensis* doth with divers Nations which are very hardly knowne by their doubtfull and double significations.

The Place and Time.

Many of these sorts of Corne have growne with us; but from whence some of them were brought, we know not, saving the double Wheate which groweth about *Lyons*, and that of *Candy*; the double Wheate, Spelt Wheate, and that of *Candy*, are to be sowne in the Spring, the rest in Autume, and are reaped in *August*, or the end of *July* at the soonest.

The Names.

It is called in Greeke [illegible], in Latine *Triticum quod tritum vix frigitur*, as *Varro* saith, and also *Siligo*, that is, *mundum a furfure, dictum quod culmus exsilit ut ait Varro*. The first is generally called in Latine *Triticum ab aristis carere*, and some take it to be *Robur*. *Lobel* calleth it *Siligo spica mutica*, the second sort thereof is called *Triticum aristis circumvallatum*, of *Lobel* by *Lobel*, but most likely to be of the ancients *Triticum Arbore grave*, as this is. *Dioscorides* seemeth to make it *Triticum Typhinum*, and *Theophrastus* the third is the *Triticum Lucanicum* of *Lobel*, and set forth to be *Tragos* by *Lugdunensis*, and by others called *Triticum Lucanicum* or *Lucanum*: the fourth is called *Triticum romanum* by *Pliny*, and *Triticum multiplex spica* by *Lobel*, but by *Tabernamontanus Triticum Typhinum multiplex spica*: the fifth *Horreum* first sent into *England* from *Candy* by the name of *Agriellari*, and so *Pona* in his *Italian Balon* doth call it, and *Triticum sylvestre Creticum*. but the figure that hee hath thereof doth not, in my minde, answer the description thereof not having any beardes: the five wee have called *Triticum Tripolitanum*, of the place from whence it was brought, but as I said, it may, in my minde be referred to *Zea*, as well from the plot, as from the greatnesse of the growth: the last is called *Strangum*, and *Triticum trimestre* by *Lobel*. The *Arabians* call it *Hoza* and *Hozoba*, the *Italians Formentone*, and *Grano*; the *Spaniards Trigo*; the *French Froument*, the *Germans Weyzen*, the *Dutch Terve*, and we in *English* Wheate. It cannot but admire mee to reade the conceits of sundry the ancients concerning corne, why some should have beardes and others not, supposing that in a fertile soyle the true kind would be without beardes or awnes, & in a leane ground it would have awnes: and againe, that in a dry time or yeare it would be bearded, and in a moist not: againe, that great windes cause their beards to take order, which the quieter doe not: and lastly, that the thicke sowing and growing, doth cause them to be without beards, when the thinner bringeth them. *Galen* also writeth in his first booke and last Chapter of the nature of nourishments, that both he and his aged father, who tooke delight in Husbandry, having sowed both Wheate and Barly very well cleansed from any other seede scattered or mixed among them, of purpose to prove whether they would change their natures into Darnell and Haver grasse: or whether there were naturall seedes of their owne kinde: found that much Darnell rose among the choise Wheate, and but little among the Barly: and that much *Ægilops* or Haver Grasse rose among the Barly, whereby it seemeth he doth confirme the ancient opinion that these and other grasses & seed will change into others either better or worse: but I (and I could never meet with that Countrie or Husbandman that could certainely prove it (although some have avouched it verbally accordingly) that there was any such *Metamorphosis*, but that these & such like weedes rose many by reason many do grow up in the Corne fields, notwithstanding the greatest industry any man can use. Like verily to have, because the first curse of God upon the earth and the reason to cleare the corne, they are taken to weede the fields of the ground it selfe hath so much of the seedes of these weedes included therein, that sowed it selfe whether they were not, nor could not be weeded out throughly, that although every seede were pulled out thereof sowne, yet when it is Spring, it will not want these weedes; and in this one point I doe believe was Galens his Father deceived, who although they chose and cleansed their seede, yet they cleansed not sufficiently the field wherein they sowed their seed. And this may also serve for an answer to *Matthiolus* a learned man of Italy who by tradition had received that opinion, as many also in our Land have, which doth cause the world still willing to continue the old errors, but no certaine truth of transmutation or transubstantion, or reasonable cause what you will, of their Barly into Haver-grasse, or wilde Oates: for let any man use the matter as he will, then that is well weeded before hand, and so continually kept weeded, and having sowne his Barly or Wheate any other graine each by it selfe, and so likewise Darnell, Haver-grasse, or any other seede, it shall be sure the same seedes doe every one keepe their own kind, but degenerate into other kindes, as hath been before opinion, and so will I, but not till then: for the barrennesse or fruitfulnesse of the soyle, or the soiling or dressing with such like, usually may make any herbe to grow smaller or bigger, which may seeme to be a change, but yet is no change of nature or kinde, but the alteration of the herbe and fruit into double, or a part of the forme from his originall, is but as we call it *Lusus* or *lusus naturæ*, and they will [illegible] as we say, as a man that is borne with some mishape or deformitie, as to have [illegible] with teeth, and such like, which as neither the parents, nor the succession proceeds from [illegible] and appointment of God in nature must stand firme, who in the Creation, [illegible] that they should have their seede in them according to their owne kinde, and not [illegible]

The Vertues.

Galen saith, Wheate is in the first degree of heate, but neither drieth nor moistneth evidently, yet somewhat drieth. To eate the corne of greene Wheate, saith *Dioscorides*, is hurtfull to the stomacke and [illegible] a plaister made of leavened bread doth more digest, than that which is made of the Wheate it selfe by it

the leaven and salt therein, for leaven hath a power to draw and digest that which is farre off; *Pliny* saith that *Aquila Pompeia* that was troubled extreamely with the Gout, did put his Legges up to the knees into a great tunne of Wheate, and thereby was eased often and holpen. *Pliny* saith also that the Cornes of Wheate rosted upon a tile, and eaten is a pleasant remedy for those that are chilled with cold: the oyle pressed from Wheate is sweete eye salve: plasters of Iron or Copper heated, doth heale all dangerous festers and Kingsevil sores on the breast, or other parts of the body, being tyed warme, and hereby saith *Galen* wee have knowne many to be healed: *Marcellus* commendeth the same oyle to be put into hollow Vlcers to heale them up, the same also is good for the chappes of the hands or feete by reason of cold, as also to make a rugged skinne smooth: the greene Cone of Wheate being chawed and applyed to the bitten place by a madde Dog helpeth it: slices of Wheate bread baked in red Rose water and applyed to the eyes that are hot, red and inflamed, or that are blood-shot helpeth them: hot bread applyed for an houre three dayes together, to the throate troubled with kernells or the Kingsevill healeth it perfectly: the flower of Wheate mixed with the juice of Henbane doth slay the flex of humours in the joynts being layd thereon: the said meale boyled in Vinegar helpeth the drinking of the sinewes with Feaver, and mixed with Vinegar and Hony boyled together healeth all freckles spots and pimples on the face: Wheate flower being mixed with the yolke of an Egge, Hony and Turpentine doth draw cleane and heale any biles or Plagues sore or any other foule Vlcer, the Branne of Wheate meale is often boyled in the decoction of sheepes head, and it given in Cliters to cleanse and open the body, and to ease the griping paines of the inwards: the said Branne steeped in sharpe Vinegar and then bound in a Linnen cloth and rubbed on those places that have the morphew, scurfe, scabbe or leprosie will take them away, so as the body bee well prepared and purged before: the decoction of the Branne of Wheate or Barly is found of good use to bathe those places that are burnished, Ruptures: the said Branne boyled in good Vinegar and applyed to swollen breasts doth helpe them, and keepeth all inflammations, it helpeth also the stinges of Vipers, and all other venemous creatures. The Leaves of Wheate meale hath a propertie to heate and to draw, and in especiall it raiseth the hard skins of the feete and hands, as also warts and hard knots in the flesh, being applyed with some fair starch moistned with Rosewater and lentils the cods taketh away their itching: the Wafers that are made of the purest and finest volatile flower being put in water and drunke doth slay the Laske and Bloudy flux, and is profitably used both inwardly and outwardly for the Rupture in children; and boyled with Roses, dry Figs, and some Iujubes maketh a fit Lotion to wash mouthes or throats, and when the kernells thereof are swollen and sore: the same also boyled in Water unto a thicke gelley and taken, stayeth the spitting of Blood, and boyled with Mints and Butter it helpeth the hoarsenesse of the throate.

Chap. II.

Zea quorum sive Tritico speltum Lobelij. Bastard Wheate.

Zea quorum sive Tritico spelta Bastard wheate.

Now those kindes of wheate I thinke it meete to adde this kinde yet a part by it selfe, being as a meane betweene Zea and Wheate, or Wheate and Barley, for as *Galen* saith in a, *Alimenti*, it groweth in the coldest places of *Bithynia*; as also neare unto Illyria, in the further parts of *Phrygia* which *Homer* also mentioneth, and as the name is so is the nature thereof, for the seed of it is by so much worse then Wheate, by how much it is better then *Bryza* of *Thrace*, thus much is *Galens* relation. *Dodonæus* from *Tragus* herennto applyeth the figure of a Corne, which as *Tragus* saith the *Germanes* call *Korn* and *Dinckelkorn*, and is the same that *Lugdunensis* calleth *Triticum granosum*, and *Lobel* taketh to bee that kinde of corne which is brought from beyond Sea unto us and sold at the Apothecaries by the name of *Hordeum excorticatum mundum*, French Barley, *Tragus* describing it saith that it is in stalkes, joynts and eares like unto *Zea*, the Corne is not much differing from Wheate, but yet is not couered in husks as *Zea* is, but is easily rubbed forth, and is yellow with colour like Wheate: it is sowen saith he in some places of *Germany*, to serve both for bread, & for the making of Wafers and Tisanes, for which purposes it serveth in the stead of Barley: *Lugdunensis* also thinketh it nothing vnlike it nor the same kind of Wheate that *Lobel* saith the French call *Semeaon*, as if it were said *Semen Zeæ*, whose Graine is small, lanke and of a dark colour.

The Place, Time, Nature and Vertues hereof are sufficiently touched in the description, and therefore there needs no more to be said of it.

Cap. 111.

Zea. Greeke Wheate.

THere are some other sorts of Corne that more properly may be accounted kindes of Wheate then any other sort of Graine, and therefore are to be entreated of before either Rie or Barley in their severall orders, and full of that Graine which the ancients called *Zea* a distinct Corne differing from others, and by *Dioscorides* held to be of two sorts (although *Theophrastus* and *Galen* have made mention but of one, (which is the *Dicocos* of *Dioscorides* as it is thought, the one *Dicocos* and the other *Simplex* but first I thinke good to set downe the *Zea* of *Theophrastus* as he describeth it.

1. *Zea Theophrasti & coniugatum.* The Zea of the antients or Greeke Wheate.

The Greeke Wheate riseth up with many strong joynted high stalkes and leaves on them much like unto the Corne is plentifull in Corne as *Theophrastus* saith. (bare without beards as *Lobel* and some others have drawn yet *Lonicerus* setteth it forth (if his bee true *Zea* with beards, for *Theophrastus* maketh no mention thereof) whose Graines are inclosed in many chaffie huskes, being the lightest of others which are not so fully set as our as wheate, and is very pleasant to all creatures: the rootes are many, and strongly fastned in the ground whereby they draw much nourishment out of the ground, defiling a rich soile, and thereby quickly drawes soile the fairest of the ground. This is the truest description of *Theophrastus* and the ancients *Zea*, especially drawne out of the ninth Chapter of his eighth booke of the history of Plants. Vnto which of all our grains and that that the later writers have referred it unto, this may agree thereto in all parts I cannot finde, for neither *Matthiolus* has *Zeadem* nor *Lonicerus* but *Zea* are naked but bearded, nor can it agree with *Camerarius* his *Zea* nor yet with *Tragus* his third *Zea* [illegible], having neither thorny nor rough stalkes, nor yet mine owne from such a bushie roote as *Theophrastus* giveth to his, unlesse it may be said it is degenerated, nor *Theophrastus* in the eighth Chapter of his eighth booke doth that no Corne is so apt to be metamorphosed wholly into *Tritico* and *Zea*, but I thinke these alterations of plants are as likely as their translations of kinde.

2. *Zea dicocos sive Spelta vulgo.* Spelt Wheate or Spelt Corne.

The Spelt Corne is pilladge and leafe somewhat like unto Wheate but not rising so high, the Eare is thicke and not easily set in severall, the Cornes grow double, that is two together, but not inclosed in our husks. Many have thought it to be severall or loose and hardly to be thrashed out, which then some what resemble Wheates the leaves are thornie full in things and flates.

2. *Zea monococcos sive simplex sive Brizæ.*

3. *Petite* Corne.

This ariseth up with a single slender and short stalke but strong, bearing a small slender spiked eare, set with rough beards like Barley alike, being as it were flat, with the Cornes set onely on two sides, every one contained singly in a husk, which are as *Tragus* saith of a darke red colour, and the Eare also, but of shape like Wheate or Barley, which maketh blacke bread, and of an ill taste as *Absyrtus* told *Galen*.

The Place and Time.

The first was anciently sowen in *Greece*, *Asia* and the East countries, and accounted by them to bee next in goodnesse unto the finest Wheate, being a Winter Corne: the second is sowen in many places of *Italy* and *France*, and will abide in a moist ground holding out the Winters injuries, yet prospereth best in a more fruitfull dry soile, and is a Winter Corne sowen in *December* and *October* and reaped in *July*. The last is a Summer Corne growing in many places of *Italy*, &c. where but to want of Corne they make no bread of it.

The Names.

It is called in Greeke *Zea* and *Coe* in Latine also *Zea* which *Gaza* translateth *Semen*, taking it as it is likely from *Pliny*, who before him said that *Zea* was *Far* or *Adoreum*, which was called also *Semen*, as the most English Corne of any other. The second is thought by many to be the *Zea* of *Theophrastus* and *Galen*, but as I said it is more likely to bee the *Zea* of *Dioscorides* (for these two authors have in many things given names to Plants the one farre differing from the other as may bee knowne by the *Manuscripts*, the one to farre differing from the other as though they had not lived in one and the same country or rather in one and the same world) and is therefore generally called by most writers *Zea dicocos*, and pseudospelta was the old *Romanes Far* and *Adoreum*, or *Semen Adoreum* of the later *Romanes*, and is now called Spelta. The last is variable called *Zea simplex* and referreth it to *Dioscorides* his second *Zea* which most doe [illegible] and is thought to be that *Brizæ* of *Galen* which he saw in the fields of *Thracia* and *Macedonia*.

3. *Zea dicocos sive Spelta & monococcos vulgo* Spelt Wheate and *Petite* Corne.

which is a forcible argument in my judgement, that *Zea* is bearded, and called *Spelta* by *Dodonæus*, *Lobel* and *Lugdunensis*, as also by *Tragus* and *Caselpinus*, or *Frumentum Monococcum* by *Dodonæus*, the *French* the second *Epigenes*, the *Germanes Speltz*, *Affche Weyssen*, and *Rauche Weyssen*, and the last S. *Peters Korn* and the *Low* the *Indians Pirre*, and in some places *Bradam*, *Mariholas* saith, and by that name have I received both the seed and the use of *Italy* as you shall finde it set downe at the end of the description of the second sort of Barley.

The Vertues.

Although this *Zea* is in a meane betweene Wheate and Barley, and *Dioscorides* saith it nourisheth not so much as Wheate, yet more then Barley yet is acceptable to the Stomacke.

Chap. 111.

Typha seu Triticum Typhinum. Light Wheate.

Typha riseth up with a single and slender stalke of straw, the eare is long and round, bearded with long hard sharpe awnes somewhat closely set together, the graine is small and light but hard, and of a redder colour then Wheate, inclosed in divers chaffie huskes hard to be beaten out: this groweth well in a leane soyle and delireth not a rich or fat ground as *Zea* doth.

2. *Triticum Typhinum aberrantium Hispanorum*, Spanish Light Wheate.

The other light Wheate differeth from the former in these particulars, the stalkes are shorter then Wheate, and lesser, the eare is small and bearded, with long and sharpe awnes like Barley, the Graine or Corne is somewhat like Wheate but lesser and yellower, and is inclosed in single huskes eathe to be beaten out, which doth seem to be differing.

The Place and Time.

Dodonæus saith that the first is most sowen in the mountainous places of *Austria* and *Stiria* more then in any other of the Provinces of *Germany*, and especially because the wilde Swine that will bee feeding upon and destroying any other Corne will not touch this or very hardly, because the sharpe awnes will pricke them, and if they should eat it, it would quickly hurt them and often times choake them. The other groweth in *Spaine* and in *Italy* as *Lugdunensis* saith, for it is often found among the Canary seede that is brought from thence, and is both Summer Cornes, that is, sowen in the Spring and reaped in the end of Summer.

The Names.

The first is Greeke *Zea* and *Typha* in Latine, but of some later writers *Typha vera* and *Triticum Typhinum*, that may bee distinguished from the other *Typhæ* the which are called Reede Mace. The first is not knowne to grow in our Land but remembred by *Dodonæus* and others to be the third sort of Wheate: *Lugdunensis* saith that *Dodonæus* is much deceived in thinking this *Typha* to be that which the French men called *Horiel*, and they *Grand Aristeau* (that is our Maslin) being a mixture of Wheate and Rie sowen together.

The Vertues.

Dodonæus saith that the bread that is made of *Typha* is not much esteemed both by countrey men and citizens, but eaten hot, is lighter then that which is made of Wheate, but if it grow to be two or three dayes old and cold it will lye heavie on the stomacke and hard to be digested: some doe thinke rightly this is the sweete Corne that *Homer* saith *Mestor* speaking to his Horses promiseth to give them, for as it is said it may bee eaten without any parage which as Wheate cannot.

Typha Dodonæi or *Triticum Typhinum Hispanicum*. *Dodonæus* his Light Wheate and that of Spaine.

Chap. V.

Olyra. Soft Wheate.

The Soft Wheate (or *Amelcorn* as *Dodonæus* saith the *Germanes* called it) groweth as great and high as Wheate, the eare is sharply bearded like Barley, whose graines or Cornes being inclosed in chaffie huskes like unto *Zea*, are being cleansed like unto Wheate.

The Place and Time.

It groweth (saith *Dodonæus*) as well as the other in *Asia*, *&c.* and *Pliny* saith in *Egypt*, *Syria*, *&c.* as also in *Greece* but *Lugdunensis* saith he knew of none growing there in his time. It is saith *Dodonæus* sowen in divers

places of *Germany*, and is a Summer Corne as many thinke, yet saith himselfe *Olyra* and *Far Clusinum* are Winter Cornes.

The Names.

Olyra in Greeke is called *Olyra* also in Latine, *Gaza* translateth it *Siligo* (which *Pliny* saith maketh the sweetest bread and hee altered it to *Silligo* which maketh the finest white bread) yet *Pliny* doth not say that it is *Siligo*, although *Hermolaus*, *Ruellius* and *Rondelius* did so thinke, for *Lugdunensis* saith he can finde no such thing in *Pliny*; who saith it is the *Arinca* of the *Gaules* being proper to their country. *Dodonæus* calleth it *Amylenm frumentum* from the *Germanes Amelkorn* as is said before, and thinketh it also to bee the *Far Halicastrum* of *Columella*, and not much to differ in any thing from the *Oriza Germanica* of *Tragus*, who called it also *Far candidum* and *Tragi tritella*, thinking *Tragus* to bee a kind of graine of it selfe, when as it is but a kinde of meate or pultage made of Corne, as *Alica*, *Chondros* &c. are, as shall bee shewed hereafter. I have rather called it Soft Wheate after the minde of *Theophrastus* who calleth it *præstia mollior*, then Starch Corne after the *Germane* name.

The Vertues.

It is to seeme the propertie of *Typha* as *Galen* saith that it is in goodnesse next unto Wheate, and that the worst *Olyra* is equall to the best *Typha* after the bread made of it is a day or two old: but eithe being eaten hot *Typha* is farre better then *Olyra*. *Pliny* saith that of *Olyra* is made the sweetest bread; *Dodonæus* declareth through all *Turkie* they much delight to eate hot bread or cakes, and some sop them in wine and so eate them.

Having now shewed you all the kindes of Wheate, let me a little exhorte you (although not without some trouble to my selfe, but much varietie and discordance among the old writers) of the severall sorts of meates, or pultages, and drinkes made of these kindes of Wheate (for those things that are made of Barley shall be shewed after Barley) which the ancients used for their nourishment and health for many hundred yeares, whereof most if not all are quite exiled from use now a dayes, and in stead

Olyra. Soft Wheate.

CHAP. VI.

Of *Far*.

THis word *Far* is very variably understood and applyed by the old writers: for sometime it is put for a kinde of Wheate or *Zea* as some take it, as *Pliny* sheweth in his 18. Booke and 8. Chapter, who reckoning up the diversities of Wheate, *Vulgatissima* (saith he) *Far quod Adoreum vocant Italiæ*, *Siligo*, *Tritici hæc puto mutationes sex in communia*, and in the tenth Chapter of the same Booke he saith, *Far Arinca dulcissimæ paxæ*, *ipsa pistilior quorum Far ex mixtura spicæ*, *cadens ex pondere* and in divers places, but I desire with what brevitie I can to shew it. Secondly for the pultage made of that Wheate as in the seventh Chapter of the said eighteenth Booke saith, *Pepulum Romanum* (corrupted from *Farrum*) *Græci* (meaning the *Romans*) *a quo farre Veteres traduxit, quo tempore nullus fuit alius usus.* Thirdly it is taken for all other kinds of Wheate themselves as some thinke, or rather as I thinke for the pultages made of them as by *Columella* appeareth in hath *Far Adoreum*, *Far Triticeum*, *Far Hordeaceum*, and *Pliny* saith *Far triticeum in Campania Far Adoreum*. And lastly it is taken for the fine meale of that Wheate called *Far in Adoreum*. *Festus* saith that the old *Romanes* did call their marriages *confarreata*, because the married people did eate of *Far* together. Some of our moderne writers have taken *Far* to bee the same with *Alica*, because of the manner of their preparations: but as shall be shewed that of *Far* differeth from that of *Alica* in many things. *Columella* setteth downe the manner of the preparation hereof in this manner. The Wheate is first [illegible] being taken from thence is cast into a Morter where it is clensed from the husks and afterwards [illegible] and rubbed with the hands until it bee fully clensed, which being done it is broken a little [illegible] graine may bee broken into foure or five peeces, and being dryed is kept to use after the manner of [illegible] boyled. Some also take the greene eares of Wheate and thereof make more pleasant meate [illegible] other. This pultage doth very well resemble our boyled Wheate, which yourney people [illegible] while it is hot, and to bring it to sell in our *London* markets by the name of Dish Wheate, and [illegible] and being boyled in milke maketh pottage called Furmentie pottage.

Chap. VII.

Of *Siligo*.

Siligo also is diversly understood by the ancients. for first it is taken for a kinde of Wheate as *Pliny* saith, *lib.18. cap. 9. Siligineum propter dixerim Tritici delicias convenientes tractibus humidis*, and againe *cap. 10. Siligo nunquã maturescit parcius, &c.* and *Columella* saith that after *Robus*, which is chiefely to be sowen the second sort saith he is *Siligo*, which is the chiefest for bread: and in another place nameth *Siligo* and *Hordeum* that they can endure *vernos tepores*. Secondly it is taken for a faultie or degenerate Wheate, as *Columella* saith, *Nonne vetitum solo siliginosa post tertiam fationem vertitur in Siliginem*. Thirdly it is taken for the finest flower of Wheate both by *Pliny* in divers places, by *Celsus* and *Iuvenall*. By *Pliny* thus, *Instituere Tyrano Lamiæ quam vocant vestrearn, è medio redire secundis quatuor Siliginis*. And in another place *e Pisana autem Similam secernat quisque, Celsus* saith *Extrema omnium similima Siligo deinde Similæ, insequitur ea pollinis, infirmissima autem pars*: where note that *Pollen* is here taken by him to be a courser sort of flower then *Similæ*, as *Cicero* also is said to be the worst, and *Iuvenall* in his Satyrs saith,

Sed tamen & niveus mollique Siligine fultus
Servatur dominо.

Chap. VIII.

Of *Crimnon*.

We finde much diversitie recorded of *Crimnon*, first that as *Galen* saith it was wont anciently to be made of Wheate, as *Alica* or *Chondrus* was of *Zea*: then that *Crimnon* of the Grecians, and *Similæ* or *Similago* of the Latines is the courser meale of the husked graine called *Far* whereof they made their pultage: againe *Dioscorides* saith *lib.2. c. 83.* and *84.* that *Crimnon* is the courser meale of *Zea*, and of white Wheate, as also of *Oliva*. It (saith he) nourisheth much, but it is (hardly made some reade, but others) hardly digested, and it bindeth very powerfully, especially if the *Zea* whereof it is made be first parched.

Chap. IX.

Of *Chondrus* or *Alica*,

Of *Alica* of the Grecians seemeth to take the name *quasi gemma* for the excellencie, and *Halica* or *Alica* of the Latins, *ab alendo* from nourishing, for all authors have so translated *Chondrus*, (although *Ægineta* maketh *Chondrus* & *Alica* to be two severall sorts, but he is contradicted by all Latine writers;) & is diversly also understood by the old writers; first for a kind of graine, as *Pliny* in reckoning up the kindes of former Cornes nameth *Millet, Panick, Lentils, Cicers, Alica*, and *Galen prima alimentorum* saith *Alicæ genere tritici est*, and *Paulus Ægineta* saith *Chondrus* is like unto Wheate but more glutinous, but more usually for the most excellent meate or pultage that was used in those times: *Dioscorides* saith *Halica* is called *Zea* called *dimacor*, *Galen*, *Paulus Ægineta* and *Ætius* shew in many places of their workes that it was made also of Wheate and other sorts of Corne: but that *Far* and *Halica* were different sorts of meate is likewise sufficiently by *Pliny* and others, for *Pliny* saith *lib.18. cap. 8. Aliud esse Zeamen à quo fit Alica, aliud ex Far*, and in the Chapter before, the old *Romanes* lived onely of *Far* made of Wheate 600. yeares, and in the 24. Booke and 13. Chapter he saith that *Halica* was a meate lately knowne, and as he thinketh not in use before the time of *Pompeius magnus*. The manner of making it *Pliny* setteth downe *lib.18. cap. 12. Alica* saith he is made of *Zea* hull steeped in water, then beaten in a woodden morter, for a stone morter would breake it too much: the flower is made by the painefull labour of those that were bound to their pestell (yet the chiefe men had one of Iron) the first being beaten small it was againe beaten in the same manner, that the naked graine might be broken, and is of three sorts, the smallest, the second and the greatest, yet saith he it had not the whitenesse that commended it unlesse choice were put to it: which gave it colour and tendernesse, and afterwards a fourth part of *Gypsum* whereof he seemeth that *Pliny* himselfe seemeth to wonder they should added, for it is likely they were washed away before they were used as *Galen* sheweth, that their brothes must bee heedefully observed to bee made of *Alica* being washed. *Dioscorides, Galen* and *Pliny* doe much commend the good nourishment it maketh: for saith *Pliny*, no meate nourisheth but that it is exceeding profitable, whether it bee taken washed with Meade or boyled in water, for so it is called in the *Apothecaries shops* (*Chondropisana*) or pottage, and that if the old Grecians had knowne it, they would have written more to much in praise of *Ptisana*. *Dioscorides* saith it nourisheth more then Rice & bindeth more also, and is more profitable for the stomacke: being boyled in Vinegar and applyed it helpeth the leprosie, taketh away the blacknesse of the bruises, and is helpefull in the beginning of a Fistula in the eye, the decoction thereof eaith that vomit nothing have a taste of the bloudy flux.

Chap. X.

Of *Athera*.

Dioscorides saith that *Athera* is made of *Zea* finely ground, but is made into a kinde of supping like unto a mild pappe, and is given to Infants, and is also used in pultesses to be applied outwardly. But there be some authors that affirme it was meale also of Wheate, *Olyra* and *Amylum*, and thereupon have set it down that the Booke binders Paste is this *Athera*.

Chap. XI.

Of Tragus.

THis also hath beene diversly interpreted by writers, some taking it for a kinde of graine by it selfe, as by the *Triticum lucidum* as is said before, because *Dioscorides* seemeth to say it is such a kinde of graine. *Alica*, and hordeum *Gallicum* also followeth him, but in stead of a graine of *Dioscorides* seemeth when as *Alica* as I shewed you before, is not properly a graine by it selfe but is made of *Tragus* *Gallicum* hitherto in the last booke *Icones Alterum* with that *Tragus* is a thing made, and like unto *Alica* *Olyra*, looked as it maybe seene, when boyled in water, which being poured away, either sweete wine or water was put in it, and Pine kernells steeped in water untill they were much swollen the like was done *de vua, vel, lo mio Pisacreta, Plinius* *Tragus* and *Plinij* lib. 18. cap. 7. *Tragus* *Tritico simile* *Tragus* *Cassiorum* *Alica* was made of the Wheate of *Alexandria*, which by most authors is *Olyra* (for it there groweth but little) husked, and dryed in the Sunne often untill it were cleane from the shales: where by wee may plainly see all sorts of graines were husked, and so ordered into divers manners of meate, and called by divers names as now the graine of countries. This hard of digestion as some reade, or as others, it is hardly made, and doth bind the belly more.

Chap. XII.

Of Zea.

THe seaventh is *Dioscorides* like unto Summer Wheate, and also of *Zea* steeped three dayes and nights till it be soft and tender, the water then powred gently from it, and other fresh water powred on it, and then trodden with the feete till all the coarse huskes be cleane taken away, in such sort the meate passe through a sive, which then being dryed in the sunne but touching fire it is to be made like unto *Alica* that it was made of *Tragus*. *Plinij* saith of all sorts of Wheate growing of *Siligo*, but the best of Summer Wheate, it was so called lest it should be taken for Winter Wheate, against definitions put the eyes to heale hollow Ulcers therein, being drunke it stayeth the spitting out into spittle and easeth it helpeth the rotten flesh or heartscell of the throate. *Zea* *Zea* of *Zea* (and so saith *Gesnerus*, and of Wheate saith *Plinij* steeped and washed as is above said that hath by this no use in Physicke but we use it often in our Countries and in deliciats.

Chap. XIII.

Of Rice.

OF this kinde of graine besides the common knowne sort, there is two sorts remembred, *Tragus*, *Dodonæus* and *Lugdunensis*, the other by *Brabantus* as you shall presently understand.

Oryza hodiernis. Common Rice.

Our common Rice is knowne in all the countries of this Land and in the common gardens of Physicke, with which I shall seeme as it were but to make too bold with you, if I should stand long hereupon, that I shall

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

ground, that is, that it first springeth up somewhat reddish, which afterwards groweth greene, and bringeth forth smooth jointed stalkes, somewhat higher than Wheate, bearing at their toppes smaller eares than Wheate, of diuers rowes, with shorter and sharper, rougher, and more prickly awnes: the graine within being smaller and more reddish then Wheate, and is not wrapped in huskes like Wheate, but easily falling of it selfe out thereof when it is ripe: while it is growing the eare standeth upright and being ripe in ripening it bloweth it downe: the roares are many, but not so thicke bushing as Wheate, nor conteining the fortune of the soyle so large Wheate.

2. *Secale aestivum seu minus.* Small or Summer Rye.

Summer Rye groweth lower with fewer stalkes, a shorter and lesser eare, yet armed with awnes as the other rowes, the graine or corne also is lesser, and is sowne in the Spring onely, and herein consisteth the difference.

3. *Secale latifolium.* Rye with great leaves.

This hath smoother stalkes then others, round also and straked, the leaves that are set at the joynts are much greater then the common sort, being a foote long and an inch broad, somewhat sharpe or rough about the edges like ordinary Rie: the eare at the toppe is large and great, set with sharpe long awnes, and as it were crested like Wheate a full hand breadth: the graine within is also like unto it, blackish but greater then it, being almost like Wheate: the roote likewise bushieth like the roote of Wheate.

The Place and Time.

Rie is generally sowen in all these Northerne regions and more in *Denmarke*, and those more Northerly countries else where, then climate not serving to well for Wheate, and sowne in *October* and *November*, and sometimes in *March* onely, and are all ripe in *August* usually: the last is brought out of the East countries, and *Iohnson* hath had onely the leaves and the eare out of *Signor Comarine* his Garden.

The Names.

The last not found as yet any Greeke Father to name it, but is generally called in Latine *Secale* of *Pliny*, and is *Farrago* also, yet *Farrago* is in many places of him, *Varro*, *Columella*, and others, taken for a greene fodder for cattell, as *Pliny* sheweth how to make a *Farrago* of Wheate, *Columella* of Barly. *Varro* saith, *Farrago* was called rather *quod far ex eo fiebat*, *aut quod primum è Farre fiebat*: *Farrago* for the present but the true *Farrago* is described by the best Authors now adayes to be no other thinge than Barly. *Tragus* and some others take to be *Zea*, *Cordus* on *Dioscorides* the *Olyra*, some others to be the *Tiphe* of *Theophrastus*, which for the hoarie like is called *Typa terrestris*, and because the *Dutch* call it *Roggbe*, therefore *Dodonaeus* maketh a Latine name of it, and calleth it *Roggen*. Both in our countrie, and in others, they have a custome to sow Rie and Wheate mixt one with the other in their fields, which they call Mastin, as well in the fields, as in the market: the *French* *Meteil* is which, as I said before, *small Rie* and *Wheate* together, and the country people and meaner sort with us make it their best bread corne, being better than cleane Rye, and worse than Wheate. The last is generally described by all Authors, as found both by *Tragus*, who calleth it *Zea altera*, *Dodonaeus* *Secale alterum*, *Lobelius* *Secale novum*, or *Secale perenne vel minus*: the last is mentioned onely by *Lobelius*, who calleth it *Secale latifolium*, which he had it out of the noble *Lord Zouche* his Garden, a *Magnifico of Venice*. The *Italians* call it *Segale*; the *Almaines Cockens*; the *French* *Seele*, and *Regale*; the *Germans* *Rocken*, and the *Dutch*, as I said, *Roggbe*, and we *Rye* or *Rie*.

The Vertues.

Rie is of a more clammy substance than Wheate, and neither is digested so quickly, nor nourisheth so well, yet is counted to be next in goodnesse unto Wheate, especially if the corne be sweete and good, and the bread well fermented and baked, and giveth a solide and sound nourishment to the body. The medicinable qualities are, almost, dwelling than Wheate, the meade and the leaven thereof ripeneth and breaketh impostumes, boiles, and sores with more speede. The meale of Rye put betweene a double cloth, and moistned with a little vinegar heated in a porrenger-dish, set over a chafingdish of quicke coales, and bound hot to the head, while it is warme so it, doth much ease the continuall paines of the head: the ashes of Rye straw put into water, and washed therein a day or a night, and the chappes of the hands or feete washed therewith, doth heale them, saith *Matthiolus*.

Chap. XIIII.

Hordeum, Barly.

There are diuerse sorts of Barly growing with us in sundry parts of the land, which I meane here to write unto you, and with them one other not so well knowne unto us.

1. *Hordeum distichum.* Beare Barly or common Barly.

The common Barly hath shorter and tenderer stalkes than Wheate, the leaves are shorter, broader and rougher, the eare is shorter set with two rowes of corne in very good order, each conteining a long rough awne or beard thereat, which is greater and longer than Wheate, and easily, of it selfe fall out of the huske: the roote is great, and spreadeth much, having many strings risen from it to supply the tendernesse of the eare.

2. *Hordeum distichum nostrum.* Bigge Barly.

This differeth not from the former, but that it is smaller, both stalke, eare, and corne, and is sowne the same manner with the former, some doe take this to be *Turkie* Barly, but I somewhat doubt that, for having growing in my Garden, taking by some to be *Turkie* Barly, which is somewhat like this *Hordeum* but that is with a small bearded eare of two rowes: the corne it selfe was like a Barly, but smaller: the huske more bright and channelled as it were, or furrowed on the one side, and round on the other, the kernell also more neare to a Wheate than a Barly, and easily comming forth of the huske; I am more than halfe perswaded it is the *Celtic Zea* or *Brica*. We have another sort hereof likewise, whose corne is a little smaller and whiter,

1. *Hordeum Distichon.* Bere Barly, or common Barly.

4. *Hordeum polystichum.* Square Barly.

called Sprit Barly not differing else if there be a Barly that hath no ailes or awnes saith *Lobel*, and so do I know it not.

3. *Hordeum polystichum sive hybernum.* Winter Barly, or Square Barly.

This kinde groweth like the former, both in flalkes and eares, differing onely in not having so many joints rising from the roots, and that the eares are set with more rowes of cornes, in some fodre, in some five or six, and that it is fowne earlier than the former.

4. *Hordeum hexastichon nudum.* Naked or bare Barly.

This other Barly that hath many rowes of cornes in the eare, differeth not from the last, but in their circumstances, the cornes inclosed in the huskes, have not that skinne on them that the other hath, being taken with the fanne, and those also soft like Wheate, but lesse, and is sowne in *Aprill* and not before, and is not scene or known in any almost in this land.

The Place and Time.

The first is one onely Barley in all the South parts of this Kingdome; the other in the North parts onely; the third is likewise reasonable frequent in our Land; but the last, although it be rare, yet we have had it in our Gardens, and was ripe in the beginning or middle of *August*; we have not heard by any, that any kinde of Barly hath been sowne before Winter in our Land, although *Lobel* saith so.

The Names.

It is called in Greeke κριθὴ in Latine *Hordeum*: the first is generally so called as it is to the title, *Hordeum commune*, and by *Columella Hordeum Galaticum*, as I thinke, or else the tenther sort of this kinde, as it is numbred: the third *Lobel* saith is reasonable frequent in this Land, but meaneth in the North parts where his chiefe residence was in his former dayes, for it is seldome seene or known in the parts about London. Fuchsius calleth it *Hordeum vulgare*, *Cereale hexastichon*, and others *polystichum*: the last is called by *Lobel Hordeum polystichum*, & *Germanicum*, likely to be that which Gesner calleth *Cryptostichon*, that is *Hordeum vulgare*, by which name I shall take it to be, and may be also the *Cantherinum* of *Columella*, which he saith, the country men called Square Barly, &c. have a small kinde of grain brought from *Germany* to our Dogdes in great quantities, termed *Pyrgo* Barly, &c. is probable to be this Barly, which *Gerarde* saith, was first sent thence out of *Italy*, having five rowes of cornes and not unlike the Wheate, but lesser. *Gerarde* hath set downe most sorts hereof, which I thinke is to little purpose, you have the two sorts of Barly *Distichon* and *Hexastichon*, this of five rowes, that of six rowes, that of four rowes is common with us, *vel* as in *Dioscorid.* yet that which hath but two rowes in the eare, maketh it recompenced to the greater number of stalkes that rise from thence, for such shall have a hundred fiftie stalkes and more rising from the roote of one corne, but it usually hath twentie, thirty, and forty stalkes, but besides the determi-

such

ple, they have an *Orrowsy* foure other forts: the firſt hath the whiteſt, bearſt, and greateſt graine of all the reſt, and is called by the country men of *Suffex* *Sprat-barley*: the ſecond beareth a little ſmaller graine, and hath fewer eares, and is a *Somerſet*, and is therefore called by the *Germanes* *Sommer-gerſte*, that is, Winter-Barly: the third is ſowne in the ſpring, and is ripe in Summer, and therefore they call it *Summer-gerſt*, that is Summer-Barly: the fourth may properly be called, with the *Frenchmen*, becauſe it is early, and ripe in the third moneth after it is ſowne: this they call *Klein Gerſten*, and *Zeitgerſte*, or as the *Saxons* doe *Tygerſte*, that is a ſmall Barly, or one ripe in ſixe weekes: they ſow it either three dayes before, or three dayes after *Pentecoſt*. Thus much *Cordus*. The *Arabians* call it *Kalbet*, or *Shair*, the *Italians* *Orzo*, the *Spaniards* *Cevada*: the *French* *Orge*, the *Germans* *Gerſten*, the *Dutch* *Gerſte* and *Suerton*, & *Lobel* ſaith, and we in *English* Barly.

The Vertues.

Barly and Wheate are the prime graines of all others, and the moſt profitable and uſeful for mans life, both for meate, drinke, and medecine, all the reſt being as it were but degenerated from them, and partaking of the one or other of the natures and qualities of them; yea Barly may ſeeme to contend with Wheate for priorite, as well as vſe, for although Wheate be the ſtaffe of our life for bread now adayes in our *Europe*, yet it was not ſo with the ancient *Athenians* in the *Levant*, and other of thoſe parts of the world now, where Barly holdeth a ſurpaſſement that Wheate; but this place will not permit that ample diſcourſe might be ſaid of it; & howſoever we acknowledge it according as the antients have recorded of it, that it nouriſheth leſſe than Wheate, becauſe it is a groſſer yet reſteth the medicinall qualities in it, it maketh more wholſome drinke for our bodies than what is made of Wheate alone, which is too ſweete, and too much ſtuffing the body with humours, and puffing it up with windineſſe, ſo far one hath, making them that uſe it unwieldy and unfit to follow their neceſſary affaires; more enough for this place. Barly in all the parts and compoſitions thereof, except Malt, is more cooling than Wheate, and a ſtrong cleanſing, being in the laſt degree of cooling and drying: it provoketh urine, ſtaith *Dioſcorides*, it breedeth windineſſe, and is adverſe to the ſtomacke; but all the preparations thereof, as Barly water, or ſome *Tiſane* drinke, or thoſe other things made thereof, doe give great nouriſhment to patient and weake and diſeaſed perſons, or troubled with feavers or agues, and heates in the ſtomacke, &c. and many of them have ſeene, and ſtill are received for good nouriſhment to the health full: the preparations, as they were anciently uſed, and thoſe that are now in uſe within, I meane to ſpeake hereafter ſeverally; I only meane to ſhew you here how it is otherwiſe uſed. A pulſe made of Barly-meale or flower boyled with vineger and honey, and a few dride figges put to them, diſſolveth all hard impoſtumes, and aſſwageth inflammations being applied: mingled with Melilot and Camomill flowers, and ſome Linſeede, Fenugreeke, and Rue in powder, and applied warme, it eaſeth the paines in the ſides and ſtomacke, and the windineſſe of the ſpleene: the meale of Barly and *Piſſam* Flea-wort boyled in water made into a pulſe, with bony and oyle of Lillies, applied warme, ripeneth tumors under the eares, throate, necke, and ſuch like places: a plaiſter made thereof with Farre, Wine, and Oyle, helpeth the hard ſwellings of the throate, called the Kings Evill, boyled with ſharpe vineger in the colde, and laid on hot, helpeth the leproſie: being boyled in Red-wine with Pomegranate-rindes, and Muſſels, ſtaieth the laske or other fluxe of the belly: boyled with Vineger and a Quince, it eaſeth the hot paines of the eyes: Barly-flower, White Salt, Honey, and Vineger mingled together, is uſed by divers to take away the wrinckles and ſpots of the face ſpeedily and certainely: the water diſtilled from the greene Barly in the end of *May*, is very good for thoſe that have defluxions in the eyes, to ſtay the humours, and to eaſe the paines being dropped into them, or white cloathes dipt in it, and bound thereto: if Barly halfe ſodden be given to Hennes, that hardly or ſeldome lay eggs, it will cauſe them to lay both greater and more often.

Now I will come to ſhew you both what hath been in former times made of Barly, as what is uſed to be made and uſed among us in theſe dayes: but I thinke it fit to ſpeake of thoſe preparations the ancients uſed, and then of thoſe which we uſe.

Chap. XV.

Of Polenta.

Polenta (which may well be called parched Barly) was anciently made after divers manners, for *Pliny* in the 18. Booke and 7. Chapter, ſheweth that ſome Grecians uſed to make it as well of greene Barly ta-ken out of the eare before it was ripe, ſteeped in water, and after beaten in a Morter, and waſhed in Baskets to take away the huſkes, then dried in the Sunne, and afterwards ſteeped and beaten againe, and ſo throughly cleanſed, and then dried and ground ſmall, unto twentie pound whereof how ſoever made, they mingled two pound of Linſeede, and Coriander ſeede, of each one pound and a halfe, and about two ounces of Iuie, all being ſo ground, they mingled together. The *Italians* made it of parched Barly, without any moiſtening, ground ſmall, and thoſe things added thereunto aforeſaid, and ſome Miller ſeede alſo. Other *Grecians* ſaith *Pliny*, made it of Barly moiſtened for a night, and then dried it, and parched or fryed it the next day, and then ground it. Some *Italians* doe thinke that moſt that was made of freſh Barly, before it was throughly ripe, and the beardes or huſkes very tender, and ſo indifferently parched, and added nothing elſe unto it. Sundry Nations did uſe this *Polenta* inſtead of bread, and namely the *Cyprians*, who although they had Wheate growing with them, yet moſt uſed it. This drieth more than Barly it ſelfe, and bindeth the belly, being drunke with red wine, and allayeth vomitings, and drunke with water it quencheth thirſt: it was often eaten with a little new wine, or ſod-den wine put unto it as every one liked.

Chap.

Chap. XVI.

Mash.

Mash is but *Polenta*, parched Barly moyſtened with ſome liquor, as every one thoughe before hath vſed nothing but Water, others put to it both water and oyle together, as *Heliodorus* ſaith, and ſome as *Hippocrates* therwith, did put ſweete wine to it: and ſome put Honey alſo: *Galen* doubteth the Mash of it ſelfe doth hardlier digeſt in the ſtomacke, and doth trouble the belly with worke, if any bide ſtay therein, but it doth the ſooner paſſe downe if it be much turned, and honey be put to it.

Chap. XVII.

Of Ptiſane.

Ptiſane the moſt prayſed and prayſe-worthy drinke, ſeeming to pleaſe (call it how you will) was uſed anciently to be made of divers ſorts of graine, and not altogether of Barly, for they had *Cheonia Ptiſana* made of *Oats*, *Cyrina Ptiſana* made of *Wheate*, and *Rizy* with that *Ptiſana* which is abounding in Rice, made *Ptiſana* thereof, which others made of Barly, and *Galen* himſelfe as was made of Pulſe, for he nameth *Phaceptiſana* that is made of Lentils, but *Ptiſana* without any other addition is alwayes underſtood of Barley, onely lurked for the excellency thereof, the manner of making it is ſet downe by diverſe authors, as *Pliny*, *Galen*, *Dioſcorides*, and others, but becauſe *Hippocrates*, alwayes accounted the Prince of Phyſitions, wrote a whole Treatiſe in prayſe thereof, I will here ſet downe his manner of making it both for meate or medicine. Take, ſaith he, of the beſt Barley, and moyſten it with water as it is for 3. or 4. houres, then put it into a courſe bagge, and teare it with a mallet or peſtell of wood, and ſo caſt off the huſkes, which then being waſhed, to take them away, drie it in the Sunne, and keepe it to your uſe: the uſe of it ſerveth as *Polenta*; but to make it *Ptiſana*; it is to be boyled gently in water until it breake, and the liquor be thicke like creame, which then is fatty, ſweete and lubricke or ſlippery, and by no meanes hard, nor cleaveth dwelt, it hath no aſtriction, nor moveth perturbations, nor ſweeteth in the ſtomacke, for the ſweetneſſe is ſmoke away in the boyling, it ſticketh not in the breaſt or ſtomacke, but by the bitternes is ſomewhat purged and cleanſeth chiefly, by the moiſtening qualitie of thoſe properties, ſaith *Galen*, recorded by *Dioſcorides* are availeable, both for the ſicke and for the ſound: *Dioſcorides* further addeth, the cruſtie of *Polenta* by reaſon of the boyling, yeeldeth more nourihment than *Polenta* that is made of Barly, and is profitable againſt ſharpeneſſe and roughneſſe of the throate, and all exulcerations. This was the manner of the ancient Phyſitions for their manner of making and uſing; but our phyſitions in theſe times ule onely Barly boyled and cleanſed in water and then beaten and thralled, putting ſome blanched Almonds or Pompion ſeede or other cold ſeedes to it, and ſtrained with ſome Sugar and Roſewater; and this is their moſt uſuall *Ptiſane* or Barly creame: ſome appoint Barly to be ſoſt ſodden, which is called Barly-water, and therewith is made either *Tiſane* made by adding Licoris, Raiſons of the Sunne, Maidenhaire, or the like, for ſuch as are troubled with coughes, ſhortneſſe of breath, &c. or elſe with Almonds or cold ſeedes, make it into an Almond milke, with Sugar and Roſewater, or given to hecticke or marſiens and weake bodies: the Barly water alone, or made into a ſyrup with ſome Violet, or Lemonds, or the like, is a fit drinke for thoſe that have loſt or leaving leaven or drunk or ſick wife diſtempered with heate, or uſed with ſome pectorall ſyrupes for the cough, ſhortneſſe of winde, hoarſeneſſe, or the like. There yet remaineth *Zythum*, and *Curmi* of the ancients to be ſpoken of, and alſo *Bracket* ſaith made of Barly, which becauſe wee ſuppoſe in theſe dayes, they did point to our Ale and Beare which are made with Maulr, the ſubſtantiall part of the drinkes, I thinke meere fit to ſpeake of Maulr.

Chap. XVIII.

Sive ſive Malteum. Maulr.

This onely uſed this word *Zyte* which he all to referred to Maulr and as the by name ſet downe by him the word *Pirmely*: *Malteum* is a word made Latine from the Germane word Maulr, both ſignifying one thing, that is, that manner of preparation, or ſeaſoning towards to ſerve to their uſe, that would make of it either Ale or Beare (the name as I take it in all countries alike without difference, and ſo well known to all that need deſire for me to ſet it downe, thereby to enforme any that having ſpent their whole time in other profeſſion, can tell better how to enforme me, but as in all the reſt of the Worke, for the enformes & theſe thoſe that not knowing will not refuſe to heare and underſtand, and thoſe that know can but ſmile at) is to take for two, three dayes and nights, which being ſwollen in that time, the water is and is afterwardes ſpread equally on the floore of a garret, or ſuch like place that is cleane, and ſtricke, and covered with clothes or other things warme, untill it begine to ſprout ready, or (which will be perceived within two or three dayes, if the weather be warme, or not very cold, five longer) then doe they turne it before it grow too hot, two or three times a day for a week or both to coole and to drie it, then doe they bring it to the kill, and there dry it through by with the or other ſuch like ſight fuſſe, to cauſe it to have the ſweeter reliſh, for being dried with heate of the Maulr will taſte bitter of the kindle and is ſome perceived in the drinke, which will taſte bitter.

Original from UNIVERSITY OF MICHIGAN

that it can be ried, is to be ground a little, and then fermented for the brewers vse. If Maulr being ground, be applied in a bagge, or double cloth hot to the sides or belly, pained with stitches or gripings, occasioned of wind or winde, it giveth much ease and helpe, and being made into a pultis, it asswageth tumors and swellings.

Chap. XIX.

Of Zythum.

Nonius, Pliny and Dioscorides onely, and no other authors before them, that I can finde, have made mention of Zythum, what it is, or whereof it was made, and yet they are so short thereof, that we cannot understand this by others relation, what thing it was to consume a drinke there in those places of Greece, &c. that they thought it not worth their labour further to explane it, even as Dioscorides hath done the like with many herbes that were most common in those times, for he onely saith it is a drinke made of Barly and no more: Diodorus Siculus saith that Egypt a drinke made of Barly, and was vsed in Galatia where was neither wine nor oyle: Pliny after him hath further explained it by saying, Of sundry sorts of Graine drink is vsed to be made, as Zythum in Egypt, and Coree in Spaine (which as it is likely was so in Plinies time, and that before their planting of Vines which hath generally now banished that Barly broth, they now drinking either faire water alone, or with a little sugar, or to their water put more or lesse wine as they desire to drinke it) Cervesia and other kindes of drinke in Gallia, and other countries, thus saith Pliny: Now the generall vse of our times is that it is the same drink which we now call Beere or Ale, or but varied according to the manner of the countrey where it is made, according to the goodnesse, quantitie and diversitie of the graine wherevnto it is made, and also of the water vsed for the water, it is well knowne that there is no Beere can bee made in the low countries by reason of raw muddy water, but will taste thereof, and be farre inferiour to that is made in England, and against it is observed by many, that the water of our River of Thames about London doth make better and stronger drinke (keeping a iust proportion in all things) then that which is made of other Spring or River water elsewhere, and for a description of the graine and the well ordering and making it into Mault, it is well knowne also to make the drink better or worse stronger or weaker; the diversities of graine also causeth diversitie of drinke: for if it be all made of Wheate alone it would be too thicke, too sweete and fulsome as I said before, or of Oates it would be too poore and thin and for the quantitie that is all in all to make it neither & durable, even two or three yeares, or poore and weake not to last a moneth. But Petrus Bellonius in his 16. booke of observations and 9. Chapter is of opinion that this Zythum of the ancient Grecians is the same drinke that the Latines call Pisa or Pisea, whereof Columella, Serapio and Zozimen also make mention: but differeth as hee saith from our Ale, because it is white like milke, thicke and of a good nourishment, and forcing into the head causing drunkennesse if it bee too largely taken: and this kinde of drinke saith hee is usually sould in all the cities of Asia in those houses appointed for it, and generally called with them Choustes; and to strengthen his opinion also in this place in Dioscorides, where hee reciteth that Cesars bondman that fled from him was found at Capua selling Pisan a taphe house, and therefore that Pisa could not bee Oxygratum (which is Vinegar and water) as the Printer hath put in Scaliger in his animations upon Bellonius as they are extant in Clusius his Exotickes, shewing a manifold errours in this his saying: the manner of making this Choustes of the Turkes I thinke not vnfit to be here set downe, that you may see the differences of the compositions of drinkes in severall places. It is made saith he of meale made into paste and boyled in a great Caudron, and then being made into small balles and dryed in the sunne, which will presently boyle vp of it selfe and grow hot without the helpe of any fire, and so make a kinde of thicke drinke: The taste or yell thereof, saith he, is white and light, wherewith the Turkish women vse to annoint themselves, especially when they are in bathing, making the rough skinne smooth and delicate, and this facultie the ancients attributed vnto Zythum: and further Dioscorides saith, Zythum provoketh vrine, hurteth the sinewes and the finewes, especially the muscles that cover the braines, it breedeth windinesse and naughtie blood and humors, and engendreth the falling sicknesse.

Chap. XX.

Of Curmi.

Curmi likewise hath no further relation or explanation from Dioscorides, then that it is also a drinke made of Barly and was often vsed for drinke, not yet by Pliny further then as is shewed before, that Barly broth was made in Gallia and other kindes in other countries. We therefore in these times resembling Curmi to our Ale as wee did formerly Zythum vnto Beere, and without let me shew you that the most ancient drinke was made in this Land, wherevnto the Welsh Gwrw (which is Ale as I shewed in their Language) hath a shew of neare correspondence to Curmi, and that our Ale was better knowne in other nations by the word Gwrw by the forme or tolle: but withall became a proverbe, that a man would thinke by his face and nose (meaning of the red pimples it would raise on their faces) that did vse to drinke it and drinke it hourly) yet a stranger both seeing it and calling it here in England Gwrw, he answered to the same words, Nihil potius dum bibitur, nihil clarius dum mingitur, made resemblance of it as it were vpon it. But Cervesia which we more properly transferre to Ale was it seemeth by Pliny, a drinke well knowne before his time, and more proper to Gaule or France then to Italy, as the matter it selfe also and which from them as it is likely hath beene transferred to us. This old English drinke hath lost much of reputation since that Biere Beere came in vse, and nothing so much desired as formerly it was, partly because

Ale

Original from UNIVERSITY OF MICHIGAN

our Ale in moſt places of this Land now adayes is not ſo well boyled to make it cleane and cleare drinke ſcarſly muddy ſweet & fulſome, that many loath it, at leaſt refuſe it for that cauſe, and in eſpeciall becauſe Beere is a cleare drinke and of better reliſh by the boyling, but chiefely that the hopyes make it more durable without ſowrenes, leſſe fulſome and much more wholſome. It remaineth now that I ſhould ſhew you the properties of Beere and Ale for medecine what diſeaſes they will helpe and what cures they will performe. The grames, that is, the Mault that is left after the drinke is drained therefrom, beſides the fodder it yeldeth for all Cattle or Poſſage, is of ſingular good uſe for thoſe that are troubled with lamenеſſe in their Legs or Feete, through cold or evill humors fallen into them, or by the ſhrinking and paines in their ſinewes or joynts, if they ſet their Legs up to the knees into a Barrell or Firkin filled with theſe graines while they are hot, or heated againe if they be cold, and willily uſing three or foure times as occaſion requireth, abate both ſwellings and paines and reſtore the ſinewes to their proper ſtrength. Strong or good Ale ſodden to thicke, that as hony it may be ſpread like thereto and applyed warme to the necke or throate troubled with the Kings Evill giveth much eaſe, and finally by the uſe thereof have alſo found much comfort for their ſinewes and joynes that have had much paine and weakneſſe in them; the Yeaſt of Ale ſerveth our white Bakers of London inſtead of Leaven, to cauſe their bread riſe as Leven doth, which elſe would be ſad and heavie unfit to bee eaten. Of good Ale likewiſe diſtilled with ſweet herbes, ſeedes, ſpice, as of Balme, Angelica, Aneſeeds, &c. and divers other the like is made an excellent *Aqua vitæ* as they call it, or ſtrong Balme water, &c. but of the dregs of Ale or Beere diſtilled the yellow kind of *Aqua vitæ* is made. The properties of Beere and Ale are very like, and therefore whatſoever is ſaid of the one may very well be referred to the other. For of them is made *Diet* Beere or Ale, by putting in Spices or purging things, according as the patients diſeaſe requireth, and as the Phyſitians can appoint.

CHAP. XXI.

Avena. Oates.

THere are onely two ſorts of Oates that may juſtly challenge any place among the Graines or Cornes which are the ordinary towen field Oates, and the naked Oates, for the wild Oate is moſt truly reckoned among the Graſſes.

1. *Avena veſca.* Manured Oates.

The ordinary Oates groweth up with divers tall joynted ſtalkes and leaves ſomewhat reſembling Wheate, bearing at the toppes a large ſpread tuft of many pointed agles, hanging downe like ſmall Winged birds from ſmall thread-like ſtalkes, within every one of which huskes lyeth a ſmall and long round graine, ſomewhat like unto Rie, but longer and more pointed: the roote is ſmall and thready.

1. *Avena veſca.* Manured Oates. 2. *Avena nuda.* Naked Oate.

2. Avena nuda. Naked Oates.

The Naked Oates grow in all points like the former, saving that the graine being somewhat smaller and whiter, is not so full enclosed in the husks, but is very easily reboed out with ones hand.

The Place and Time.

They are both sowen in our fields in sundry places, yet the naked Oates nothing so frequent, and doe love rather a hard ground then either hot or dry, and are usually the first seede is sowen upon those grounds that were weeded and hocked up; they are sommer corne, that is, sowen in the Spring and mowen in Autumne.

The Names.

They are called in Greeke [illegible] and in Latine *Avena*, peradventure say some it may come of *Ava*, *quia ava fames*, because as *Festus* the people of *Germany* lived hereof: but I am not *Pythagorian* to believe [illegible] nor of *Theophrastus* [illegible] that Oates are made of *Bea* as *Theophrastus* affirmeth that barly is changed into Oates as *Pliny* saith, but it is wonderfull that so great learned men in naturall things should be carried away with such strange and erroneous opinions: but these and many more the like are too frequent with most of the old writers, as is plainely scene in many places of their workes. For however there [illegible] many times, and in many things and plants, as by over aboundance or by defect or mixture in their parts, yet that any one transmutation of one *species* in plants should be into another, I never saw reason to believe any can shew, naturally so growing other then naturally as before said, unlesse as God of stones can raise seed and of water wine, it come miraculously, which it is should so happen supernaturally it, doth not proceed from any kinde or course in nature: but of this enough here. I have spoken elsewhere somewhat more to this point. All authors that have written of these two graines, doe so little vary their titles of them that they may easily be known; the *Arabians* call it *Chartall*, the *Italians Civa*, the *Spaniards Avena* and *Civa*, the *French* [illegible] the *Germans Haber*, the *Dutch Haver*, and we in *English* Oates and Haver also.

The Vertues.

Oates as *Galen* saith have some what cold and drying withall, and thereby doe helpe the laske of the belly, yet is it unperfect and nourisheth little, like unto a Barly lunch Oate, but *Pliny* saith the *Germans* lived thereon which is certaine, for to this day they doe so in many places, and even in some countries with us also, as *Lincolnshire*, *Lancashire*, they make it not onely their bread corne or make cakes, &c. thereof, but they make it also into milk and the eat make their drinke, and are thereby inabled to live in as great health and strength of body, as those that feed on Wheate onely, whereby wee may well perceive that it hath a warming qualitie rather then a cold in [illegible] however it may have a cooling in medicine. Oatemeale in broth is usually given to binde those that have a laske or other flux, and with some sugar is to be licked given to those that have a cough or cold. Whole Oates fryed with bay salt and applyed to the side, takes away the paines of Stitches and windes in the sides or belly. A pole made of the meale of Oates and some oyle of bayes put thereto helpeth the Itch and the Leprosie, as also the Fistules of the Fundament and dissolveth hard Impostumes; the meale of Oates boyled with Vinegar and applyed taketh away wrinkles and spots in the face or other parts of the body.

I should next unto these graines (if I thought it fitting to make a Chapter as others have done) speake of the severall sorts of these severall sorts before specified, but because there is nothing in them that is worth the Description or Figure (for among the rest, being but certaine eares of Corne here and there among the rest that are blasted by casualtie, I thinke them not worthy of more relation then that they doe sometimes to be seene, or as our *English* proverbe is [illegible] of a plentifull harvest of Barly and Corne, yet I thinke it not amisse to give you the figures of them here.

Oates, Found on Hedges.
Wheate and Barley.

Chap. XXII.

Oryza. Rice.

Rice is numbred among the graines or Corne that are used for nutriment, and therefore must bee set downe here, as Oates, because it beareth the seede in a [illegible] or eare, yet in a different manner.

[illegible] with stronger stalke then Wheate about a [illegible] with sundry joynts and a large thicke leafe at [illegible] out into the Reede, at the toppe it beareth a [illegible] out into branches, whose blooming is said to [illegible] with the seede standing severally on them, enclosed in a hard browne braked huske, and an awne at the

head

head of every one of them which being hulled is very white, of the bigneſſe almoſt of Wheate cornes, ſhunt at both ends.

The Place and Time.

The originall ſeede hereof came out of the Eaſt *Indies*, where yet their chiefeſt not onely Corne they live upon, and not with them onely but through all *Ethiopia* and *Africa* and from thence hath it ſince brought into *Syria*, *Egypt*, *Italy*, &c. where now it is ſowne to bee ſowen, and ſowed not onely to grow in moiſt grounds, or ſuch as may be overflowen at the Summer time, and the waters ſet out againe, being but a Summer Corne, and is yearely ſowen and gathered in the middle or end of Autumne with us, but ſwifter yeares in divers places of the Eaſt *Indies*, where principally chiefely conſiſteth in the largeneſſe of it, whereof, with the hotter countries onely produce.

The Names.

It is called in Greeke ὄρυζα, and ὄρυζον in Latine *Oryza* by all authors, yet ſome doe call it *Oriza* for a difference to the *Oriza Cornucopiæ*, (which *Cæſalpinus* in *Dioſcorides* ſaith is called *Scorzonera* with Pliny, or being a kinde thereof as the leaſt, although it differ, having the ſame colle and bile, and the ſame properties in bulkes, leaves, and ſtalkes with it, alſo like *Milium*, growing alſo in marſhy and plaine places as Rice doth) yet *Hermolaus*, *Ruellius* and ſome other have thought it to bee the *Hordeum Galaticum* of *Columella*, but I have ſhewed yea what that is in the chapter of Barly: why *Cato* ſhould account Rice *vetus Gramineum genus inter cerealia*, as he doth Pulſe of Oates, and of Panick afterwards, many doe wonder, being their formes are ſo different, but howſoeſe I thinke it deſerveth the reaſon, becauſe it was not made inuſtrument as the reſt of the other Cornes are: The *Arabians* call it *Arus*, and *Asa*, the *Italians Riſo*, the *Spaniards Arroz*, the *French Ris*, the *Germans Reiß*, the *Dutch Rijs*, and we Rice.

The Vertues.

Rice is chiefely uſed medecinally to ſtay the Laskes or fluxes of the ſtomacke as well as of the belly, whereto if it be a little parcht before it be dried, and ſteeple quenched in the milke wherein it ſhall be boyled, being ſomewhat binding and ſtrengthening alſo to encreaſe ſeed, being boyled in milke and ſome Sugar and Cinamon put thereunto, the flower of Rice is of the ſame propertie, and is ſometimes alſo put into cataplaſmes that are applied to repell fluxes from flowing or falling to the place, and is alſo conveniently applyed to wounds to ſtay inflammations when they begin.

CHAP. XXIII.

Milium. Millet.

OF Millet there are divers ſorts, ſome familiarly growing in Europe others brought out of the more remote countries, as ſhall be declared.

1. *Milium vulgare album.* Common white Millet.

This Millet groweth with many hard joynted tall ſtalkes, full of a white pith ſet far and a little hairy or downy on the outſide, with long and large Reede-like leaves at them compaſſing one another, the toppes of the ſtalkes are furniſhed with a number of whitiſh yellow long ſpeare-like feathers, hanging downe their heads. Set all among with ſmall ſeede incloſed in a whitiſh huſke, which being taken off appeareth ſhining pale yellowiſh or whitiſh colour, ſomewhat hard little bigger then the ſeede of Flaxweed, which ſcatters much in the ground but perſiſheth yearely.

2. *Milium nigrum.* Blacke Millet.

This other Millet differeth little from the former, being ſomewhat leſſe with us, having that at top more full of ſeede, ſo is the ſeede alſo blackiſh and ſhining very like elſe to the other.

3. *Milium ſive Sorghum.* Indian Millet.

This Millet is in all the parts thereof larger, greater and higher then the former, riſing to be five or ſix foote high or more, the ſtalkes are full of joynts and large long leaves at them, the *Jubæ* or tuft ſtanding upright and ſomewhat downe the head at the other, whereon ſtand the ſeede as big but not ſo flat as Lentils ſomewhat round, ſmooth, whitiſh, yellow, red or blackiſh, hard and ſhining, the roote buſheth more then the other yet perſiſheth alſo.

The Place and Time.

Millet, of all the ſorts are firſt into *Europe* out of the Eaſterne countries, the two firſt ſorts long before the other kinde, and the ſortes of it, and require a ſtrong ground well watered, for they ſcorne a poore ground to be not ſtill enriched, nor will it proſper in leane drie ſoile; it is to be ſowne in *Aprill*, and the grayne in the hotter climates will be ripe in *Auguſt* or *September*.

Original from UNIVERSITY OF MICHIGAN

1. Milium album nostrum.
Common White and Red Millet.

2. Panicum frugum.
Indian Millet.

The Names.

The Greeke is called *Milium* in Latine, *a miliaria famina dictum nonnulli putant*, *Pliny*, *Galen* calleth it *Psilothron*, another *Psilon*. *Dioscorides* thinketh it is *Meline*; but *Dioscorides* and *Galen* make *Meline* to be *Panicum*. All these call the two small sorts *Milium* with their distinctions of blacke and white: the last is called *Milium album*, by *Matthiolus* and others, and *Saracenicum* by *Fuchsius*, and *Meline* by *Dodonæus*, *Lobelius*, and *Angelus Palea* by *Lobel*. *Cesalpinus* calleth it *Panicum Indicum*, and *Tragus Panicum Dioscoridis* and *Pena*, *Bellonius* and *Matthias* in *Gallia* they call it *Harrocon* as the *Arabians* doe, whereof they make their Bread in Famine, and the Italians their fine in want of other Iewell, it is called *Meyzali*, *Cenchry* the *Portugals* finding it in that Countrie: the *Arabians* call it *Gegares* and *Giavera*: the *Italians Miglio* and *Sorgho*, the *Spaniards Mijo* and *Mijo*, the *French Mil* and *Millet*, the *Germanes Hirse*, the *Dutch Hart*, and wee is *English* Millet; and the last *Indian* Millet, and of some *Italian* Millet.

The Vertues.

The first is cooling in the first degree and dryeth in the third almost, and hath withall a little tenuitie of parts, and faith *Dioscorides* if it be kept from winde and weather will ever last and abide: it is sometimes made into bread, but it is very bad stuffe, not having any tenacitie in it whereby it nourisheth little, but doth ill vp with some, yet in a dearth eaten in *Germany* boyled in milke with some sugar put into it: *Matthiolus* saith that it breadeth obstructions, and eaten with great delight while it is hot, by reason of the sweetnesse, but being old it is hard and dry of digestion: the gruell or pultase saith *Dioscorides* bindeth the belly and prouoketh urine: the decoction made it seemeth called *Syrupus Antipsoricus*, or as *Wecker* hath it *Syrupus Amylaceus*, taken warme with honey, Wine or Creame, sweating, aydeth being couered in bed, and is effectuall as a cataplasme for Feuers and Impostumes: some put into a bag and fryed hot easeth the griping paines of the Collicke and of the sides: it is applied, the powder also in the ioynts and sinewes: in *Italy* and other places they give the graine to their Hennes and Capons to fatten them. The *Indian* Millet flakes saith *Matthiolus* are good to helpe those that are pimpled or scabbed vnder the eares or else where, in this manner: Take the pith out often of the ioynts of a Wheate straw, which being turned with a new red sponge, take the powder of them with twelve graines of Pepper, and an ounce of Wheate Paste or Dowe, all which being made vp with a new laid Egge into a Cake, and so baked vnder the embers, the cake being diuided into 3 parts, let the patient take one part of it every other night when the Moone is in the wane as they goe to bed, and not drinke after it that night: this hath he practised before these Moones, and hereby saith he hath knowne many to be cured: the red flowers saith he vsed to the weight of a dram cureth women of the reds, as the white flowers doth the whites: it is vsed for all fluxes of the belly.

Chap. XXIV.

1. Milium Indicum maximum. Maize, Guinea, or Egyptian Millet, vel Turcicum aliquorum. Indian or Turkie Wheate.

THere is a kinde of Millet although farre greater and differing notably from the former I must ioyne this next, although some have made diuers sorts thereof, yet I cannot perceiue any more then two specifi-call differences, the one breadth earest at the ioynts of the stalkes, the other ariseth from the former following the seasons and other differences in stalke not in any other things then the colours of the blossoming tuft and of the graine afterwards.

1. Milium Frumentum Indicum vel Turcicum vulgare. The vsuall *Indian* or *Turkie* Wheate.

The stalkes thereof ariseth from the roote which is thicke and bushie, sundry strong and tall stalkes of eight foote high, as thicke or a mans wrist if it grow in any ranke ground, full of great ioynts with a white pith in the middest of them, the leaues are long, thicke and great as of Millet, as the copper coloured sorte hath many trashie like strings hanging downewards like vnto the rope of Millet, which are either white or yellow or blew as the graines of the same doe proue, which fall away, nothing appearing after them; but while they are vpon the ioynts of the stalke with the leaues, from whence one or more of the lower ioynts vp towards the toppe, runne forth the eares one at a ioynt we haue many leaues folded ouer them inclosed at the toppe with a small long tuft of threadie haires hanging downe at the ends, which when they are ripe are to bee cut off, which beside an hauy pound taken away, the head appeareth much like vnto a false Cone or Pine apple, set with six or eight or ten rowes of Graines orderly and closely set together, exceeding almost a Pease or Tarre in bignesse, but flat on the sides that ioyne one vnto another, and the same round on the outside as the beginnings were, hard but brittle and easie to bee broken or ground, with a white meale within them somewhat dry and not clammy in the chewing. *Lobel* expresseth the figure of sundry sorts as he broketh because as hee saith it grew greater and greater, and the roote grew greater, and sent more separate tufts, the roote not differing in any thing else but I take it to specifie all difference, nor vnderstanding by any that it is taken for another sort, and therefore I haue omitted to speake to more therein.

2. Frumentum Indicum alterum siue minus. The other lesser *Indian* Wheate.

This other *Indian* Wheate is like the former both in stalkes and leaues, but not halfe so high or great, the eares likewise are not halfe so long, of sundry differing colours as it, but they doe not grow at the ioynts of the stalke as the other, but at the toppes following the flowers, which maketh a specifi-call difference betweene both, the graine is likewise made into bread not of that nourishing qualitie that the greater sort is, too weakening both as to strength as bloode in mans blood as it.

The Place and Time.

The first growes both in the East and West *Indies*, and from both places haue beene brought into the Gardens of the curious, with vse and sometimes borne ripe eares but not alwayes, and will beare a strong tall ground like Millet doth, to be sowed early in the Spring and ripe in *September*. The other is a stranger and is borne here in the

The Names.

It is very probable that this graine is that which *Theophrastus* maketh mention of to grow in *Italie*, which he saith was reported to be as huge as Iuy leaues, and *Pliny* following him reporteth the same thing verbatim. But wherein the Author findes two sorts of Wheate, which shewes how subiect it is to change and grow greater by vse and more report, for *Theophrastus* reporteth the measure of the graines but by report, which might increase in the way as it did betweene *Theophrastus* and *Pliny* his time, quite as huge as Wheate eares. Therefore the learned *Fuchsius* and others condemne *Ruellius* for calling it *Frumentum Turcicum*, according to the Countries but are found more iust to be blamed themselues, for no doubt but this very *Indian* Wheate which [illegible]

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

found to grow in all the East of the West *Indies*, yet not found naturall in any place, but planted every where by the natives, & is the same with *Theophrastus* and *Pliny* their *Frumentum* of *Persia* and *Asium Bathrianum Indicum*. They of the West *Indies* call it *Maiz* generally. The last is onely remembred by *Peter Martyr* and *Benzo* after him, which *Acosta* saith the *Spaniards* in the *Indies* or the *Indians* call *Aconchos*. The drinke made of *Maiz* is generally in the *Indies* called *Chica*, but by some *Aca*.

The Vertues.

Many doe condemne this *Maiz* to be drie and of as little nourishment as Millet or Panicke, but they doe not well consider the chiefe, for although the graine be dry, yet the meale thereof is nothing dry as the *Turkie* Millet, but hath in it some clammineſſe, which bindeth the breast soft, and giveth good nourishment to the body: for wee finde both the Indians and the Christians of all Nations that feede thereon, are nourished thereby in as good manner no doubt, as if they fed on Wheate in the same manner: the sweetnesse also of the stalke and the herb the greatest power of nourishment in it, and as some doe thinke it doth not thicke blood and humours, able to suffocate as the fleah to breede obstructions, and therefore will not unfitly be put into our platines that are made to ripen Impostumes: *Acosta* saith that by feeding too much thereon it engendreth grosse blood, which breedeth itches and scabbes in those that were not used to it. Of it is made drinke also, both in the *Indies* and our *English* plantations, that will intoxicate as quickly as our strong Beare if it bee made accordingly: but is found to be very effectuall to hinder the breeding of the Stone, so that none are troubled therewith that doe drinke thereof, the leaves thereof are used also to fatten their Horses and cattle.

Chap. XXV.

Panicum, Panick.

There is but one sort of manured Panick growing with us in *Europe* howbeeit some have set forth with a larger and taller spike as the place produced it where it grew, but of *Indian* sorts there are very many brought us continually from the backe of *Africa* and *Ethiopia*, and from *America* also whereof to make any large mention were to small purpose, and but to fill up roome; I will onely give you the description of a couple, the one more frequent the other more rare as they grew with us, with a briefe remembrance of some others.

1. *Panicum album vulgare*, Ordinary Panick.

This Panicke groweth up with a reasonable strong joynted stalke full of pith, but not downie as Millet is, having somewhat large leaves on them greater by much then of Wheate, and very neare unto those of Millet that they can hardly be distinguished, at the toppe of the stalke commeth forth a pretty long round close spike, rounded at the end also, and as it were hairy, with small short branches all the length of it when it is full ripe and opened,

2. *Panicum album vulgare*, Ordinary Panick.

Panicum Indicum panniculatum villosum. *Indian Panick with a hairy tufted head.*

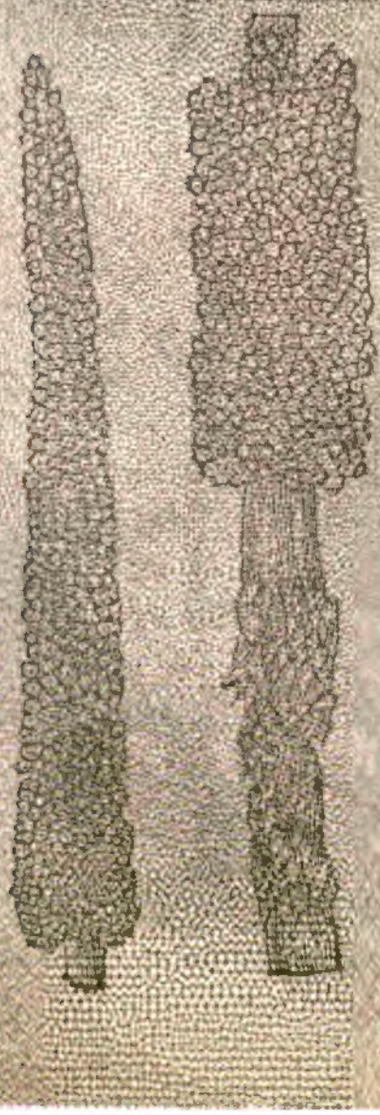
Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

full of hairy soft huskes which include a small white seede lesse then Millet but not shining so much, the roote is bushie like unto it but smaller and dying yearely.

2. *Panicum Indicum panniculo villoso.*

Indian Panick with a more hairy spiked head.

This kinde of Panicke being brought to *Britton* from the West *Indies* as *Lobel* saith in his time of abiding there, and there sowen, was like in stalke and leafe to the former but greater, and the spiked head grew to bee a foote long but more hairy, bending at the top a little, somewhat like the great *Amaranthus*, or flowre Gentle.



3. *Panicum Indicum cæruleum.*

Blew *Indian* Panick.

The blew Panick groweth to the height of a man, with many and great jointed stalkes like unto a Reede, full of spongie white pith, which neere the ground are of a shining purplish blew colour, and spreadeth sundry branches with large and long leaves on them compassing the stalke at the bottome, and hollow stalkes in the middle of them: from the joints towards the toppe as also at the toppes come forth short round Panick like heads closer then the former, of a blew with a shining purple colour as the stalke below, or rather much more orient and fresh, full of hairy huskes, and small long blew with round seedes in them like unto naked Oates.

There hath beene brought us from sundry parts both of the East and West *Indies* by Mariners and Chirurgions divers other sorts, some with white heads as big as ones fiste, thicke and short, with round white seedes, having an hole or dent in every of them. Another whole head was a foote long and with a bowing toppe, as hairy as the second sort. Another that was slender a foote and a halfe long, small at the upper end and bigger below like unto that *Panicum Americanum* that *Clusius* hath set forth. Wee have had also another brave spiked head that hath beene bigger then both ones fists, and a good span long, the stalke being as thicke as ones fingers of a fine whitish yellow colour. Many

more forts we have had and feene which not having kept any particular figure or note of them are slipt out of our knowledge and remembrance further to describe them, and therefore let this serve to have said so much of them, yet having kept the figures of some of them I here exhibite them unto you.

The Place and Time.

The most common is onely sowen in Europe where soever it groweth, and as it is likely came out of the Eastern countries towards *India*, from whence have come likewise some of the other, and the rest from the West: they are not to be sowen untill *April*, and unlesse the yeare be hot the third sort seldome commeth to maturity although the fruit of the same doth, and doe both require strong fat ground.

The Names.

It is called in Greeke [illegible] and *Panicum* in Latine, and [illegible] according to *Dioscorides* and *Galen*, yet [illegible] as *Varro* saith it, which as most doe gather is rather deduced from *pinis quod nullum quidpiam significat* them from [illegible] which is blacke, and it may be thereupon *Plin.* calleth it *Melanthrocum*, yet *Theophrastus* speaketh both of *Panicum* and *Milium* as of two severall plants. *Virgil* saith *Panicum a panicula dictum fuit*, and putteth it among the Graines by *Dioscorides* and *Columella* doe also, but *Galen* as is before sayd among the *Legumina Pulses* for the reasons before shewed. *Ruellius* maketh two sorts of the first, the one hee calleth *Germanicum panicula mouere* because it may be growing in *Germany*, the head was like which *Tragus*, *Fuchsius*, *Cordus* and others set forth, and as I said in the beginning they cannot be two different plants: the second is remembred by *Gheslin*, *Dodonæus*, *Lobel*, *Lugdunensis* and others. The *Arabians* call it *Dochon*, the *Italians Panico*, the *Spaniards Panijo*, the *French* [illegible] and *Panis*, the *Germanes Pfenich* and *Heydelpfenich*, the *Dutch Penic*, and we Panick.

The Vertues.

Panick is as Millen cold and dry, and giveth little nourishment, and as *Galen* saith *Milium* is better to all purposes then Panick, (sweeter also and easier to digest, yet saith he the countrey people feede thereon being boyled in milke even as they doe Wheate, but saith he, that of *Italy* exceedeth ours of *Asia*: *Iohannes Leo* in his History of Africa saith, that in some places thereof they make very fine bread of Panick, of what sort he mentioneth not: it dryeth thicke as Milium doth, it is given to Pullen, Pigions and other small birds, but hath no further use in Physicke then to dry up moist and fluxible humors.

Chap. XXVI.

Tragopyrum. Bucke-wheate.

As a Complement to finish this History of Cornes and Graines I must set this in the last place, because although the forme and manner of growing be differing from all the former, yet because the seede serveth to the same use, it is reckoned by the later writers deservedly to bee ioyned unto them. It riseth up with divers round hollow, brittle, reddish stalkes a yard and more high, set with divers leaves each by it selfe on a stalke, which is broad and round, and byforked at the bottome, small and pointed at the end, somewhat resembling an Ivie leafe but softer in handling; at the tops of the stalkes come forth divers clusters of small white flowers which turne into small triangular blackish seede, somewhat like unto a Beech nut but much lesser, with a white pulpe within: the roote is small and thready.

Tragopyrum. Bucke-wheate.

The Place and Time.

It is thought to have beene first brought out of *Asia* into *Italy*, but it is now generally sowen in most of the Northerne countries, where for the use and profit made of it many fields are sowen therewith, and that usually not untill *April*, and is ripe in *August*: it will not refuse to grow in an hungry ground, and is said generally to bee as good as a dunging to the ground wherein it is sowen, the straw thereof also being rotted thereto.

The Names.

It is generally taken to be the *Erysimum* of *Theophrastus*, which *Gesner* translateth *Tricoccum*, as also the *Irio* of *Pliny*, some to put a difference betweene this *Erysimum* and the other, call this *Erysimum* [illegible] it is called by *Matthiolus*, and *Lugdunensis*, *Frumentum Sarasenicum*. *Dodonæus Fagopyrum*, and *Tragopyrum*, *Tragoriticum* and *Fagopiscum*, as the *Dutch* names doe import *Buckwheate* and *Buckeweyt*. *Tragus* calleth it *Ory-*

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

mum vulgare. And *Cordus* and *Tabernamontanus Oryzum* (vocate, but *Dodonæus*, and *Lugdunenses* do differently write, did ill that opinion, labouring to prove that the *Oryzum* of *Varro*, *Columella*, and the other Latines is a gramen herbe, but rather the name of greene fodder, cut before it grew ripe, to feede, stell and to purge sheep, made of severall sorts of pulse and Oates, mingled together and sowen to feede them, but *Trago* proveth it sufficiently from *Varro*, that *Oryzum* was sowen to fatten and purge cattle, and that to be taken while it was yellow, whereby it is evident that it could not be a medley of corne and pulse sowen together for the purpose, whereof ever are in flower altogether at a time, but some particular herbe, and thus it be sooner then any other, which at soone springing of it from the seede, which is within three or foure dayes after the sowing doth argue the name *Oryzum* to be proper thereunto from ὀρύω, the Greeke word signifying *cito* quickly, from whence *Oryzum* is derived, and the quality answerable also.

The Vertues.

Buckwheate is a graine that as *Dodonæus* saith nourisheth lesse, then either Wheate, Rye, or Barly, but more then Millet or Panicke, and the bread or cakes made of the meale of the seede doth easily digest, yet some (to the contrary) and quickely passe out of the stomacke, and giveth small nourishment, though not bad, and is withall * little flatulent or windy, yet Country people in divers places of *Germany* and *Italy*, doe feede hereon almost as their onely bread graine, and are strong and able persons following strong labour, for the bread or cakes are pleasant, and doe somewhat presse or lye heavy on the stomacke, as Millet and some other the like will. And both, and wassifed generally to fatten cattle and poultry, of all sorts exceedingly, and quickly, yea it is an observation among a great many in our owne land, that what cattle or pulline soever is fatted therewith, if it be not killed within a short time after they are thus fatted, they will dye of themselves, being suffocated with their owne fat: it provoketh urine, encreaseth milke, loosneth the belly, and being taken in wine, is good for melancholy persons: the juyce dropped into the eyes, cleareth the sight.

GRAMINA, IVNCI, ET ARVNDINES.

GRASSES, RVSHES, AND REEDES.

CLASSIS DECIMATERTIA.

THE THIRTEENTH TRIBE.

CHAP. I.

Gramina Tritícea, Corne-grasses.

THE next Tribe to be entreated of, is of the severall sorts of Grasses, which are almost infinite, but because some are growing on the Vpland grounds, others in the low and moorish, some in the waters, and others by the sea side, I must divide them; and for a more methodicall and orderly proceeding in them, I thinke it fittest to range them under severall heads, that so they may be better expressed and apprehended. I will first therefore set downe those grasses that are neerest in likenesse unto the Cornes in their spiked heads, and after of those that are like the other sorts of graine, and then of the rest in their order: but because these Grasses are of small use, although of much varietie and curiositie, I shall endeavour to be the briefer in them: and first of those Grasses that resemble Wheate and Rye.

1. *Gramen latifolium spica tritícea compacta*, Close eared white Wheate Grasse.

The stalke hereof is about halfe a yard high, set with two or three joynts, and faire Wheate like leaves at them a foote long, bearing at the toppes a longer spike than Wheate, and broader, made of severall pares like the barley corne, but more separated in sunder, shewing it to be a Grasse and no Corne indeede, yet closer than the rye, and without any shew of beardes or awnes thereon.

2. *Gramen latifolium spica tritícea divulsa*. Thinne eared red Wheate Grasse.

This differeth little from the former, but in the spike which hath the small pares thereof more separated and somewhat wider the stalke, and armed every one with a small short beard or awne.

3. *Gramen angustifolium spica tritícea compacta*. Close eared red Wheat-grasse.

The stalke hereof is very smooth and round, two foote high, set with long narrower white leaves, rough and pointed: the spike is about a spanne long, somewhat like unto red Wheate, closely set, but each of the huskes hath a sharpe rough awne thereat.

4. *Gramen angustifolium spica tritici mutica simili*. Rush-leaved white Wheate Grasse.

The stalkes hereof are long and round like Rushes, and pointed at the ends, set on the round stalkes, a foote and halfe high, a whole spiked roppe is long and slender, without any awnes at the toppes of the huske, and somewhat like unto white Wheate, that is without beardes, the roote is white, knottie and creeping.

5. *Gramen spica Briza maior*. The greater Spelt-wheate grasse.

This hath rootes and stalkes like unto corne of a mans height, with narrow leaves, the toppes of the stalkes have sundry long spikes, above a hand breadth long, set on both sides of them one above another, each whereof bearing like a small eare of Wheate, armed with small awnes, but very short.

6. *Gramen spica Briza minus*. The lesser Spelt Wheate-Grasse.

This other growth not above an hand bredth high, with small short, soft and hoary leaves, the roppe hath commonly but one, otherwhiles two or three spikes, of an inch long and bearded.

Y. Gramen

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

7. *Gramen Secalinum maximum.*
Rye-Graſſe, two great ſorts.

The ſtalke ſet or riſeth ſometimes to be two or three foote high, having fewe and thinne leaves thereon; the ſpike is of two, three or foure inches long, bearded, and very like unto an eare of Rye, but with running rootes and joynted. Of this kinde there is a ſeeley foot alſo not differing from them before but in the ſmallneſſe, and that the roote is theaddy.

The Place and *Time.*

Moſt of theſe graſſes have beene found in our owne land, in paſtures and corne grounds in *Kent*, not farre from the Thames, and flouriſh when others doe.

The Names.

Each of theſe hath the name in the title that *Bauhinus* in his *Prodromus* doth call them by, or with very little variation which is according to *Lobels* intention.

The Vertues.

We know of no uſe that theſe are put to in Phyſicke, and therefore we can ſay no more of them.

Chap. II.

Lolium & Gramen loliaceum.
Darnell, and Darnell-Graſſe.

BEcauſe the ſpiked head of Darnell doth ſomewhat reſemble the ſpikes of ſome of the former, I thought it meete to joyne it, and the former.

1. *Lolium album.*
White Darnell.

The Darnell it ſelfe hath all the Winter long, ſundry long fat and rough, leaves; which when the ſtalke riſeth, which

slender and joynted, are narrower but rough ſtill on the toppe, groweth a long ſpike compoſed of many heads or eares growe alſo ther, containing two or three huſkes, with ſharpe, but ſhort beardes or awnes at the ende, the ſeede eaſily ſhaked out of the eare, the huſke it ſelfe being ſomewhat rough.

2. *Lolium rubrum ſive Phœnix.* Red Darnell.

The leaves here of are ſhorter and narrower than of Barly, the ſtalkes are reddiſh, ſometimes halfe a foote high, ſometimes higher alſo, the ſpike is very like the former, but ſmaller and ſhorter, and ſometimes reddiſh alſo. Chiefly in the corn grounds.

3. *Lolium arvense aristatum glumis.* Another Darnell with Oaten toppes.

This ſeveth hence from the firſt in roote, leaves, or ſtalkes, but ſomewhat higher, onely the toppes hereof be like to the ſmall heades are more like to winged Oaten heades, with ſharpe points ſet on ſlender foote ſtalkes.

4. *Phœnix ſimplex & tenuissima gluma.* The ſmalleſt ſingle Darnell Graſſe.

This is very like the red Darnell, but that it hath very few ſlenderer and ſhorter ſtalkes than it, and the leaves are narrower, the ſpiked head hath a few ſingle huſkes, ſet very ſparingly thereon.

5. *Phœnix altera brevioribus & paucioribus ſpicis.* The greater ſingle Darnell-Graſſe.

The leaves and roote hereof are like the red Darnell, the ſtalkes grow two cubits high, joynted and ſtraked, the ſpike is thinly ſet with chaffie heades, but they are bigger, rounder, and thicker.

6. *Phœnix aculeata.* Small prickly Darnell-Graſſe.

The ſtalkes hereof are five or ſixe inches high, being rough, hard, full of joynts, pointed or prickly at the ends, and with a few ſhort leaves on them, and with all, have ſmall ſhort, rough, and chaffie like cornes, ſharpe at the ends, ſet at the joynts: the roote are ſmall white threads or fibres.

7. *Phœnix multiplex ſpicata pratensis.* Branched Darnell-Graſſe.

This hath ſlender joynted ſtalkes, a cubite or more high, and narrow leaves, the ſpiked head is as it were branched or feathers, and herein conſiſteth the chiefeſt difference.

8. *Phœnix multiplex ſpicamentis.* Double Darnell-Graſſe with a bowing coppe.

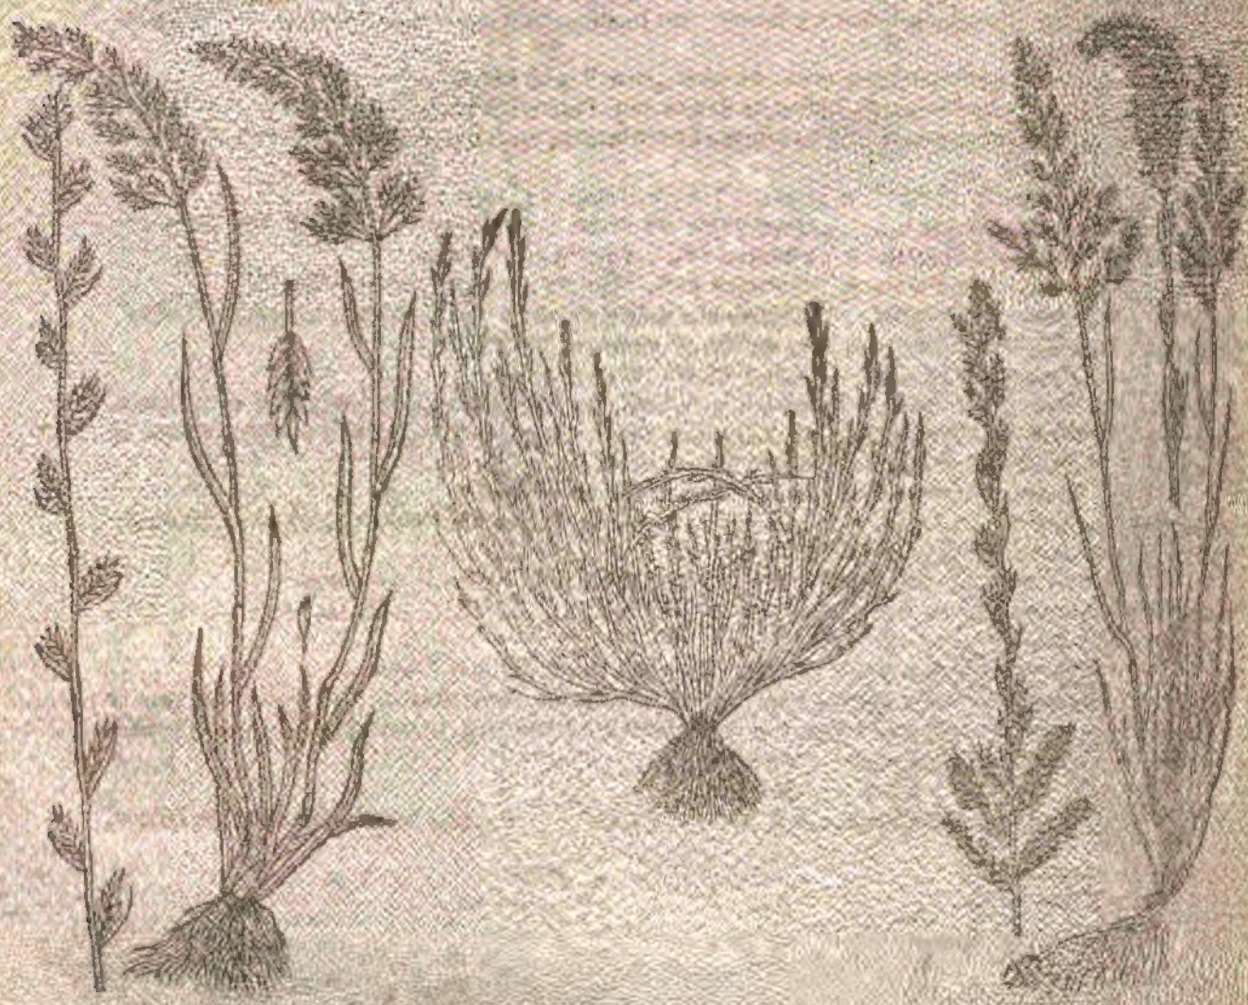
This differeth little or nothing from the laſt, but in the ſpiked heades, which are thicker ſet together, and the ſpikes of them bow downe or turne a little round.

9. *Phœnix paluſtris & longiſſimis ſpicata.* Branched Marſh Darnell-Graſſe.

The Darnell-Graſſe from a creeping white joynted roote, with many fibres thereat, ſhooteth forth two or three joynted ſtalkes, two foote high at the leaſt, the ſpiked head is a foote long, branched as the ſeventh is, each branch a finger length with winged huſkes like unto Oates.

The Place and *Time.*

All theſe grow, either in the fieldes of corne, or in the borders and path-wayes of other fieldes that are fallow.



1. *Lolium album.* White Darnell.

2. *Phœnix ſive Lolium rubrum.* Red Darnell.

Original from UNIVERSITY OF MICHIGAN

and the last some times in marsh and wet groundes, as well as in the edges of plowed grounde. Gerardus *Infelix Lolium*, because of the harme it did the fieldes.

The Names.

Darnell is called ζιζάνιον in Greeke by most Greeke Authors, yet ἄρακος by some, and *Lolium* in Latine yet Theophrastus it is called *Zea* as well as *Lolium*; and of some *Triticum temulentum*, and by *Lonicerus Triticum furiosum*; it is called so *Zizania* from the *Arabians* that so call it, the *Italians* call it *Loglio* and *Loglia*, the *Spaniards Tara*, and *Grana* the *French Ivraye*, the *Germans Rauwerffen*, the *Dutch Tuich*, and we in *English* Hyre and Darnell: it is also called *Zizaniū Theophrasti* by *Hispanicus*, and so divers authors doe call it in Latine *Zizania*, *Lolium vulgare*, *Lolium rubrum* to distinguish it from the former called *Lolium album*, *Dodonæus* some *Lolium* called it *Lolium nigrum*, and thereupon the *Germans* call it *Swiff Korn*, *Tragus* calleth it *Lolium Germanicum*, & diuersly entituled according to *Lobel* his intended illustrations, and are some of them mentioned by *Fuchsius* in his and *Trachonius*.

The Vertues.

Common Darnell, or *Gales* with, is held to be hot in the beginning of the third degree, and dry in the second, it thereby attenuateth, resolveth, and cleanseth, it troubleth the braine and causeth some dreames, if the seedes happen into bread, and if the seedes happen into drinke, it will make one drunken: the meale of Darnell is very good to slay gangrenes, and other putrid sores, and corrupt sores: it also clenseth the skinne of all leprves, morphewes, ringwormes, and the like: used with salt and reddish rootes: and being used with quicke brimstone and vinegar it cleanseth nailes, and breaketh those that are hard to be dissolved, being boiled in wine with figges and is probable for the sciatica, if it be bathed in the decoction thereof: some with wine of the wife thought to help conception, if a woman be perfumed with it, and [illegible] continente; yet *Cordus* thinketh Darnell is unprofitable to be used in fumigations. Myrrhe, and Frankincense to the decoction for the sciatica: Darnell made [illegible] splinters and broken bones in the flesh: if the seede be cast into the fire it will make that it will make all that are in the roome to fall a coughing, and writhing [illegible] the red Darnell boiled in red wine stayeth the laske, and all other fluxes, and women [illegible] neth urine when it passeth too fieldenly from one. Some doe hold that if the [illegible] in a crimson leather, or a scarlet cloath, it will stay the abundance of the courses. And [illegible] *Et cereant loliis nodosi vimina culmis*, that it was accounted to be hurtfull to the sight, and [illegible] objected to one that was ill sighted, that he fed on Darnell.

Chap. 113.

Hordeum sponteum. Way-Barly.

Although hereto-fore there was but one kind of this wilde or Way-Barly knowne yet by the diligent search of others, there are some others found, which shall be shewed together.

1. *Hordeum sponteum vulgare.* Common Way-Barly.

This hath divers Grasse-like leaves, but somewhat hard, and among them sundry beary stalkes a foote high, bearing small whitish yellow eares, with long and somewhat rough beardes, white seede within the huskes is lancke and small, the roote is already and perisheth not.

2. *Hordeum sponteum altera simile sine aristis.*

Great Way-Barly.

This other doth in all things seeme like the former, but that it groweth taller, and commeth to neare unto the former middle Rye-Grasse, that many have taken it to be the same, as indeed may well be so called also.

3. *Hordeum sponteum nanum.* Dwarfe wild Barly.

This dwarfe kinde groweth scarce halfe a foote high, with smaller and thinner leaves than the common sort, and the spike or eare is nearely resembling common Barly, both in the double rowe and beardes, that one would surely say it was sowne Barly: but that onely the smallnesse of all the parts contradicted it.

The Place and Time.

These wild sorts are found in sundry places with us, yet the latter more vsually than the other, but found by those that are expert in such matters, and at the foote of other walles, and in the sides of the fields in many places: the last was onely found by *Iohn Tradescant*, and communicated to us.

The Names.

This is generally taken to be *Holcus Plinij* by the best Herbalists now adayes since *Dodonæus* first so called it; and that you may understand how *Pliny* describeth his *Holcus*, I will here set it downe as it is *lib. 27. cap. 10. Holcus in Italia vocatur herba, cruciatus agricolarum communes, culmo quale Hordeum reliquis; hic circa Ianuarium, vel circa Iacrimam edoris & corpori aridus, bono semini & Bellonium (others have it Aristidem) quoque, others it Hordeum spontaneum* or *spontaneum*, and some others *Hordeum sponteum*: *Dodine* calleth it *Graminis Tollacti 3. genus*; it is called in the *Dutch Haft coorn*, and by us Wall-Barly, Way-Barly, or Way-Bent or Brome.

The Vertues.

Wall-grasse, as *Pliny* saith to draw thornes, &c. out of the body: and by that it seemeth hasty to grow; but *Lobel* saith that the chaffe of ripe eares is yellow.

Chap. 114.

Avena sterilis & Eryfolys. Wilde Oates and Haver-Grasse.

There are divers Grasses that are like unto Oates, some more or lesse, whereof these that are most vsuall shall be shewed here in this Chapter, and the rest in the two next that follow.

1. *Avena sterilis barbata sive Avena sterilis.* Common wilde bearded Oates.

The ordinary wilde Oate groweth both in leaves and stalke somewhat like unto the manured kinde, but is altogether lesse, riseth to high, being slenderer, smaller, and softer, the vsuall heade is spread in the like manner, having such like winged huskes, with longer awnes at the ends of them, but gentle, and not prickly, and yeelds small foote stalkes, the seede is small and lancke, as though it had no substance in it: the roote is long.

2. *Avena sterilis minor.* Small wilde Oates.

This wilde Oate is very like the former, but lesser in stalke and leafe; the spayred toppe consisteth of many small chaffie eares, bearded onely at the ends, and hanging downe their heads with small seede on them when they are ripe. Of this kinde there is another that beareth not his Oaten toppe until the other be past. *serotina.*

3. *Eryfolys Narbonensis.* *French* Haver-Grasse.

This Haver-Grasse hath divers Grasse-like leaves of a pale greene colour: the stalke is jointed in three or foure places with leaves at them, and at the toppes two or three heads, set one above another, which are round and long, hard and striped with divers beards at the ends of them, wherein when they are ripe and broke are found three small graines or seede; the roote is compoled of a small head, with many long fibres growing from it.

4. *Eryfolys*

4. *Aegilops Tragi facie Belgarum.* Dutch Haver-Groffe.

The roote Haver-Groffe is very like the laſt, both in ſtalke and leafe, the toppe onely is in part like unto the wilde Oate, and in part to the laſt Haver-Graſſe, having ſome beardes ſet at every ſtalke, within which lye long rough browne ſeades: the roote alſo is ſomewhat like the laſt, but the head from whence the fibres proceed, is not ſo conſiderable.

The Place and Time.

Both the former and the latter are found in many places with Vs, among Rye and Barley, but the ſecond more plentifully by hedge ſides, the third is frequent in *Provence*, and *Narbone* in *France*, among their corne, and flowreth in *July* and *Auguſt*.

The Names.

The firſt is called in Greeke Τραγος, that is *Avena hirſuta*, to diſtinguiſh it from the graine, or Corne: it is called alſo by *Dodonæus Bromus herba*, and by *Lobel Bromus ſterilis capitibus ariſtis, Feſtuca* by *Gaza*, and *Feſtuca* and *Avena ſylueſtris*, and *Tragus* by others, by *Matthiolus Ægilops*, and by *Tragus, Ioly graſſe grey*, according to his deſcription. The ſecond is called by *Lobel, Bromus ſterilis altera*, and *Feſtuca altera*, by *Dodonæus, Feſtuca* alſo: *Caſpar Bauhine* calleth it both *Bromus herba*, and *Sythonium*. The third *Lobel* calleth *Feſtuca Ioui, Ægilops Narbonenſis*, and thinketh it to be the true *Ægilops* of *Dioſcorides*, and conducing to that uſe in the eyes, as the ordinary uſe is by *Meſue* the ſonne and others. *Ægilops* like wiſe, but by *Gaſpar Bauhine, Tragoaegilops ſemine ariſtato in Sicilia*. The laſt is called by *Lobel, Ægilops Bromoides Belgarum*, although hee found it as plentifull in *England* as the Low Countreys. It is *Dodonæus* his *Feſtuca prior*, and *Thalius* his *Avena ſylueſtris ſpuria*. The firſt is called by the Italians *Loglio ſalſo*, and *Orzo Salvatico*, by the *French Auoron*, by the *Dutch Tabhaver*, and by Vs, Wilde Oate, or rather Poore Oate. The ſecond is called both by the *Dutch* and in Berwick, and Berwick Oates.

The Vertues.

Lobel ſaith that he hath often tryed the *Ægilops* to be effectuall, to helpe that Fiſtula or hollow Vlcer that happeneth in the corner of the eyes, ſo called for it hath a drying quality without ſharpeneſſe, hee alſo ſaith that the ſeede ſteeped in drinke procureth a kinde of drunkenneſſe: and that the horne ſhoes of the ſtalkes are good againſt the flegmatick ſwellings of the ſoure, to bathe it with the lye made thereof, it alſo diſſolveth hard tumours and kernels in the fleſh, and aſſwageth the ſwellings in the Ioynts. *Dodonæus* teacheth to make a medicine to drink for Vlcers in the mouth, by boyling the whole herbe with the roote of the firſt wilde Oates in water, untill the third part be conſumed, which being ſtrained, is to be boyled againe, with as much hony unto the thickneſſe of a ſyrrup, to as he ſaith put ſome Aloes in powder to it, and ſweeting ſpices there in to be put up into the noſtrils: the ſame herbe alſo he ſaith, being boyled in Wine with ſome dryed roſes, helpeth a ſtinking breath: the reſt is not knowne to be uſed to any Phiſicall uſe.

Chap. V.

Gramina Auenacea arvorum. The field Oaten Graſſes.

There are ſome other ſorts of Graſſes reſembling wilde Oates, and called Oate Graſſes, whereof ſome grow in the Fieldes, others on the mountaines, of thoſe that are found in Corne grounds, and other fields, we will ſpeake of in this Chapter, and of the other in the next.

1. *Gramen Bromoides maximum hirſutum.* Great hairy Oate Graſſe.

This great Oate Graſſe is all hairy, the ſtalkes and leaves are greater then of Oates, foure or five cubits high, whole panicle at the toppe ſpreadeth into many chaffy bearded eares hanging downe ſtarke headie, the ſeede is hairy, this groweth in the paſtures about *London*, as alſo in *Eſſex*.

2. *Gramen Bromoides ſegetum latiore panicula.* Great Corne Oate Graſſe.

This Corne Graſſe hath Oate-like ſtalkes, three or foure cubits high, the leaves are ſhorter and narrower, the roote is of a hard nature, divers ſtalkes with chaffie bearded eares in branches, comming forth at a ioynt, or cod: it bringeth forth ſeede in ſpring time, and is ſtrawed.

3. *Gramen Auenaceum incanum.* Great hoary Oate Graſſe.

This hath ſhorter narrow leaves, ſomewhat hairy and a little hoary withall, the ſtalke hath few ioynts, the panicle is made like the laſt but leſſer, and is ſomewhat hoary: This is ſometimes found leſſer, and are both found in *Oxford-ſhire*, the borders of Corne fields, both in *Kent* and *Eſſex*.

4. *Gramen Auenaceum pratenſe.* Medow Oaten Graſſe.

The leaves here of are hairy, growing next the roote, long and narrow, the ſtalke is leſſer and lower with ſuch a panicle on the toppe, but leſſer ſpread and not hoary: this is in many Medowes.

5. *Gramen Auenaceum ſquamoſa gluma.* Scaly eared Oaten Graſſe.

The leaves narrow leaves, a little hairy, a ſpanne long, the ſlender ſtalke hath ſuch alike panicle as the laſt, but the eares ſcaly eares round ſingle, every one upon his owne ſmall thredlike footeſtalke.

6. *Gramen Auenaceum pinnata longiſtyla ſpica.* Winged Oaten Graſſe.

The ſtalke here of is ſlender, ſometimes higher, and ſometime lower, the leaves are narrower than the laſt, the panicle is made of ſmall eares hanging like ſmall, and not much ſpreade, each part being as it were winged or devided into many parts, one of one ribbe or footeſtalke.

7. *Gramen Auenaceum filicea paniculâ Krampeline.* Red Fernelike Graſſe.

This groweth with ſlender ſtalkes a foote high, the leaves are ſoft and narrow, the pannicle at the toppe, is three cornered, being of a whitiſh greene colour, divided into many winged branches, many parts being ſet on both ſides one againſt another, and each part divided like a Fearne leafe.

8. *Gramen Auenaceum nanum erectum.* Vpright Wall Oates Graſſe.

This Graſſe groweth upright, a ſpanne and ſometimes a foote high, the leaves are almoſt as ſmall as any Graſſe whatſoever, the head is an handfull or a handfull long, ſparſed or divided, each ſmall eare being bearded, the roote is thready: it groweth ſtrong upon old mud Walles that ſtoode in Fields.

9. *Gramen Avenaceum fupinum arvenſe.*
Low Meadow Oaten Graſſe.

The leaues hereof are as ſmall as the laſt, an inch, or an inch and a halfe long, the ſtalkes are ſlender and weake leaning downewards with a few bearded huskes ſpike faſhion at the toppe.

10. *Gramen Avenaceum ſupinum ſpicatum ſecalinum.*
Long winged Oate Graſſe flowring like Rye.

This Graſſe ſpreadeth many ſtalkes not being able to riſe vp, of a cubit long, full of ioynts, and ſmall ſhort leaues on them, of a whitiſh greene colour, the toppes are furniſhed with foure or five Oate like heads, but more winged and with ſhort aunes, ſomewhat hard and flowring like Rye.

11. *Gramen Avenaceum exile molliſolio.*
Small ſoft leated Oaten Graſſe.

This ſmall Graſſe is very like the *Gramen exile durius*, that it may eaſily be miſtaken, and differing from it onely in the leaues, that are longer and ſoft, as the whole plant elſe is not halfe a foote high, and in the ſpiked toppe, whoſe parts are winged.

12. *Gramen Avenaceum altum alteri innatum.*
Small Oaten Graſſe one head ſet on another.

This fine ſmall Graſſe reſembleth well the *Gramen Britannicum vulgare*, having diuers taſte like leaues and hard, with ſuch like tall long ſtalkes, toppe whereof beare theſe ſmall ſharpe huskes at their toppes onely as others doe, and others out of a ruff of leaues in the middle of the ſtalke, tendeth forth an other ſhort ſtalke with ſuch like huskes on them as the other.

The Place and Time.

All theſe ſorts grow in the fields of this Land, ſome in one place, and ſome in another, as they haue been ſowen, either of plowed or fallow grounds, and flower in the Summer ſeaſon.

The Names.

Oates is called in Greeke [illegible], and [illegible], both by Theophrastus, whiche common to all kindes in Latine *Granum granandi*. The severall names of all theire Graines, are expressed in theire Titles, as much as is convenient for them, being all of late observation, not specified that I know, by any before.

The Vertues.

There is no especiall property knowne to be in any of them but are as yet only knowne by their face and name.

Chap. VI.

Gramina Avenacea sylvestria & montana. Wood and mountaine Oaten Graſſes.

THE firſt of theſe Graſſes that doe reſemble Oates ſhall be expreſſed here, whether they be found in Woods or on hilles and mountaines, &c.

1. *Gramen montanum Avenaceum Cluſij.* Mountaine Oate Graſſe with hoary huſkes.

This hath ſlender ſoynted ſtalkes a cubit high, with very narrow and long leaves, and at the toppe a long ſpiked head, bowing the head cloſe with woolly ſhort huſkes, containing ſeede like unto thoſe of naked Oates, the roote is made of divers long fibres.

2. *Gramen montanum Avenaceum alterum.* Mountaine Oate Graſſe, without hoary huſkes.

Another differeth not in any thing from the former, but in the ſpiked head, whoſe huſkes are not hoary as the other are.

3. *Gramen Avenaceum exiguo glumis ſpicatum.* Oate Graſſe of *Denmarke*.

This graſſe hath ſlender weake cleare ſtalkes, a foote high, with long leaves on them, and at their toppe a weake ſlender ſpiked head, thinnely or ſparſedly ſet with ſmall huſkes, containing Oatelike ſeede, the roote is ſtringie, and creeping under ground. The like hereunto, but with ruſh-like leaves, and woolly heads, *Ranunculus* [illegible] *alterum.*

4. *Gramen Avenaceum Accompolignum Danicum.* Red Oate Graſſe of *Denmarke*.

This ſomewhat like the laſt, but with much lower ſtalkes, cleare and reddiſh, the huſkes at the tops of them are more upright and longer, having the like Oateſeede in them. A leſſer ſort hereof was found about *Greenwich* with a hungry ſolle. *alterum.*

4. 4. *Gramen montanum Avenaceum & Avenaceum tertium glumis ſpicatum.* Mountaine Oate Graſſe, and Oate Graſſe of *Denmarke*.

4. 5. *Gramen Avenaceum Secundum Danicum & Avenaceum ſecundum rubrum.* Red Oate Graſſe of *Denmarke*, and Oate Graſſe with red huſkes.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

6. *Gramen Avenaceum variegatum.* Party coloured Oate Graſſe. And with few ſeedes.

7. *Gramen Avenaceum ſylvarum.* Hairy wood Oate Graſſe. Wood Oate Graſſe.

5. *Gramen Avenaceum ſeculis rubris.* Oate Graſſe with red huskes.

The roote hereof is long and white, like unto Quiche Graſſe creeping in the ground, having neere the ground narrow ſhort leaves, where the ſtalke is reddiſh, but longer up higher, the huskes that are ſet ſparkedly at the top, all on one ſide for the moſt part, are of a darke reddiſh purple colour, and white within, with ſmall ſeedes in them.

6. *Gramen glumis variis.* Particoloured Oate Graſſe.

The leaves hereof are greene, long, and narrow, from among which riſe two or three, ſmooth and ſtreaked ſtalkes, a foote high, bearing a ſhort ſpike of ſmall huskes of divers colours, the roote is thicke, covered with a rough white barke.

7. *Gramen Avenaceum pascuorum minus & tenue ſpicatum.* Oate Graſſe with few ſeedes.

This is ſomewhat hairy all over, the leaves are of a ſad greene colour, ſet on ſtalkes two or three cubits high, and at the toppes a ſpike bending head, having ſeven or eight ſmall long huskes, with few ſeedes in them, this groweth neere woodſides in many places.

8. *Gramen Avenaceum ſylvarum.* Wood Oate Graſſe.

The weake ſtalkes hereof are halfe a yard high, with ſoft long narrow leaves on them, and at the toppe of them a few ſhort chaffes, and open like unto ſome of the Oate Graſſes before: the roote runneth very much in the ground.

9. *Gramen Avenaceum exile.* Small Wood Oate Graſſe.

This is ſlenderer and ſmaller in all the parts thereof, but ſtanding a little more upright, the ſeed more ſcattered by it ſelfe, and therein differeth moſt from the other.

10. *Gramen Avenaceum villoſa gluma.* Hairy Wood Oate Graſſe.

The ſtalkes hereof are two cubits high, with ſmall narrow leaves, foure or five inches long, the ſpiked head ſomewhat long and hairy huskes, ſtandingly ſet one above another, this is often found leſſe by the halfe, the roote are threddy and yellowiſh.

The Place and Time.

Theſe doe all grow in Woods, and by Woodſides, on hills and the like places, where they flower in Summer time.

The Names.

The firſt is remembred by *Cluſius*, the fifth, and ſixth by *Bauhinus*, the reſt have not been formerly mentioned by any before.

The Vertues.

None of theſe are uſed in Phiſicke to any purpoſe that I know.

Oat-

Chap. VII.

Gramen Miliaceum. Millet Grasse.

There are diuers Grasses, whose Feather like toppes, doe in some sort resemble the bushy toppe of Millet, whereof I meane to entreate in this Chapter, and vnto them adde one or two other, which are called *Sorghum*, because they are more like vnto *Turkie* or *Indian* Millet then the former.

1. *Gramen Miliaceum vulgare.* Common Millet Grasse.

The common Millet Grasse, riseth vp with a jointed slender stalke, with two or three somewhat large leaues at euery ioynt, and at the toppe, a bushy spreading tuft of many long Feather like sprigges, consisting of many small huskes, within which lye small seede, which the small birds greedily deuoure: the roote is bushy and fi-

2. *Gramen Miliaceum alterum.* Another Millet Grasse.

Another Millet Grasse hath a small weake stalke, a cubit high, with a few narrow leaues, foure or fiue inches long growing at the bottome, and two or three thereon at the ioynts, the feather like tofte at the toppe is spread as the former, but the chaffie huskes are much smaller and finer: the roote is fibrous and reddish.

3. *Gramen Avenaceum paniculo miliaceo.* A third sort of Millet Grasse.

Another sort hath sundry reede like leaues, growing from a white fibrous roote, yet shorter then the last, a smooth stalke vp alike or two, about a cubit high, with two ioynts thereon towards the toppes, and narrower and longer leaues standing at them, at the toppes whereof standeth such a feather like toppe as the first, of a foote or more long.

4. *Gramen Sorghinum.* Indian Millet Grasse, or Pipe Grasse.

The Indian Millet Grasse, which the *Flemmings* call Pipe Grasse, and *Lobel* thereupon *Gramen Seruorum Fistulosum*, because the leaues doe make them pipes of the hollow reede like stalkes, growing haile a yard high or more, with fiue or six Lilly like leaues thereon, and a spread spiked toppe of many parts aboue, somewhat like vnto the common Millet, and larger seedes therein then in Millet, the roote is fibrous.

5. *Gramen Sorghinum alterum.* Another Indian Millet Grasse.

Another sort hath hollow stalkes like the last, but they are weake, bending downe to the ground, and shooting vp sundry shoots therein, whereby it rooteth afresh, having narrow long leaues on them, the stalke seeming, as it were to runne through them like to a pipe, and at the toppe doth a like spread spiked head as the former, whose like in the leaues all parts are smaller.

The Place and Time.

They doe all grow in Fields, and by the hedge sides, as well in our Land, as in any others, although obserued

1. *Gramen Miliaceum vulgare.* Common Millet Grasse.

4. *Gramen Sorghinum.* Indian or Turkie Millet Grasse.

but by few, that are curious in theſe minutes, and flowriſheth at the ſame time with the reſt.

The Names.

The firſt is called *Gramen Miliaceum*, by *Lobel* and others, and is the fourth kinde of Graſſe by *Tragus*, the two next are mentioned by *Bauhinus* onely, in his *Pinax* and *Prodromus*: The fourth is called *Gramen caninum ſpica* by *Lobel*, and *Gramen ſpicatum Flandricum*, as is before ſaid, and is the fifth Graſſe by *Dodonæus*, and *Gramen Saxatile* by *Taberna montanus* and *Gerard*, who calleth it in Engliſh Darnell Graſſe, but I follow the Latine *Dutch* name. The laſt is of *Bauhinus* his relation likewiſe.

The Vertues.

All theſe Graſſes are neglected, as not diſtinct in Phyſicke, and therefore left to the ſmall Birdes to feede on, as they doe upon many other more.

CHAP. VIII.

Gramen Panicum. Panicke Graſſe.

THere be ſundry ſorts of Graſſes that reſemble the head of Panicke, ſome newly, and others long knowne, ſome large, ſome ſmall, all which cannot be conprehended in one Chapter, I will therefore ſhew you ſome here, and the reſt after them.

1. *Panicum ſylveſtre barbatum.* Wild Panicke of *France*.

This Wild Panicke hath ſome neere reſemblance unto Millet, in the ſpreading of the wheat, being compoſed of ſundry parts, each neere reſembling a Panicke head, and yet called *Avena ſylveſtris* by ſome, the ſpyred ſtalke with leaves thereon are very like unto Panicke, yet much leſſe in all, and therefore it may likewiſe referred to Panicke, the roote is fibrous alſo like unto Panicke.

2. *Panicum ſylveſtre ſimplici ſpica.* Panicke corne Graſſe with ſingle eares.

This ſingle Panicke Graſſe, hath weaker and ſmaller ſtalkes then the former, and leſſe ſtore of ſtraight, and ſhorter leaves on them, the toppes of the ſtalkes are ſeverally furniſhed with a ſpiked rough head, like to my garment it toucheth, and ſmall at the toppe full of ſmall whitiſh ſeede.

3. *Panicum ſylveſtre Dalechampij.* Wilde Panicke Graſſe of *Dalechampius*.

This Panicke Graſſe differeth from the laſt in that it groweth more upright, two foote high, the ſtalke hath ſundry Graſſe like leaves on them, but longer and broader, with one uſually under the hairy ſpiked head, which ſticke ſo faſt, to their garments that it toucheth, that it is hardly plucked off. There are two other kindes

Aira dicta.

3. *Panicum ſylveſtre barbatum.*
Wilde Panicke of *France*.

4. & 5. *Panicum ſylveſtre ſimplici ſpica.*
Sylveſtre Dalechampij, & alterum.
Branded, ſingle eared, and wilde Panicke Graſſe.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

are not found in our owne Land, which is smaller, the other at *Santa Cruz* in *Africa*, which is larger, and with a more naked head, else little differing.

4. *Gramen Paniceum arista longa & aspera.* Bearded Panicke Graſſe.

The bearded Panicke Graſſe hath ſtalkes and leaves not much unlike to the ſecond ſort of Panicke Graſſe, but lower and taller, having divers browne heades at the tops, one above another, armed with long and ſharpe beardes or awnes like unto corne: the roote conſiſteth of many long fibres.

5. *Gramen Paniceum minus.* The leſſer Panicke Graſſe.

This is leſſer then any of the other before, having low bending ſtalkes a ſpanne long, and ſharpe long leaves thereon, with ſmall long brownish chaffie ſpiked eares, like unto thoſe of Cockes foote Graſſe, ſet ſparedly at the toppes.

6. *Gramen Paniceum ſylveſtre Anglicum, & Afrum.* Wild Panick Graſſe of England and of Barbary.

We have in divers woods with us, a wilde ſort of Graſſe, whoſe ſpike doth well reſemble the Panickes before, and we have had one like it, brought out from Barbary, differing onely in the largeneſſe thereof, both in leafe and head from our Engliſh.

The place and Time.

Theſe Graſſes grow uſually among rubbiſh, and in waſte grounds, and ſometimes alſo in good and manured ground, bearing their toppes in Sommer, as others doe.

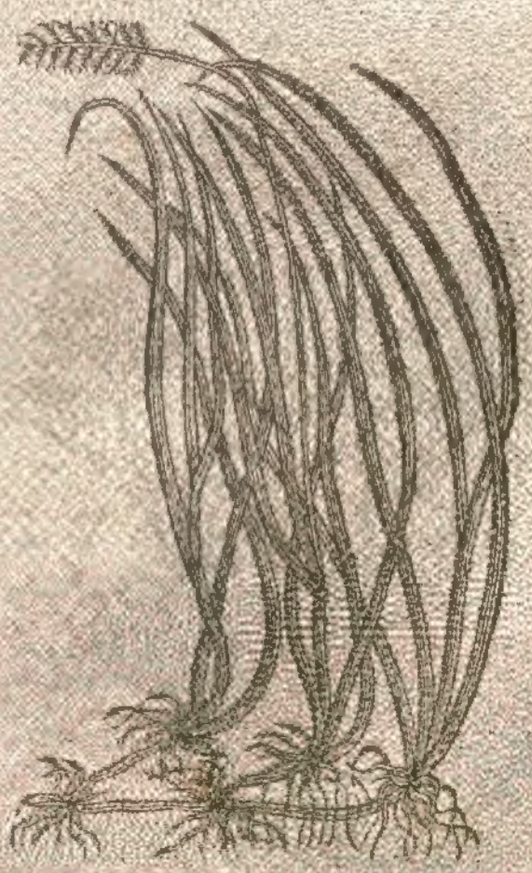
The Names.

The firſt as I ſaid, is taken by *Cluſius* to be *Milium ſylveſtre*, by *Matthiolus Camerarius* and others called *Panicum ſylveſtre*, and thereupon *Lobel* addeth *herba riorum*, becauſe it was ſo accounted by the moſt. *Caſalpinus* calleth it *Panicaſtrella ſpecies*. *Lugdunenſis* taketh the third to be the *Herba alba Plinij*, and *Tragus* the ſecond to be *Milium herba Plinij*: which *Caſalpinus* calleth *Panicaſtrella*, and *Lobel Panicis effigie gramen ſimplex ſpica*. The fourth and fifth are *Lobels* ſecond and third *Panici effigie gramen*. And the laſt hath not beene mentioned by any before.

The Vertues.

If the ſecond or third, or any of their *ſpecies* be the *herba alba* of *Pliny*, then he ſaith it is hurtfull and dangerous to cattell, but eſpecially for ſheepe to feede thereon: there is nothing elſe recorded of them by any.

Chap. IX.



Gramen Paniculatum pratenſe. The Medow tufted Graſſe.

Of the kindes of Graſſe that are called *Paniculata*, (that is with ſmall heades like Panicke, or round and long Catkines, called Panickes) there are divers ſorts, ſome growing in the fields and Meddowes, others in the plowed and Corne grounds, a third ſort is diſtinguiſhed by growing on hils and in woods, and a fourth ſort in the moiſt plaines of fields, and in the waters: In this Chapter I will firſt ſpeake of

1. 3. *Gramen paniculatum molle, & asperum vtrumque nostrum.* The ſoft Medow tufted Graſſe, and the golden tufted Graſſe.

2. *Gramen Paniculatum Germanicum odoratum,* Sweete Dutch Graſſe with a tufted head.

those

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

shore that grow in the fields and Medowes, and then of the rest in their order.

1. *Gramen pratense paniculatum molle.* The soft Medow rutted Graile.

This soft Medow Graile, hath sundry long and somewhat broad soft or woolly Graile-like leaves, among which a small tuft of short white fibres, and from among the leaves rise up a stalke, two or three, about a cubit high, with some few leaves upon it, and at the toppe breaketh forth a soft woolly spiked head, much divided, whose branches are reddish.

2. *Gramen paniculatum Germanicum odoratum.* Sweete Dutch Graile with a tufted head.

The roote of this Graile doth creepe in the ground, being white, and full of joynts, flowering [illegible]

4. *Gramen pratense [illegible] maius.*
The greater ordinary Medow Graile.

3. *Gramen pratense [illegible]*
The lesser rutted Medow Graile.

4. *Gramen [illegible] album,*
The [illegible]

4. *Gramen pratense [illegible]*
The [illegible]

Original from UNIVERSITY OF MICHIGAN

ioynts, the ſtalkes are two cubits high, with but few ioynts on them, whoſe leaves are almoſt as long, and ſome whereof exceede the height of the ſtalkes, being narrow and ſmall at the ende, bearing on each a much more cloſe and nothing ſo much ſpread a Panicle, as the former, and which for the ſweetneſſe of them, are tyed in ſmall bundles, and laide among garments or linnen to perfume them.

3. *Gramen paniculatum aureum veſtitæ comæ.*

Golden tufted Graſſe.

The golden headed Graſſe hath many long narrow leaves, like unto other ſmall Graſſes: the ſtalkes are a cubit high, with long tufted toppes, made of ſundry Panicles or ſpikes bowing towards the head, and of a faire but pale yellow with, colour, like to oates or barley and blacke, ſpreading here and there under ground.

4. *Gramen pratenſe paniculatum majus.*

The greater tufted Medow Graſſe.

The common Medow Graſſe, hath many Graſſe-like leaves and among them ſundry ſtalkes halfe a yard high, bearing a ſpokefull at the toppe of them, ſomewhat reſembling the colour and faſhion of the Water-reede. Hereof there is another ſort, and two other ſorts ſmaller then they, the one with white tufted toppes, and the other with reddiſh tufted toppes.

5. *Gramen gigantæum multiplex.*

Medow hard graſſe with manifold tufts.

This graſſe riſeth up with diverſe ſtrawie long ſtalkes, ioynted, and bowing downwards, the leaves are ſmall like graſſe, and the tufted head or Panicle is very much divided, and ſpreadeth abroad, growing hard and of a ſad reddiſh colour, the roote a thicke tuſh of white threds.

The Place and Time.

They grow all of them in fields, and Medowes, and are in their perfection in the Sommer time, when others are.

The Names.

The firſt is called by *Tabern.* *Gramen paniculatum maſſe*, and by *Lugdunenſ.* *Gramen hordeum Dalechampij*: the ſecond is called in Italian, *Gramo panicolatum odoratum*, and *Germanicum* of the ſame, uſually by divers other Herbariſts, and *Gramen* more by the Inhabitants where it is naturall. The third is called by *Tabernæmont.* *Gramen aureum Dalechampij*, & by *Bauhine*, *Gramen paniculæ pendulæ aureæ*. The fourth is called both by *Tabern.* and others, *Gramen pratenſe majus vulgatius*, whereof as alſo, ſome are in degrees leſſer and leſſer then others: the laſt ſort, being the *Gramen moſchatum* of *Lugdunenſis*, which *Bauhinus* maketh the laſt of the *Gramina tremula*, calling it *Gramen minimum paniculis elegantiſſimis*. The laſt *Bauhine* calleth *Gramen paniculæ multiplicis*, and ſaith that they of *Montpelier* called it *Gramen minus ſpicatum*, and that there is a greater and a leſſer.

The Vertues.

The Medow Graſſe is of moſt uſe in Phyſicke, next to the Quiche-graſſe, yet the ſeedes of theſe, and not the roote as the rootes of the other, and not the ſeedes, ſerve to open the obſtructions of the bowels, and to expell wind, if the decoction thereof be drunke: being uſed outwardly they helpe to diſcuſſe windy ſwellings, and hard tumors that will hardly be repreſſed or diſſolved, the greene herbe is leſſe in never uſed Phyſically that I know, but the dryed herbe, when it is made Hey, is boyled in water a good while, and then bound to the ſores of Horſes, or Cattle that are chap-fallne by too long abſtinence from meate, and doth preſently helpe them.

Chap. X.

Gramina Paniculatæ arvorum, Corne Graſſes with Panicles.

The ſorts of theſe Panicle Graſſes to be entreated of are thoſe that grow in the Corne fields, or in ſuch as have beene plowed, and doe lye Ley.

1. *Gramen arvenſe paniculæ criſpæ.* Curled Panicle Graſſe.

This Graſſe hath deſcending from a threddy roote, reddiſh ſcaly heads and thence riſe narrow Graſſe like leaves, and low ſtalkes, bearing a head of many tufts, ſet one above and againſt another, conſiſting of ſmall and reddiſh curled huſkes, inſuing from a ſmal huſke. I have thought good to adde the figure of that Graſſe that *Lobelius* calleth *Bromus Dalechampij*, becauſe *Bauhinus* ſaith it is this, but not well expreſſed, but ſurely I take it to be another ſort.

Bromus ſecundus Dalechampij.

2. *Gramen ſegetum paniculâ ſpeciosa.* The great Corne Graſſe.

This goodly Graſſe groweth up with a few long ſoft greene leaves, like to thoſe of Millet, ſome below, and others upon the tall ſtiffe, round, ſmooth, greene ſtalke, a yard and a halfe high, bearing a leave tufted toppe, ſpreading, and ſometimes ſlender ſprigges, very like to the tufted head of the Millet graſſe, but more beautifull: the roote a ſmall tuft of fibres.

3. Gra-

1. Gramen hirsutum Dalechampij.
Dalechamps Hairie Grasse.

2. Gramen segetum spicatum perforatum.
The Eare greene Corne Grasse.

3. Gramen segetum palustre longum.
Cattell Poudre Grasse.

4. Gramen segetum erectum.
The Cornestacke Grasse, or Beare Eare.

3. *Gramen agreste vernix spica.* The Corne Reede grasse, or Bent grasse.

This Feather like Grasse shooteth forth, joynted tall stalkes, and faire leaves, almost like the last, the toppe of the stalke is furnished with a long and large tufted head, spread like unto sprigges of feathers, are somewhat like common reedes, standing for the most part all one way, and hanging downe their heades, and are of a faire browne grene shining colour, which are (being fine and slender) easily shaken with the winde.

The Place and Time.

They grow in the borders of Corne fields, and grounds that have beene plowed, and flowrith chiefely in the beginning of Summer.

The Names.

The first of these is the *Gramen* of *Matthiolus*, the *Gramen minimum Xerampelinum* of *Lobel*, called *Gramen arundinaceum* by *Dodonæus*, and by him taken to be the *Gramen Cattorum Dalechampi* of *Lugdunensis*, but as I said before, I make a doubt thereof. The second is the *Gramen segetum paniculâ spicatâ laxiore* of *Lobel*, *Raulinus* calls it *Gallinarum panicula spicata*. The third is called by *Lobel*, *Agrostis ventricosa Flandrorum*, because the Flemings so use it, and *Gramen agreste fastigiatè arundinaceo-tomosa panicula*, as also *Trichinarium gramen*, because it is commonly eyed in a row together, one by another (even in the Summer) to be set in chamber chimneyes, among sweete herbes, when no fire is made therein, to coole, decke up, and refresh the roome, it is usually called in English Bent grasse, and of some Windle-strawes, it is the *Gramen graminaceum arvense* of *Tabermontanus*; as also *Gramen procense* of *Dodonæus*, but cannot be the *Gramen equinum Cæsari*, as *Dodonæus* thought, for (saith he) it was white and woolly, which this is not.

The Vertues.

They are said to have the like properties unto the Quich grasse but of the rest there is no certainty of any good they have in Physicke.

Chap. XI.

Gramen paniculatum montanum. Mountaine tufted Grasses.

THe *Gramen Iuncinum* or *pilosum* should be here numbred with the other Mountaine kindes, but that I have shewed it you in my former booke.

1. *Gramen montanum paniculâ patulâ deflexiore.* The first mountaine Panicke Grasse.

From a small white roote with short fibres, spring up three or foure joynted stalkes a foote high, having a few small and short leaves on them, and such likewise at the the foote of the stalkes, but few and smaller, at the toppe whereof standeth a brownish panicle of three inches height, compoled of many very small stalkes. This is sometimes found growing higher, and with larger Panicles. *Alexand.*

2. *Gramen sylvaticum paniculatum altissimum.* Tall tufted Wood Panicke Grasse.

The roote of this Grasse creepeth in the ground, set with divers fibres from whence rise two or three very tall round like stalkes, two or three cubits high, bearing faire broad greene leaves on them, like unto *Cyperus*, and at the toppe many small tufted Panickles: both stalkes and leaves are so tough, that the Country Shepheards make into cloakes there with against the weather, and the Husbandmen make withe ropes, and traces for their Horses with them also ploughes.

The Place and Time.

The first groweth on the hills by *Basill*, the other in the Woods by *Mount Alexand.*

The Names.

Authors onely hath set out these by the same Names are in their titles.

The Vertues.

There is as little use of these, as of the former.

Chap. XII.

Gramen cristatum & spicatum. Crested and spiked Grasse.

THere are other Sorts of Grasses that beare Panicles or tufted heads, but they usually grow in or neere waters, which shall be declared in that Classis to which is appropriated to such of that nature and quality. Those that beare crested or spiked heads, are of divers kindes, &c.

1. *Gramen cristatum lœve.* Smooth crested Grasse.

The white rootes of this Grasse do meet themselves in the ground very much, from whence spring up divers very slender stalkes two foote high, with few or no joynts on them, and with small short greene leaves at them, the tops of the stalkes have slender long spiked heads set on them, divided into many parts, each where-unto stands the stuff of a bud, whereof it tooke the name, being of a pale yellow with greene colour, and some-what purplish, as *Matthiolus* compareth it to the head of *Crista gallis*, Cockes combe.

2. *Gramen cristatum subhirsutum.* Hairy crested Grasse.

This other crested Grasse differeth from the former, onely in these particulars, the rootes are of a reddish yel-lowish colour, lower, and smaller stalkes, a little hairy or Woolly at the bottomes, with longer leaves, and a more spread white head, not so thicke set together, and groweth rather among the hedges and bushes.

3. *Gramen cristatum Anglicum.* English crested Grasse.

This kinde hath fewer and longer rootes, not matting and encreasing in that manner, the stalkes are straight, and longer and narrower leaves on them, the spiked head differeth from it, in being longer and closer set, and not spread into tufts, but as it were into close shorter heades, the whole spike somewhat resembling a small long Fox-taile Grasse, this groweth plentifully in many by places neere *Hackney* a little of from *London*.

4. *Gramen*

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

Gramen cristatum hirsutum spicatum, glabris nitens, Cristatum Anglicum, spica oblonga.
Smooth, Hairy, English and double crested Grasse.

Gramen spicatum purpureum.
Purple spiked Grasse.

Gramen spicatum folijs Caryophyllei.
Spiked Medow Grasse with Gilliflower leaves.

Gramen folijs Caryophylleis spica spicata.
Gilliflower leaves Grasse with a spike.

4. *Gramen cristatum spica multiplici.* Double English crested Grasse.

A variety hereof hath beene found, bearing divers smaller parted spikes from the greater, indeed like to any thing, or very little elfe.

5. *Gramen pratense Dalechampij spica purpurea.* Purple red spiked Medow grasse. *Dalechampius.*

This Medow Grasse hath a bulb of white threds for the roote, with many Sedge-like leaves rising out of it, which are both narrower, softer, and greener, having divers short stalks not a hand breadth high, with two or three more on them, set with leaves, and at the toppes out of a round skinne or huske, poked at the end, like the Sedge leafe, breaketh forth a thicke, short, and somewhat flat spike, of a brave reddish purple colour.

6. *Gramen pratense spica flavescente.* Yellow spiked Medow grasse.

This other yellow spiked Grasse differeth so little from the last, either in roote, leaves, stalke, or quality, (unles leaves have called the one the Male, and the other the Female, the head or spike only in some shew of colour, and in some places on his, of a more reddish and shining colour, not easily to be discerned in many parts of the other, but standing bare or naked, being alwayes slenderer and longer.

7. *Gramen*

7. *Gramen pratense spica multiplici rotata.* Rough spiked Graſſe.

The ſpiked Graſſe hath a ſmall roote made of a few fine threeds like haires, from whence riſe long and narrow leaves, ſhagged all the length of them, and ſo compoſed as is hardly ſeene in any other herbe, for ſome of them wreathed, as if one leafe grew out of another, on the top of the ſtalke ſtandeth a very long head, conſiſting of many more reddiſh ſpikes, ſet together one above another, then is any other Graſſe, and ſomewhat rough in handling.

8. *Gramen ſpicatum folijs Caryophyllæis.* Spiked Medow Graſſe with Gilloflower leaves.

The leaves of this Graſſe are ſomewhat hard, thicke, and ſhort, and greener then thoſe of Gilloflowers, or pinkes, the ſtalkes are halfe a foote high, at the toppes whereof ſtand ſmall ſpikes, ſome times more and ſometimes fewer, browniſh at the firſt, and afterwards ſomewhat reddiſh, with many yellow threads mixt among them: the roots runne under the upper crust of the ground, moulding one within and over another: there is neither of the greater or leſſer cattle that will willingly feede hereon, as being to hard and ſappleſſe, that it ſeemeth unfit to create any milke or nouriſhment in them. This cannot be the *Gramen Babinum* of *Lobel*, as ſome take it to be, although in face it be ſomewhat like it, for the contrary qualities of feeding cattle ſhew a repugnancy.

9. *Gramen Caryophyllum folijs flore ſpicato.* Gilloflower leafed Graſſe, with ſtaly ſpikes.

This kinde graſſe hath ſmall long leaves, narrow and bowing: the ſtalkes are ſmall and low, not much above a foote high, bearing at the toppe a ſhort ſtaly head: the roote are ſmall blackiſh threds.

The Place and Time.

All theſe according to their titles grow in Fields and Paſtures, or neere unto them, and flouriſh at the time with others doe.

The Names.

The firſt is the *Gramen criſtatum Raubini* of *Lobel*, and by *Raubinus* himſelfe, *Gramen pratenſe criſtatum, ſive cum ſpica criſtata brevi.* The ſecond is a variety of the former, mentioned by *Raubinus* likewiſe: The third is unknowne, as it groweth with us, and howſoever thought by ſome to agree with the former, yet by comparation, they are found to differ as is alſo ſhewed, the fourth is mentioned as a variety of the laſt: the author his name in his title, to be knowne whoſe it is: The ſixth is called by *Lugdunenſis*, *Gramen Anthoxanthes.* The ſeventh is the *Gramen ſpicatum Oxichampi* by *Lugdunenſis*: The eight is ſo called by *Lobel*, as it is in the firſt, by *Lugdunenſis Gramen nigrum*, by *Tabernæmontanus Gramen Caryophyllum.* The laſt is the leaſt, and the laſt mentioned by *Thalius* in his *Hercynia ſylva*, of his *gramina Lolacea.*

The Vertues.

Theſe Graſſes, eſpecially the purple ſpiked Medow kinde, is thought to come neere the properties of the other Graſſes, not becauſe we have no certainty hereof, we leave it and them untill we can learne to what diſeaſes they are moſt conducible.

Chap. XIII.

Gramen ſpicatum montanum & nemoroſum. Mountaine and Wood ſpiked Graſſe.

THe other ſorts of ſpiked Graſſes, as I ſaid, were of thoſe that grow on hills, and in Woods, which ſhall be here expreſſed.

1. *Gramen montanum ſpicatum Cluſij.* *Cluſius* his mountaine ſpiked Graſſe.

From a long roote, of a fingers thicknes, parted ſometimes into two or three ſtringes with many fibres thereat, and ſome what hairy at the toppe, ſhoote forth ſundry heads of leaves, each containing five or ſixe ſomewhat long, thicke and halfe hollow like a gutter, very like unto thoſe of the greater Thrift compaſſing one another at the bottome, a little bitter and ſharpe in taſte, from the middle of whom ſpring up ſtiffe ſtraight, bare, and knottleſſe ſtalkes, about a foote high, bearing at the toppes ſundry ſmall flowers set ſpike fashion, and of a greenish colour.

2. *Gramen ſpicatum anguſtifolium montanum.* Mountaine ſpiked Graſſe with narrow leaves.

This Graſſe differeth onely from the eight Graſſe deſcribed in the laſt Chapter, in that it hath longer and much narrower leaves, ſlenderer ſtalkes and lower, and in the place of the growing, for it groweth onely upon hills and mountaines, flowering and flouriſhing earlier then moſt of the other, namely in the middle or end of May.

3. *Gramen ſylveſtre anguſtifolium ſpicatum.* Wilde ſpiked Wood graſſe.

The roote hereof is yellowiſh, growing aſlope in the ground, with ſmall fibres at it: the leaves which the ſtalke beares are many but very ſhort and narrow, ſcarce foure or five inches long, the ſtalkes oftentimes exceede not the length of the leaves, wherein ſtand ſmall white ſpiked heads, ſcarce an inch long, beſet with ſhort haires.

4. *Gramen Caryophyllum ſpica multiplici.* Double ſpiked graſſe with Gilloflower leaves.

This roote compoſed of a buſh of many reddiſh hairy fibres ariſe ſundry ſhort narrow leaves, like unto thoſe of the firſt kinde, among which ſpring very many ſlender ſtalkes, naked without joynts or leaves, ſcarce growing above two foote, containing very ſhort reddiſh ſpikes many ſet together.

5. *Gramen Caryophyllum ſpica varia.* Variable ſpiked graſſe.

The ſeverall roots hereof are ſmall long and threddy, buſhing thicke together, from whence ſpring long and narrow leaves like thoſe of Gilloflowers among which grow ſundry ſmall naked ſtalkes, bearing a ſlender long ſpiked head, ſometimes ſingle, and ſometimes divided or branched into ſeverall long parts, made of many ſmall

6. *Gramen Caryophyllum Rabinum.* The principall Gilloflower graſſe.

This graſſe hath many thicke ſtems of ſtalky long and pointed leaves, living in a round compaſſe, as the head of the roote, like to thoſe of Gilloflowers, not having any nerves or vaines to be ſeene in them: none hath as yet written of the toppe or head, what forme it beareth, but it may be *Raubinus* hath ſeene it, in that he placeth it with the reſt of ſpiked Graſſes.

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

7. *Gramen spica geminata Columnæ.* *Columna* his double spiked Graſſe.

From a ſmall whitiſh fibrous foote, riſe up diverſe weake and leaning ioynted ſtalkes, with ſmall Graſſe-like leaves thereat, and at the toppes of each, two ſeverall ſpikes, ioyned together at the foote of them, dented on the edges with a middle ribbe, betweene the foure angles, and conſiſting of three or foure rowes of leaves, like ſcales, in each whereof is conteined a ſmal brownish corned head.

8. *Gramen spica mutica longiſſima.*

A long ſpiked Graſſe with a bending top, or Capons taile graſſe.

From among many long and narrow graſſie-leaves, which by time & age, grow ſomewhat rounder, ariſeth a ſlender ſtalke, about two foote high, with two or three ſmall leaves as ioynts up to the top, where ſtandeth a very long ſpike, bending a little downewards, compoſed of ſmall and hairy eares, which grow grayiſh, being ripe, with ſmall whitiſh ſeede within them, the roote is ſmall and creepeth

3. *Gramen pratense Virginianum hirsutum.* A goodly Virginia graſſe with a jointed ſpike.

This goodly *Virginia* graſſe groweth great, with many faire large and broad Graſſe like leaves very ſmall pointed, and rough hard in handling, the ſtalke is ſomewhat great and tall, bearing a long ſpike at the toppe joyned one under another, each of them almoſt halfe an inch apeece, being almoſt round, yet a little flat: the roote is long and ſtringy.

The Place and Time.

The Graſſes growe on hils, and in woods, ſome of them in *Germany*, *Italy* and *Virginia*, and ſome of them alſo in our land as time and diligence hath brought them to light their flouriſhing being with the reſt.

The Names.

The firſt of theſe is ſo called by *Cloſius* as it is in the title, who ſaith he found it or the like, on the Sea coaſts of *Narbon*. *Gerard* hath it by the name of *Gramen maximum alterum*. The ſecond, third, fourth and fifth, are mentioned by by *Bauhinus*, by the ſame titles they beare here, ſaving that where he intituleth ſome of them by the name of *Caryophyllatum*, I give it *Caryophyllum*, and as I thinke leſſe ambiguous, for *Caryophyllata herba* differeth much from *Caryophyllum* as the leaves whereof, and not unto *Caryophyllata*, theſe Graſſes have reſemblance: the ſixth is called by *Cluſius* in *Eorla Gramen Alpinum Rubrum, quaſi proſtratum, & procumbens*, and by *Lobel Roſtratum Rubrum*. The ſeventh is called by *Columna Gramen ſpica geminata*, and by *Bauhinus*, *Gramen ſpica gemina*, both good ſtalke. The eighth is the Capons taile graſſe of Maiſter *Gardiners* invention: The laſt came from *Virginia*, and Maiſter *John Tradeſcant* the younger brought it from thence alſo, with a number of other ſeedes and rare plants.

The Vertues.

We have no evidence what properties theſe Graſſes have in Phyſicke, but are onely ſet as food for Cattle, but ſhould be extolled by the naturalls of thoſe places where it groweth, to be moſt ſingular to cauſe Cattle to give aboundance of milke.

Chap. XIV.

Phalaris. Canary Graſſe.

Of Canary graſſe there are three ſpeciall varieties to be declared in this Chapter, but there are divers other baſtard ſorts which ſhall be ſhewed in the next.

1. *Phalaris vulgaris.* Common Canary graſſe.

The common Canary graſſe is but an annuall plant, to be new ſowne every yeare with us, by them that will ſee it grow, bearing joynted ſtalkes halfe a yard high, with graſſie leaves on them like Barley, and three or foure at a ſtand, chaffie heads ſomewhat pointed above, with blooming ſide gellowith, wherein lye flat rounded ſhining ſeede, bigger then Miller, and leſſe then Lintſeede, of a yellowiſh colour, and ſomewhat like to the ſeed of *Seſamum*, the roote withers, dying every Winter with us.

1. *Phalaris vulgaris.*
Common Canary Graſſe.

2. *Phalaris ſemine nigro.*

Canary graſſe with a blackiſh ſeede.

This other *Phalaris* differeth not from the former, but in being ſomewhat leſſer both in ſtalk, leafe, and head, and chiefly in the ſeede, which is of a pale blackiſh and ſhining colour: the roote hereof perſiſteth like the former.

3. *Phalaris bulboſa ſemine albo.*

White bulbed Canary graſſe.

This Graſſe alſo groweth very like the former, but with ſlender, render, and taller jaynted ſtalkes and leaves on them, and the leaves more ſoft and gentle, the ſpiked heads are ſmaller and a little longer, and not fully ſo cloſe growing together, ſofter alſo in handling, and bringing ſmaller, for which cauſe in them then the former: the rootes are many ſmall white bulbes, growing in tufts together with long fibres, deſcending from them, whereby they are faſtened ſtrongly in the ground, and dye not every yeare as the others doe, but encreaſe into great tufts.

The Place and Time.

All theſe ſorts have ſeene found growing in *Spaine*, and brought by *Bock*, with ſome baſtard ſorts, and many other ſorts. The firſt hath ſeene of many yeares knowledge, and brought in from the Canary Ilands with theſe ſmall ſinging birds, which wee call Canary Birds, whoſe name theſe bring: *Lobel* ſaith it groweth alſo in *Provence* at *Tolon*, *Hieron Tragus* ſaith, the ſecond came out of *Italy*, where Cardanus finde it. They all are ripe with us in *Auguſt*.

The Names.

It is called in Greeke [illegible], in Latine alſo *Phalaris*, and ſo all Writers, yet *Dalechampius* on *Pliny* taketh it to bee the *Phalaris alterum* of *Theophraſtus*, and is often times called in

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

stead of *Millium*, being of so neere agreement in quality, that there is not a neerer *succedaneum* [illegible] Canary Ilands, *Alofis* by the people there, and *Canario* in *Malta* as *Lugdunensis* saith, who referreth [illegible] both the former sorts, although *Bauhinus* referreth it onely to the second. The last is not mentioned [illegible]

The Vertues.

Canary seede is in some places and Ilands made into bread, but it hath as little nourishment [illegible] rather lesser, and therefore to mend it some put to it wheate, that the bread may be the lesse, which else would [illegible] too brittle and dry. The juyce of the herbe being drunke is very profitably used to ease the torturing [illegible] of the Stone, the stoppings of urine, and the diseases of the bladder, and the seede also of the like properties [illegible] *Lonicerus* saith: it is as I said, the neerest substitute for Millet in any cataplasme or [illegible] and [illegible] and represse the fluxibility of humours.

Chap. XV.

Gramen Phalaroides. Ballard Canary Grasse.

Of this ballard kinde we have divers sorts to offer to your view and consideration, as they [illegible] severally deterined: some of them are most like unto the true *Phalaris*, bearing but one [illegible] head on a stalke, which shall be declared in this Chapter: and there are some other kinds that [illegible] many small heads in a tuft, called *Phalaris pratensis*: and we in English Quakers, and Quake [illegible] grasse, which shall be shewed in the next, because of their differing forme and use.

1. *Gramen Phalaroides maius.* The greater ballard Canary grasse.

This greater sort is very like the true *Phalaris*, both in stalke leafe and head, but that first, they [illegible] wilde by the way sides, in the Medowes of our owne Country: and then the stalkes are single, with [illegible] on them, and lastly the head or eare is smaller, hoary, softer, and the roote like wise smaller and fibrous perishing yearely.

Gramen Phalaroides [illegible]
The [illegible] sorts of Ballard Canary Grasse.

2. *Gramen Phalaroides minus.*

The lesser Ballard Canary grasse.

This is in all things like the former, but that the eare or head is smaller and longer, and the leaves doe so compasse the stalke at the bottome, that it seemeth to runne through it, as through a truncke.

3. *Gramen Phalaroides spica molli Germanicum.*

Ballard Canary grasse of *Germany*.

The stalke of this is of a cubits height, somewhat bigger then the last, with a joynt or two thereon, and short leaves at them, compassing it at the lower end: the head is shorter and smaller then the last, of a shining ashe colour, and soft in handling.

4. *Gramen Phalaroides spica hirsutiore.*

More hairy Ballard Canary grasse.

This is somewhat like the last, but hath more store of leaves and stalkes, rising from the roote which is living: and the spiked head is longer, narrower, and set with short haires.

The Place and *Time.*

The first as I said, groweth in our fields, as well as in other Countries. The second in *Spaine*. The third in *Germany* about *Vlmes*. And the last by the pathes going through many fields in this country, and flourisheth in July.

The Names.

Lobel calleth the first sort here *Gramen Phalaroides secundum*, but in *Germany*, *Gramen Alopecuroides maius*: *Bauhinus* calleth it *Gramen Phalaroides maius sive Italicum*, the other two are called by *Bauhinus* according to their titles, and saith withall, that the learned about *Vlmes*, where it is frequent, doe call it *Oxeadon*, from the colour of it. The last is not mentioned by any before that I know.

The Vertues.

These being very like unto the true *Phalaris*, may serve as neere in [illegible] but yet we have no certainty thereof.

Chap. XVI.

Phalaris pratensis sive Gramen tremulum. Quakers, or Trembling grasse.

Because, as I said these kindes of grasses doe differ in their forme from the other, I have first [illegible] rate them, and joyne the most likely in a like manner together.

1. *Phalaris pratensis maior, sive Gramen tremulum maius.*

The greatest Quaking grasse, or Lovely grasse.

This greater kinde hath many narrow Grasse like leaves, each [illegible] and upon the joynted [illegible]

which are a foote high and better, on the toppes of the ſtalkes the number of ſmall flat and long, ſomewhat ſcaly heads, lyeing one by the next, and each of theſe are on a fine hairy ſtalke and pendulous, which are ſometimes of a whitiſh colour when they are ripe, and ſometimes of a browniſh green colour, being ſhaken with any the leaſt winde that may be.

2. *Gramen tremulum medium.*

Maidenhaire graſſe, or the leſſer quaking graſſe.

This leſſer ſort groweth ſomewhat like the former, with ſlender leaves and ſtalkes, and a large panickle or tufted head, of greener, ſhorter, and rounder ſcaly pointed eares, ſtanding on ſmaller or finer foorſtalkes then the former, which are in ſo continuall motion, that the moſt ſteddy hand cannot hold them from ſhaking. Of this kinde *Boel* brought us another out of Spaine, ſomewhat greater then it, and of an obſcure or ſullen gray colour, in nothing elſe differing.

We have alſo two other ſorts hereof, growing in Vpland Corne fields, as at *Hatfield*, &c. on the graſſie balkes there, not differing in leaves or ſtalkes from the laſt, the heads ones here a little leſſer, and ſo is the whole panickle alſo, the one whereof is party coloured, of purpliſh and greene: the other of a braſſe colour and white.

3. *Gramen tremulum minus panicula parva.*

Small Quaking graſſe.

The roottes hereof are reddiſh, creeping here and there, from whence riſe two or three ſhort ſtalkes, with few joynts, and ſmall narrow greene leaves at them, as the many that grow below are, but out of the uppermoſt joynt, and the leafe as it were out of a hole, breaketh forth a ſmall long ſingle ſpike of ſmall ſcaly heads of a browniſh colour, with yellowiſh bloſſomes at their ſeaſon, which is the Spring.

Of this kinde there is another found in *Gaſcoigne*, whoſe panicle is more branched, ſomewhat like the ſecond kind, but ſtanding cloſer together.

4. *Gramen Phalaroides minus ſapinum Danicum Lobelij.*

Low Quakers of *Denmarke*.

This Graſſe groweth low, lying or creeping upon the ground with many ſmall ſhort leaves, and greater ſtalkes then is proportionable for the ſmallneſſe of the plant, not above two or three inches long, having at the toppes of them a ſmall ſlender ſpiked eare, ſeparated into a few ſmall chaffie pointed heads, of a whitiſh colour being ripe, the rooote is of a browniſh colour and hairy.

Hippuris vera aliorum recentiorum.

Alterum.

3. *Gramen tremulum maximum Pannonicum & minus.* The ſmall Quaking graſſe and the greateſt of Pannie called Pearle Graſſe.

4. *Gramen Phalaroides Danicum & alterum minus eius.* Low Quakers of *Denmarke* and the other ſmall one.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

There is another small one with small short leaves and stalkes, full of small leafy heads upon very short stalkes.

1. *Gramen tremulum maximum album Hispanicum.* The greatest white Spanish Quakers, or Pearly grasse.

This greater white Spanish kinde is a small grasse, with slender stalks, and a few soft greene leaves at the toppes whereof stand the greatest and stattish soft leafy heades, of any of the other before, and of a silver shining white colour, very beautifull to behold, each much like unto the head of an hoppe standing on a small stalke, like footestalkes as the others doe, but are almost as moving and shaking as the other: the roote is small and thrid, perishing every yeare with us, and seldome rising againe by it owne sowing, but of the sowing thereof in the Spring, yet sowing it selfe in Spaine, and abiding there all the Winter, in regard they have no frosts.

The Place and Time.

All these kindes of Grasses doe grow in the Corne fields, some in Ley grounds, and others in dry Medowes and Pastures. The first and second with the severall sorts of it in our owne Country as well as in Spaine, Italy, & elsewhere, the other sorts are all of them specified in their titles or descriptions where they are mentioned. They flourish (some what earlier then divers other Grasses.

The Names.

The first is called by *Lobel Gramen panicularum phalaroides*, by *Clusius Gramen tremulum, quasi arundinaceum tenerius* grasse, by *Dodonæus Gramen pratense tertium*, by *Tabernæmontanus Gramen agreste altissimum tertium*, and is diversed from him, by *Bauhine Gramen panicula elegantissima spica longa et magna*, and I have called it *Phalaris gramen major*, for unto it is referred the greatest number of heades of any the rests. The second is called *Phalaris gramen minus &c. Anonymes gramen album* by *Clusius*, *Zeagus* by *Tragus* and *Celsus* in Italy, and *Gramen polystachyon* by *Lobel* in his *Illustrations*, that he intended to publish. The fourth is called so as is in the title: the last is *Phalaris Gramen tremulum maximum*, and questionless if it be not *Phalaris altera* of *Columna*, *Chiendent* of the *Frenchmen*, may be a variation hereof, by the name of *Gramen tremulum majus panicula nodosa*, giving such shew of him as he brought it out of *Spaine*, but he gave it me first, by the name of *Gramen tremulum glumis*, and is now a dayes among our Gentlewomen much affected, and called Pearle grasse, the kinde of the second kinde are by them called Maiden haire grasse, or rather Maides haire grasse. The *Dutch* call them *Lovegras*, and we ordinarily Quakers, or Shakers, or Quaking grasse, &c.

The Vertues.

The chiefest use that these grasses are put unto, is for Gentlewomen to weare on their heads or attire, as they would doe any fine flowers or pretty toy to behold, as also put into wreathes and Garlands, that the Country people make for their sports and pastimes. And hath no use in Physicke for any Medicine that I can heare of.

Chap. XVII.

Alopecuros. Foxtaile grasse.

Having handled the *Phalaris*, to wit, I the *Alopecuros*, that is speake of the *feminine* kind in this Chapter, and joyne unto it such as are likest thereunto, and speake of the *collard* kinds in the Chapter following.

3. Alopecuros genuina.

The true Foxe-taile grasse.

The true Foxe-taile grasse groweth up with two or three soft hoary stalkes about a foote high, with small long and narrow soft leaves on them as hoary as the stalkes, whereon stand soft woolly, or hoary heads, somewhat long and round, beset round with soft haires, of a pale straw colour, resembling the taile of a Foxe, whereof it tooke the name: the roote is small, and made of a few fibres which perisheth yearely.

4. Alopecuros altera Anglica, & Pinaciana.

Another Foxe-taile grasse like unto the former.

This other Foxe-taile grasse hath leaves and roote not much unlike to the former but longer, and the stalkes grow higher, the heads also are rounder, and thicker, and nothing in quality of hearty.

5. Alopecuros maxima Anglica.

The greatest English Foxe-taile grasse.

This greatest Foxe-taile grasse groweth to be halfe a yard or somewhat more, sometimes having three large leaves like unto Wheate but larger, set at the joynts, and at the toppes, large great, tall tuft and woolly heads like the former, but much greater and longer, either higher or lower.

The Place and Time.

The first of these is not found naturall in *England*, as the others are, but groweth in diverse places about *Montpelier* in *France*, we onely have it in our gardens for curiosity.

Alopecurus genuina. Altera & tertia Anglica.
The three sorts of Foxe-taile Grasse.

The Names.

It is called in Greeke [illegible] *Alopecuros*, and so in Latine which is *Cauda vulpis*, and so they call it at *Mompelier* as *Lobel* saith: *Bauhin* seemeth to call it *Gramen Sesleriacum*, *Tragus* calleth it *gramen tomentosum Alopecuros quasi Panis Theophrasti*. The second *Lobel* calleth as it is in the title, because he found it in *England* as well as *Flanders*, and is that which *Dodonæus* calleth *Alopecuros*. The last *Lobel* found in the Welt parts of this land betweene *Portpeasants*, and the Ile of *Anglesey*, and called it *Alopecuros maxima Anglo Britannica*, and hath not been knowne to any before.

The Nature.

There is no speciall property found to be in any of these for Medicine, but to be Worne onely as a toy, to please the Women-kinde.

Chap. XVIII.

Gramen Alopecuroides. Ballard Foxe-taile grasse.

There are divers sorts of these wilde or ballard Foxe-taile grasses, some greater, other lesser, all which I meane to comprehend in one Chapter, seeing they are of no great moment, and but to content the curious, yet I will show you the greater first, and the lesser after them.

1. *Gramen Alopecuroides maius.* The greater ballard Foxe-taile grasse.

The greater of these wild Grasses riseth up with a stalke two cubits high, with few leaves long and narrow on them, the spike is somewhat great and long, resembling the former, but not so soft or Woolly. There is a lesser sort, differing chiefly in the smallnesse, being somewhat smaller but longer.

2. *Gramen Alopecuroides Africum.* Ballard Foxe-taile grasse of *Africa*.

This *African* hath at some part of the stalke small long leaves, set by themselves at the joynts, and at others diverse together, the head or spike is somewhat great and very long, woolly and soft, as the other, the roote is great and long.

3. *Gramen Alopecuroides spicatum maximum Anglicum.* Our ballard Foxe-taile grasse of the greatest size.

This hath many long narrow leaves, rising from a bushy roote, and among them stalkes two cubits high, with few joynts and leaves on them, at the top whereof standeth the longest spiked head of any other, somewhat pointed at the top, and broad at the bottome, set about with white haires on the husks, which are somewhat like to those of Oates.

4. *Gramen Alopecuroides cuspidatum vulgare.* Great spiring ballard Foxe-taile grasse.

This is somewhat like unto the first sort here in this Chapter expressed, but that the spiked head is longer and

3. *Gramen Alopecuroides maius.*
The greater ballard Foxe-taile Grasse.

3. *Gramen Alopecuroides minus.*
The lesser ballard Foxe-taile Grasse.

spiring

5. Gramen Alopecuroides Africanum & majus, maximum Anglicum. Bastard Foxe-taile Grasse of Africa. And Ours of the largest size.

7. Gramen Alopecuroides [illegible] A Bastard Foxe-taile Grasse [illegible]

6. Gramen Alopecuroides spica asperra brevi. Short rough eared bastard Foxetaile Grasse.

7. Gramen Alopecuroides spica longa [illegible] The great long eared bastard Foxe-taile Grasse

...ward, and that is small at the toppe, and somewhat broad...
...with chaffe-like husks set on them, and that the leaves...
...narrow, and much shorter.

Gramen Alopecuroides aliquam radicem emittens.
Sive Cynosuroides Theophrasti.
A ballard Foxe taile grasse, called ballard Lymon
of *Montpelier.*

I acknowledge, that this Grasse might not unfitly have...
...place among the Sea plants and Rushes, but in regard...
...doth more resemble the ballard Foxe taile-grasses, let...
...the diligent reader inure it here, whose description is this. It...
...somewhat resembleth the greatest English Foxe taile grasse, de-...
...scribed in the Chapter before, differing in that this hath thicker,...
...broader leaves, like unto Rushes, the head or spike is...
...broad also, seven five or six inches long, of a silver like shi-...
...ning colour, but the bloomings are of a pale red, and the husks...
...alike, which when it hath stood long, beginneth to open it selfe,...
...and lets fall some downie matter for the winde: the roote creeps...
...along under ground, shooting forth leaves and stalkes in di-...
...vers places.

2. Gramen Alopecuroides spica aspera brevi.
Thicke rough eared ballard Foxetaile-grasse.

The small roughe eared grasse riseth up with two or three ap-...
...pointed stalkes with somewhat narrow and soft leaves on...
...them, at the toppe whereof standeth a thicke and short rough...
...eare of an inch and a halfe long not fully but as it were halfe...
...naked or balke on the backe side being as it were bare, so that...
...seeme to stand but on one side: wherein is small white seed...
...inclosed: the roote is small and white perishing yearely.

3. Gramen Alopecuroides spica longa major & minor.
Great and small long eared ballard Foxetaile-grasse.

These Grasses are one not much unlike another, the one being...
...greater and the other smaller, both in stalke and leafe, the spiked...
...eare long and slender, and of a whitish colour.

4. Gramen Alopecuroides minus spica aspera longa.
Small rough long eared ballard Foxetaile-grasse.

This differeth from the last in being greenish, more stored with...
...stalkes and leaves, and the spiked head more slender long, and rougher also.

5. Gramen Alopecuroides minus cuspidatum. Small sharpe pointed ballard Foxetaile-grasse.

The stalke hereof is about a foote high, stored but with few joynts, and shoots narrow leaves on them, the spiked...
...eare is almost as long as the last but sharper pointed, and with some peeces growing out of the sides.

6. Gramen Alopecuroides cuspidatum minimum. The least pointed ballard Foxetaile-grasse.

This is lesser then any of them before, in stalkes and leaves but longer in both, as the spike or eare is also being...
...very small and slender and pointed at the end.

The Place and Time.

All these Grasses except the second and fifth, doe grow in the fields and meadowes of the land, some neere *Lon-...*
...don, about *Hackney*, and others in *Kent*, and keepe the same time of flourishing with the rest. The fifth is found...
...by the Sea side at *Marlow*.

The Names.

The first foure of these Grasses, both the greater and the lesser are expressed by *Lobel* and others, under the name...
...of *Alopecuros*, and *Cynosuros spicata*. The second *Lobel* brought us out of *Barbary*. The third and fourth we have...
...growing wilde as well as tame. The fifth is called by *Tabermontanus* and *Gerard*, *Schoenanthum minus* and by *Lo-...*
...*bel* *Gramen gramineum Joannis Schoenantho*, but afterwards altering the title, he set it with these Grasses, and...
...called it as it is in the title heere. The sixth is called by *Lugdunenses Gramen Echinatum Leucholoeum*; but *Bauhinus*...
...calleth it *Gramen Alopecuroides spica aspera*. The seventh and eighth are called by *Bauhinus*, *Gramen Typhoides*, and...
...so called by others *Gramen Alopecuroides*, as the last are also.

The Vertues.

There is nothing remembred by any, wherefore any of these are profitable.

Chap. XIX.

Gramen Typhinum vel Typhoides. Cats taile Grasse.

Although I doubt not but the Cats taile it selfe in this place, being referred to the wet and moorish...
...places, where it shall be remembred among other of the like nature, yet I will here shew you the...
...sorts of Cats taile Grasses.

1. Gramen Typhoides maximum. The greatest Cats taile Grasse.

This great tall Grasse groweth up with faire large leaves like wheate, and stalkes two foote high, on...
...which stand long round spiked heads, foure times bigger then the next, and almost of an equall...
...bignesse and roundnesse from the bottome to the toppe. Yet sometimes it is found with stalkes three or foure cor-...
...bare

1. 2. Gramen Typhinum mas & femina minus.
The greater Cats raile grasse and the Female.

2. Gramen Typhinum minus.
The lesse Cats raile grasse.

but high, and the spike somewhat shorter and smaller to the toppe.

3. *Gramen Typhinum maius sive vulgatissimum.*
The most common Cats raile Grasse.

This Grasse that is most common in our more barren grounds, differeth not but in the smallnesse from the former, the stalkes not rising much above a foote high, and the round spike two or three inches long: the roots have small round heades like bulbes from whence the leaves doe spring and encrease there.

4. *Gramen Typhinum minus.*
The lesse Cats raile grasse.

This differeth not from the last, but in having more store of narrower greene leaves and lesser stalkes with smaller long slender spiked heads.

5. *Gramen Typhinum Danicum.*
The Danish Cats raile grasse.

The Danish kinde hath leaves and stalkes much like the last, and differeth in these two things onely from it, first in having shorter spiked heads and more rough, and next that at the bottomes of the stalkes next above the roote, they have two small knottes or bulbes one as it were set upon another.

6. *Gramen Typhinum alterum Zelandicum.*
Dutch Cats raile grasse.

This Grasse is smaller then the last, both in leafe and stalke, yet not little in the head or spike, the chiefest difference from it is, that it hath two little bulbes one upon another among the roote.

7. *Gramen Typhinum Harlemense.*
Harlem Cats raile grasse.

This differeth little from the Danish kinde, but in being lesse both in stalke and leafe, and having two small knots above the roote, but lesse evident.

Original from UNIVERSITY OF MICHIGAN

The Place and Time.

The three first are often found in our owne land, but the three last not knowne as yet, and doe all keepe the same time with others.

The Names.

The first here set downe, is no doubt the same with the first and greatest *Cyperus Typhinus* of *Bauhinus*. The second hath heretofore been called *Cyperus Typhinus major* by divers. The third is likewise called *minor*. The other three have their names to their titles, not being mentioned by any before.

The Vertues.

They are as unprofitable for any Physicall use as the last.

Chap. XX.

Gramen Cyperoides, Cyperus Grasses.

Of Cyperus Grasses there are a great number, some growing in watery and moorish places, either up-land or neere the Sea, others in the corners and borders of fields or Woods, or the moister places of them, which shall be declared in this Chapter and the other in the next Classis hereafter, and first of those that may be ranked both with Cyperus and *Typha*, to the one in the leafe, and to the other in the seed.

1. *Cyperus Typhinus*, Cats taile *Cyperus* Grasse.

This Cyperus Grasse hath many long narrow three square hard greene leaves rising from a bushye roote, among which rise up sundry greene stalkes, two foote high and better, with some joynts and leaves at them, and at the toppes two three or foure slender long rough heades set together one above another, like some of the Cats tailes, and of a darke greene colour tending to purple.

2. *Cyperoides spicatum paniculum pro Bifolcreo.* Tufted bastard Cyperus grasse.

This Grasse hath divers, some long and somewhat broad, and shorter, paler greene leaves then the last, from whence arise three square stalkes like Cyperus, about halfe a yard high, set with leaves from the bottome to the middle of the stalkes, encompassing them at the bottome, the toppes being furnished with a larger tufted head, much equall for the plant, wherein is contained the seede: the roote is blackish and tuftie.

3. *Gramen Cyperoides sylvarum tenuius spicatum*, Slender eared Wood Cyperus grasse.

The stalkes of this grasse are three square, a foote high or more, with faire, but hard and rough grassie leaves, some or five inches long, the spiked heades that grow at the toppes are many, one above another, slender and long, some three others, as some of two inches, others of one inch, or an inch and a halfe of a yellowish green colour with long yellowish seedes in them, with yellowish great and stringy rootes.

1. *Cyperus Typhinus.*
Cats taile Cyperus Grasse.

3. *Cyperoides gramineum flos Bifolcreus.*
Tufted bastard Cyperus Grasse.

3. Gramen

4. *Gramen Cyperoides elegans multiflorum spica.*
A fine Cyperus Graſſe with many heads.

This Graſſe hath ſlender triangular ſtalkes about twe foote high, the leaves are long and narrow, with a long pointed ſpiked head made of many ſmall ones, ſo cloſe ſet togeither that they ſeeme to be but one ſpike or head.

5. *Gramen Cyperoides echinatum montanum.*
Mountaine prickly Cyperus Graſſe.

The ſtalkes hereof are three ſquare, and not much above a ſpanne long, the leaves below, and on them are very long and narrow, the heads are ſhort, with many rough burres on them, ſome ſeparated and ſome cloſe.

6. *Gramen Cyperoides ſparſa panicula Alia Pona.*
Land Cyperus graſſe with a diſperſed tuft.

The long leaves hereof are of a browne greene colour, and ſomewhat flat betweene a roſh and a graſſe: the ſtalke alſo is ſomewhat more flat then ſquare, ſometimes but one cubit high, and ſometimes two or three, the toppe whereof is furniſhed with a large round ſpread pannicle made of many parts, and each ſmall prickly head ſtanding on a ſlender footeſtalke, which oftentimes is bent downe with the weight of the heades: the roote is full of fibres.

7. *Gramen Cyperoides Norvegicum parvum lanuginoſum.*
Cyperus graſſe of *Norway* a little woolly.

The ſlender ſtalkes of this graſſe grow about two ſpans high, the bottomes of them being a little woolly, and having at the middle onely a joyne with a leafe, the lower leaves ſet cloſe upon the ground three or foure inches long, ſomewhat like thoſe of the graſſe Crowfoote: the heades of the ſtalkes have ſmall round ſhining eares on them of a pale browne colour, with a ſmall long leafe under every head.

Anglicum duplex varietas.

There have beene two ſorts of this kinde of graſſe, found neere unto *Leigh gate*, the one ſmaller then the

6. 7. *Gramen Cyperoides ſparſa panicula & Norvegicum parvum lanuginoſum*
Cyperus Graſſe with a diſperſed tuft, and of *Norway* a little woolly.

...ing tooretoore of burres at the heads of the ſtalkes. The other greater and ſome what higher then that of Ver...

8. *Gramen Cyperoides, Norvegicum alterum.* Another *Norway* Cyperus Graſſe.

The other Graſſe groweth in moiſt Woods, as well with us as elſewhere, with a number of long narrow leaves, ſome three or foure inches, others ſix or ſeven inches long, the ſtalkes are cleare and ſmooth, halfe a yard high, bearing at the toppe many ſonelike heads, ſet cloſe together.

9. *Gramen Cyperoides ſpicatum latifolium.* Broad leafed Cyperus Graſſe.

This graſſe may be numbred among the other of this kinde, in that it hath long blacke creeping rootes, with ſome knees at them, very like unto the ſweete long Cyperus, and hath broad leaves, almoſt a foote long, among which the ſtalkes being a foote high, beare three chaffie ſpiked heades at the toppes, of an inch or an inch and a halfe long, whereof the middlemoſt is longeſt, each of them like unto the ſmall Cats taile graſſe.

10. *Gramen Cyperoides ſpicatum latifolium alterum.* The higher broade leafed Cyperus graſſe.

This alſo is reckoned with the reſt, having as long leaves, but higher ſtalkes by much, bearing at the toppes five ſmall long eares of ſpikes one above another, an inch or two long, with a ſmall leafe at the foote ſtalk of them: the roote is ſomewhat long but ſcaly with many long fibres ſet thereat.

The Place and Time.

The firſt groweth in the lower places of wet fields neare the Sea ſhore. The ſecond we have ſometimes found growing in ſtanding waters, betweene *London* and *Kemiſh* Towne, in the bottome of a field, ſome in *Norway*, divers other where about *Highgate*, and in a Wood neere thereunto and in other places of the Land, and keepe the ſame time with others.

The Names.

The firſt is called by *Tabernæmontanus*, *Gramen Typhinum*, and by *Bauhinus Gramen Typhoides ſpica multiplici*, but by *Gerard*, *Gramen Typhinum*, and ſo doe I, finding it to participate of both, and inquire leſt out of the new *Gerard*, where others are, for want of the figures. The ſecond is called by *Lobel*, *Cyperus graminea ſive Aſiaticus*, by *Lugdunenſis Juncus latus*, by *Thalius*, *Pſeudocyperus ſpicatus*, and by *Bauhinus Gramen Cyperoides miliaceum*. The like not written of by any before, and therefore their titles are ſufficient to diſtinguiſh them.

The Vertues.

Without nothing to ſet downe of the propertey of any of theſe graſſes, but are wholly neglected, as unprofitable to any Phyſicall uſe, neither doe they ſerve for fodder, though they may for litter to horſes and cattle.

Chap. XXI.

Gramen Canicum, Dogs graſſe, or Quich graſſe.

Of the Dogs graſſes there are many ſorts, ſome growing in fields and other places of the Vpland grounds, others in the fieldes neere the Sea: of the former we will ſpeake here, and of the other in the next Claſſis, among the Sea plants.

1. *Gramen caninum vulgare.* Common Quich Graſſe.

2. *Gramen Canicum longis radicibus & latiori gramine minus.* Lenger rooted Quich graſſe with a more ſpread panicle.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

1. *Gramen Caninum vulgatius.* Common Quich grasse.

It is well knowne to all I thinke, that this Grasse creepeth farre about under ground, with long white jointed rootes and small fibres almost at every joynt, very sweete in taste (as the rest of the herbe is) and interlacing one another, from whence groote forth many faire and long grassie leaves, small at the ends, and cutting or sharpe on the edges: the stalkes are joynted like cane, with the like leaves on them, and a long spiked head, with long husks on them, and hard rough seede in them.

2. *Gramen Caninum longius radicatum, & paniculatum.* Quich grasse with a more spread panicle.

This differeth very little from the former, but in the ears or panicle, which is more spread into bunches, with shorter and broader huskes, and in the roote which is fuller greener, and farther spread.

3. *Gramen Caninum latifolium minus minor.* The lesser Quich grasse with a sparkled ear.

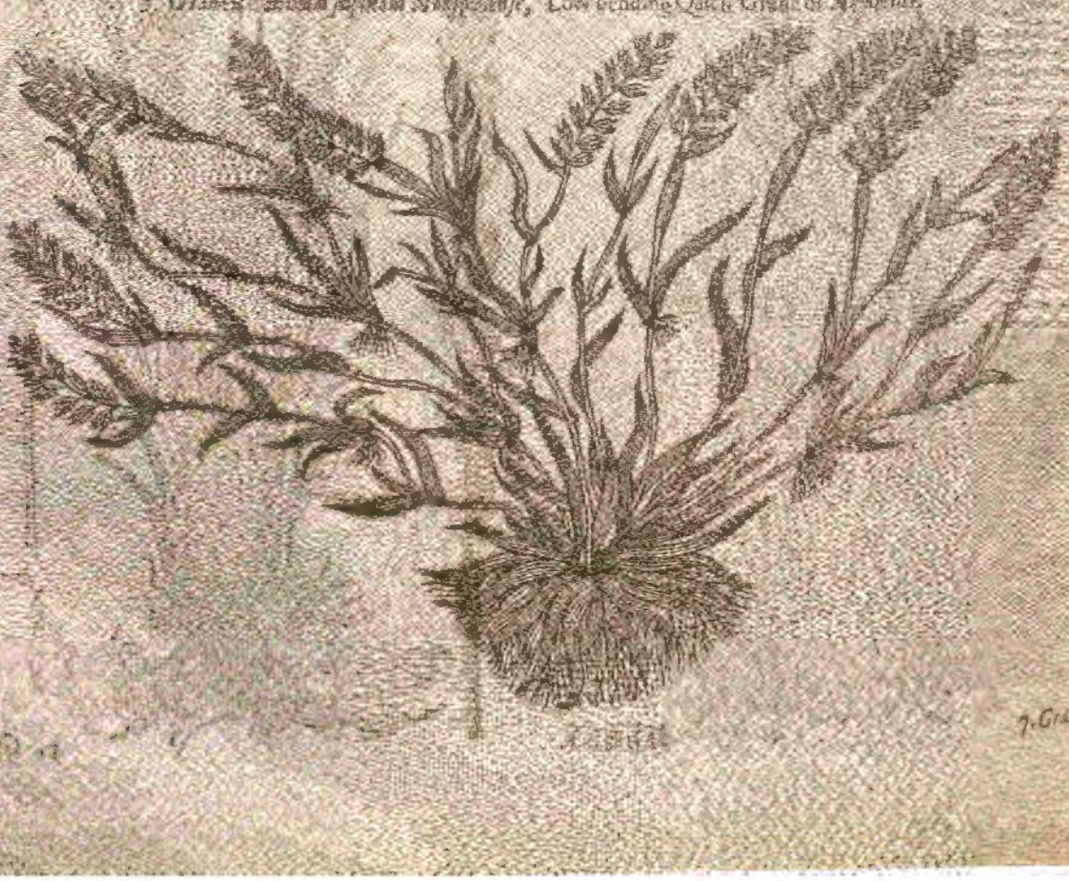
This small Quich grasse hath slender stalkes, about halfe a foote high, with many very narrow leaves both below and on the stalkes, the tuft or panicle at the toppe is small ascending to the plant, and spread into many parts or branches: the roote is small and joynted, but creepeth not so much, and hath many more fibres among them then the others have, and is a little browner, not so white but more sweete.

4. *Gramen Caninum supinum serotinum.* Low bending Quich grasse.

This creepeth much under ground, but in a differing manner, the stalkes taking roote in divers places, and scarce raising themselves up a foote high, with such like greene leaves as the ordinary, but shorter, the spike head is bright and sparked, or spread abroad, somewhat like the Field grasse.

5. *Gramen Caninum supinum Hampelense.* Low bending Quich grasse of *Hampton*.

This differeth very little from the last in any other part thereof, then in the panicle or spiked head, which is longer and not spread or branched into parts as it is.



6a. *Gramen repens tenuifolium Canis to simile sive gramen dulce,* A small sweete grasse, like quich grasse.

This small grasse hath divers very low creeping branches, and rooting at the joynts as the two last, bearing many small and narrow leaves on them much lesse then they, and a small sparked panicle, somewhat like the ratstaile grasse.

6. *Gramen Caninum supinum serotinum.* Low bending Quich Grasse.

5. *Gramen Caninum supinum Hamptonense,* Low bending Quich Grasse of *Hampton*.

7. Gramen

7. *Gramen non erumpit radice repente.* Wall graſſe with a creeping roote.

This Wall graſſe from a blackiſh creeping roote, come forth many ſmal ſtalkes a foote high, bending or crooking with a few narrow ſhort leaves on them, at whoſe toppes ſtand ſmall white panickles, of an inch and a halfe long, full of many ſmall chaffie huskes.

The Place and Time.

The firſt is uſuall and common through the Land in divers plowed grounds, which troubleth the husbandmen ſometimes in the ploughing up of ſome of them, as to pull up the reſt by hand after the ſpringing, and being gathered together to burne them, as it doth Gardiners where it happeneth, to weed it out from among their trees and herbs: the ſecond and third are nothing ſo frequent, and are more naturall to ſandy and challoye grounds: the two laſt are likewiſe found in fields that have beene ploughed and doe lye fallow, and the laſt is often found growing on old decayed walles, in divers places: they all keepe the time of Summer with the reſt.

The Names.

This is called in Greeke uſually ἄγρωστις, that is ſimply *Gramen*, as of moſt uſe, and in Latine *Gramen Caninum* by *Lob.* *Gramen Canarium*, *mediocre*, from *Pliny* who firſt called it *Canaria quaſe combuſtis ſegetis, quæ faſtidium adhibent, ſimilium cum pruinis reſurgunt in hiemem Cynoſuri alijs, & a foliorum primo protinus forma quibuſdam Gallis dicitur.* *Geſner in horto* calleth it, *Gramen Dioſcoridis*, and other Authors call it onely *Gramen*, and *Indianiſh Gramen vulgare.* The ſecond and third *Lobel* called in his other part to the *Adverſaria*, *Gramen Caninum longiore radice, non rubro ſed nigro*, and I thinke it alſo the *Gramen Caninum minuſculum of Bauhinus.* The fourth *Lob.* calleth *Gramen Caninum ſupinum*, and added *at cauſe* afterwardes to it: the fifth is ſo called alſo by him, becauſe it was ſent him from *Montpelier.* The ſixth is the *Gramen dulce* of *Lobel.* The laſt is ſo called by *Bauhinus* in his *Pinax.* The *Italians* call it *Gramigna*, as the beſt of all others, the *French Chiendent*, and *Dent de chien*, and our Quich graſſe, or Couch graſſe.

The Vertues.

The Quich graſſe is the moſt medecinable graſſe of all others, ſerving to open obſtructions of the liver and gall, and the ſtopping of the urine, being boyled and drunke, and to eaſe the griping paines of the belly, and inflammations, and waſteth the excrementitious matter of the ſtone in the bladder, and the Vlcers thereof alſo, the mouthes bruſed and applyed doth conſolidate wounds: the ſeed ſaith *Dioſcorides* doth more powerfully expell urine, and ſtayeth the belly or laske, and callings of vomitings. *Galen* ſaith the ſame thing, and further addeth that the roote is modeſtely cold and dry, and hath alſo a little mordacity in it, and ſome tenuity of parts, the ſeed cold in the firſt degree, and moderate in moiſture and dryneſſe: but the herd is more cold and dry, by reaſon of more tenuity of parts, and ſomewhat harſh. *Pliny* confoundeth this and the Corn ſtow graſſe together, applying the ſame properties to the one, that are attributed to the other: the diſtilled water, or the decoction alone being given to children for the wormes: but if ſome wormeſeede be put to it, it is the more effectuall. The Quich graſſe is what which hath beene ever in uſe in our Land with the Apothecaries for their medicines, as alſo in the herber parts of *France*, but the further parts thereof, and about *Geneva*, they uſe the knobbed or bulbed kinde, but neither of them was known to *Matthiolus*, or the *Germanes* or *Italians* in his time, as it is like, in that he hath made no mention of it.

Chap. XXII.

Gramen Caninum bulboſum & nodoſum, Bulbed and knobbed Quich graſſe.

Vnto this kinde of Dogs graſſe, is to be joyned ſome other graſſes, whoſe rootes are knobbed or bulbed, yet that lore which *Bauhinus* maketh mention of in his *Prodromus*, growing in the water, I will reſerre to the next Claſſis, whereunto it is proper.

1. *Gramen Caninum bulboſum nodoſum vulgare.* Common bulbed and knobbed Quich graſſe.

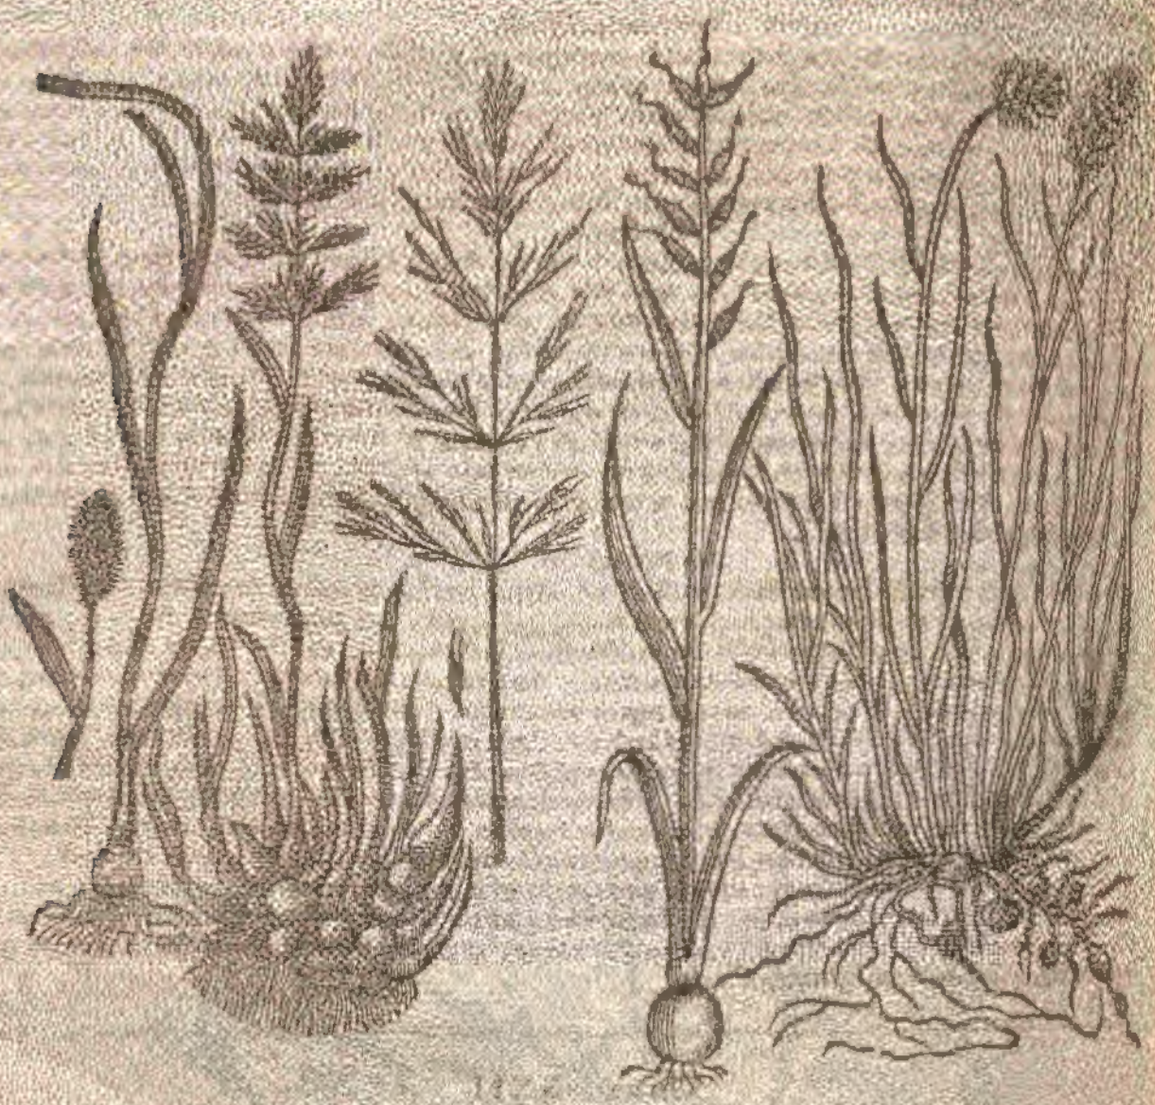
This kinde of Quich graſſe hath for his rootes, three or foure, or more round white knobbes or bulbes, one ſet upon the head of another, with divers fibres underneath them, from the uppermoſt of which doth forth divers long hard graſſie leaves, ſharpe at the edges, and in the middle of them a joynted ſtalke, with three or foure ſuch like leaves upon them, at the toppe whereof is a long panickle, ſpread into many parts like to that of Oates, wherevnto ſome have compared it. *Lobel* exhibiteth another lore hereof differing onely in many parts, that the rootes which are ſmall and round, and ſet at diſtances all along the rootes, and as it were at the ends. *Nodoſum.*

3. *Gramen nodoſum ſpica parva.* Knobbed graſſe with a ſmall round ſpike.

The ſmall Graſſe hath a ſmall whitiſh round knob or bulbe for the roote, with ſmall fibres under it, ſhooting forth from the head thereof another, ſomewhat like unto a bulbe, but much ſmaller, and like a ſlender knob, with a ſtalke joynted ſtalke above it, and a long narrow pointed leafe at each of them being foure or five inches long, and the ſtalke topped with a ſmall ſpiked head, ſomewhat like unto the head of the Cats tayle graſſe.

3. *Gramen bulboſum geminum.* Double bulbed graſſe.

This double bulbed graſſe, hath a greater round ſwerte bulbed roote below, covered with a reddiſh skinne, ſending forth a ſtalke at the head thereof: the upright ſtalke is not a foote high, joynted and kneed, like unto a Wheate ſtalke, having foure or five narrow graſſe-like leaves on them, and at the head thereof a ſmall long panicle made of diverſe huskes, each ſtanding by it ſelfe, like the huskes of an Oate, out of which appeareth ſmall ſmall blowings.



4. *Gramen bulboſum Alpinum.* The bulbed graſſe of *Alpes.*

This Alpine graſſe hath a ſmall white round roote, covered over with a reaked outer skinne, and ſmall white long ſtrings ſmooth, from the midſt whereof come forth two or three ſtraked ſtalkes, above a foote high, and ſuch like graſſie leaves ſet on them, the ſpike is ſomewhat like to the Wall barley, breaking out of a broade leafe that incloſeth above it.

1. 1. *Gramen Creticum bulbosum vulgare, or Cretan vulgare bulbous Grasse.*
Common bulbed Cretan Grasse, with a bulbe and his rock small round like.

1. 2. *Gramen bulbosum rarius, or other bulbous Grasse.*
Bulbed Grasse.

3. *Gramen bulbosum Mysorense.* The *Sicilian* bulbed Grasse.

Let me adde this plant here, for I know no fitter place to infer it, although it be not universable to the rest, whose description is thus. The roote is very small and round somewhat like unto a wilde Saffron roote, and of the bignesse of a Chestnut, having only two or three long leaves, as small as haires, with some thorter on the sides: on the toppe where of groweth a small long and round knob or bulbe, of the bignesse of an ordinary stone, somewhat yellow or browne on the outside, and having three rough circles about it, equally distant one from another, but white within, and of the substance of a Chestnut.

The Place and Time.

The first groweth not so common with us as the creeping rooted Grasse, yet sufficient plentifull in many places of the land. The second neere *Basill*. The third in *Spaine*. The fourth neere *Aleppo* in *Syria*. The last both neere *Verona* and *Padua*, and at *Carpasium*, and *Mysene* in *Sicilia*.

The Names.

The first is called *Gramen radicosum minus rotundo folio* by *Bauhinus*, who also doubteth whether it may not be one of *Cyclops Plinij*, which hath a kinde of bulbe; other call it *Gramen bulbosum, tuberosum, or radicosum*. The second is mentioned onely by *Lobelius* in his *Pemptades* and *Dioscorides*, by the same title it hath. The third is the second *Gramen radicosum* by *Bauhinus*, and the *Gramen Mysense* by *Lobelius*, who tooke it to be the *Cyperus* of *Theophrastus*. The fourth *Bulbocodium* saith it is called by the common people in *Italy Porrum*, and *Cepa silvestris*. The last is mentioned by *Dioscorides*, *Pliny*, *Lobelius* in *Mysebourcum*, *Matthiolus* in *Dioscoridem*, and many others, where he saith it is called *Scilla* or the *Sea-onion*, that usually sell it in the Markets, and by some others there called *Cepa*, from the sweete sallet like Chestnuts that both roote and heades have in eating. Many more there be, of severall sorts, roots, and that they of *Verona* call it *Fasiculum* or *Faselum*.

The Vertues.

The first knobbed Dutch grasse is found by certaine experience, not onely with us, but in *Spaine*, *Cyprus*, where it plentifully groweth, and is used to be more effectuall to provoke urine and to breake the stone, to allay the torments of the belly, that come by contrarie conditions of humours, and ordinarily, and generally it is holden lately to be used in any the like cases that the other is, and with as good successe. The third *Mysene* such vertues could understand of no physicall use it was put unto, but that Hawes were much delighted to sell by reason to digge up and eate the roots: the last is used for food, being windy withall, that is not used Physically.

Chap. XXIII.

Gramen geniculatum. Kneed Grasse.

THere be many kinds of grasse that groweth in the upland, there is onely a greater and a lesser as shall be shewed in this Chapter, but there are others growing in the waters, and neere the Sea sides, which shall be declared in their proper places.

1. *Gramen geniculatum majus.* The greater Kneed Grasse.

The greatest of these grasses hath many long trayling branches upon the ground, with knobby greene joints, and shooting out leaves from those joints that lye next the ground, so that it doth sometimes runne three foote in length, with one long leafe at each joynt, small at the end but broadest below, from which ar-

1. *Gramen geniculatum majus.*
The greater kneed Grasse.

2. *Gramen geniculatum minus.*
The lesser Kneed Grasse.

ses up the stalke some foure or five joints, from which doe spring forth divers small long spikes of chaffie husks of an ouer-worne colour, which stalkes and tops are full of a moyst pleasant juice, that it feedeth Cattle much sooner then any other Hay, and therefore wise Farmers that have cattle growing in them enough, doe keepe the Hay thereof for their chiefe winter provender, and the seed of it for poultry: the roote is full of strings and fibres.

2. *Gramen geniculatum minus.* The lesser Kneed Grasse.

This lesser kinde of Kneed grasse creepeth not so much on the ground as the former, but spreadeth more upright with small knobby joints, not altogether so great as the other, the leaves small, the stalkes send forth spiked heads at the tops, like unto the former, but smaller, and of a ruddier ouer-worne colour: the roote is throughly like the precedent.

The Place and Time.

These grasses grow in moist meadowes in sundry places of this Land, but have beene especially observed, the greater about Wilton, in a great meadow lying among the bridges at the towne end, belonging to the Earle of Pembroke: the lesser at Wandsworth, both of them in Wiltshire.

The Names.

These grasses are well knowne by their reference to the former sort to the kindes of *Gramen dactylon*, or *Hordeum*, because it creepeth together in a tuft, and differeth in *Agrostemon* or *Tabernamontanus* and *Gerard* from all other which groweth in waters or out Land as well as others: they have their knees on their stalkes.

The Vertues.

They are not known to be imployed to any other purpose then is formerly declared.

Chap. XXIV.

Gramen Dactyloides sive Ischemon. Dew Grasse, or Cockes foote Grasse.

Although formerly there was but one sort of *Ischemon* knowne, yet since for the manifold diversities or rules thereof, there are divers others referred thereunto as *species* thereof.

1. *Ischemon sylvestre latiore folio.* Common Cockes foote Grasse.

The common Cockes foote grasse hath sundry cleere reddish joynted stalkes, with large grassie leaves on them somewhat dented on the edges, broad at the bottome and small to the end, of an harsh or binding nature: at the toppes of the stalkes grow divers long and slender rough spikes of a brownish colour when they are ripe: the roote is made of many fibres.

2. *Ischemon sylvestre spicis villosis.* Another Cockes foote grasse.

This other grasse hath purplish stalkes, a cubit high, with fewer and much narrower leaves on them, the tufted heads are more in number then the former, and more hairy, having as it were short yellow beards on both sides of the panicles, wherein is the seede: the roote is bulbie like the other.

3. *Ischemon fœtidum sive Gramen Manna effundens.* Dew Grasse.

The Dew grasse hath likewise faire joynted purplish stalkes, and larger grassie or reede like leaves then the former, somewhat hairy or woolly at the bottome of them, and about the joynts at the toppes of the stalkes stand the tufted panicles, and more also set together, made of many small chaffie huskes, with long white beards on them, somewhat greater then Millet, and lesser then Rice, standing all as it were on the one side: the seede greater and more fruitfull, whole plante differeth from the former no other wise almost then a manured from a wilde plant.

4. *Gramen Scoparium Ischemi paniculis.* Broom Grasse.

The broom grasse hath a rootie tobilling of many very long hard threds or fibres, a cubit long or more: of the like are made in *France* where it is naturall those brushes that we doe usually brush our heads, &c. withall: the stalkes are hard, slender and joynted, about a cubit high, with small long leaves on them like unto the former sort of *Ischemon* here before set forth but sweeter in taste, at the toppes of the stalkes stand five or six very bright long panicles, like unto the Cockes foote but larger, flatter and lesse dented.

5. *Gramen Canarium Ischemi paniculis.* Cockes foote like Quich Grasse.

The Cockes foote like Quich grasse might as well have beene numbred among the Quich grasses many of them being as it were indifferent betweene them both: it hath running joynted roote like the common Quich grasse and to both stalkes and leaves some what resemble it, but the head is differred or spread more as the former long panicles of the Cockes foote grasse, the small chaffie huskes whereof contayne rougher seede.

1. *Ischemon sylvestre latiore folio,*
Common Cockes foote Grasse.

2. *Ischemon sylvestre spicis villosis.*
Dew Grasse.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

6. *Gramen Dactylon repens,*
Creeping Cockes foote Grasse.

His small grasse sendeth forth from a spanned threddy roote many long slender and weake branches, crayling or creeping upon the ground, and shooting forth roots at the joints, the leaves that grow at the joynts are small and grasse-like, long and narrow, and at the toppes of the stalkes which rise not much above a spanne high, foure or five small slender blackish spikes within the huskes wherein the seede.

7. *Gramen Dactylon Ægyptiacum.*
Egyptian Cockes foote Grasse.

The roote of this *Egyptian* Grasse doth somewhat creepe under ground like unto Quich grasse, but much more slender: the leaves are very small, set upon small stalkes of a hand breadth long, having at the small long panicles set with rough and soft awnes, opposite one to another like a Cockes combe, in which seede is found.

Both these in figure and description, but *Ferrarius* affirmeth, that a Countryman having lived long in Egypt, sent the aforesaid roots upon *Alpinus* his *Ægyptian* plant, and nothing others save that a little differing in figure, and the rough panicles distributed into five or six parts: nothing at all of the creeping roote, nor of the joynts whereon I have thought good to joyne this one with that the difference may be seene.

8. *Gramen Dactylon Africanum.*
Cockes foote Grasse of *Africa*.

This grasse of *Africa* is much like unto the last, but groweth little higher, the leaves more small, and the spikes or panicles somewhat longer and thicker, more scattered or loose as it were with greater distance creepeth about as the last and shooteth forth roots of our winters.

The Place and Time.

The two first are usually found naturall in divers places of *Italy*, and *Narbone* in *France*, as also in divers places of

of our owne Land, but the third is usually towen as Corne is in their fields in many places in Germany, and is sayd to be natural in Italy: the fourth in the Ile which is not farre from Orleannce: the fift is found in Spaine and Narbone in France, and so is the first also, and is there the most common: the two last are but rarely seene.

The Names.

It is called in Greeke *Typha*, and to likewise *Ulva* in Latin, it is also called *Typha* by Apuleius and called *Sive Apuleia* by him also, and *Cramen Vlvacum* by all other Authors, onely *Leonicenus* corrected it rightly it to be *Cyperus*, because the *Solenarius* called it *Cyperus sive Bulbus*, and *Tabernamontanus* generally maketh mention of the second: the third is called generally *Cyperus Asinus*, and some *Cyperus Italicus*, but it is of so much use among the *Germanes*, yet *Thalius* and some others call it *Cyperus sativus*. *Cordus* and *Lobel* also call it *Cyperus Germanicus*. *Schwagen Cyperi flores*, *Cyperi Indici* also *Cyperus* the small, *Sengrunella* and *Caprifolium*: the fourth *Lobel* calleth *Cyperus Scoparius Hetruscus*, as it is in the title: the fift *Lobel* formerly called *Cyperus Germanicus alterum*, but afterwards *Cyperus Germanicus*, *Cyperus Germanicus vulgaris*, *Cyperus vulgaris*, *Dutchcampy* as *Dodonæus* saith, but I think he is mistaken, for I cannot take it for *Cyperus* at all: it *Cyperus* as it were the first of *Dioscorides*, and so *Cordus* allotteth it to be calling it *Cyperus Leguminosus*: the last is called by *Lugdunenses*, *Cyperus vulgaris Dodonæus*, as *Dodonæus* saith it is not so in the other: the seventh *Prosper Alpinus* hath made mention of in his booke of Egyptian plants and saith that the *Egyptians* call it *Nymphæa Indica* or *Cyamus crudus*. The last is not remembred by any before, and therefore this title is sufficient for it. They may be all called *Cramen Dactylon* or *Dactyloides*, as *Dodonæus* calleth it, for the forme of the pannickles, representing spread fingers, and therupon might as well be called in *English* Crowfoote as Cockes foote grasse: the *Germanes* call the third *Hirsmeider quesch*, and wee in *English* Cocks foote grasse.

The Vertues.

Cockes foote grasse bruised and layd to any place that bleedeth, doth lay the blood presently, whether it be new or wound, yet if the rough spike be put into the nose and rubbed it will make it bleed, then the ordinary manner of using it worketh a contrary effect both to draw blood and to lay it: being boyled with *Acorus*, that is Sweet Sedge and some hempseed bruised doth quickly heale the biting of a mad dogge: the same also applied to tumors dissolveth them: it is said that the juice of branch that beareth only three spikes together is a present remedy against the Measles, and put into the eyes that runne and water by some distillation of the nose, causeth them to look red & so to be more cleared, or else being bound to the necke in the beginning of the said disease, doth speedily dissolve the humours and cleare the eyes. The Dew grasse is said to dissolve the hardnesse of women called the feeders here for small birds, and Pidgeons and Hens and for men also, for the *Germanes* and others eate like Rice, and in Potage, or put it into the broth of fish as we doe Oatemeale and divers other ways, being familiar and common nourishment to them as Oatemeale is to us. The Cockes foote Quich grasse is thought to have all the properties, and effectuall also that either of the Quich grasses before spoken of have, and therefore let reference serve you to them. The *Egyptian* Cocks foote as *Alpinus* saith is used by the *Egyptian* women to keepe them alone, either in the time of bladder, but *Prosper* aforesayd said he could not learne it to be so: Such, as saith that he met with a Religious man comming from mount *Sinai*, that declared that the flux of the urine vessels, but that the bladder might bee voyded, by putting up the finger and pressing the bladder, and by putting into the neck of the bladder by the Urinary passage a Goose quill, and blowing strongly through which he himselfe (saith he) knew to be true. They also use the decoction of the roots and leaves to procure courses and to give it to children to expell or drive forth the measels, small pox, *Saint Anthonies fire*, purples in generable in rooms, as also they use to give it in pestilent small feavers: the whole herbe, but especially the roote is held to be of singular good use to heale both greene wounds and old Vlcers, some of them also eate the decoction thereof to procure the care familiarly.

Chap. XXV.

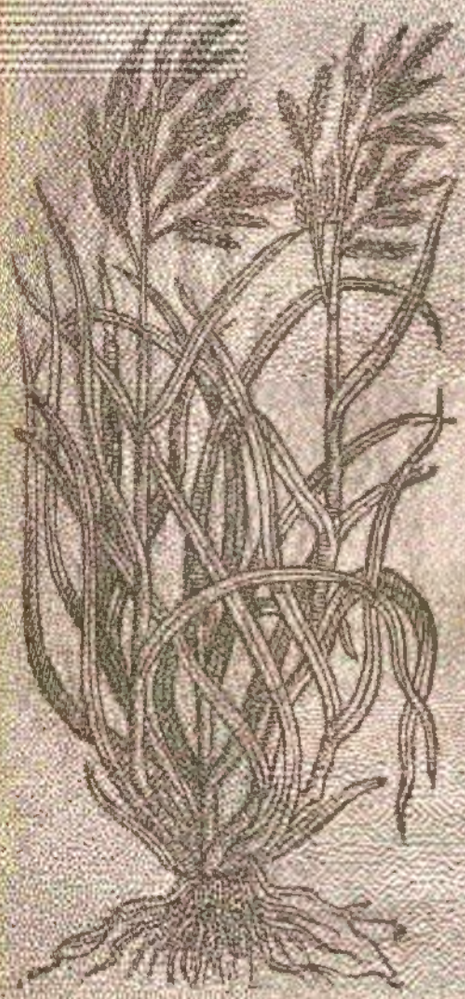
Gramen Arundinaceum. Reede grasse.

Of the Reede grasses there are diverse sorts, some growe on the land and others in waters, or that grow in the Ireland grounds, shall be entreated of in this Chapter, and the other in the

1. *Calamagrostis Gramen Arundinaceum maius.* The greater Reede grasse.

The greatest Reede grasse is set up with many jointed stalkes and large sharpe leaves like unto those of the water Reede, but lesser: the toppes of the stalkes are set with many small eares hard long spikes or heades, somewhat like the common Reede, which when they are ripe doe fall and are blowne away with the wind: the roote is full of long creeping strings and fastened here and there with joynts, from which proceed other new buds which presently take roote in the ground. There is a lesser sort hereof, whose toppes is not so full of spikes, having lesse eares or cods thereon.

2. *Calamagrostis altera Norvegica.* Reede grasse of Norway.



This other Reede grasse of Norway groweth not to great but harder and coyler both in leaves and stalkes, the former is like spikes but not so long, the toppe is larger, more spread into several pannickles sharper and smell rough, standing like unto those of the wilde corne full of many long strings. We have one like hereto in Hackney it is the same (our milder Country altering the roughnesse) having the like eares and threds growing at the head of the roote.

3. *Calamagrostis nigras sylvæ S. Ivanni.* Reede grasse of Saint *Johns* wood.

This Reede grasse is in stalke and leaves some what like the next woolly Reede grasse, but lesse, and divided in two or three places, two or three cubits high with narrower leaves sharper and smell rough, a little striped with blue: the toppe pannicles are sometimes a foote or more long, parted into many, very small which are soft as silke, and of a shining over-worne murrey colour: the roote is white with the like strings spread in the ground sometimes.

Calamagrostis five Gramen tomentosum.
The rotter or woolly headed Reed grasse.

Calamagrostis five Gramen tomentosum.
The soft or Woolly Reede grasse.

This woolly Reede grasse, is in the roughnes, dryness and forme of the leaves, not much unlike to that sort of Horsetaile grasse before spoken of in the Chapter of Horsetailes, which they of *Montpelier* called *Thymbrochenanthum*, but much greater, and not woolly as some related thereof: the stalkes likewise being two or three cubits high, and with few joynts are rough, bearing large spiked heads, set all along a panicle, reddish for some time, but growing to ripenesse of a shining silver like whitenesse, and as soft as wooll in handling, from whence it tooke the name, the root is somewhat hard and rough at the toppe, with divers long fibres issuing from it. This description is according to the Dutch copy, translated by *Lobel* himselfe.

Calamagrostis rectior panicula,
Round tufted Reede grasse.

This sort of Reede grasse hath narrow long leaves somewhat softer and gentler in handling then the other before, yet not eaten by any cattle: the rough panicle is selfe is more round, and thicker, with shorter heads, set close together like small knots or knobs, but somewhat flat on one side, the bloomings hereof are of a yellowish purple colour, some panicles likewise are found to be more long and narrow: the roots are small and stringy.

Calamagrostis tota villosa.
Round rotter Reede grasse.

Calamagrostis montana tota villosa foliis strictis longis.
The greater Mountaine Reede grasse.

8. *Calamagrostis montana maxima flore Scirpi pilosi Tragi.* The greater Mountaine Reede graſſe.

The greater mountaine Reede graſſe groweth up with ſtrong ſtalkes, as high as a man, without any ioynts on them, ſaue one at the moſt, ſerued thereat with, and not hard long leaues: at the toppes whereof are many long ſlender ſtalke ſpikes, far more ſpatiedly then the others, each whereof is of a bright reddiſh yellow colour, and ſtanding vpright. Another ſort hereof is much lower and ſmaller, the ſpikes being ſmaller and ſhorter, and not ſo purple, or of a darke red colour: the roote is ſomewhat hard, but with diuers fibres thereat. *Alterum.*

The Place and Time.

The firſt ſort, both the greater and the leſſer grow in moiſt Medowes that are ſandy, rather barren then fertile. The ſecond and third are expreſſed in their titles. The fourth in the borders of dry fields, and by the hedge ſides in many Countries of this Kingdome, eſpecially in *Darbyſhire*. The fifth alſo in the like places. The laſt groweth in the moiſt Woods that are on hills and mountaines: they flourish in the ſummer time, and their ſtalkes periſh when Winter comes.

The Names.

The Greekes call it καλαμαγρωστὶς, *Calamagroſtis* alſo and *Gramen Arundinaceum* in Latine. *Lobel* calleth the firſt *Calamagroſtis Neapolitana*, and *Arabicum Gramen arundinaceum ſpica multiplici*. The ſecond is not remembred by any before *Lobel* noted it in *Norway*, when he went into thoſe parts with the Lord *Zouche* Ambaſſadour. The third alſo is to be knowne by the title. The fourth is called by *Lobel*, *Gramen tenuiſolium Calamagroſtis quæ maior, cum Gramen plumoſum*, extant in his *Dutch* Booke, and it may be is that *Gramen arundinaceum plumoſum*, that *Matthiolus* deſcribeth for the 44. in his *Prodromus*, or very like it. The fifth alſo is not remembred by any Author before. The ſixth of both ſorts is called by *Tragus*, *Scirpi primum & alterum genus*, and is thought to be the ſecond *Lychnanthemos* of *Theſius*, and by *Bauhinus*, *Gramen arundinaceum tribus nominibus*.

The Vertues.

There is none of theſe Graſſes ſerviceable for any Phyſicall vſe that we know: neither doe any Cattle feede much vpon them by reaſon of their hard and ſharpe cutting leaues except the firſt, and that but ſeldome neither: the ſtalkes alone of them are platted into mats for Country women to lay and dry their new preſſed cheeſes on, and for other like vſes.

Chap. XXVI.

Gramen Nemoroſum glabrum. Smooth Wood Graſſe.

There are two kindes of Wood graſſes, the one with ſmooth leaues, whoſe lore ſhall be entreated of in this Chapter, and the other with rough or hairy leaues, in the Chapter following.

1. *Gramen nemoroſum capillaceum panicula alba.* White tufted Wood graſſe.

This ſmall graſſe groweth thicke and thicke together in a tuft having a number of greene leaues riſing from the roote, being as ſmall as haires, and of a foote long, the ſtalkes riſe vp among them a cu-

2. *Gramen nemoroſum maius ſpica ſubfuſca.* The great brizzle Wood graſſe.

4. *Gramen nemorum exile hirſutum.* Small hairy Wood graſſe.

ſpit

bie or more high, smooth and bare almost without joyne or leafe on them, the toppes whereof end in a slender white panickle, not an hand breadth long, compoſed of ſmall huskes ſet with beardes: the roote is hard and theedy.

2. *Gramen nemoroſum majus ſpica rufeſcente.* The greater browne Wood graſſe.

The greater Wood graſſe hath a number of narrow graſſie leaves ſpringing from the roote among which come forth many ſmooth round ſtalkes, without any joynt or leafe on them at the toppes whereof ſtand long browniſh ſpiked heads, ſeperated a little one from another, and as it were a little bearded: the roote is a tuft of many ſmall fibres or ſtringes.

3. *Gramen nemoroſum minus.* The leſſer Wood graſſe.

The leſſer ſort differeth not from the greater, but that it is in all parts leſſer and lower, the ſmall chaffie husked eares being ſmaller and nothing ſo ſoft, but rather hard and a little more ſparſed.

4. *Gramen nemoroſum exile durum.* Small hard Wood graſſe.

This ſmall graſſe hath divers ſmall hard leaves a ſpan and a halfe long, the ſtalkes are ſlender, with many joynts and leaves on them, at which joynts, and at the toppes alſo come forth ſmall long chaffie ſpiked heads.

The Place and Time.

Theſe according to their titles doe grow in Woods frequent enough in our owne Land in divers places, *Lobelius* ſaith the firſt groweth plentifully in an Oaken wood not farre from *Arſcotſfield* in *Suſſex-land*, and ſlowly where others doe.

The Names.

Theſe have their names in their titles, being called *Nemoroſum* or *ſylvaticum* by all Authours that have written of them.

The Vertues.

Theſe Graſſes are not uſed in Phyſicke, nor are they any good fodder for cattle, but are utterly neglected both by man and beaſt.

CHAP. XXVII.

Gramen nemorum hirſutum. Hairy Wood Graſſe.

OF this kinde of hairy Wood graſſe, there are ſome more ſorts then of the precedent, as hereafter ſufficiently ſhewed.

1. *Gramen nemorum hirſutum latifolium majus.* The greater broad leafed hairy Wood graſſe.

This greater Wood graſſe hath divers long and ſomewhat broad leaves running downeward ſpringing from the roote, ſmaller to the end, grayiſh underneath and greene above, ſet about the edge with ſmall

Original from UNIVERSITY OF MICHIGAN

small long haires, the stalke from among them groweth to be two foote high, with leaves at the joynts, and at the toppe with divers small greenish flowers in little huskes which contains small seede: the roote is a tuft of many small long threds.

5. *Gramen nemorum hirsutum majus alterum præcox tuberosa radice.*

A greater early Wood grasse with a knobbed roote.

This earely Wood grasse hath larger leaves then the former, of a deepe greene colour and hairy also, the stalkes are leaves at the joynts, as in the other, and such like heads or knaps of flowers, the roote is thicke, but somewhat short and browne, almost like a Tormentill roote, with a number of small blewish haires growing thicke.

7. *Gramen nemorum hirsutum latifolium minus juncea panicula.*

The lesser broad leafed hairy Wood grasse with Rush like panickles.

This lesser Wood grasse is very like in the growing unto the tuft or broader sort, but that the leaves being narrower and the panickle or tufted head, at the toppe of the small stalke, is smaller and somewhat resembling the toppes of Rushes.

7. Gramen hirsutum capitale globosum.
Globe headed hairy Wood grasse.

8. *Gramen nemorum hirsutum majus angustifolium.*

The greater narrow leafed hairy Wood grasse.

The greater narrow leaked Wood grasse, is very like in the manner of growing unto the first sort of Wood grasses, but that the leaves are much narrower, shorter, and turning downewards as the first, the stalke is bare without joynt or leafe, having at the top three small rough and almost round scaly heades set together: the roote is small and long with small hores set thereat.

9. *Gramen hirsutum angustifolium majus alterum.*

Another sort of narrow leafed hairy grasse.

From a small reddish fibrous roote riseth up a stalke neere two foote high, and smooth, usually bearing at the toppe a soft white panickle, some what spread, and made of sundry small scales as it were, in every one whereof lyeth a small round blackish seede: the leaves are few a little hairy and some of them compassing the stalke: the whole panickle hath two small leaves set at the bottome thereof, the one rising higher then it, the other lower: this saith *Ranbinus*, groweth in the moist fields of *Micheldeld* by *Ruffill*.

6. *Gramen nemorum hirsutum minus angustifolium.*

The lesser narrow leafed hairy Wood grasse.

This lesse Wood grasse is lesser then the last sort, having many long and narrow leaves growing at the roote, as hairy as any before, the stalke hath two or three joynts, and short leaves on them, and at the toppe divers small heads standing upright each standing on a small hairy footestalke: the roote is somewhat long, like a *Capers* roote with a bush of small long threds.

7. *Gramen nemorum hirsutum minimum.*

The least hairy Wood grasse.

The least hairy Wood grasse hath more store of narrow long hairy leaves then the last but else in all things it agreeth with the first in heads and flowers, but being whiter then the rest.

8. *Gramen hirsutum spicatum exile fuscum.* Small hairy browne Wood grasse.

This Wood grasse is as small as the last, but with lesser store of leaves, the heads on the stalke not above foure or five inches high, are Woolly and not fully round but a little flat and of a yellowish browne: the roote is small and fibrous.

9. *Gramen nemorum hirsutum capitatum globosum.* Globe headed hairy Wood grasse.

This Wood grasse hath long leaves as broad as the third sort here before, with some hairs set upon the edges, the stalkes are about a foote high, with joynts and leaves on them, the toppe being furnished with two or three round tuft white woolly heads, compased of many small silver like threds: the roote is small and fibrous.

The Place and Time.

All these grow in Woods, some about *Highgate* and other places, and flowrish in the end of Summer, save the second, which is earlier then any of the rest by a month or two sometimes.

The Names.

The first is called by *Lobel* and others, *Gramen hirsutum nemorum, Bauhinus* giveth the figure of it in the 2. of the fifth, but I have therunto added *alterum* to distinguish it from the fourth, being of lesse increase: the fifth is called *Cyperella Cordi* by *Cæsar in horto*, and *Gramen exile hirsutum Cyperoides* by *Lobel*, *Gramen Dalechampi* by *Lugdunenses*: and *Gramen hirsutum capitatum Pisselli* by *Bauhinus*. The seventh is the *Gramen nemorum Dalechampi* by *Lugdunenses*. The eighth is not mentioned by any before *Cordus*. The ninth called *Cornucopiæ Vlisp* by *Anguillara*, *Gramen Lucidum* by *Tabernamontanus*, *Cæsalpinus* saith the *Italians* doe usually call it *Herba Lucciola quia nitet noctu*, it shineth more by night then by day.

The

The Vertues.

There is nothing of any properties in them fit for medicines or any other use, the Cattle also refusing them by reason of their hardnesse.

Chap. XXVIII.

Gramen aculeatum & Echinatum. Prickly headed Grasse.

Although some of these grasses grow sometimes in moorish grounds yet they are as often found in the driest corners and bare places of medowes also, and therefore may more fitly be inserted into this Classis then the next.

1. *Gramen aculeatum Italicum.*
Matthiolus his prickly headed grasse.

This small grasse hath leaves and stalkes somewhat like the small ordinary grasses but that at the joynts with the leaves come forth small prickly heads, moulded in huskes, and ending in three points wherein lye small long pointed seede.

2. *Gramen aculeatum Germanicum.*
The prickly headed Grasse of *Germany*.

From a white threddy roote rise up divers grassie leaves, and among them sundry slender stalkes leaning this way and that, whereon are set short spiked heads very rough and sharpe, made of many huskes wherein lye white seede.

3. *Oxagrostis parvula Hispanica.*
Spanish sharpe pointed Grasse.

This small *Spanish* grasse groweth not above halfe a foote, and sometimes but three or foure inches high rising from the roote, with two or three stalkes branching forth into sundry wings, and somewhat long, narrow and sharpe pointed hard leaves set one against another, and at the topper of the stalkes small spiked heads of halfe an inch or more in length, fashioned somewhat like the heads of *Heleosynum Matthioli*: the roote is white, long, joynted and creeping in the ground.

2. *Gramen aculeatum Germanicum.* The prickly headed Grasse of *Germany*.

3. *Oxagrostis parvula Hispanica.* Sharpe pointed Grasse. 5. *Gramen Trichoides.* Hairy headed Grasse. 7. *Echinus capitis.* Round prickly headed Grasse. 1. *Italicum aculeatum.* *Matthiolus* his prickly headed Grasse.

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

4. *Gramen echinatum planum.* Flat prickly headed Graſſe.

This ſmall graſſe riſeth not much higher then a palme or handbreadth, and from a white roote made of many fibres tendeth forth a few ſmall hairy leaves an inch long, as alſo a ſmall and fine ſtalke, with a thin ſpiked head and moſt ſharpe awnes at the ends of the huskes whereof it conſiſteth.

5. *Gramen echinato capitulo.* Round prickly headed Graſſe.

The roote of this graſſe is compoſed of many white threds, ſending forth ſome few narrow rough leaves two or three inches long, among which riſe up ſlender, ſome higher and others lower ſtalkes, with one or two ſmall leaves at them, each having at the toppe a ſmall round head ſet with very ſharpe prickles, within the huſke whereof lye white cleare ſeede.

6. *Gramen Triglochin Dalechampi.* Arrow headed Graſſe.

Vnto theſe graſſes let me adde this alſo, which although others doe referre to another *genus*, yet I doe to it for the ſharpe heads ſake: It hath ſundry narrow ſlender leaves foure inches long, among which the ſtalke riſeth hath no joynt or leafe thereon groweth a foot high, bearing many ſmall three ſquare heads in a long ſpike one above another, each on a ſeverall ſhort footſtalke, faſhioned ſomewhat like to a broad Arrow head, or the leafe of *Sagitta* is, but that they are ſmall and rounder, biforked below and ſharpe pointed above, the roote is a ſmall bunch of many ſmall white fibres.

The Place and Time.

The three firſt grow in dry places and old mudde walls, and in the like places doe the other alſo grow and flouriſh at the ſame time with other ſorts of graſſes.

The Names.

The firſt was firſt called by *Matthiolus Gramen aculeatum*, and ſince by others in like manner, *Bauhinus* called it *Iuncum* as he doth the ſecond *Germanicum*, which *Lobel* called *paluſtre echinatum*, and *Lugdunenſis Gramen echinatum Dalechampi*; the third is not mentioned by any before now: the fourth is ſet forth by *Bauhine*, or called *Gramen pratenſe echinatum*; the fift is deſcribed both by *Bauhine* and *Columna* this calling it *Gramen arvenſe echinatum tribuloides capitatum*, the other *Gramen ſpica ſubrotunda echinata*, or *Gramen echinatum latius*: the laſt is called by *Lugdunenſis Gramen Triglochin ſive Vermiculatum Dalechampi*, which *Bauhine* doubtfully referre, as unto that *Gramen* of *Thalius* that ſome as he ſaith would make a ruſh, but hee would not do it for that the leaves were graſſie, and groweth in wet or mooriſh places, but *Lugdunenſis* ſaith his doth grow in dry grounds; as alſo unto *Gramen ſpicatum marinum alterum* of *Lobel*, whereunto I acknowledge it hathsome reſemblance, but that the place ſeemeth to contrary it: and that it is alſo the ſecond *Calamagroſtis* of *Pena*, and the fourth *Calamagroſtis* of *Lugdunenſis*; ſo that it ſeemeth that for ſome likeneſſe he applyeth the one to the other.

The Vertues.

Matthiolus would tranſferre the vertues of his *Gramen aculeatum* to thoſe of *Dioſcorides*, but there is much doubt made thereof by the learned, and of the reſt there is nothing can be learned worth the relating.

CHAP. XXIX.

Schœnogroſtis ſive Gramen Iuncinum. Ruſh Graſſes.

THere are divers ſorts of Ruſh Graſſes, ſome that grow in the upland grounds, ſome in the watery and mooriſh places, and ſome neare the Sea ſhores, of the former onely I purpoſe to entreate in this Chapter, and of the reſt in the next Claſſis among the mooriſh and water plants.

1. *Gramen Iuncinum montanum ſubcæruleo ſpica Cambro britannicum.*
The gallant mountaine Welſh Ruſh Graſſe.

This gallant Ruſh Graſſe hath a great many fine slender Ruſh like leaves, little leſſe then a cubit or halfe a yard long, from among whom riſeth up two or three ſlender ſmall ſtalkes, eight or nine inches long and much lower then the leaves, bearing at their toppes out from betweene two leaves which are rather like ſtalke, being grene below and ſmall toward the end yet one alwayes longer then the other, a ſmall ſpiked ſcaly like head, of a blewiſh colour.

2. *Gramen Iuncinum ſpicatum minus.* Another gallant ſmall Ruſh Graſſe.

This ſmall Ruſh Graſſe is very like the former, but that it hath much ſmaller ruſh like leaves not full three foure inches long, riſing out of a browne hard huske or hole, ſet at the toppe of a ſmall browne roote, from which ſpring up divers joynted ſtalkes with ſuch like leaves on them, and a ſmall head at the toppe alſo like the former, but of a browne cleare Cheſnut colour and ſmaller as the whole plant is, having alſo ſmall ſeede therein as in the former.

3. *Gramen Iuncinum Dalechampi.* *Dalechamps* his Ruſh Graſſe.

Dalechamps his ſmall Ruſh graſſe that groweth in cold and dry places, hath a number of ſmall round rufhie greene leaves riſing from a very long white fibrous roote, whence ſpring divers joynted ſtalkes with ſmall leaves on them, and at the toppe a ſpaced or open ſpiked head, ſomewhat like unto the *Halleſium Iuncinum* conſiſting of many purplish huskes.

4. *Gramen Iuncinum vulgare.* The common Ruſh graſſe.

The leaves of this common Ruſh graſſe are almoſt round, ſeven or eight inches long, among which ſtand ſtalkes that are a ſpan long, beare at their heads ſeverall ſmall panicles ſpike faſhion one above another, and compoſed of browniſh yellow threds.

5. *Gramen Iuncinum ſylvarum maius articulatofolium.* The greater joynted wood Ruſh Graſſe.

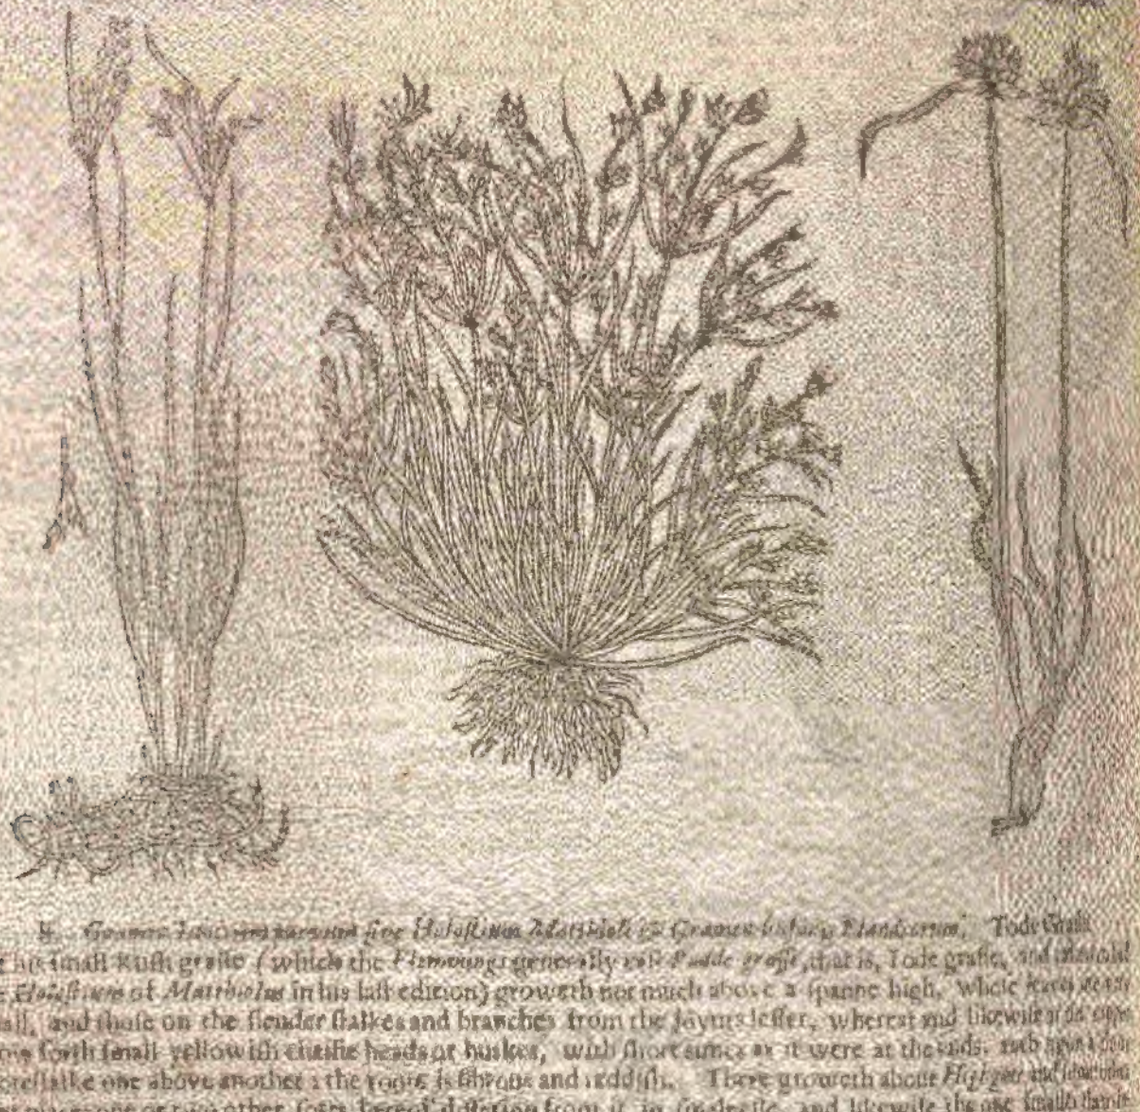
The ſtalkes of this Ruſh graſſe are ſomewhat flat and very greene, the leaves are almoſt round with many overthwart croſſe joynts on them; the rufted heads at the toppe of the ſtalkes that are neare two cubits high doe ſpread into many ruſh-like pannicles and ſomewhat flat alſo; the roote creepeth a little in the ſmall fibres.

4. *Gramen*

6. *Gramen lanuginosum folijs nervosis articulatis foliis.* A leffer joynted wood Rush Graſſe.

The ſlender leaues of this Graſſe that riſe from the hard ſpreading roote with many fibres thereat doe take roote againe in the ground and beare ſuch like jointed leaues, and ſmall ſpread pannickle heads above, very like vnto the laſt but ſmaller by the halfe in each. And there is a ſmaller alſo whoſe leaues are long and tender, but not *Mus.* ſo ſmall: the pannickle whereof is ſmaller alſo but ſparſed in like manner.

7. *Gramen lanuginosum juncei ſparſa panicula.* Rush Graſſe with rush-like ſparſed heads.



The ſtalkes hereof are ſlender, ſomewhat flat and almoſt two foote high, the leaues are ſmaller then the common ſort are about two ſpans long: the toppes likewiſe are ſmaller and ſpread with whitiſh heads: the roote is fibrous and ſpreading, it felte with long fibres.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

2. *Gramen luteum spicis paniculatis.* Rush Grasse with yellow panicled tufts.

3. *Gramen luteum parvum flore Holosteum Matthioli.* Tode Grasse

4. *Gramen luteum tertium sive Montanum Roth Grasse with the seed.*

5. *Gramen luteum minus Holosteum Matthioli sive Gramen luteum Plantaginis Plantaginum.* Tode Grasse.

The small Rush grasse (which the *Flemmings* generally call *Pudde grasse*, that is, Tode grasse, and likewise the *Holosteum* of *Matthiolus* in his last edition) groweth not much above a spanne high, whose leaves are very small, and those on the slender stalkes and branches from the joynts lesser, wherout and likewise at the toppe grow forth small yellowish chaffie heads or huskes, with short eares as it were at the ends, each given a doore together like one above another: the roote is fibrous and reddish. There groweth about *Highgate* and likewise in other places one or two other sorts hereof differing from it in smalnesse, and likewise the one smalth from the other, whose heads are thicker or closer set together.

Nod. anno.

6. *Gramen montanum luteum capite squamoso.* Mountaine Rush Grasse with scaly heads.

From a small fibrous roote rise up two or three rush-like leaves about halfe a foote long, the edges whereof are smooth and without any joynt or leafe thereon rising a foote high, at the toppe whereof grow two or three rough leaves, the one standing long the other short shooteth forth a scaly head, small at the toppe and thicker standing the head of the *Rhodia* or Canary Grasse.

The Place and Time.

Some of these grasses grow on hills or heaths in woods or neare them: the first on a high hill in a field called *Barnes* commonly covered with clouds and mists and watered with sundry showers of raine when as the last time the Sunne will shine here in the valles below it: the woods neare *Highgate* and the meadowes adjoyning doe nourish many of the other varieties: the last was found on mount *Bolder*, and doe all flourish in the summer moneths of *June* and *July*.

The Names.

By the name given in Greeke and *Gramen Junceum* or *Juncoides* in Latine he all these plants knowne: The first *Lobel* had rightly called *Nardo Gangitidi spicis paniculatis capitatis plantis*, but I have altered it and referred it either to these Rush Grasses whereunto it is most like, and so is the second also, being neither of them mentioned by any before save the two sorts of the first: the seaventh and the two smaller sorts of the eight are not known in any other authors: the third fourth fifth and eight are so entituled by others as they are here set downe: *Thalius* called the eight *Gramen spicatum canlem* and *Raubinus Gramen nemorosum caninum* which I have it is held not to any wood: the last *Raubinus* so called as it is in the title.

The Vertues.

All these sorts of Grasses have beene so lately found out, that there is no knowne use made of them in Physick, and for the eight although *Matthiolus* in his last edition gave the figure of its entitulings it *Holosteum*, and gave out any deliverance, and I record to referre it to that of *Dioscorides*, whose properties is to binde and consolidate flesh wherein there is no way guilty, but it is altogether unlyke like a grasse and without joynts like a rush, and therefore called *Holosteum Matthioli* ever since by all authors, or by these other names it beareth, for as yet unknowne what that true *Holosteum* of *Dioscorides* is, not any knowne plant can be found in all things to answer it fully.

Chap.

Chap. XXX.

Juncus, Rushes.

There are divers sorts of Rushes, some great some small, some soft and smooth, others hard, some barren others bearing seed, some sharpe pointed, others not, some on the Land, either in plaines or neare the Sea, others in the fresh waters, some sweet, others not at all: those I meane to entreate of in this Chapter that are not sweete, for of those kindes, the one called *Acorus verus* or *Iuncus odoratus*, and the other *Iuncus aromaticus* or *Cyperus odoratus*, I have spoken in the first Tome of this worke among the other sweete herbes: and first of the soft or smooth sorts of Rushes in this Chapter.

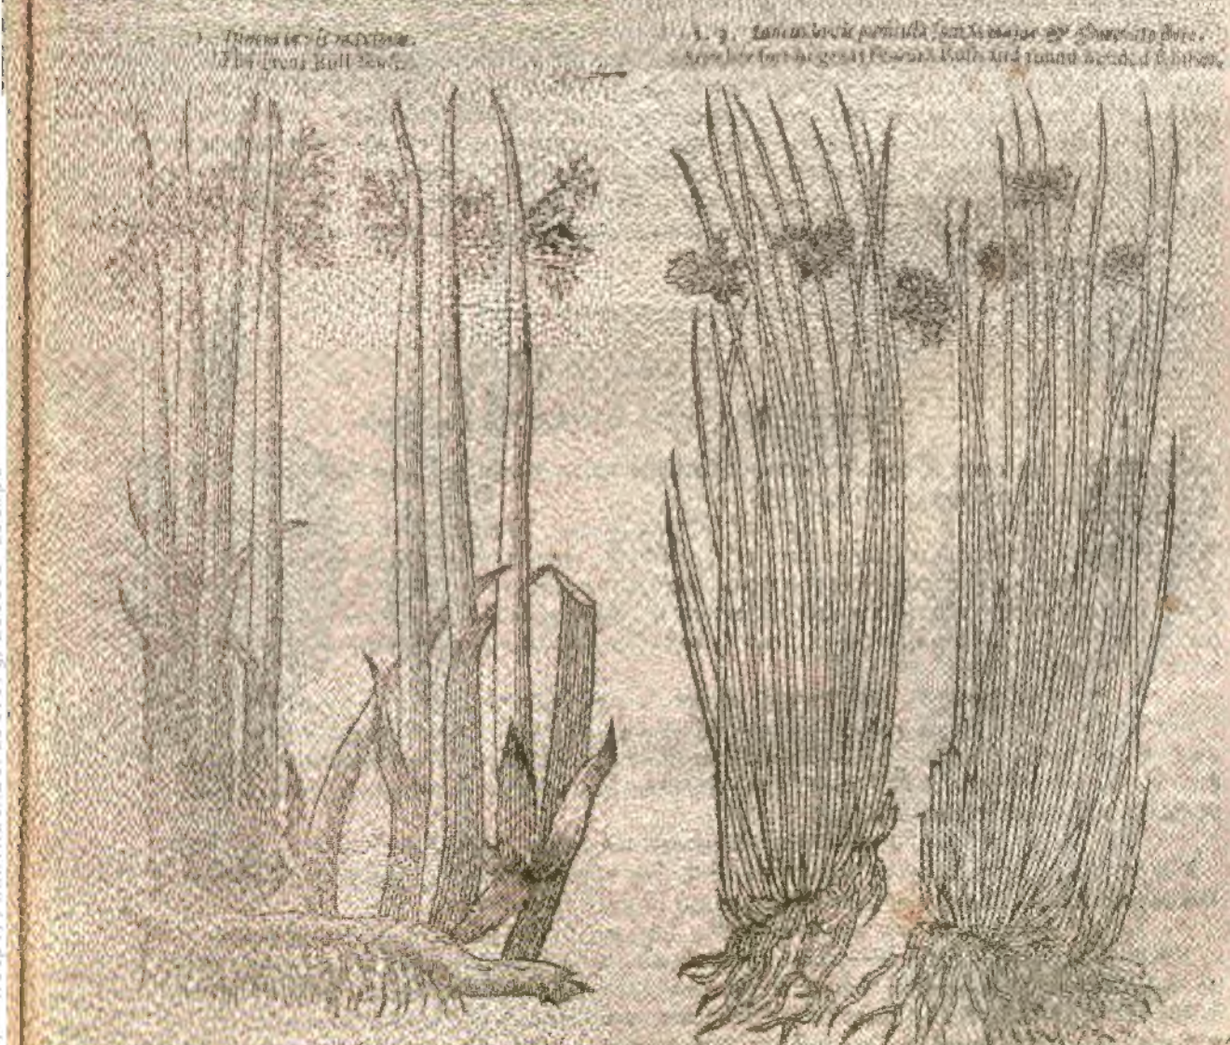
1. *Iuncus laevis maximus.* The greatest Bull Rush.

The great Bull Rush sendeth forth sundry tall, soft round smooth stoores which are the Rushes, of a fresh pale greene colour greater then any of the other sorts of Rushes, having certaine sheathes like leaves compassing them at the bottome, and pointed at the ends but not sharpe, full of a white pith which are serviceable (the outer rinde being pilled away) for lights, being dryed and dipped in Suet or Tallow: towards the tops of which on the one side breake forth sundry small brownish chaffie heads, each upon a short footstalke, wherein lye three square blackish seedes: the roote is of a blackish brownish colour, and groweth long & very great matted with divers strings or fibres thereat.

2. *Iuncus laevis vulgaris.* The common smooth Rush.

The Rush is in all things like the former but much lesser and shorter, having a whitish pith within them as the other hath, for the like use, but that the leaves are longer, and the culme or stoore is slender and not spread upon the top: the roote hereof are not greater then the other, but are full of fine even threds.

3. *Iuncus laevis panicula sparsa major.* Another sort of great smooth Rushes.



This other greater sort is like the last but with fewer stoores of Rushes, of a darkish greene colour, and the softwood brownish: panicle is more spread at large, and each pare standing on a pretty long footstalke, and is broad below and pointed upward: the roote is bulbie like the last.

4. *Iuncus laevis glomeratus flore.* Round headed Rushes.

Round headed Rushes have divers stoores rising from the roote like unto the second sort and pithy within like it, the chiefest difference consisteth herein that the rufted heads stand somewhat close together and are round, not pointed at all.

5. *Iuncus laevis panicula sparsa minor.* Small Rushes with dispersed tufts.

This differeth from the greater sort before described, onely in the smallnesse of the plant, and growing in dryer grounds which may peradventure cause the smallnesse.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

6. Juncus acutiflorus maximus minorve sativus. Small smooth pointed Rushes.

The roote hereof is small blacke and threddy, shooting forth a smooth round stalke foure or five inches long bearing at the toppe, a brownish red foure square head, having a small hard long thred above it, & beneath three small long leaves at the foote of the stalke of an inch long, like unto Rushes.

7. Juncellus seu Chamæsphacos. Small or Dwarfe Rushes.

Dwarfe Rushes grow not above an inch or two high, although they naturally grow by pairs like twins, three or foure Rushes somewhat great and thicke for their proportion rising from a fibrous roote, this hath not been observed to bring any heads for seede, and therefore is called *Juncellus*. Like to which is that small Rush mentioned in the *Adversaria* by the name of *Juncellus* but that it groweth somewhat higher, and seedeth in tufts on the Rushes.

Juncellus Lobel ic.

The Place and Time.

Many of these Rushes grow in watery plashes and grounds, and the first usually in the deeper waters, the last grow in dryer places, and flourish chiefly untill the end of *August* or *September*, yet some green all the yeare.

The Names.

The word in Greeke so called *à iuncio* or *iungendo* for so in former times it was called, *à Iuncus a iungendo* or *ligando* from the same act of binding things together: the first is taken by *Cordus* and *Gesnerus* in the Title, interpreted by *Gesner* but a diminution of *Theophrastus* letting downe *Matthiolus* always for his *Iuncus* as being the greatest, which is as *Pliny* saith *ad texendas segetes aptum*: yet as *Lobelius* saith, since the Low-Dutch or *Gherardus* pulleth to be inflecting it as well as thicke to be brought into sundry workes, *Lobelius* also and others take it to be *Scirpus*: yet it is thought that the ancients tooke them to be different plants. Now *Andreas Bellunensis* in *Dioscorides* for *Iuncus florens* hath *ἐλεπὸν ἰσχὺν ἔχοντα*, and such indeed is the Rush-mat in any Inne whereon, whereupon came the proverbe, *Nodum in scirpo quærere*, to seeke a knot in a rush: because such are very dangerous and doubtfull, whereof no scruple or doubt needs to be made: some thinke the name of *Iuncus florens* is corrupt and that in stead of *Ἰούγκος ἄνθος Iuncus laevis* it should be *Ἰούγκος ἄνθος* that by transposing *Psalma* 23. *Gesner* there with, who hath *laeve* and so hath *Hieronymus Bauhinus* also in the *Prince* and *Dodonæus* call it *Iuncus* or *scirpus Holoschœnus*, and *Lugdunensis Holoschœnus Theophrasti*, *Tragus* and some *Iuncus palustris minor*, and *Lobel* and others *Iuncus aquaticus & lævis maximus*: the first and *Bauhinus* call it one *Scirpus vulgaris*, and saith it is the same that *Tabernæmontanus* calleth *Iuncus sylvaticus*: the third and *Bauhinus* one *Scirpus palustris* of *Tragus*, *Iuncus lævis* Countrymen of *Cordus*, *Dodonæus* and *Lobel*, and *Lugdunensis Scirpus* and *Lugdunensis* the fourth *Lobel* called *Gramen aut Iuncus* simply by *Matthiolus* and others, and *Iuncus lævis* by *Lugdunenses*: the fifth *Bauhinus* his title and so are the two last the *Arabians* call it *Duc*, *Iuncus Græcus*, the *Spaniards Iunco*, the *French Jone*, the *Germanes Binsen*, the *Dutch Beese* and we Rushes.

The Vertues.

The seede of Rushes of this sort kind especially saith *Galen* and *Dioscorides*, rosted saith *Pliny* being drunke with wine and water doth stay the flux of the belly or Laske and womens Courses, when they come down too abundantly: it is good also to *Vrines*, but it causeth headach: it procureth sleepe likewise, but it must be used with caution, least it bring a dead sleepe with it: the borrome or tender leaves or pith of the Rushes rosted and being applyed to the stings of the *Phalangium* or poysonous Spider healeth them, the roote with *Polypody* in water to the quantity of a spoonefull helpeth the cough. *Pliny* maketh mention of an *Oleum Iuncinum* made of Rushes like as that of Roses, but sure it was not made of any of these sorts of Rushes but of the *Iuncus odoratus*, or some fine Rush. *Galen* sheweth excellently the propriety of the seedes of Rushes, that it is compounded of a subtile substance somewhat cold and a watery somewhat hot: so that by drying the lower parts it doth restrain the vapours to the head, whereby sleepe is procured.

CHAP. XXXI.

Iuncus asper sive Acutus. Hard or Sharpe Rushes.

Of this kinde of Rushes there are also divers sorts, some great, and some small, some bearing seede, others barren or bearing none.

1. Iuncus communis vulgaris. Common hard Rushes.

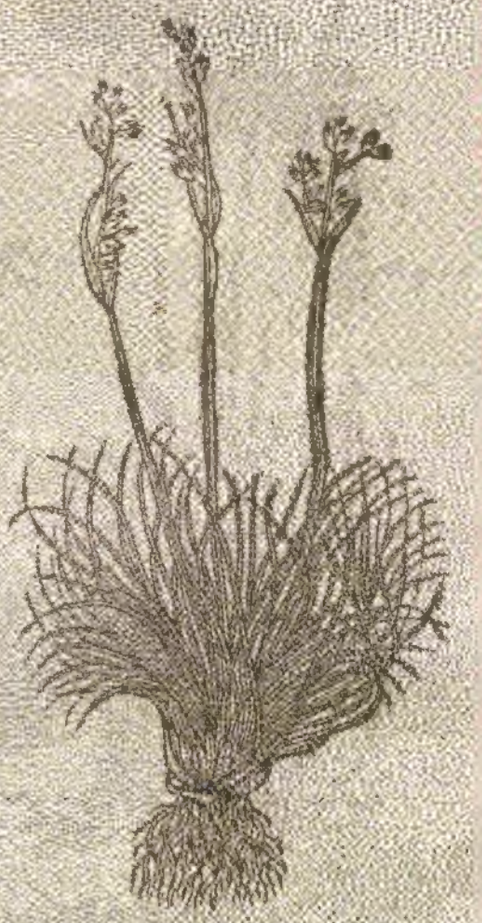
Our common Rushes that serve to strew the rooms and chambers in this Land, growe in the same manner that the former sort doth, but that sometimes the stalkes as it were of two Rushes are knit out of another, and not all from the roote seperately as others, and are also hard and sharpe pointed, with more no pith within them, the rules are small, hard, pinched abroad and short, that they lie not round as the former other sorts do.

2. Oxyschœnos sive Iuncus acutus Alpinus, femina rotundo, vulgaris. Hard or sharpe Rushes.

The Rushes *Alpini* forteare many about halfe a foote long or more, somewhat great hard and sharpe pointed from among which rise up naked Rushes or stalkes halfe a yard high, and from betweene two short leaves bring forth a spiked pannicle, of sundry small chaffie husks like unto Reed grasse, of a dun or russet colour: the roote is full of brownish hard fibres.

3. Oxyschœnos sive Iuncus acutus minor. Small hard Rushes.

This small Rush groweth very like unto the full, but with fines smaller, and as hard: Rushes as the other, the rush or panicle also is very like it, but fuller and not so much spread open.



4. Iuncus maritimus capitulis Sorghi. Sea hard Rushes with blackish rounde seede heades.

This hard Sea Rush hath sundry skinny browne heads, set neare about the hard long tapering pointed leaves many small fibres under it, out of which rise thicke round hard, long and very sharpe pointed Rushes which rise higher than the Rushy stalkes three cubits high sometimes, bearing at the toppes from between small leaves a number of blackish round heades a little pointed, sometimes but one and sometimes two or three together

1. Juncus acutus vulgaris.
Common Sharp Rushes.

2. Juncus [illegible]
Wild Garden Sharp Rushes.

3. Scirpus [illegible]
Small hard Rushes and English Sea-head Rushes.

4. Juncus [illegible]
Sea-head Rushes with black round heads of Seed.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

5. *Iuncus acutus maritimus alter.*
Sea hard Rushes with whitish round heads of seede.

8. *Iuncus maritimus Narbonensis.*
The Sea hard Rush of Languedocke.

joyned together, hanging downe from a short footestalke, which when they are ripe, open into three parts, shewing small and somewhat long seede within them.

5. *Iuncus acutus maritimus alter.* Sea hard Rushes with whitish round heads of seede.

This other Sea Rush groweth after the same manner that the first doth in all things, as well in height as thicknesse or greatnesse, onely the heads of seedes are rounder, and not pointed, and breake out of the Rushes two or three inches under the toppe, or sharpe pointed ends, about Midsomer each of those round heads will be covered as it were with a white downy or cottony matter, which bindeth and dryeth exceedingly.

6. *Iuncus acutus maritimus caule triangulo.* Sea sharpe Rushes with three square stalkes.

The roote hereof is creeping and fibrous, sending forth a few short leaves, and long three square stalkes about a foote in length, very sharpe pointed at the end, two or three inches under which breake forth sundry soft and wooly heads of a brownish colour.

7. *Iuncus acutus maritimus Anglicus.* English Sea hard Rushes.

Our English Sea Rushes differ little in the growing from the other Sea Rushes, but that the pannicle is longer and slenderer, compoted of many chaffie huskes.

8. *Iuncus maritimus Narbonensis.* The Sea hard Rushes of *Languedocke.*

This *French* Rush hath many slender tough and pliant long and sharpe pointed Rushes, of a pale greene colour, from among which riseth a small stalke, little longer then the leaves, bearing at the toppe three leaves, whereof one is exceeding long, and the other are short, in the middle of whom standes a large round head compoted of many long sharpe huskes set in eares, of a pale brownish colour, wherein lye small seede: the roote is brownish long small, and creeping, set with divers short fibres thereat, smelling reasonably well.

The Place and Time.

The first groweth in many low moist neglected grounds and fields, where it taketh up much rome and doth little good: The second was found by *Doctor Lobel*, in his life time, upon a high hill in *Wales* called *Brenis*, in sundry the wet and moorish grounds, in many places thereabouts. The third about *Montpelier* or thereabouts. The fourth and fifth in *Narbone* as *Lobel* saith, and betweene Saint *Iohns de luce* and *Bayon*, as we have beene informed. The sixth both on the *Peerian* shore, and in the way from *Montpelier* to the Sea. The seventh growes in many of our English coasts. And the last about *Narbone* in *France* also. And doe all flourish in the end of Summer.

The Names.

The Greeke call it Ὀξύσχοινος *Oxyschenos*, and in Latine thereafter, *Iuncus acutus* &c. *alter.* The first is called *Iuncus acutus Vulgaris* by *Lobel* and *Dodonæus*. The second hath not beene set forth before, and therefore hath the name according to the place of the growing thereof. The third is also but now made knowne to all. The fourth and fifth are set forth by *Lobel* and *Pena* in their *Adversaria*, under the title of *Iuncus marinus* &c. *alter.* The former *Rambaud* calleth *Iuncus acutus, capitulis Sorghi Oxyschenos Dioscoridis.* The latter is referred by him unto the *Iuncus Holoschœnos major* of *Lugdunensis*, and was brought by *Rael*, from *Bayon*, by the name of *Coriandri semine rotundo*, and taken to bee the true *Oxyschœnos* of *Dioscorides.* The sixth *Bauhine* calleth *Iuncus* in the

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

Matthiolus: The seventh is peculiar to our Coasts, and hath the name accordingly. The last is the *Iuncus maritimus Germanicus* of *Lobel*, whereof I cannot finde that *Bauhinus* hath made any mention.

The Vertues.

The properties of this hard Rush are referred to the former, working the like effects as it is thought, but more weakly.

Chap. XXXII.

Iuncus acuminis reflexo. Hard Rushes with bending heads.

There are yet some other kindes of Rushes to be handled, which because I would not huddle together, I must distribute into sundry Chapters, that so every *species* may be under his owne *genus*, as neere as may be.

1. *Iuncus acuminis reflexo major.* The greater bending Rush.

The greater of these turning Rushes, groweth after the manner of the greater soft Rushes, both for his roote somewhat round heads, covered with blackish browne coates or filmes, and under them cuts of threds, from which heads the hairy long Rushes have a yard long or more, breaking a good way under the toppe, which bendeth or turneth it selfe downwards, out of a round dumpy head into many slimy round leaves, standing on short footestalkes, which leaves are three cornered, full of cornered shape very small yellowish seede, of a bitter harsh taste.

2. *Iuncus acuminis reflexo alter.*

Another turning or bending Rush.

This other hath the Rushes more then halfe a yard long having a blackish thinne tuft or umbell, breaking forth two or three barbes under the turning end, and standing without any footestalke, which are composed of threds of chaffe and bleyish at the toppes.

3. *Iuncus acuminis reflexo trifidus.*

The triple rifted Rush.

The roote hereof is blacke, joynted, and fibrous, the Rushes are many, slender and foure or five inches long, the stalkes are parted at the toppes into three, and seldome into fewer slender long Rushes, three or foure inches long a peece, betweene which come forth three small thinne tufts or panicles.

The Place and Time.

They all grow in *France* and *Germany*, and keepe the same time that others doe.

The Names.

The first is called by *Lugdunensis Iuncus Milancranius* of *Theophrastus*, who taketh it also to be the *Iuncus Dactylon* and *feminea* of *Theophrastus*, *Gesner* and *Tabernamontanus* call it *Iuncus laevis*, and may be *Pena* his *Iuncus Lachmanthemon*. The other two are remembred by *Bauhinus* in his *Pinax* and *Prodromus*, but in my opinion the last is the small *Iuncus maritimus alter* of *Lobel*, as whosoever will compare them shall finde.

3. *Iuncus acuminis reflexo major & trifidus*
The great bending Rush and the triple rifted Rush.

The Vertues.

We have no other certainty of the Vertues of these, but a likelihood to be as effectuall as the last kinde of Rushes.

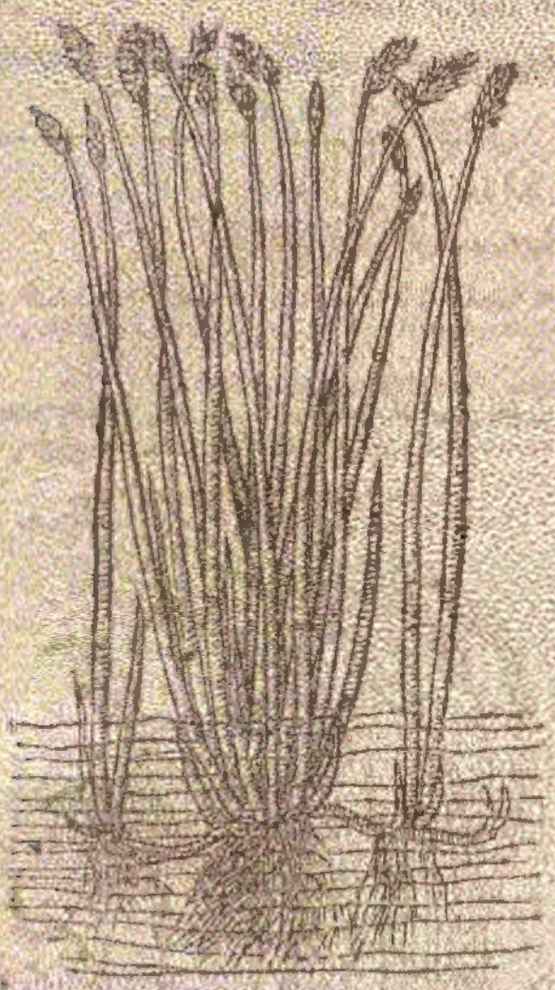
Chap. XXXIII.

Iuncus aquaticus capitulis Equiseti. Aglet headed Water Rushes.

There are two or three sorts of this Aglet headed kind of Rush, which for the difference sake from the other kindes of Rushes, I thought good to entreate of by themselves.

1. *Iuncus capitulis Equiseti.* Aglet headed Rushes.

This lesser sort bringeth forth from a creeping spreading roote, stored with many intricate fibres, diverse slender naked Rushes about a cubit long, full of whitish pith, and having at the bottomes of them certaine red skinnes compassing them, and bearing each of them at their toppes, a small catkin or Aglet like the first head of an *Asparagus*, blooming with small white threds, like a Plantane head, which fall away quickly.



2. *Iuncus capitulis Equiseti alter.* Another Aglet headed Rush.

This other Rush hath sundry short Rushes arising from the creeping roote, from among which other slender and taller Rushes doe spring about a foote high, each of them bearing such a like Aglet as the former, but somewhat lesser.

3. *Iuncellus*

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

1. Iuncus equestris, Floating Cyperus, Aglet headed Rushes.

2. Iuncus Equisetifer capitulis aliis, The other Aglet headed Rush.

2. *Iuncellus equestris Equisetifer fluitans*, Floting Rushes with Aglet toppes.

This small Rush hath from a small threddy roote, commeth forth a very small slender bowing Rush, which divideth it selfe into many other small Rushes about two or three inches long, floating upon the water, whose growth is diverse: Whereof some grow upright and others doe bow or bend downe againe, each of them bearing such a head like the former, with a small long Rush growing by it.

The Place and *Time*.

These all have beene found in our owne land, as well as beyond Sea, the first not onely in the pond and ditch of a small village called *Hallwood* hard by *Antwerpe*, but in divers places with us also, the other in the brooke of ponds, of both *Wales* and *England*, in sundry places and are to be seene in the end of Summer when they florish.

The Names.

The first is called by *Lobel Iuncus nauticus minor capitulis equisetis*, and by *Lugdunensis iuncus floridus flagellum*. The second hath his title sufficient to expresse it, not being described by any other. The last *Dalechamp* calleth as it is in the title, yet calling it *minor*, as he doth the first *major*.

The Vertues.

There is no property knowne to what malady any of these may be applyed but are held appropriate to such as many others be.

Chap. XXXIV.

Iuncus cyperoides floridus. The flowring Cyperus Rush.

There hath formerly beene knowne but one sort of these flowring Rushes, but Dodoneus hath added another lesser sort.

1. *Iuncus floridus major*. The greater flowring Rushe.

This greater flowring Cyperus Rush (as it is differing from all the other sorts of Rushes, [illegible] collection) all in beauty) hath sundry heads of leaves like unto those of *Cyperus*, with many [illegible] creeping or spreading roote like the Rushes, bushing with many fibres, from whence spring round [illegible] like stalkes two or three cubits high, bearing at the top a large spread tuft or umbell of a pale [illegible] (yet *Tragus* describeth them to be white) with some threds dyed with yellow in the middle, which [illegible] bring in their place small round blackish heads, containing small seede within them.

2. *Iuncus floridus minor*. The lesser flowring Rush.

The smaller Cyperus Rush hath a whitish jointed roote, a small stalke of a hand breadth high, having three long sharpe pointed Rush like leaves, two whereof are higher then the stalke, and at the [illegible] five flowres, or [illegible]

bearing at the top another, after which come two small round heads containing in each foure talkes, of the bignesse of the Canary kinde of Millet.

The Place and Time.

The first growes in watery ditches, pooles and plashes, in most parts of this Kingdome: The other hath been observed in sundry places, and are flowring all the summer long, ripening their seede in the meane time.

The Names.

Although this hath no Greeke name, yet it hath found divers names, being called by *Thomas Anguillara secunda*, by *Matthiolus*, *Lobelius*, *Camerarius* and others, *Juncus floridus*, by *Tragus*, *Fuchsius*, *Dodonæus*, *Gesnerus* and others, *Juncus odoratus*, by *Cordus*, *Gladiolus* and by *Dodonæus*, *Xiphium angustifolium*, which hath caused it erroneously to be called *Juncus florens*, being in as great an error as before, following *Cordus*, that calleth it *Gladiolus* from the false relation of *Theophrastus*, making *Theophrastus* his *Cyperus* to be *Gladiolus*, as may be smelled him before, wherennto it hath no correspondence, having a little in the leaves, but also calleth it to be *Cyperus Dioscoridis*, whereunto it agreeth as little, some also call it *Antonius Thespesius*, and *Lonicerus Carex alterum*. The Dutch call it *Juncus floridus*. The *Dutch Water Lafel*, and *Gerard* of Gladdon, following *Cordus*, who confoundeth *Theophrastus* his *Cyperus*, with *Dioscorides* his *Gladiolus*.

The Vertues.

Matthiolus saith it is thought to worke the like effects that the other sorts of Rushes doe, but according to *Cordus* his mistaking to be *Gladiolus*, he saith it is good to helpe the paines of women in their delivery of childing, being boyled in wine and drunke.

Juncus floridus. The flowring Rush.

Chap. XXXV.

Spartum herba sive Juncus. Mat weed or Mat Rushes.

Although the *Spartum Plinij* be a kinde of Rush, growing rather in dry then moist places, yet because the other sorts of Grasses that serve with us for the same purposes, to make Mats and other such like workes, doe grow in wet and Moorish grounds, neare the Sea side, and are called by the same name of *Spartum*, I must rather then divide it place it with the other.

1. *Spartum Plinij sive Juncus Hispanicus.* Spanish Rushes.

The *Spanish* Rush riseth up with a number of round Rushes a cubit long, each whereof is parted a little over the ground, into three or foure more slender long, tough and greene Rushes, somewhat broader then a bristle, being whitish in the middle, which some after have both their edges to draw one together, that it maketh them seeme round, so that the partition is hardly discerned, and then grooy harder, and whitish, when they are dry (for we see them in trailes, and in the round mats where with the Roomes or chambers are matted, as they are wrought there and brought over to us) from among which rise up sundry stalkes, somewhat higher then the rest, bearing at the toppe a small long head of many sharpe pointed huskes, after which come small long seede, like unto some of the other Grasses: the roottes spread in the ground into many tufts, matting therein that in some places they take up two foote square or more.

2. *Spartum Plinij alterum molliss.* The softer *Spanish* Rush.

The other *Spanish* Rush groweth in the very same manner and order, that the former doth, and differeth from it in these particulars, the Rushes are more fine and slender, softer also, and bearing a shorter tuft at the top, consisting of a skinny huske or hote: the roottes hereof doe mat like the other, and grow in moister places.

3. *Spartum marinum asperum.* Our Matweed or Marrum.

This Matweed hath divers long hard, and very sharpe pointed Rushes, pricking their fingers that are not hood-ed, that grow among them, the stalkes have soft spiked long heads, like unto the eares of Rye, and blooming like it: the roottes creepe in the ground, and fasten themselves strongly therein.

4. *Spartum marinum asperum alterum.* The other of our Sea Matweedes.

The other Matweede is in the growing like the former, but that the rushes are broader and shorter, and the heads also: the roottes likewise creepe and are strongly fastened into the ground.

5. *Spartum parvum Batavorum & Anglicum.* Small Matweede.

The Small Matweed hath shorter smaller and harder rushes, the stalkes are a cubit high, having small thin long leaves at the toppes then the former: the roottes likewise are long, hard, and somewhat rough, fit to be wrought into little baskets or the like.

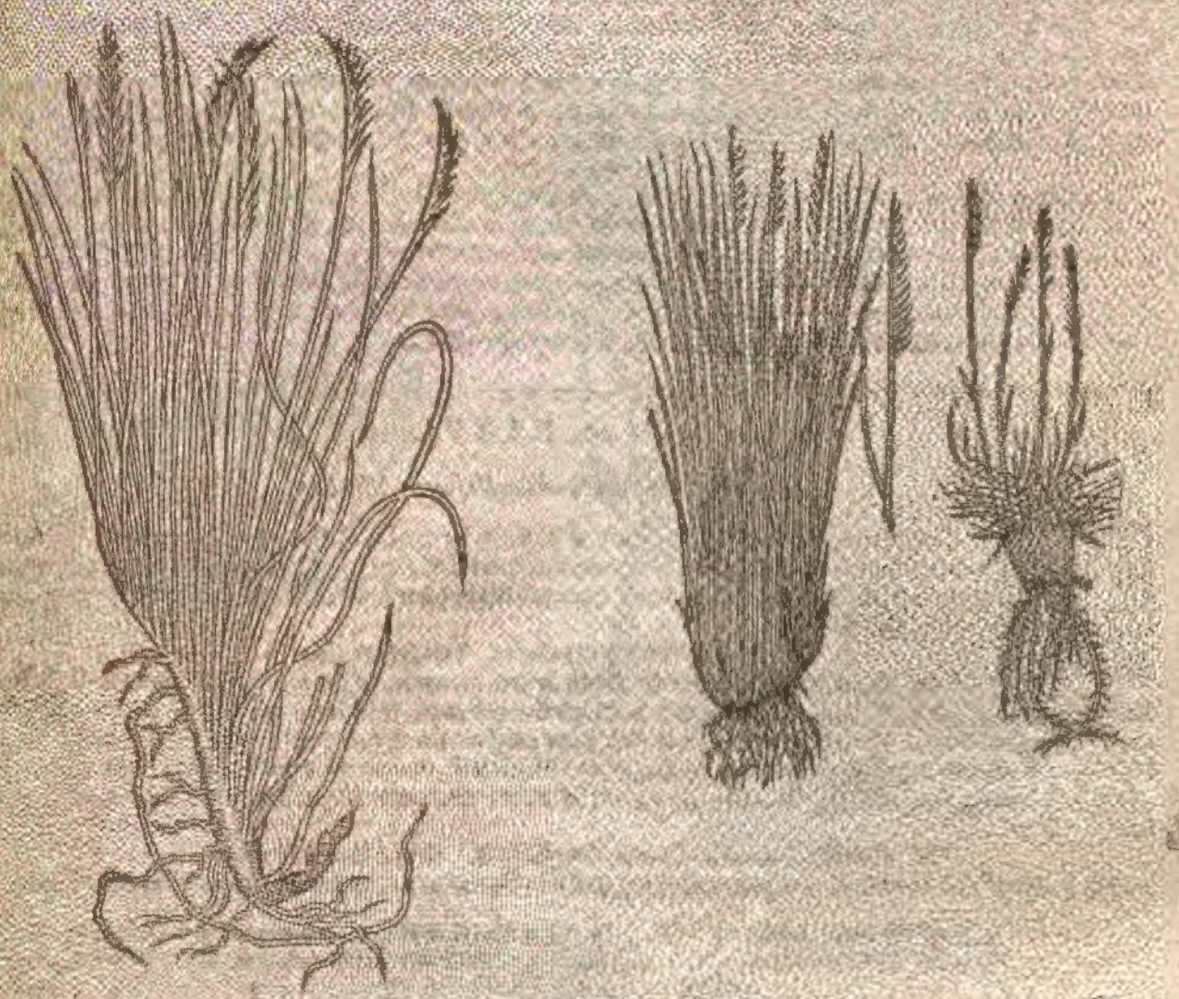
3. Spartum Plinij sive Juncum Hispanicum.
Spanish Rushes.

4. Spartum Plinij alterum genus.
The other sort of it.

3. Spartum marinum erectum.
Dog Marweed or Marram.



4. Spartum marinum repens alterum.
The other of our Sea Matweed.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

6. *Spartium parvum, Narbonense & Anglicum.* The small Matweede.

6, 7. *Spartium Narbonense & minimum Anglicum.* The small French and English Matweedes.

6. *Spartium Narbonense.* *French* Matweede.

The *French* Matweed hath smaller rounder and whiter leaves or rushes then the last, and closer growing together like unto the smallest and finest sort of rushes, and are about a spanne long apeece, or somewhat more: the small slender stalkes have small single headed whitish spikes on them, smelling like Mother: the rootes are small long threds.

7. *Spartium minimum Anglicum.* The smallest *English* Matweed.

The smallest *English* Matweed hath many small slender round rushes like threds, almost foure or five inches long, growing thicke together, among which the stalkes which are very small, have smaller heads and single like the last, the most consisting but of one or two small towres: the rootes are long and yellow like the former small *English* sort.

8. *Spartium Hispanicum capillaceo folio.* The *Spanish* Matweed.

The *Spanish* Matweed hath sundry rushes rising from one small threddy roote, which divide themselves into soft very fine rushes, sometimes but halfe a foote long, and sometimes a foote: there hath beene no head or spike found with it as yet.

9. *Spartium variegatum.* Party coloured Matweede.

The round rushes of this Matweed are seldome above foure or five rising from the roote, parted red and greene, sometime greene and red, and change their beauty, and come all to be of one colour: this was found on the hills by *Franckfort*, by the Mayne. The *Spartium Ambiguum* of *Clusius* I have set forth in my former Booke, under the title of *Genista Pannonica*.

The Place and Time.

These former sorts grow not onely in *Spaine*, but in divers Iles adioyning thereto, as the Canaries, Madera, &c. and are specified in their titles or descriptions, and doe flowrish in the end of Summer.

The Names.

Wee have formerly shewed you the *Spartium Graecorum*, which is a shrubby kinde of Broome, to doe this also, called *Spartum Romanum*, or *Scorpius* to distinguish it from the other. The first is the *Spartum* of *Pliny*, which was in his time as plentifully growing in *Spaine* as now, and therefore the Tract thereof was called *Spartaria*, wherein new Carthage, called *Carthagena* now standeth, and therefore all Writers call it *Spartum Carthaginense*, chiefly *Dioscorides* upon *Pliny* calleth it *Juncus Ibericus sive Hispanicus*, and *Bauhinus*, *Gramen Spartum primum pauciflorum*. The second is also called *Spartum Plinij*, or *herba alterum*, by all but *Bauhinus*, who calleth it *Spartum secundum panicula brevi folliculis inclusa*. The third is the *Spartum herba tertia maximum* of *Lobel*, who calleth it *Spartum nostras*, meaning his owne Country, but *Gerard* transferreth this title to our owne Land, and so doe I, for so he and I might very well doe, growing plentifully on the Coasts of *Norfolke*, as *Gerarde* and in other places with us also. The fourth is the *Spartum herba quarta Matritense* of *Clusius*, which

Lobel calleth *Sparsum nostras alterum*, and *Bambras*, *Gramen Sparsum spicatum latifolium*. The fifth is the *Sparsum nostras parvum* of *Lobel* and I have added *Anglicum* to it in the title, being to be found with us, as well as them, *Bauhinus* calleth it *Gramen Sparsum lanceolatum*. The sixth is the *Gramen Sparsum* [illegible] *Lobel*, but it being sent to Doctor *Lobel* from thence was named as it is in the title, which is [illegible]. The seventh was found in our owne Land, and for the smallnesse called *minimum*. The rest are named of the *Authors*, *Gramen Sparsum*, with the rest of their titles as I here set them. The *Italians* and *Spaniards* call it *Sparto*, and the second sort *Albardi*. The *Dutch Halm*, and we in *English*, Helme, and Marrame, but the people along the Coasts of *Norfolke* and *Suffolke* call it Marram, and may be called sea Rushes as well.

The Vertues.

We know of no use these have in Physicke, but are employed wholly by the *Spaniards*, in all the places where it groweth (I meane the Spanish kinde) not only for Mats, small and great, for Cheesepresses, baskets, and such like, but the second in being soft, and fit for such purposes, are used to fill sackes to serve them for beds, upon the which they draw to lye upon. Our sea kindes are used by divers, both with us and in the Low Countries for Mats, Hassocks, and divers other such like meane workes very serviceable.

Chap. XXXVI.

Equisetum, Horsetaile or rough joynted Rushes.

As Comparable to small this History of Rushes, let me joyne this unto them, for so likewise they may very well be both for their forme, although differing as roughnesse, joynts, and naturall leaves as placed growing, whereof there are many sorts, both of the moorish and Champaigne, as shall be shewed.

1. *Equisetum majus palustre.* The greater Marsh Horsetaile.

The greater Horsetaile that groweth in wet grounds, at the first springing forth hath somewhat like to those of Asparagus, and after grow to be hard rough, hollow stalkes, joynted at sundry places, of the height of a foote high, so made as if the lower part were put into the upper, wherein grow on each joynt a small long ruffe like hard leaves, each part resembling a Horsetaile, whereof it came to be so called, at the tops of the stalkes come forth small catkins like unto those of trees: the roote creepeth under ground, and spreadeth in sundry places.

2. *Equisetum palustre Linariæ folio.* Broad leafed Horsetaile.

The roote of this Horsetaile creepeth, and is joynted like the former, the stalkes like wise are [illegible]

1. *Equisetum majus palustre.*
The greater Marsh Horsetaile.

3. 4. *Equisetum palustre minus & alterum*
Small Marsh Horsetaile and narrow Horsetaile.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

7. Equisetum tenuissimum & longissimum folio.
The smallest and finest leaved Horse taile.

8. Equisetum hirsutum sive nudum & rotundum.
Naked and roundish Rush Horse taile.

hee and joynted in the same manner, set with leaves after the same fashion, but that they are broader then those of Tode Flax, and like almost unto those of Broome Tode Flax, greene rough, long, and easie to breake, what jule or carkins it beareth I have not beene observed.

9. *Equisetum palustre minus.* Small Marsh Horse taile.

This smaller Horse taile differeth not in the manner of growth from the former, the chiefest difference resteth in that it is smaller, and the leaves or bristles (some call them sewet and flaxen) that are set at the joynts.

10. *Equisetum arvense hirsutum folijs.*
Stinking Horse taile.

11. *Equisetum arvense hirsutum folijs.*
Barren Marsh Horse taile.

This other small Horse taile differeth little from the last, saving that the prouen found not to beare any seede as the others do, and yet *Dodonæus* calleth it *Polyspermon*, as being plentifull in seeding. It hath severall joynts at some times and in some places.

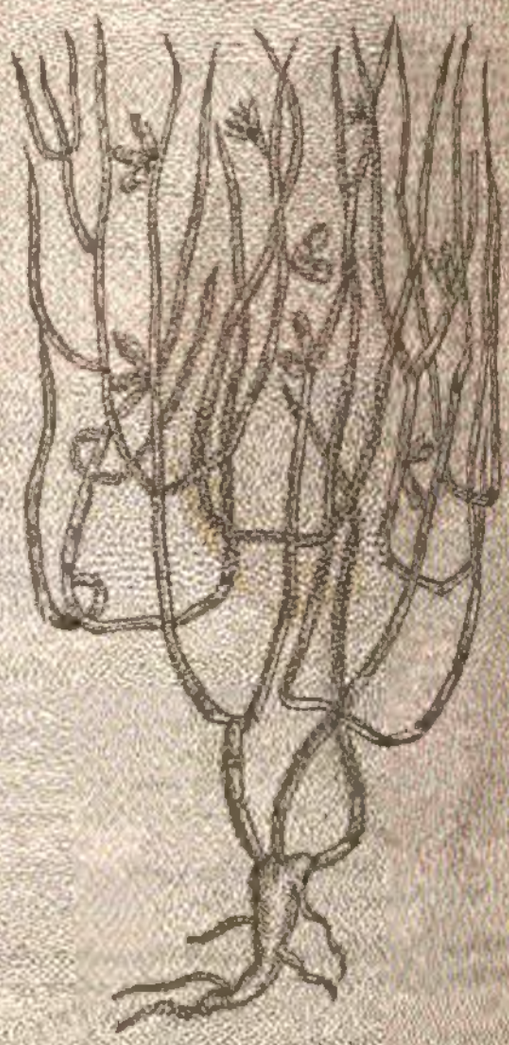
12. *Equisetum minimum muscosum tenuifolium.*
The smallest and finest leafed Horse taile.

The finest taile grasse for the fastnesse and fineness of the rootes growing in the lower wet grounds in the woods about Kentish Town farre from *London*, deserveth also to be numbred with the rest growing in the same manner that the others doe, differing onely in the forenamed parts. This seemeth to differ from that which Gerarde in his *Herbarie* in the third booke, calleth *Equisetum palustre tenuissimis & longissimis foliis*, onely in growing higher and the leaves some what longer.

13. *Equisetum minus polystachion.*
Many headed Horse taile.

Besides the severall and running rootes, in the joynted stalkes and leaves of this it differeth from the rootes, this Horsetaile differeth from the former small ones, but in this that at the joynts it beareth three or foure fine small stalkes with small leaves without eares on the toppes of them, and a greater at the head of the maine stalkes, more loosely set or lesse compacted then the rest blooming very pale bluish flowers.

7. *Equisetum luncreum sive nudum.* Rush or naked Horse taile.



The rush Horse taile groweth up with sundry joynted rough Rushes about a foote high or more sometimes, without any leaves at the joynts, and hereby it is knowne from all the rest, and is more used by sundry workemen

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

11. *Equisetum pratense maius.*
The greater medow Horse tayle.

12. *Equisetum arvense, tenuius*
ramosum. Small pale Corne

to smooth and polish their workes of wood and bone then any other: the roote is jointed likewise and creepeth.

8. *Equisetum sylvestre ramosum.* Branched Rush Horsetaile.

This differeth only from the last in growing with many stalkes from the toppe of one, that fall flat to the ground, and that many of those stalkes doe branch themselves forth into others, all of them full of joynts without leaves.

9. *Equisetum exilius minus variegatum.* Small party coloured Horse taile.

From a small blackish creeping roote (prang up sundry small hollow pale greene stalkes of a foote and somewhat lesse high, full of joynts, the lower joynts whereof are blackish and the upper whith without leaves: it is most likely to bee the same Mr. *Johnson* in his *Gerard* hath found with small leaves, and called Horse taile Coralline, howsoever this may sometimes seeme to differ both from *Gerard* and he) at the toppe whereof standeth a small short head, somewhat like a small catkin, the crowne whereof being white have sight of a very small sharpe pointed leaves under it, which being touches on will crackle and make a noyse.

10. *Equisetum fetidum fub aqua repens.* Stinking Horse taile.

The stinking Horse taile groweth up both in and out of the water, with sundry branched stalkes, but those adwater, and set with short leaves at every joynt, having divers small buds growing at every joynt, which while it is in the water, but taken forth and dryed it becommeth gray and brittle, easie to be rubbed into powder with ones fingers, and falling also into pouther of it selfe by lying, and smelling somewhat like ours, but not so strong. It growth not onely in the ditches of the bathes of *Spaw* neare *Leige* but in *Zeland* and *Holland* also, and may be the sort of Horse taile that delight to grow in waters and wet grounds onely, and are found in many such like places. There are some other sorts that are sometimes found growing although seldome so well in the like wet grounds as in the uplands, which for their double habitations I thought good to reserve by themselves to speake of them in the last place.

11. *Equisetum pratense maius.* The great Medow Horse taile.

For the forme and manner of growing this differeth not from the former but in growing greater and taller with more store, and longer leaves then any at the joynts, each leafe being also jagged with sixe, seven or more sharpe pointed leaves.

12. *Equisetum arvense longissimis foliis.* Corne Horse taile.

This Corne Horse taile groweth very like the last, but greater in stalke although sometimes it rises and not joynted at all that ever I could observe, yet I have seene it in *Kent* and other places growing in the borders of the Corne fields, and often ploughed up when they fallow their grounds, to great a stalke but not like a small bush.

13. *Equi-*

3. *Equisetum sylvaticum minus.* Wood Horsetaile.

The small Wood Horsetaile groweth like the tall, but the joynts are farther seperate in sunder, and the leaves thereof are somewhat small and long withall, the roots are like the rest.

4. *Equisetum montanum Cordi.* Mountaine Horsetaile of *Cordus.*

The mountaine horsetaile is somewhat like unto the eight sort here before set downe, having divers Rushie like stalkes with leaves on them, branching forth both above and below, at severall places whereof come forth small spoky eares like tall small long and round reddish baskets containing small seede within them, the roote is small and long.

The Place and Time.

The rules or descriptions for the most part may the places of all these be knowne where they grow, and needeth not here repeated againe: they doe spring up with their warlish heads in *April*, and their blooming eares in May, seeding for the most part in *August*, and then perish downe to the ground, rising afresh in the spring.

The Names.

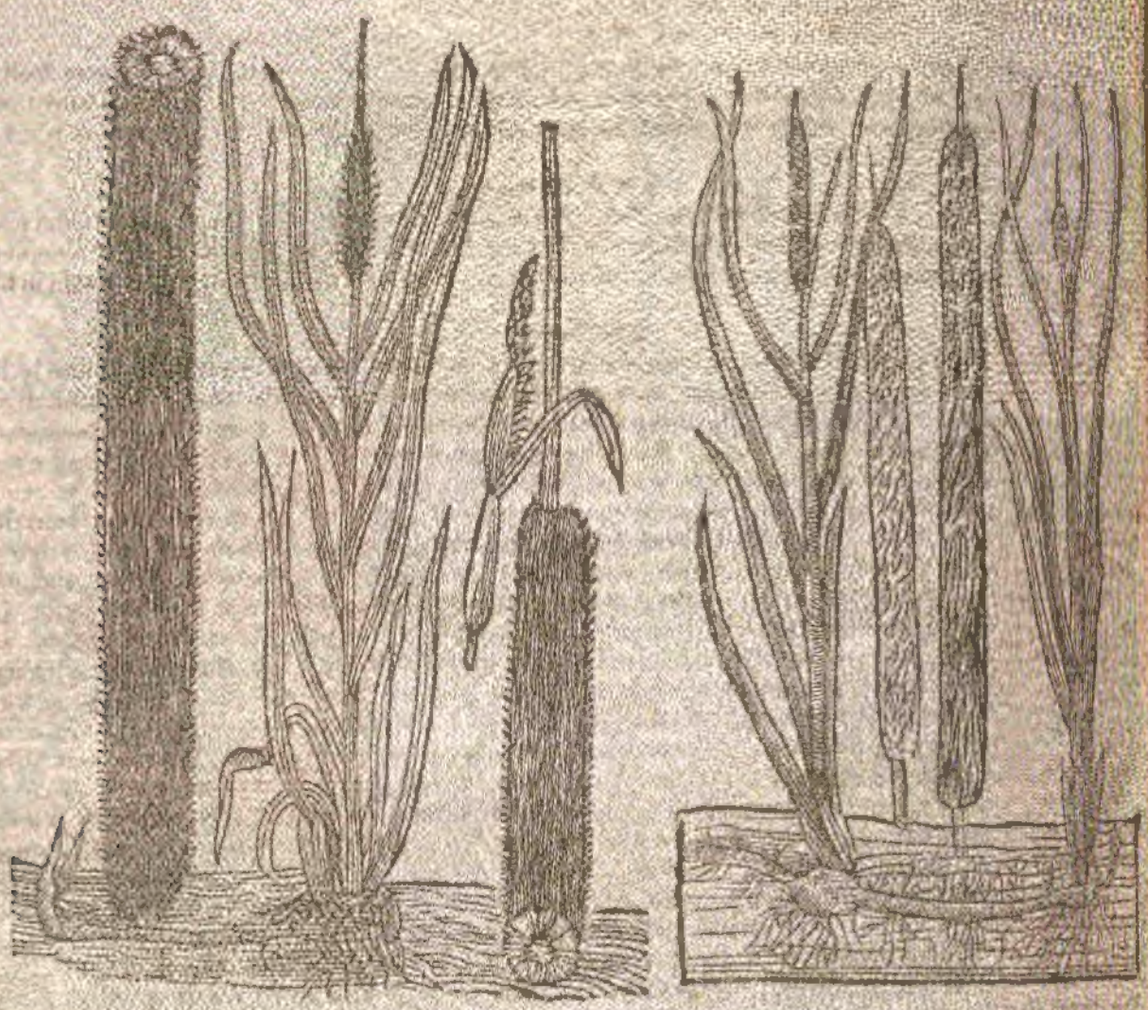
The Greeks call it *Hippuris*, and *Hippouris* in Latine also by divers, and *Equisetum* or *Canda equina* which is the very Greeke *Hippuris* of the forme of an Horsetaile, and with the Italians of leaves being turned downe doth resemble an horses taile, of other names it is called in *Equinalis*, and by *Plinie Equifolia*, and of some *Salix Equina*, and *Sanguinalis* from the especiall effect it hath to staieth blood. The first is the *Hippuris major* of *Dioscorides* and others, and *Equisetum majus* by *Lobel* and others, *Anguillara* tooke it to be *Cauda Equina*, but that I have shewed you before is another plant that is so ruddy and like either the second *Equisetum* onely maketh mention of by the Greeke it beareth a method of the *Equisetum palustre* of *Lonicer* in his *Dutch* booke, the fourth is taken by many to be the *Polygonum* named of *Dioscorides*, and *Plinie* his third *Polygonum* of the many joynts it hath in a Greeke, *Fuchsius*, and many others, by *Lobel Polygonum femina sparsa viridis*, and by *Cordus Sanguinalis Fœmina* and *Semperuiua*: the fift not our owne land not mentioned as I take it by any author, although as I there say *Fuchsius* his *Equisetum tenuissimè & longissimè foliatum* is somewhat like unto it the sixt, seuenth and eight are all of *Rauwolfius* demonstration also accounted, yet *Cæsalpinus* mentioneth the tenth by the name of *Equisetum quintum genus minimum*, the eleventh is the first *Hippuris* of *Tragus* and called also by him and *Lugdunensis Equisetum longum*, by *Cordus Sanguinalis Fœmina sterilis* and by *Bauhinus Equisetum folijs arduis non ramosum sive Sanguinale Fœmina sterilis*: the eight is *Equisetum* of *Matthiolus* and *Lugdunensis* called by *Lobel* and *Dodonæus Hippuris minor*, the eleventh is the *Equisetum alterum* of *Matthiolus Lugdunensis* and others, the *Hippuris altera* of *Tragus*, *Hippuris sterilis* of *Lobel* and *Equisetum pratense longissimè foliatum* by *Bauhinus*: the twelfth is the *Hippuris minor* of *Tragus*, *Polygonum sterile* of *Fuchsius*, and *Hippuris sexualis major* of *Tabernæmontanus*: the last is the *Hippuris minor* of *Tragus*, and *Equisetum sylvaticum* of *Tabernæmontanus* and *Bauhinus*. The *Arabians* call it *Tiphe alcasi Hippuris* and *Dioscoridis*, the *Italians coda di cavallo*, the *Spaniards Cola de mula* and *cola de caballo*, the *French Queue de cheual* and *Prestes*, the *Germans Schaffheue*, and *Rossschwantz*. The *Dutch Peerd steert*, and we in *English* generally Horsetaile, and of some Shave grasse, and as I sayd in the beginning by resemblance a Rush might be called long pointed Rushes.

The Vertues.

Horsetaile the smoother rather then the rough, and the leaved then the bare, is both more used and of better effect in Physicke, and is as *Galen* saith with the binderneese of a binding qualitie, and dryeth without sharpenesse. It is very powerfull to stanch bleedings where soever, either inward or outward, the juice or decoction thereof being drunke, or the juice, decoction or distilled water applyed outwardly, it stayeth also all sorts of Laskes and fluxes in man or woman, and the pissing of blood, and healeth also not onely the inward Vlcers and excoriations of the intralls, bladder &c. but all other sorts of foule moist and running Vlcers, and soone solderth together the toppes of greene wounds, not suffering them to grow to maturation: it cureth also Ruptures in children quickly, in the elder by time, according to the disposition of the partie, and the continuance: the decoction hereof in wine being drunke is said to provoke urine, to helpe the strangury and the stone, and the distilled water thereof drunke two or three times in a day a small quantitie at a time, is also to ease the pleurisie in the intralls or vaine, and to be effectuall against a cough that commeth by the defluxion of rheume from the head: the juice or distilled water being warmed, and hot inflammations pustules or red whelkes and other such eruptions in the skinne being bathed therewith doth helpe them, and doth asswage the swellings, heate and inflammations of the fundament and priuie parts in man or woman. Countrey housewives doe use any of these rough sorts that grow neare at hand to scoure their woodden, peuter and braste vessels, the young buds are dressed by some like Asparagus, as being boyled, are after buttered with flower and fryed to be eaten.

Chap. XXXII.

Typha. Cats taile or Reede Mace.



Next unto these you all the sorts of Reedes, I would set this in the first place to be entreated of, as a meane betweene the Rushes and Reedes, before I come to those are properly called Reedes, whereof there are three sorts.

1. *Typha maxima.* The greater Reede Mace.

The great Reede Mace sheareth forth divers very long, soft and narrow leaves, pointed at the ends in a manner like Sedge, because the middle on the backside is great, and sticketh forth, amongst which rise up sundry smooth round and pithy stalkes, jointed and not hollow above a mans height, with joynts and leaves on them, from the lowest part upwards a good way, but bare and naked thence to the toppe, where they have small long and round eares, like wing forth at the first some yellowish flowers, which being past the torch or spike groweth greater, and consisteth wholly of a flocky substance, of a blackish browne colour on the outside, somewhat solid

1. *Typha maxima.* The greatest Reede Mace.

2. 3. *Typha minor & minima.* The two lesser sorts of Reede Mace.

or weight, yet is lo soone blowne away with the winde: the roote is white somewhat thicke knobbed and jagged, spreading much with many long fibres at it, sweet in taste if it be chewed.

2. *Typha minor.* The lesser Reede Mace.

This differeth in nothing from the former, but in that it attaineth not to that height and greatnesse that the former doth.

3. *Typha minima.* The least Reede Mace.

The least Reede Mace likewise differeth not from the last, but in being smaller both in leafe and stalke, which are more hard or rough, and in the top which in some places beareth a smaller spike above, the lower being greater with a small distance betweene them, and a small leafe at the bottome of it.

The Place and Time.

They doe all grow either in the middle of watery ditches or ponds, or by the banckes and sides thereof, in moorish places of fenny ground, and flower about Midsommer, the Torch Mace being ripe in *August*.

The Names.

It is called in Greeke *Τύφη* and in Latine *Typha*: *cylindrum vocant quasi fistulosum, quod in medio habeat, aut gignere se ad instar fistulæ mentiatur: sunt ut inquit Ruellius, quasi fistulæ cereæ, quæ vere primo masticantes pastantur. Virgæ Maces, dictæ perpolitum quiddam habent & lævigatum fastigiatum: caulem:* Some call it *Cestrum marinum* as *Dodonæus* saith, and some *Xylosmum*, put a difference betweene it and that kind of *Typha* is put among the Corner, and that rather called *Typha*. *Theophrastus* maketh mention of them both as it is thought, and *Dioscorides* hereof that one, for he saith that his *Typha palustris* is without leaves, which therefore cannot agree herewith: *Pena* also ignorantly in his *lib. 1. c. 56.* among the forts of water Reedes. It hath no other name given it by any to our knowledge, but of some it is taken to be *Ulua* and *Dodonæus* calleth it *Papyri species*, and *Lugdunenses* particularly the name of *Dodonæus*. *Dodonæus* seemeth to take this to be that *Serapio* that *Ovid* in his *Fasti* mentioneth to be *in planitie sorpea matta fuit*: but not onely I but divers others more learned doe doubt thereof. *Lobelius* referreth it to the *Phleum* of *Theophrastus* (but not *Phleos*, for that is a thorny plant) as I have before said which he numbereth *inter paluſtria Orchomeny*, and *Aristophanes* also as I recited him in the Chapter of *Cyperus* bringeth in the Frogs rejoycing that they had spent the day *inter Cyperum & Typhas*. *Theophrastus* saith is called *Anthelaea*: *Dodonæus* saith, but I rather judge it of the fruit. *Theophrastus* mentioneth both *Typha* and *Phleum*. The second is onely remembred by *Clusius* to be that he saw growing in *Sleper*: the last is called *Typha minor* by *Lobel* in his *Adversaria*, and by *Typhula* and *marina* by *Clusius* in his *Pannonick Observations*. The *Italians* call it *Cattola*, and say if the dust of the heads get into the eares of any it will make them deafe.

Original from UNIVERSITY OF MICHIGAN

...called, The Female Reede or Irish. The Common Narrow-leaved, The Hard Lyth-leaved, and Dwarfe. And we in Suffolk in divers places Cats taile and Reede Mace by others but in being between a Rush and a Reede, it might truly be called Torch rush or Torch reede. Some also call this as well as the next by the name of Sedge.

The Vertues.

Matthiolus giveth such a grievous hard name, that the poulter should helpe children when they are burthened with Bacon, and the roote of *Ladies-seale* and Horse-tongue, but others doe utterly condemn it, and take it to be very dangerous, in that it would rather strangle them then helpe them, for it is usually knowne and used as a baite to kill Mice. *Dioscorides* saith that the flocky substance mixed with Vinegar, is good against burnings. It is held by good Authors to be used in the place of the true Paper reede, for those uses it is appointed. It doth make exceeding cleane and dry, and being applyed to the bleeding places stancheth blood. The leaves hereof are usually kept to make Mats, and for childrens chaires, and many other such uses.

Chap. XXXVIII.

Sparganium. The Burre Reede.

Of this kinde of Reede I have foure sorts to shew you, two whereof are generally remembred of most Writers, a third as the least of them all, is mentioned by *Bauhinus*, but we have a fourth lately brought from *Virginia*.

1. *Sparganium ramosum.* Branched Burre Reede.

This branched Reede hath larger, broader, and rougher leaves then those of the Garden sort, three square as it were like them, and sharpe both at the edges and points, among which ariseth a rough rounde stalke two foote high, with the like but fewer leaves on them, dividing it selfe toward the toppe into sundry branches, bearing on them divers small greene burres, which are not rough at the full, but growing ripe are hard and prickly, somewhat resembling the rough burres of *Platanus*, the Plane tree, with a leafe at the joynt, up to the toppe, the roote buddeth into many fibres and fibres.

2. *Sparganium erectum latifolium.* Vulgar branched Burre Reede.

This other burre Reede groweth up in the like manner, with leaves somewhat broader then the former, and a longer flower stalke, but branched at all, not bearing the like balles or burres, but somewhat fewer and not so prickly: with a leafe at every one of them likewise, the roote also is like the other.

3. *Sparganium minimum.* The least Burre Reede.

The small Burre reede hath a stalke about two inches high, rising from a small roote, compased of a few long

1. *Sparganium ramosum.* Branched Burre Reede.

2. *Sparganium ramosum latifolium, & erectum.* Branched and Vulgar Burre Reede.

Reinges

1. *Sparganium non ramosum.* Small unbranched Burre Reede.

4. *Sparganium maius foliosum seu Pugionium.* The great branched Burre Reede of Virginia.

stringes or flowre, on the toppe whereof standeth a small round head, and another lesse then it thereupon, of the same forme and colour with the former, having three or five long narrow leaves standing on each side of the head, and rising higher then the stalke it selfe.

4. *Sparganium maius foliosum Virginianum.* The great branched Burre reede of Virginia.

This kinde of burre reede hath onely two or three very long and somewhat broad, pale green leaves rising from the roote, and in the midst of them a strong round stalke, without any leaves thereon, but standing naked neare the toppe into many round somewhat prickly Burres, of the bignesse of a Walnut, without any small flowers appearing thereon. The roote is somewhat knobby at the head, with divers strings thereat.

The Place and Time.

These Burre Reedes grow in watery ditches, ponds and rivers usually, or by the sides of them in many parts of this Land, except the two last, the one whereof in *Germany*, the other in *Virginia*, brought by *M. Tradescant* the younger, they flourish with the Reede mace or thereabouts.

The Names.

It is called in Greeke [illegible] and in Latine also *Sparganium*, and *Xiphion* also as *Dioscorides* saith in his time. *Matthiolus* called it *Typhinum* generally by most Authors, *Ferula nigra*, *Enula*, and *Dodonæus* take it to be *Acorus*. *Tragus*, *Gesner* also and *Thalius* call it *Phalangium*, because the burres of it as I said are like those of the Phalangie. *Lobel* taketh it to be *Cyperus*, *Lugdunensis* maketh it to be *Phleos femina* of *Theophrastus*, but as I have formerly noted, there is great difference betweene his *Phleos* and *Phleum*, this last being a moorish plant, and the former not. The second is called *Sparganium alterum* by *Lobel*, *Lugdunensis* and others, and *Tabernæmontanus* alone by *Dodonæus*, who matcheth fruit with that which *Matthiolus* set forth for *Sparganium*, and saith that it doth not in any respect agree to *Dioscorides* his description, having burres at the toppe of the stalke. The third *Dodonæus* onely hath mention of, and the last by no other before.

The Vertues.

Galen onely saith that *Sparganium* is of a drying faculty, and *Dioscorides*, that the roote boyled in wine is good against the poyson of Serpents.

Cap.

Chap. XXXIX.

Papyrus. The Paper Reede.

The ancient Greeke called *Papyrus* by *Theophraſtus*, *Dioſcorides*, *Pliny*, and others, whereof the Paper bookes were made, that were uſed in their and their former times, we may out of their writings deſcribe unto you if it be the ſame which *Alpinus* and others ſay, groweth now in *Egypt*, and they call by the name of Papyr: however we will ſhew you what they ſaid it was, and how it grew, and withall ſhew you how *Alpinus* and others deſcribe it now, and likewiſe ſhew you another ſort thereof, as followeth.

1. *Papyrus ex Plinio Nilotica.* The Paper Reede of the ancients growing in *Nilus*.

The ſame Paper reede which *Theophraſtus* & from him *Pliny* do deſcribe growing ſay they not in the depth of the Lake *Nilus*, but in the pooles of *Egypt*, whereunto the River *Nilus* hath broken out, and in the River it ſelfe growing not in the depth of the ſtreame, but neere the bankes, where the water is onely about two cubits from the ground: it ſelfe, whoſe roote is of the thickneſſe of a great mans wriſt or arme, as he can graſpe. *Pliny* hath an armes greatneſſe, about twelve cubits in length, diſcending divers of the long out ſmall and thicke rootes, above one another of the couddie and earth wherein it groweth, from whence riſe three ſquare edged ſtalkes, (they are not (as I conceive) *Papyres*, which I do tranſlate, for of leaves they have no mention) of foure cubits bigneſſe beneath, ſpreading into many parts, and growing ſmaller to the toppe, where it cariieth an unprofitable tuft or top without any fruite or ſeed. This is *Theophraſtus* his owne word for word, as neere as the deſcription could be made into ſence, which *Pliny* hath altered in ſome things and mangled in others, ſetting downe *Thyrſus* for tuft, they being of different forme, yet *Pliny* ſaith nothing therein both, but leaving out *Theophraſtus* foure cubits greatneſſe, which is ſomewhat difficult well to underſtand and to apply to the purpoſe: wherefore will I herein give you the deſcription thereof, as *Theophraſtus*, and *Plinius* ſince hath amended it. It riſeth (when above the water) from a reede like roote, with many fibres thereat, with ſundry three ſquare ſtalkes, ſometimes ſeven cubits high or more, with a pith in the middle, with leaves both above and below (the greater ſtalke without leaves are large (and three ſquare as *Alpinus* ſaith, but *Theophraſtus* ſaith nothing thereof) bending downe and like to the ſtarre reede or Cyperus, the leaves under the tuffs or the toppes, which are compoſed of ſtrong long and upright threds, ſet thicke together, and ſmall flowers at the toppes of them, which paſſe away without ſeede, as it is thought, for none hath beene obſerved. This is their exact deſcription of it, ſo that by comparing them both together, we may ſay that the roote is like other Reedes, but much greater, that is as bigge as one with or arme, yet not of ten cubits long, for that (as I thinke) is more proper to the ſtalke, from the roote to the toppe of the tuft, the ſtalke it ſelfe (I cannot be of) foure cubits greatneſſe, for that compaſſe exceedeth a great man but five foure or fifteene of fifteene inches compaſſe, which may very well agree to the naturall largeſt breadth of Paper, which was thirteene inches as *Pliny* reporteth, which was after it was wetted with the water of *Nilus* and ſmoothed out, and thereby enlarged, which had cloven out from the ſtalke, thoſe inward being ſelfe will ſerve. The plant ſay the ancients is ſweete and eating the *Egyptians* before that bread of Corne was found out eate them for their food, and in their time was planted and the ſweetneſſe ſucked forth, the reſt being throwne away: the roote ſerveth them not onely for fewell to burne, but to make many ſorts of veſſels to uſe, for it is the onely matter for the purpoſe: *Papyrus ipſa* (ſay they) that is the ſtalke, as I tranſlated it before, is profitable many wayes, as to make Ships, and of the barke to weave, and make ſailes, mats, carpets, ſome kindes of garments and ropes alſo.

Papyrus Nilotica Aſpera.
The Paper Reede of *Nilus* growing there.

2. *Papyrus Sicilianus.* The Paper Reede of *Sicily*.

The other Paper Reede (which may be the *Sari* of *Theophraſtus*, mentioned by him next unto the *Papyrus Ide*, as before &c. Which as he ſaith is very like it but leſſe, being three ſquare alſo) riſeth ſix or ſeaven cubits above ground, bearing many three ſquare and ſoft leaves broader and longer then thoſe of *Cyperus* or *Sparganium*: the ſtalke is many, full of pithy wooll, ſmooth and naked, without any leafe unto the toppes, where it beareth a great thicke tuft of cloſe ſet ſlender ſtalkes, with ſmall Moſſie flowers on the beside of them, and a few ſhort leaves under the tufts, which become fruitleſſe, not bearing any ſeedes: the roote is ſomewhat long like a reede, with many fibres thereat.

The

The Place and Time.

The places of both these Reedes are expressed in their titles, the former prospering in Egypt, and Syria, as *Theophrastus* saith, and in *Euphrates* also, neere *Babylon* as *Pliny* saith, The other groweth in Candie and Sardinia, in *Italy*, and other places, being in growth much lesse then the former, and flourisheth in the end of Summer.

The Names.

It is called in Greeke πάπυρος, and in Latine *Papyrus* also, the stalke was called στέλεχος, whereof were made which the Latines call *Charta* or *liber*, because the translators set *liber*, or *cortex* for χάρτης, but not properly, for otherwise the property of the word, but as *Pliny* saith, there was no *Charta* leaves of Paper made of the rinde or barke, but of the inner coates, which they divided into thinne flakes, whereinto it naturally parteth, then layed them on a Table, and moistening them with the glutinous water of the river, they prest them, and after dryed them in the Sunne, and according to the largenesse thereof was the greater price, but because the later times of old age, grew so copious in writing and transcribing Bookes, that they could not at any price, get sufficient of their use, *Attalus* as it is thought first at *Pergamus*, invented the skinnes of beasts to be dressed and prepared for that purpose, which ever since have beene called *Pergamenæ*, sheetes or Bookes of Parchment. For as saith *Strabo* furnished his Library at *Pergamus* with 200000. volumes, written on this Parchment. Those which *Plinius* & *Guilandinus de Papyro* is called *Papyrus Ægyptia sive Biblus Ægyptia*. The second is called by them *Biblus fœmina*, by *Guilandinus Papyrus altera species, quæ Taberna vocatur*, by *Lobel Papyrus Romana*, by *Bauhinus Papyrus Syriaca*, and *Sicilianus*, and is likely to be that *Papyrus* that *Alipius* saith groweth in *Egypt*, and called *Bird* or *Berd* by the *Egyptians*, and as I said before, is most likely to be the sort of these which some doe therupon call *Pseudo papyrus*.

The Vertues.

The rootes of the ancient *Papyrus* was much used to be eaten, as is before said, either raw, boyled or roasted by the people of *Egypt* in former times sucking the juice, and spitting out the rell as *Theophrastus*, *Dioscorides*, and *Pliny* doe shew, it was used as *Dioscorides* saith, to open the closed mouthes of Fistulaes being put into them in manner whereof is to take the dryed flakes of Paper, and to lay them in soake, which being bound to sores with a thred, is to be dryed againe, and then being unbound is to be put into those Ulcers, whose mouthes are suddenly closed, thereby naturally to be cleansed and healed, which this being put therein, by the moysture of the Ulcer, is caused to swell to that bignesse it had when it was greene, or soaked, and so give way for the cure, in which manner also *Guilandinus in Papyro*, saith that the Chirurgions in *Italy* use against the flakes of the *Arundo Indicum*, Indian Millet. The burnt ashes thereof were used to lay upon any place of the body, but especially those in the mouth. But the ashes of the writing Paper of late, are made of the flakes performed better: but whereas now adayes many by mistaking the ancient, use to doe use the ashes of our Paper, which is made of linnen cloutes, for the same purposes aforesaid, they are greatly, and besides doe no good at all therewith, but in the stead thereof divers learned men doe advise to use dryed flake of *Typha*, to performe the same effect. *Theophrastus* declareth that they formerly used the roote hereof instead of fewell, as also applyed them to make many sorts of utensils, of houshold stuffe, which yeelded much wood and very good, for as he saith, they made Ships thereof, and of the *Radix* (which he used, the Translators not knowing the true meaning of the word, did turne it into *Cortex*, the barke) they made sailes, and coverlets, a kinde of garment also, mats, and ropes. *Alipius* saith that the *Egyptians* use of the burnt flakes of this their sort, in the same manner, and to the same purposes that the former was wont put unto. And besides, saith that the distilled water of the flakes is very probably used to take away pearles web and other mists and darknesse happening to the eyes.

Chap. XL.

Harundo. The Reede.

OF Reedes there are two principall kindes, the one sweete, called *Calamus aromaticus* or *Acorus verus* of *Theophrastus* in the end of the first Classis of this Booke; the other not sweete, wherof there are many sorts. *Dioscorides* numbreth up five. *Nastus sive Sacchi*, *Thyrsus sive Panicula*, *Phragmites sive Arundo*, *Donax sive Cyperus*, and *Phragmites sive Vallatoria*. *Theophrastus* both many more and numbreth up five and twenty: most of which is not knowne onely to us by the dry Canes, I shall give you a view of some here, and speake of those that are proper to these neere affinities in this Chapter.

1. *Harundo Vallatoria sive vulgaris.* Our Common Reede.

Our Common Reede shooteth forth with many great round hollow stalkes, full of joynts, set one after one unto another, to a great height in some places more then in others, with long and narrow but pleasant greene leaves at each of them, sharpe on both edges and somewhat compassing the stalke, at the top groweth a long and broad spread soft brownish pannicle of the toppe, whose clothe or downy seede, flyeth away with the winde: the roote is white, hard, round, long, and with divers knobbed joynts therein, creeping not deepe, and shooting up stalkes from divers of the joynts: the whole stalke dyeth and perisheth every yeare usually cut downe before Winter, when as it is growne white to serve for many purposes.

2. *Harundo Anglica multifida.* Finger Reede.

This rare Reede is like the former, in the manner and greatnesse of growing, differing onely in the leaves which are two of them foure a yard long, and two or three inches broad, with many great ribbes running along them, and parted at the ends into three or foure parts, some what like unto the fingers of the hand.

3. *Harundo Donax.* The *Spanish* Reede or Cane.

The *Spanish* Reede differeth not in the manner of growing from the former, but in the greatnesse, the stalkes being harder, thicker and rising unto two mens height sometimes, whose joynts are more distant one from the other, with larger leaves at them, and a larger pannicle at the toppe. Very like hereunto are the Reedes

Original from UNIVERSITY OF MICHIGAN

...ges, but by reason of the greater heate they grow ...ther and greater, so that they serve in stead of timber to build them houses and to cover them.

4. *Harundo Indica versicolor.*

The Indian or party coloured Reede.

This Reede is in the growing like unto the last, growing in a manner all place as great and as high, although it be not so with us, the chiefest difference herein consisteth in the leaves, which are painted with white & green like or lace or guilted galle but with larger stripes then is another sort hereof growing in *Bengala* which is smaller and more pliable and apt to bend, whereof they make Baskets and many other such pretty things.

5. *Harundo Saccharifera.* The Sugar Cane or Reede.

The Sugar Cane or Reede groweth naturally both in the East and West *Indies* but planted in sundry warme countries where heaven or eight foote high, whose Canes are sometimes ones thumbe, full of a sweete pith, thicke set with joynts and very long but narrow leaves at them, with many great ribbes in them, the tuft or pannickle at the top like unto the other but shorter: the roote is not so hard or woody but spreadeth knobbed joynts and heads at them whereby it may be encreased, and is almost as sweete as the Canes; in the naturall places this yeeldeth forth of it selfe sometimes or else being cut a certaine white juice or liquor which being dryed and hardned in the Sunne was called by the ancient writers *Sal Indum* and *Saccharum Indum*, which was used before Sugar was made out of the Canes by boyling.

6. *Harundo ramosa sive Typeios Lugdunensis.*

Low branched Reede.

The branched Reede hath the lower part of the stalke with many joynts onely without any branches, covered with a yellowish barke, but upwards it shooteth forth branches on all sides, and they againe other lesser branches up to the toppe almost at every joynt, and all of them

5. Harundo Indica Saccharifera. The Sugar Cane or Reede.

4. Harundo Indica Secunda versicolor. The party coloured Reede.

Lisht Striped

5. Harundo Saccharifera.
The Sugar Cane or Reede.

6. Harundo [illegible] Ægyptia.
Egyptian bunched Reede.

7. Harundo Alepia Sagittalis, or Scripta.
The small writing Reede, the Arrow or Dart Reede,
and the greater and lesser solid Reede.

8. Arundo graminea aculeata.
The thorny Reede.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

bigged athwart, with lines and stales thicke set on them without any leaves that were seene on it, being onely for ornaments sake, in a larke full of Cobbs and Chaffe as it was brought from Troia.

7. *Harundo minor sive Elegia.* The small writing Cane.

The small Reede may seeme to be the same with the last rehearsed, and so *Englenesius* doth take it, correcting *Pliny* where he mentioneth the Reede *Elegia* that it groweth not high but spreadeth above the ground like a bush, being pleasant to cattle while it is fresh, saying it should be rather *Epigeios*: but *Bellonius* in his 8 booke of Observations and 47. Chapter saith, he found this Reede growing in a valley on mount *Athos*, which the Greeke monkes there called *Elegia*, whereof they made writing pens, as also *lib.* 2. *c.* 86. in the lower *Scythia* knowe they them as well as heere before, for throughout all *Turkey* they use no pens made of Goose quills as we doe, and those writing pens which we have seene have beene brought us out of *Turkey* doe declare it to be a small Cane with joints like unto other Reedes, hollow like a quill, whereas that *Epigeios* of *Theophrastus* and *Dioscorides* have scarce eight joints, then that there of can be made any quill or pen to write withall, wee have yet no more knowledge thereof: this onely let me adde hereunto that none may mistake this for the *Harundo Saccharifera* which is bigger and fairer not hollow.

8. *Arundo graminea aculeata.* The thorny Reede.

This Reede shooteth forth thicke and short rootes with fibres at them, from whence extend on the ground many jointed round Reede like stalkes about a finger thicknesse, spreading out into branches with small and long leaves set on both sides at distances, whose lower parts being broad compasse the joynts, growing narrow to the end which is very sharpe, hard and thorny; yet it hath neyther flower nor seede that ever could be observed, and is usefull without talke or but a little yet many thereof: it groweth in moist grounds and watery places as other Reedes do.

The Place and Time.

Moist sorts of Reedes delight to grow in waters or watery overflowne grounds, the severall countries are specified in their titles or descriptions, and are all ripe about the end of *September*.

The Names.

It is called in Greeke κάλαμος and in Latine *Calamus* and *Harundo* or *Arunda* as some write it, whereof the male according to *Theophrastus* is the *Master Reede*, the solid or stuffed Reede, and the *female* the hollow. The first is *Thelycalamus* as *Ruellius* and *Dodonæus* calleth it and *Vallaris* of *Vallatorium*, as *Lobel*, *Tabernæmontanus*, *Lugdunensis* and others call it, and *Stereocalamus* as *Matthiolus* and *Tabernæmontanus* doe, but *Angelius* calleth it *Cerula Theophrasti*, and *Cortusi*, *Arundo vulgaris*: the second hath beene onely found with us; the third is called *Arundo spinosa* by *Matthiolus* and others, and *Donax sive Cynosura* by *Dodonæus*, *Lobel* and others, and *Indica* by *Cæsalpinus*, to conclude it is one and the same sort whether it grow in *Italy*, *Spaine* or else where, although in one country greater and higher then in another, according to the soile and climate: the fourth is probable not to be the same that *Theophrastus* calleth *Lacanice*, although it was entituled *Indica* by them that sent it; the fifth is generally called *Arundo Saccharifera* and *Saccharata* by all that have written of it: the sixt is as I sayd the *Arundo Epigeios* of *Theophrastus* by *Lugdunensis*, which *Bauhinus* calleth *Arundo repens*, for what cause I know not, and *Cyperocalamus*; and thinketh it to be that which *Gesner* in *horto* calleth *Arundo humilis*, and *Copia Elegia* was named by them that had it: but surely the *Epigeios* is differing from the true *Elegia* as I have before noted, the seaventh is called as I sayd before *Arundo Elegia* by the *Greekes* with whom it groweth. The last name is called by *Alpinus* as it is here. The *Arabians* call it *Arab*, the *Italians Canne*, the *Spaniards Canos*, the *Frenchmen* and *Rotsen* the *Germans Rohr*, the *Dutch Riet*, and we Reede.

The Vertues.

It is saith that the rootes have a cleansing quilitie but not sharpe and the leaves also. The fresh leaves bruised, whereunto applyed to those places that have thornes splinters or the like in the flesh, doe draw them forth in a short space: the same also applyed with vinegar helpeth members out of joynt, and satisfactorie unto the lames, the cold leaves also bruised and applyed unto hot impostumes, inflammations or S. *Anthonies fire* taketh them away: the inner rinde of the Reede pounded with Vinegar helpeth the falling of the haire, the same doth also the other sorts of Reedes as well: the flower or woolly substance of it hapned into the eares sticketh so fast as that by no meanes it will be gotten forth again, but will procure deafenesse withall: Some have writ as sayd observed, that the Name and the Reede are so perpetuall enemies the one not abiding where the other is, as also the nettle betweene the Asparagus and the Rasor as they are wonderous well being planted among Reedes. They are also but so many very necessary matters both to thatch houses, to serve as walles and hedges to keepe in the cherishing of their plants, to Weavers to trim their boates, to Weavers to binde their worke and divers others uses. The sugar that is made of the Sugar Reede, hath obtained now a dayes to be much and daily used as it is almost not accounted Physicall, because of the roompasseth or heate and moisture that is in it, helping coughes and hoarsenesse of the throate, and is used to be put into clysters as well as cooling and warming medicines.

PLANTÆ PALVDOSÆ AQVATICÆ ET MARINÆ MVSCI ET FVNGI.

MARSH, WATER AND SEA-PLANTS, VVITH MOSSES, AND MVSHROMES.

CLASSIS DECIMAQVARTA.

THE FOVRETEENTH TRIBE.

CHAP. I.

Having declared all the Grasses of the Vplands, with Rushes and Reeds in the last foregoing Tribe, I thinke it fittest to ioyne those other Herbes & Grasses, that grow either in the Marshes or Waters, or neere the Sea side, before I entreate of the other *Maritime* Plants, & then follow on as I purpose.

Trifolium Paludosum.
Marsh Trefoile.

The Marsh Trefoile sheeth up with a spongious flexible stalke halfe a yard high or more, with sundry smooth, thicke and somewhat broad darke greene leaves set thereon, at farre distances, three alwayes ioyned together, and standing on a long foote-stalke, from the middle of the stalkes up to the toppes, where commeth forth a long bush or spike of fine pale blush flowers, each of them consisting of five round pointed leaves, with a long thicke pointed umbone in the middle, which set together with the leaves thereof are covered with a fine hairy downe or lint, which addeth the greater beauty to it, after which are past, come small round heads in their places, containing in them brownish yellow seede and bitter: the roote is long and white, creeping in the mud all about, and shooting afresh at the ioynts.

The Place and Time.

It groweth only in wet and moorish grounds, and will not abide out of it, for the stalke doth quickely grow lancke and withered being broken off from it. it flowreth in *July*, and the seede is ripe in *August*.

The Names.

It is generally called *Trifolium palustre*, or *paludosum*, and is the *Menianthes* of *Theophrastus*, which he saith groweth

Trifolium palustre. Marsh Trifoile.

...shall, whereupon it is called by *Lobel* and *Gerard*, (who giveth two figures being all one,) *Alcanthos palustris*, which differeth from the *Alcanthos* of *Dioscorides*, being the *Leptophlon Asphaltites* or *Limonium*, which *Matthiolus* taketh it to be. *Hippurus* of *Dioscorides*, by correcting his Text, and yet it will not be, and besides that some called it *Trifolium hircinum*, and others *Fibrinum* as *Tabernæmontanus* also doth, who maketh two names, *major* and *minor*, and both names made from the *Dutch* appellations. The *Germanes* calling it *Bibersclee*. And the Low *Dutch*, *Boeks boonen, ofte wilt fielsum hircinum*. We call it in *English* generally Marsh Trefoile, some Marsh Clover.

The Vertues.

It is of no property in it to be applyed as a remedy for any disease, but if you will take it to be *Hippurum*, and so take it unless as *Hippurum* is, then *Dioscorides* the weth that the seede is good against the cough, and pleurisie of the brest or chest, for as *Galen* saith, it clenseth and cutteth tough and grosse humours, and maketh apte also to be expectorate or spit forth; it is also good to purge or clense the liver, and helpeth those that ...

Chap. II.

Caltha palustris vulgaris simplex, Common single Marsh Marigold.

The single Marsh Marigold (for I have spoken of the double in my former Booke, although I give you the figure of it here againe) hath divers great broad round deepe greene shining leaves, a little dented about the edges, every one on a long thicke round fleshy stalke by it selfe, among which arise up sundry thicke stalkes, a yard high or more, with some leaves thereon and at the toppes divers faire great gold yellow flowers, like unto Crowtoes flowers, but much larger and shining, the roote is composed of many long strings, which grow deepe in the myre.

The Place and Time.

It groweth only in Waters, and watery ditches, and by their banckes sides, and floureth somewhat early in the good while, and is past before the end of *April*.

The Names.

It is vulgarly called *Caltha*, and to put a difference betweene it, and the *Calendula* which is also called *Caltha* [illegible] *palustris*. *Fuchsius* calleth it *Caltha Dioscoridis*, and *recentiores*, *Caltha palustris*, who also finde it was called *Populago* from the likenesse of the leafe unto an Horse hoose; *Gesner* calleth it *Ranunculus palustris*, and *Ranunculus Populago*, for what cause I know not, nor yet why two sorts, whereas they are all one although

Original from UNIVERSITY OF MICHIGAN

lesser or greater in one place then another. The *Dutch* call it *Dotter bloemen*, And we Marsh Marigolds, of some Goulden, and in some Countryes Bootes.

The Vertues.

We have not understood that any hath applyed this in Physicke for any griefe or disease.

CHAP. III.

Cotyledon palustris. Marsh Penny wort.

THE Marsh or water Penny wort, as some call it, groweth creeping on the ground, with long trayling branches, shooting forth fibres at sundry joynts, and roundish deep greene leaves, a little hollow in the middle and unevenly dented about the edges, each standing on a small long footestalke, the flowers are very small and white, comming forth under the leaves, the rootes are very small fibres that doe not grave deepe in the ground.

The Place and Time.

It groweth alwayes in wet grounds, marshes or bogges, as on *Hampstede* heath, and in many other places neere *London*, and floureth in *July*.

The Names.

It is called by most Herbarists in these daies *Cotyledon palustris*, and *aquatica*, *Lobel* calleth it, *Cotyledon aquatica acris Septentrionalium*, and in his observations maketh a doubt if it be not the *Colliriche* of *Pena*, but misseth therefore by *Columna*, who calleth it *Ranunculus aquaticus mobilicaulis*, making it a *Ranunculus*, as it is most probable, howsoever it be termed *Cotyledon*, from the forme of the leaves. The Apothecaries as well as they beyond Sea, doe use this kinde instead of the true *Penidium Veneris*, being deceived in that the forme thereof doth some what resemble it, but sure they have amended that error now, to better knowing the true plant. It is called in some Countries of this Land the White rot, because if sheepe feede thereon, it will kill them.

The Vertues.

By reason of the sharpe taste it cannot but be of an hot quality, somewhat like the Crowfeete, and therefore requireth respect in the use and not a carrent tradition, we have no certaine property recorded of it.

CHAP. IV.

Ranunculus palustris. Marsh Crowfoote.

OF this kinde of Crowfoote there are divers sorts, which shall be declared in this place, being referred for it.

1. *Ranunculus palustris flammeus major.* The greater or Marsh Spearewort.

This greater Marsh Spearewort hath a long joynted roote, floored with many blackish fibres from whence riseth up a thicke jointed smooth stalke two foote high, furnished with large and long like long, and broade leaves then in the next, some being more then halfe a foote long, and two or three inches broad, but rise up to the tops, where stand a few pale yellow Crowfoote like flowers, but larger then other.

2. *Ranunculus palustris flammeus minor sive angustifolius.* The lesser Spearewort.

The lesser Spearewort groweth rising with many fibres of tappy greene stalkes, with longer, thicker, and narrower leaves then the, and many tufts of pale yellow flowers, like other sorts of Crowfeete, the seede like the former, and like other sorts of Crowfeete: the roote is nothing but a bush of threades or fibres that grow deepe in the mudde.

3. *Ranunculus flammeus foratus.* Dented Spearewort.

This other dented Spearewort is altogether like the last, or is the very same but that this doth more commonly bring the leaves dented about the edges in more plenty then in the other, for both of them often times bring forth some dented leaves and the dented with some plaine leaves among them.

4. *Ranunculus flammeus Bayonensis.* The French Spearewort.

We have had another sort of Spearewort sent us from *Bayon*, growing in their Marshes neere the Sea coast, whose leaves are long and narrow, sharpe pointed at the ends, the stalke is branched and beareth larger yellow flowers then the last, the rootes are like to

5. *Ranunculus flammeus flore albo minor.* Small white flowred Spearewort.

This little Spearewort hath such like long leaves as the lesser Spearewort hath, standing upon long footestalkes but lesser and narrower by much: the stalke is bare without leaves, saving that at the toppe where the flowers breake forth it hath two small long leaves, the flowers are smaller then the common small sorte, the pistils white the seede and roottes are alike also.

1. Ranunculus Pannonicus major flore luteo & albo ferotino. The greater and later Pannie Crowfoote or Spearewort, with deuided leaues.

2. Ranunculus palustris Sardous latifolius. Water bulbed Sardin Crowfoote.

3. Ranunculus Pannonius auriculatus flore pleno albo. The French and Italian white double Spearewort.

7. Ranunculus Sardous latifolius. The true Sardinian Crowfoote.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

8. *Ranunculus aquaticus Hyperici folio.*
Water Crowfoote.

9. *Ranunculus Sardous hirsutus aquaticus.*
Water Crowfoote with Ivy leaves.

8. *Ranunculus palustris Sardoniæ levis.*
Round leafed Marsh Crowfoote.

This kinde of Crowfoote shooteth forth a round hollow stalke neere halfe a yard high, branching forth into sundry parts, the lower leaves whereof are more round then those above, and are divided, some into three, which are the fairest and lowest, others into five divisions, and each of them dented about the edges, somewhat like unto Coriander leaves, of a pale greene colour and smooth, but those upon higher on the stalkes and branches are still more and more divided, so that some of the highest have no devision or dent in them, at the toppes stand small yellow (yet *Cordus* saith he hath observed sometimes purplish) flowers, after which commeth a small long rooted head of many crooked seedes set together, as in other sorts is to be seene, the roots are a bush of small white stringes: the whole plant is as sharpe and vinulent as any of the other sorts, here or elsewhere described.

10. *Ranunculus tenerale folio maculato.*
Water Crowfoote with blacke spotted leaves.

9. *Ranunculus palustris Sardoniæ hirsutissimus.* The true Sardinian Crowfoote.

The true Sardinian Crowfoote groweth very like unto the last, but somewhat higher and rougher, but more divided and hairy, like small cotten upon them, in other things there is little or no difference.

8. *Ranunculus aquaticus Hyperici folio.* Water Crowfoote.

The Water Crowfoote is set forth from a small thready roote, a long trailing tender stalke with many joynts thereon, at every one whereof that are under the water standeth divers fine jagged or leaves very small almost like to it they were fibres, but that they are greene, but toward the toppe those that grow above the water have none of those fine leaves at the joynts, or very few, but onely round leaves upon short footestalkes, very little and dented about the edges, and with them come forth likewise small white whose flowers of five leaves apeece, with some yellownesse in the middle after which come small rough heads like a Crowfoote.

9. *Ranunculus Hederaceus aquaticus.* Water Crowfoote with Ivy leaves.

This small Crowfoote groweth up with divers triangular leaves upon slender trailing stalkes, shooting forth at the lower joynts and with the leaves which are sometimes marked with a blacke spot, come forth also of yellow flowers likewise upon short footestalkes.

I. Ranu.

10. *Ranunculus Hederulæ folio aquaticus.* Water Crowfoote with Ale-coast leaves.

This Water Crowfoote creepeth like wise, and shooteth fibres at sundry joynts of the stalkes, whereon stand smal roundish indented leaves, somewhat like unto those of Ale-hoofe, or Ale coast, having paleish flowers, called fine pointed leaves with roundish heads of seed after them.

The Place and Time.

All these sorts of Crowfeete grow in Moorish and wet grounds, and sometimes at the brinckes of Waters, Ponds and Ditches. The first is scarce to meete with but the two next, and the two last are plentifully enough in most places of the Land, the fourth and fifth came out of *France*, the sixth and seventh, are found likewise in some places, but not so frequent as the other following. They flower in *May*, and *June*, and give their seede after.

The Names.

The Greeke name *Batrachion*, and the Latine *Ranunculus*, doe most fitly agree to this herbe, in that Frogges delight much to resideare where they grow. The first is the *Lingua Plant* of *Lugdunensis*, which *Thalius* hath called *Ranunculus Flammeolæ*, & *Ranunculus Lanceolatus minor* by *Tabermontanus*. The second is called *Ranunculus* of *Anguillara*, and the twelfth of *Cordus in Historia*, the *Ranunculus flammeus aquaticus* of *Lobel*, and *Lugdunensis*, the *Flammula Ranunculus* of *Dodonæus*, the *Ranunculus aquaticus* [illegible] & *major* of *Thalius*, and *Lanceolatus minor* of *Tabermontanus*: some take it to be *Pliny* his *Sideritis*, lib. 21. c. 13. and others his *Ranophyllon*, lib. 27. c. 9. The third is set forth by *Dodonæus* without any other notion, and by *Lugdunensis* called *Flammula aquatica*. The fourth and fifth have their names in their first notions for them. The sixt is the *Struthea & Apiastrum* of *Pliny*, although he confoundeth the *Melissa*, being also called *Apiastrum*, in that Bees delight to feede thereon, with this, which is in the leafe somewhat like unto it, but the whole much more) and therefore by some called *Apiastrum* & *Herba Cambri*, as *Gualterus* doth; for when he was taken prisoner by Pyrates, and carryed into *Barbaria*, saw this herbe growing plentifully there; some *Apium aquaticum* of *Tragus*, and *Apiastrum* of *Cordus* on *Dioscorides*, by *Apuleius* called *Scelerata*, and the last *Ranunculus* of *Matthiolus*: *Lobel*, and others, the first *Ranunculus palustris* of *Cordus in historia*; of *Lugdunensis*, *Tragus*, and others, and the *Ranunculus palustris apij folio latis* of *Paulinus*, but by *Lobel*: *Ranunculus palustris angustiore folio*. The seventh is as I take it the true *Sardonia* of *Dioscorides*, described by him in the seventh book and called by some in his time *Apium sylvestre*, and called also *Ranunculus Sardonius* by *Augustanus*, and true bread *Ranunculus* of *Matthiolus*, and of *Cordus in hist. Batrachion* saieth it *Ranunculus palustris apij folio tenuiore*. The eight is called by *Lobel Ranunculus aquaticus hepatica facie*, and so it is generally taken of all Herbalists with us, by *Dodonæus*, *Ranunculus aquaticus*, by *Lugdunensis Hepatica aquatica*, and by *Thalius Ranunculus palustris*, by *Ranonius Ranunculus aquaticus folio rotundo & capillaceo*, who maketh that other of three, with onely five leaves to be another sort, when as they are both but one, even as this *Trichophyllon* of some is also. The ninth is called by *Lobel*, and *Gerard Hederula aquatica*, who saith he never saw flowers thereon, *Lugdunensis* calleth it *Ranunculus Hederaceus*, *Dalechamps* and *Ranonius Cenicula aquatica trifolia*. The last hath not beene mentioned by any before. The *Dutch* call the first sort *Eyterlocken*, because if sheepe eate thereof it doth inflame and exulcerate their entrals, which effects they call *Eyter* as *Dodonæus* saith, some call it in *English* Banewort, and others Spearewort.

The Vertues.

These Marsh and Water Crowfeete are no lesse sharpe and exulcerating, then any of the other sorts of sharpe Crowfeete, and therefore whatsoever hath beene said before of the properties of them, may fitly be applyed to this, for any of the remedies there set downe, and any of these may be used, if the other be wanting, either for lippe sore, rough nailes, warts, ulcers, or any foule markes in the skinne, &c. and for brevity, not willing to repeate the same things, expressed in the Chapter of *Ranunculus* Crowfoote before, I referre you thereunto.

Chap. V.

Pseudo Asphodelus palustris. Marsh or water Asphodill.

There are two sorts of this bastard Asphodill the one greater then the other as shall be shewed in the subsequent discourse, for of the other Asphodills I have shewed you their sorts in my former booke although I shew you here some of their figures.

1. *Pseudo asphodelus major.* The greater bastard Asphodill.

The roote of this greater Bastard Asphodill is long and joynted, with many fibres thereat from whence rise up sundry long and narrow leaves like unto Corne Flag, but not so stiffe or hard, and straked downe-long, compassing one another as they and the Flowerdeluces doe at the bottome, of a deepe greene colour, from whence ariseth up a stalke halfe a yard high, with divers short leaves enclosing the stalke as it were with sheathes at their severall joynts, and at the toppes stand sundry yellow flowers as it were in a spike, each of them made of six leaves apiece, like the other Asphodills with some threds in the middle, after which come somewhat long and three cornered heades with small blackish seed in them.

2. *Pseudo asphodelus minor folio Iridis angustifolio.* The lesser bastard Asphodill.

This lesser Asphodill hath many narrower shorter and tenderer smooth greene leaves, somewhat like unto a narrow leaved Flowerdeluce, but neither so hard nor so thicke, the stalke riseth from among them scarce a foote high, having very few smaller leaves thereon, and paler yellow small flowers at the toppe of it, which turne into long three square reddish heades containing small reddish browne seede within them: the roote consisteth of many long fibres not spreading farre or much, but increasing into sundry heads.

The Place and Time.

Both these sorts have been found in our owne land as well as here and Sea in the marrish and wet grounds, the greater onely at *Lancaster*, as *Gerard* hath recorded, but in divers other places: and the last likewise by *Trent* not farre from the River side there, and in the West parts of the Land also and in other places, flowring in the end of May, and seeds ripened after.

The

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

The Names.

They are called both *Asphodelus luteus palustris* as *Dodonæus* doth the firſt, and *Pſeudo asphodelus* as *Clusius* doth the laſt, *Asphodelus pumilio ſalix Iridis*. And although *Bauhinus* hath three ſorts, making the *Asphodelus Lancaſtrensis* which *Lobel* ſaith he had out of *Scotland*, and ſaw it likewiſe in *Norway* to differ from the firſt, ſurely he is miſtaken therein for it is all one ſort.

The Vertues.

We have not knowne theſe uſed in Phyſicke for any purpoſe, but I have had intelligence from my good friend Doctor *Anthony Kaiſer* of *Exeter*, that he having heard it is ſome places neare unto him, could underſtand of the country people no other name thereof, or properſie appropriate unto it but knavery, which whether they meant in knavery, or knew any uſe of knavery in it, I neyther can learne nor am much inquiſitive hereafter.

Chap. VI.

Acorus paluſtris ſive Pſeudoiris & Iris lutea paluſtris. The yellow water Flag.

The water Flag groweth like the Flowerdeluces, but that it hath much longer and narrower ſadde greene leaves joyned together in that faſhion, the ſtalke likewiſe groweth ſometimes twiſe as high, bearing many ſmall yellow flowers, ſhaped ſomewhat like unto the Flowerdeluce, with three falling leaves and other three arched that cover their bottomes, but in ſtead of the three upright leaves as the flowerdeluces have, it hath onely three ſhort peeces ſtanding in their places, after which ſucceede thicke and long three ſquare heads, conteining in each part ſomewhat big and flat ſeede, like unto thoſe of the Flowerdeluces: the roote is longer and ſlenderer then of the Flowerdeluce, of a pale browniſh colour on the outſide, and of a whiteiſh colour on the inner ſide, with many hard fibres therat, and very harſh in taſte. *Lobel* ſhewed in his *Adverſaria* (before) was a great roote brought from *Theloſe*, which was ſaid to be *Radix China*, but deceaved many in that it was no ſuch thing in deede, for it was in taſte aſtringent, and in the proofe in ſuch differing from the former.

Acorus paluſtris ſive Pſeudoiris lutea paluſtris.
The yellow water Flagge.

The Place and Time.

It uſually groweth in watery ditches, ponds, lakes, and moores, which are alwayes overflowne with water, as at *Lambeth* in the ditches on the bankes ſide may be yearely ſeene, and in many other places, flowring in *July* and ripening its ſeede in Auguſt.

The Names.

This is not here which was called *veteribus conſervatrix* as *Gaza* miſtaketh it, but is rather *Dodonæus Pſeudoiris* a baſtard brother thereof: for in the former ages of our fathers it was held by many for the true *Acorus* of *Diſcorides*, ſo ignorantly had the matter been carryed for many yeares, until ſcruples began to trouble mens mindes, not finding the things anſwerable to their deſcriptions in old writers, which cauſed them in theſe later times to be ſomewhat more inquiſitive and diligent to finde out the true and genuine plants, and give them their proper names (and herein ſo to follow out in Divinitie think you as you ſee it hath been in Philoſophie) for thereupon although *Brunſelſius* call it *Acorus*, yet *Tragus* called it *Adulterinus*, and *Cordus*, *Geſner*, *Camerarius* and others call it *Acorus falſus*, and *Lobel Acorus paluſtris*, *Dodonæus Turner* and others call it *Gladiolus luteus*, but *Matthiolus*, *Lobel*, and others *Iris paluſtris lutea* which *Clusius* following the true *Acorus* ſaith that the moſt judicious take to be the *Acorus* of *Theophraſtus*.

The Vertues.

The roote of this water Flagge is very aſtringent, cooling and drying, and thereby helpeth all Laſkes and Fluxes, whether of bloud, as bleedings at mouth, noſe or other parts, or humours, as the reumes of that nature, and womens too abounding courſes: the diſtilled water of the whole herbe and roote is a moſt ſingular good remedy for watering eyes, both to be dropped into them, and to waſh a longer while therewith and applyed to the forehead, it alſo helpeth the ſpots or blemiſhes that are in the face, as alſo in any other parts: the ſayd water ſomented on ſwellings and hot inflammations in any parts of the body aſſwageth them: the powder alſo and thoſe ſpreading ulcers called *Noli me tangere* doth much good: the ſame is alſo good for fiſtle ulcers happening in the privy parts of man or woman or elſe where.

Chap.

CHAP. VII.

Tussilago. Colts foote or Folefoote.

COlts foote shooteth up a slender stalke with small yellowish flowers somewhat earlie, which fall away quickly, and after they are past, come up somewhat round leaves, yet sometimes cornered a little about the edges, much lesser, thicker and greener, then those of Butter burre, with a little downe or fleece over the greene leafe on the upper side, which may be rubbed away, and whitish or mealy underneath: the roote is small and white, spreading very much in the ground, so that where it taketh, it will very hardly be clensed from it againe, if any little peece be abiding therein, and from thence springing fresh leaves.

The Place and *Time.*

It groweth in wet grounds usually, yet as well also in the dryer places, and flowreth in the end of *February*, the leaves beginning to appeare in *March*.

The Names.

It is called in Greeke ἴκμα, and *Tussilago* in Latine, *a notissima utilitate quam pro ophthalmicis & suffumigiis*, and in the Apothecaries shops *Farfara*, and *Ungula Caballina*, and of some *Populago*, from the likenesse of the leaves unto the white Popler leaves: many suppose that this may be *Tiphyum* of *Theophrastus*, as well as the *Petasites*, in that both of them bring their flowers before their leaves: *Pliny* calleth it *Farfarum*, and *Farfugium*. All Authors call it *Tussilago*, but *Camerarius* maketh three sorts of *Bechium*, that is this and the *Petasites*, which he calleth *Tussilago major*, and the third he saith is the *Caltha palustris*, which as he thinketh may be used instead of *Tussilago* which is silliedly a great error, the *Caltha* comming neerer to the nature of *Ranunculus*, then *Tussilago*. The *Italians* call it *Farfara*, and *Farfarella*, and *Pugnia de cavallo*. The *French* *Pas de cheval*, and *Pas d'ane*. The *Germanes* *Kraudes lattich quasi Pulmonum lactuca*, and *Rossluh* that is, *Ungula Caballina*. The *Dutch* *Eeef bladers*, that is foote leafe. And we in *English* Folefoote, and Colts foote, and Horse hoofe.

The Vertues.

Colts foote while it is fresh is cooling and drying, but when it is dry the cooling quality which remained in the moisture, being evaporate it is then somewhat hot and dry, and is best for those that have thinne rheumes and distillations upon the Lungs causing the cough, thereby to thicken and dry it, as the fresh leaves or juyce, a Syrup made thereof, is fittest for an hot dry cough, and for wheesings, and shortnesse of breath: the dryed leaves taken as Tabacco is in the like manner good for the thinne rheumes, distillations and coughes, as also the more taken in like sort as *Dioscorides* and *Galen* say. The distilled water hereof simply or with elder flowers and Nightshade is a singular remedy against all hot Agues, to drinke two ounces at a time, and to have some cloathes wet therein and applyed to the head and stomack, the same also applyed to any hot swellings or any other inflam-

mations

garding doth much good, yea it helpeth that disease called Saint *Anthonies* fire, and burnings also, and is singular good to take away Wheales and small pushes that rise through heate, as also against the burning heate of the yard of the privy parts to apply wet clothes therein to the place. *Matthiolus* saith that in the roote of the Colts foote there groweth a certaine Cotten or white Woolle, which being cleansed from the roots and carded in linnen clothes and boyled in lye for a while, and afterwards some late water added unto it, and dryed againe in the Sun is the best tinder to take fire, being stroke from a flint that can be had.

Chap. VIII.

Caballus. Great and strange Colts foote.

Of this kinde of Colts foote as I may so call it there are two sorts described by authors which I meane to shew you in this place, and unto them adde another *American* plant which in my opinion commeth nearest unto the others.

1. *Caballus incanus rotunde folio.* Hoary strange Colts foote.

The hoary strange Colts foote hath a long white roote divided into many heads, with many long strings and fibres thereat, of a clammy taste like unto gum *Tragacant*, encreasing thereby much and shooting up many hoary reddish striped stalkes, with large round leaves on them, bigger and thicker then Colts foot, and more woolly also on the upper side, yet with a greenenesse to bee seene in them, but very woolly and white underneath, with some ribbes and veines in them of a little bitterish unpleasant taste, from among which rise up the hoary woolly yet reddish stalkes two or three foote high, having sundry lesser leaves on them, and all of them set about the edges, branching forth at the toppe into sundry small sprigges of pale purplish flowers made of three small leaves a peece, with some threds in the middle, which after they have beene a while blowne doe vanish away into downe that is carried away with the winde. *Dalechampius* saith that in the middle of the flowers is found hanging downe small white graines like pearles to make it answeare to *Plinies* description.

2. *Caballus glabro folio acuminato.* Smooth strange Colts foote.

The other sort hath as large leaves as the former, but thicker harder greener and smoother and not hoary at all, not cut or waved on the edges, and pointed also with the roundnesse and not open at the stalkes as the other, the stalkes are in like manner smooth and striped, bearing the like flowers at the toppes but somewhat paler, the roote also is alike.

1. *Caballus folio incano rotundo sive glabro arundinis.* Hoary and Smooth strange Colts foote.

2. *Caballus Americanus.* Colts foote of America.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

3. *Cacalia Americana.* Strange Coltsfoote of *America*.

This stranger riseth up with many round stalkes about a yard high, and two somewhat round but pointed leaves a little dented about the edges at each joyne of them, the upper leaves being smaller, and little or nothing dented, at the toppes of the stalkes come forth divers branches with pure white flowers, diversly cut, made of five leaves apeece, rising out of each huske, which being past, there succeede small long seede, sticking each on a little downe, which are carryed away together with the winde: The roote consisteth of a bush of blackish threds or fibres, which abideth the extremity of the Winter, both stalkes and leaves perishing yearely, but grow new with it at the end, this hath no sent that I could perceive, neither in roote, leafe, nor flower, whatsoever *Cornutus* saith thereof.

The Place and Time.

The two first sorts grow in the vallies of mountaines in sundry places beyond Sea, and by the Bathes, where they want not moisture, but not in our owne Land that as yet I can heare of, and flower and seede in the Summer time: The last is *America*, both *Virginia* and *Canada*.

The Names.

It is generally taken by all our later Writers to be the *Cacalia* mentioned of *Dioscorides*, which *Gaza* calleth *Cacanum* and not *Caccanum*, as some copies have it, for he mentioneth not *Cacalia* as *Dioscorides* hath it, yet giveth the same properties to *Cacanum*, that *Dioscorides* doth to *Cacalia*, which is not unlikely with him, unlesse he meane the same thing: These plants are called by no other name then *Cacalia* by any Writer but *Cordus* only, who calleth the second *Trifolium Alpinum sive montanum Dalechampij*. *Bauhine* would make a third sort of these *European* kinds, but I finde his description to answerable to the first sort, that I thinke it is the very same, and therefore give no further description of it. The last *Jacobea Cornuta* called *Valeriana Prince folio flore albo*, because he hath another of that sort with a purple flower, saying the roote smelleth like *Nardus* or *Valeriana*. But I can find no such thing in it, I have called it great and strange Coltsfoote, and not mountaine Coltsfoote, as some have done, because there are other herbs more properly to be called Mountaine Coltsfoote, which grow always on the dryer grounds, as shall be shewed in due place, and these in the moister parts of the mountaines: and because the flowers are white and stand like a *Valerian*, I have therefore as I thinke added it to these *Cacalia's*, for by that name did Master *Tradescant* receive it first from beyond Sea, of whom I received the plant that groweth with me.

The Vertues.

The roote steeped in wine and eaten is good for the cough and the hoarsenesse of the throate, which *Cordus* affirmeth laying the same of his *Cacanum*, but it is without sharpenesse and good for the hoarsenesse. *Dioscorides* addeth that the Pearelike graines which are found in his *Cacalia*, beaten and mixed with a cerote or ointment, doth make the skinne smooth, and will stay the falling of the haire as *Pliny* saith.

CHAP. IX.

Lappa sive Bardana. The Burre Docke.

WE have three or foure sorts of Burres some greater then others, and some with more woolly heads, as also a strange *American* sort.

1. *Bardana major vulgaris.* The common Burre Docke.

The common Burre Docke bringeth forth many large hard greene leaves, somewhat like unto the Butter Burre or wild Docke, but more crumpled, and of a darker greene colour on the upper side, and and somewhat grayish underneath, among which rise up hard and rough greene stalkes, two or three foote high with many the like but lesser leaves on them, and in my branches also, bearing at their toppes divers rough heads or burres, with crooked pointed prickles, apt to sticke on any garment or other thing that toucheth it, out of the toppe of each of them come forth many hard purplish threds, which are the flowers, which shortly after fade and fall, turne to downe in the heads, and opening themselves shed their grayish seede, like to the Knapweede, which together with the winde is often carryed away, and often falleth downe on the ground, the roote groweth great and thicke, blacke on the outside and whitish within, sweete and pleasant in taste at the first, but somewhat bitter after. We have had from *Virginia*, and those other Northerly parts, another sort thereof, whose leaves are rounder and smaller, and the burre smaller, harder and with very sharpe hard crooked points, strongly sticking to what it toucheth.

Virginia.

2. *Bardana major rosea.* The Rose Burre.

This burre differeth in little or nothing else from the former, but in the head, which instead of the prickly burres hath many small greene leaves, set together like a small Rose Plantaine, and but little prickly at their endes.

3. *Bardana major lanuginosi capitula.* The woolly headed Burre.

This also differeth little from the first but onely that the leaves grow not altogether so great, and the heads being smaller are woolly all over, and the prickles not so sharpe or sticking.

4. *Xanthium sive Lappa minor.* The small Burre.

The small Burre riseth up with a rough crested stalke, about two foote high, with many blackish spots upon them, breaking out into sundry branches, with two much smaller and whiter leaves at every joynt, standing upon long footestalkes, divided into three parts usually, somewhat like unto a Marish Mallow leafe, but not dented about the edges: at the joynes of the stalke and branches with the leaves towards the toppes of the same come forth small flowers, which abide not long, and after them two or three small close burres, a little pointed at the toppe, wherein lye two or three small lancke seedes somewhat like unto an Oate which fall not out, nor the heads open: the roote is small somewhat long and fibrous, perishing yearely.

The Place and Time.

Some of these grow not in our Country that I can learne, but neere *Lipswicke* in *Germany*, which is the Rose Burre, the ordinary is plentifull enough with us by ditches and water sides, and the high wayes likewise, as also

The Common Burre Docke.

The lesser Burre.

more, but the two last are not so frequent, yet are found in sundry places, and the last in two or three places be-
tweene Glenham and Coopsale in the foote way.

The Names.

It is called in Greeke Λάππα and Ἄρκιον, and not Ἄρκτιον, for that is Ἀρκτίον a plant with leaves like Blatta vie,
of which I have entreated in the first Classis of this Worke and the 23. Chapter: but Latine Personata, and Lappa,
and also called Bardana in shoppes. The first is called Personata or Lappa major by most writers. Dodonæus
calleth it Fodana, Lappa major, Bardana Lappa major Arctium Dioscoridis. Others generally, it seeme verie few
more, one and others doe Echium and the like, inter vera frugum, thinking belike that this is a degeneration
from good Herbes, by reason of the burres, as Candol and Tribuli be also accounted as they thought, which
is verie intolerable for Christians to averre, who doe or may learne out of a verie few words the Galen, or the
ancient, said, that the curse of man caused God to curse the earth, and to cause it to bring forth Cardues and Tribu-
li, where it pleased, as it ever all kindes of herbes, even as Echium and the rest doe, and each seede bringeth forth
his owne kinde, according as God appointed it in the beginning, from the Creation of man till the end. The
second name vsurped onely by Dodonæus, under the title of Lappa major altera. The third is called by Matthiolus,
Lappa major alterius, and thinketh it to be the Personata Veter. for he maketh mention both of Per-
sonata Perfoliata in the same Booke and Chapter, and Lobel calleth it Arctium vulgatum sive Personata Plinii,
Lappa major sive vulgaris sive spinulis tomentosis sive Arctium Dioscoridis, as Lobel doth, whereby it
appeareth that Lappa major vulgaris, and Arctium of Dioscorides together, which Dodonæus before his edition sulli-
ciently confuted, for although Bauhinus applyeth Arctium to the former, and Arctium to this later, yet these
seeme to like one of another and the description of Arctium and Arctium in Dioscorides, so differing both in
one and many things, I doe wonder how he can make them to agree. The fift is called the Scythian of Dio-
scorides, although Tragus will not call it so, but rather Lappa minor, and is called Phalangium, and Strangu-
lum, Cæsalpinus and all other Authors since, doe call it Bardana, yet some Strumarium, and we ge-
nerally Burre Docke, and Burdocke minor. The Italians call the greater sort Lappola maggiore, and the lesser
and the Scottish Gloucon or Glouron, and grande Bardane, and petit Glouteron. The Germanes
call them Klette, The Dutch groote distel, and kleene distel. And we in English great Burre or Burre
Docke, and Dutch burre: and the lesser, the small Burre or Burre burre.

The Vertues.

The green roots are cooling, and drying moderately, and discussheth without sharpnesse, whereby it is good
against Vlcers and sores, a dramme of the rootes taken with Pine kernels, doth helpe them that spit roulde
matter and bloody withall. The leaves applyed on the places troubled with the shrinking of the sinewes or cr-
ampe give much ease, the iuyce of the leaves, or the rootes rather themselves, given to drinke with old wine

doth wonderfully helpe the bitings of any serpents, as also of a mad dogge, and if the roote be sodden with a little salt and laid on the place, it will suddenly ease the patient of the paine: the juice of the leaves taken with honey provoketh urine, and remedieth the paines of the bladder: the seede being drunke with wine forty dayes together doth wonderfully helpe the Sciatica: the leaves being bruised with the white of an egge, and laid on any place burnt with fire, doth take out the fire, giveth sodaine ease, and healeth it up afterwards. the decoction of them fomented on any fretting sore or cancker, stayeth the torroding quality, which after must be annointed with an ointment made with the cold liquor *Aceruga*, niter and vinegar boiled together. The roots may be conserved with Suger and taken fasting, or at other times for the said purposes, and for Consumptions, as also for those that are troubled with the stone or stake: the seede is much commended to breake the stone, and cause it to be expelled by Urine, and is often used with other seedes and things for that purpose: The lesser burre seedes as they saith have a digesting quality in them, and are hot and dry, and thereby good to allwage tumors: the roote of the roote bruised and often imposed on kernels or hard knots in the flesh doth dissolve them: the decoction also of the roores made with wine, helpeth to consume the hardnesse of the spleene, being fomented warme on the place: the burres being gathered before they be ripe, bruised and laid to steepe in warme water or wine, and the haires moistened therewith, after they have beene rubbed with a little niter doth make them yellow.

CHAP. X.

Lapathum. The Docke.

THe Docke is of a large extent comprising within it sundry sorts of herbes: some whereof are to be planted in Gardens, as being rare and worthy plants, and therefore worthy to have some carefull paines bestowed on them, which are entreated of in the second Classis of this Worke: others belong to the Kitchin Garden, as fit for sawce and meate, and such are the sorrels which are called sowre Dockes, spoken of alls before in the sixth Classis of this Worke and some are found in the fields and wet places where they grow, which shall be described in this place. Vnto the same also I might adde all the sorts of Spinage, if I had not set them forth in my former Booke, or were of *Bauhines* minde, that they belonged to the family.

1. *Lapathum acutum maius.* The Red Docke.

The red Docke hath a great and long blackish roote on the outside, and some what reddish and yellowish within, sendeth forth many long broad and narrow with greene leaves, more pointed at the ends then in other sorts, among which riseth up a stiffe hard stalke, three or foure foote high, set with the like leaves, but smaller still upwards,

1. *Lapathum acutum maius.* The Red Docke.

3. *Lapathum acutum minus.* The lesser Red pointed Docke.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

and branched forth into sundry spriggets, bearing small reddish flowers, and brownish triangular seede after them.

2. *Lapathum acutum minus.* Small sharpe pointed Docke.

The roote of this Docke is long and slender, parted diversly with small fibres thereat, and of a yellow colour on the inside, the leaves are narrow and long waved in on the edges, as if they were crumpled, the stalke and flowers, with seede following, is like unto the former, but that they stand not on such long spriggets, but close together, some at the joynts, or compassing the stalkes, and others at the toppes, and of a darker colour.

3. *Lapathum acutum minimum.* The smaller pointed Docke.

This small Docke differeth little from the first, for forme and manner of growing but in the greatnesse, being much smaller and lower, the roote is small and more yellow.

4. *Lapathum sylvestre vulgatius.* The Common wild Docke.

The common Docke that groweth every where, differeth little from the Garden Docke or Patience, but that the leaves hereof are broader and rounder at the points, and the rootes more yellow, and of lesse use then it.

5. *Hippolapathum rotundifolium Africanum.* The round leafed Docke of Africa.

This round Docke is very like in the leaves unto the other round leafed Docke, mentioned in the second Classis before, in this we the rootes are somewhat thicker, the stalke riseth higher, the flower is greenish, and the roote is somewhat round like unto a Turneppe, but yellow both within and without, the whole plant and every part thereof is sweetish in taste at the first tasting, and is therefore not cold as the other Dockes are, but hot in the first degree.

6. *Lapathum rotundum sive horum Hortense.* English Mercury.

I shall needes put this herbe among the Dockes, according as the best Herbarists doe, rather then with the wild *Arraches*, as some others have done, and shew you that it hath divers broad and long thicke fat darke greene leaves, upon long stalkes, pointed at the ends, and double pointed at the bottomes, somewhat like unto Sorrell, the stalkes are many, two foote high, full of leaves, and at the toppes many spikes of greenish flowers, and flat seede after them, the roote is thicke great and long, and yellow like a Docke: the whole plant is often overspread with a mealy dust, like unto *Arrache*, which hath caused divers to referre it to them.

7. *Hydrolapathum majus.* The greater Water Docke.

This great Water Docke groweth very like the common wilde Docke, but greater and higher, with larger and longer leaves, and not so round pointed, the rootes also are shorter, and fuller of fibres, and of a darke red colour within.

8. *Hydrolapathum minus.* The lesser water Docke.

The lesser Water Docke hath lesser leaves, long and narrow, and lower stalkes, fuller of branches, with flowers and seedes like unto the rest of the Dockes, and so are the rootes likewise, but smaller and full of long stringes and fibres.

9. *Lapathum*

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd

Original from UNIVERSITY OF MICHIGAN

9. *Lapathum marinum foetidum.* The ſtrong ſented Sea Docke.

Dorſtenius *Bauhinus* putteth this herbe among the Dockes not knowing belike whereunto elſe to referre it: even ſo would I ſee more of it, and ſay with him that the ſtalke is reddiſh, a foote high and bending divers waies: the leaves that ſtand on long foote-ſtalkes are ſomewhat round, and of a darke red colour, ſometimes waved about the edges, and winged uſually at the bottomes, or with two ſmall peeces like eares: the ſtalke is parted into many branches, with the like but leſſer leaves on them, and a little dented about the edges: at the toppe of the ſtalkes is a tuft of flowers, compoſed of foure mollie leaves a peece, after which follow ſcaled round heads, containing the ſeede.

10. *Lapathum ſanguineum.* Bloud-wort.

This is alſo, becauſe it is often uſed as a pot herbe, ſo planted in Gardens: yet found wild alſo, having reddiſh leaves, of a ſwarthy watered ſtripes, the reſt of the plant comming neereſt unto the red Docke, but ſmaller as is alſo the whole plant reddiſh. *Coſalpinus* mentioneth another ſort hereof, with broader and rounder leaves. *Cordus in Hiſtoria Stirpium.*

The Place and Time.

These Dockes the nine firſt and the tenth, growe in moiſt and wet places on the Land, and thoſe other in ſalt places neere the Sea, that is, *Aſpra* neere *Sophia*, and the other neere *Mompelier*: And beare ſeede in the moneths of *Auguſt* and *September* in their, and ſome earlier.

The Names.

They are called in Greeke λάπαθον ἥμερον, & ἀγρίον, *Lapathum ſativum* in good ſalet herbes, & *pro ventris laxare* uſurpatur, the word is uſed by *Ariſtotle*, *lib. 2. Phyſic. cap. 8.* ſaying, ὁ δὲ λάπαθος ἐπὶ τὸ κάθαρσιν ἀμφοτέρως, id eſt *Lapathia ambobus*, hoc eſt *alvum ſolvere*. *Lapathum* alſo, and *Rumex* in Latine. The firſt is the *Oxylapathum* of *Dioſcorides*, and ſo called of *Fuchſius*, *Matthiolus*, and others, but it is not the *Oxalis*, for *Dioſcorides* doth diſtinguiſh betweene them, the one ſmooth, the other juice, the other from the ſharpe taſte, for *Oxys* is referred both to the taſte and forme. *Cordus* in *Dioſcorides* calleth it *Rumex acutus*, *Tragus*, *Lobel*, and *Dodonæus*, *Lapathum acutum*. The ſecond is called by *Lobel*, *Lapathum acutum folio criſpo*, as *Tabernæmontanus* did, whoſe figure *Gerard* uſed and called it *Hydrolapathum ſanguineum*. The third is ſo called by *Lobel*, as it is in the title. The fourth is called *Rumex egregius* by *Cordus*, *Lapathum folio minus acuto, ex rotundo* by *Lobel*, *Hippolapathum ſylveſtre* by *Tabernæmontanus*, whoſe figure *Gerard* hath called it *Hydrolapathum magnum*. The fifth was brought us out of *Africa* by *Boel*, who for the likeneſſe of the leaves, and ſome other reſpects, called it as it is in the title, which we have continued, not knowing where to place it, untill we have further knowledge of it, then of the dryed plant which he brought. The firſt is uſually called *Rumex Hortenſis* by *Matthiolus*, *Bruntfelſius*, *Tragus* and others, *Rumex criſpus* alſo by *Tragus*, and ſometimes by *Fuchſius*, *Turſa bona* by *Dodonæus* and *Lobel*, and *Lapathi ſylveſtris ſecundum genus* by *Dalechampius* and *Bauhinus*. *Lapathum vulgatius*, by *Geſner Atriplicis ſpecies*, and by *Lonicerus Atriplex Canina ſylveſtris*, *Tabernæmontanus* calleth *Rumex paluſtris*, *Tabernæmontanus Lapathum paluſtre*, *Geſner*, *Matthiolus*, and *Dodonæus*, *Hydrolapathum ſylveſtre*, *Lobel* and *Anglicanis Hydrolapathum magnum aquaticum* or *maius*. The *Engliſh* is called *Hydrolapathum minus* by *Lobel* and *Anglicanis*, and not *ſatiuum* as *Bauhinus* letteth it downe in his *Pinax*. The *Italian* by *Bauhinus* his appellation is called as it is in the title. The laſt is called *Lapathum nigrum* by ſome, and *Sanguineum* by others, *Sanguis draconis herba* by *Geſner in horto*, and *Lapathum ſanguineum* by *Lobel*. The *Engliſh* call the Docke *Dunnock*, and *Hannah*. The *Italians Romice* and *Lapatio*. The *Spaniards Labaſa*, and *Romaza*. The *French Parelle*. The *Germanes Ampffer* for the generall word as *Sauer ampffer* for Sorrell. The *Low Dutch* and *Peerdack*. And we generally Docke, and then adde the ſeverall denominations as ſower Docke for Sorrell, Wilde Docke, Garden Docke, &c. The *Engliſh* Mercury is called by the *Germanes Gooſe Hearick*, and *Lamerſt*. The *Dutch* Garden *Hearick* and *Lammerſt hoye*. The *French Herbe de Charpentier*.

The Vertues.

All the ſorts of Dockes have a kind of cooling but not all alike drying quality, for the Sorrels are more cold then dry of the reſt, and the bloud-wort more drying, but the ſeede of moſt of them is drying and binding: ſome of the Ancients held the Sorrell were uſed to be eaten. *Theophraſtus* therefore put them *inter oleracea*, and for the moſt part the leaves were ſtewed or boyled, and ſo they did the more eaſily paſſe through the belly, without giving it any ſmart or good nourithment, having a moiſture to the body. The ſeede of moſt as I ſaid, ſtaieth of the fluxes of the ſtomacke, doth ſtay lasks and fluxes of all ſorts, and the ſubverſions or loathings of the ſtomacke called cholter, and is as laſt pill to thoſe that ſpit bloud. The roots like wiſe of the moſt of them except the Sorrels or Sharbes and the ſea Docke are drying and binding, conducing to the ſame effects aforeſaid, but of they have a opening quality in them ſo to looſen and make the body ſoluble, and are therfore of greater uſe then all the other parts beſides, opening the obſtructions of the bloud, and cooling and clenſing the bloud, and helping thoſe that have the Iaundice, and for that purpoſe are our *Engliſh*, and Munkes Rubarbe, the Garden and the wild red Docke roots boyled with other things to make drinke, Ale or Beere: the ſeede being taken in wine helpeth the ſtrings of the ſtomacke called *Diaphragma*, and *Pleura*. The roots boyled in vinegar, helpeth the itch, ſcabbes and other breakings out in the bodie, if they be waſhed therewith, the diſtilled water of the herbe and roots tendeth to the ſame effect, and helpeth to extirpate the ſcabbe of freckles, morphewes, and all other ſpots and diſcolourings therein. The *Engliſh* Mercury boyled is called, or good *Henry* the roote is drying and clenſing: the herbe is mollifying and looſening, and the herneſe or moiſt ſlipper neſſe therein taken inwardly, but applyed outwardly in wounded and ſore places, cleanſeth the filthineſſe and healeth and cloſeth them up afterwards wonderfully: The properties of the Rootes and Sorrels are ſeverally declared before in their proper places.

Chap.

Chap. XI.

Raphanus palustris, sive aquaticus. Water Reddish.

THere are two sorts of herbes entituled Water Reddishes, which I must therefore here set together, to shew you which they are.

1. *Raphanus aquaticus.* Water Reddish.

The Water Reddish, creepeth up in the water with slender weake and bending stalkes, greene and red, whereon are set at every joyne a long and somewhat broad leafe, very deeply cutte or gashed in on the edges unto the middle rib, at the toppe of the stalke commeth forth a small tuft of yellowish flowers, made of foure leaves a peece, after which follow small and almost round pods with round seede in, and the roote runneth in the muddy, shooting out fibres in sundry places. I have thought good to give you both the figure hereof, which be such is more exact then that of *Lobel*, and *Lobels* also in his *Icones*. *Lobel* saith, in his life, as both he and I have seene such growing, it seemeth that *Raphanus* his seede of another sort.

2. *Raphanus aquaticus alter.* Another Water Reddish.

This other Water Raddish groweth more upright in that it seldome groweth in ponds of water, as the other doth, but in or neere watery ditches to be a yard high or better, with sundry stalkes rising from a long rough white roote, with divers strings and fibres thereat, whereon are many long leaves, much cutte on the edges both edges, as the toppe of the stalkes stand large tufts of whitish or purplish flowers, which turne into flat pods and seede in them, not so round as the former.

The Place and Time.

The first groweth never but in waters or brookes, or where store of water is continually, the other as well bottomes neere the waters as in small watery ditches sometimes and flower after Midsommer, viz. in August and abiding above a moneth after.

The Names.

The first is called *Raphanus aquaticus* by *Tabermontanus* and *Gerard*, and *Raphanus silvestris* by *Dodonæus*, *Lobel*, (who taketh it may be the *Raphanus* of *Theophrastus*, that is like to Rocket and pale-wort) *Lobel* calleth it *Raphanus sylvestris aquaticorum aquaticus*, and *Dodonæus Radicula Theophrasti*, *Lobel* also *Cardamine Cymbrium Plinij*. The other is the *Raphanum aquaticum* of *Tabermontanus* and *Gerard*, which *Dodonæus* saith

1. *Raphanus aquaticus, Tabitij.*
Tabits Water Reddish.

1. *Raphanus aquaticus Ruellij.*
Water Reddish of *Ruellius*.

Chap. XIII.

Marrubium aquaticum. Water Horehound.

Vnto the Water Horehounds I must adjoyne two or three other plants, neered thereunto both in face and place, which I reserved out from the former Horehounds, to set here.

1. *Marrubium aquaticum vulgare.* Our ordinary Water Horehound.

This Water Horehound groweth somewhat great and high, with strong square stalkes, having two somewhat large and long leaves set at every joynt, somewhat deepely dented about the edges, not hairy or rough at all but smooth and greene: at the joynts with the leaves towards the toppes grow small whitish flowers in rough greene huskes compassing the stalkes about: the seede that followeth is blackish and round, foure usually set together in the huske: the roote is a tuft of blackish strings.

2. *Marrubium aquaticum alterum.* Hairy Marsh Horehound.

This other Water or Marsh Horehound hath square stalkes, but hairy and a little hoary and rough, whereon are set leaves by couples, as in the former, hairy hard and hoary, much more cut in on the edges, even to the ribbe, making them lesser like the leaves of the great Mountaine Scabious, the ends being pointed and hairy: the flowers are white and small, standing in rough sharpe pointed huskes compassing the stalkes as the flowers of the former doth.

3. *Marrubium nigrum fœtidum Bullatæ dictum.* Stinking blacke Horehound.

The stinking blacke Horehound hath divers square blackish hairy greene stalkes arising from the roote whereon are set upon long foote stalkes round darke greene leaves full of veines, a little hairy, and endented about the edges, smelling somewhat strongly two of which are at a joynt: the flowers are gaping and of a purplish colour, not unlike the red dead Nettle, in great rough huskes compassing the stalkes as the others doe, the seede like unto it, but smaller and round, and foure set together usually also: the roote is blackish and threddy. I have found this with white flowers, in the way to Eccles, halfe a mile from *Greenstead*. *Plat. Alb.*

4. *Marrubium nigrum Creticum.* *Candy* blacke Horehound.

This blacke Horehound of *Candy* hath the tall leaves that rise from a stringy roote, somewhat like unto that of a Primrose, being many larger and longer then those of the white Horehound, dented about the edges and not pointed, as big as those of Balme, and of so blacke a colour as it may seeme to be so coloured or dyed by art: and its are both the square stalkes, and rue grassy like leaves but jetted that grow together, at the severall joynts of them, up to the toppes, where the flowers stand compassing them, being in forme like unto those of Horehound, but blackish also, it is wholly to obscure to sight.

4. *Marrubium aquaticum vulgare.* One ordinary Water Horehound.

3. *Marrubium nigrum fœtidum Bullatæ dictum.* Stinking Horehound.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

The Place and Time.

They all grow in moist and wet grounds: the first and second in our owne Country in sundry places. The second in Candy. The last in Candy. They flower in the Summer moneth, and give their seede soone after.

The Names.

The first is called *Marrubium aquaticum* by *Fragus*, *Dodonæus* and *Lugdunensis*, or *Marrubium palustre* by others. *Matthiolus* setteth it for the first *Sideritis* of *Dioscorides*, *Agrestium*, *Creticum*, *Lacunæ*, *Camerarius*, and *Cæsalpinus*. But *Lobelius* and *Lobel* put it for his *Sideritis altera*. *Turner* also calleth it *Lancea Christi*, and *Marrubium sylvestre alterum*, as he doth the second *Marrubium sylvestre*. The third is called in Greeke by *Dioscorides* *Ballota*, and *Marrubium nigrum* in Latine. Most writers doe call it, yet some call it *Marrubium fœtidum*: *Lobel Auth.* and *Bauhinus* *Marrubium nigrum fœtidum*, and *Ballote*. The last is so called of *Matthiolus*, who saith that the seede was sent him from Candy by the name of *Marrubium nigrum*.

The Vertues.

We know not the vertues of the blacke Horehound, for there is no use of it known in Physicke, that we know it is of a sharpe and biting taste, and being applyed with salt, doth heale the scabs of dogges, as *Dioscorides* before him did set it downe. The same beaten under the ashes until they grow yellow, and applyed to the hard swellings of the fundament that come long since unto the Hemorrhoides, doe stay the bleeding of the same, and being used with hony they cleanse filthy sores.

4. *Marrubium nigrum Creticum.* Candy blacke Horehound.

Chap. XIV.

Stachys palustris. Marsh base Horehound.

It hath square round and hairy stalkes, about two foote high, with two somewhat long and narrow darke greene leaves, and grey underneath, pointed at the ende, and dented about the edges, with round dents like Betony, set at every joynt, and somewhat a strong naked space betweene the upper joynts, with the leaves come forth whorles of pale reddish flowers, set in rankes like unto Betony. The roote is somewhat long and thicke, joynted at severall joynts with fibres at them.

Stachys palustris.
Marsh base Horehound.

The Place and Time.

It groweth in the plashy places, of low grounds, in sundry Countries and flowreth in *July*.

The Names.

Dioscorides calleth it *Stachys palustris Galeni*, but *Gesner* in his *Collectanea Stirpium*, calleth it *Betonica fœtida*, and questioneth whether it should not be the *Herba Sideritis Lugdunensis* saith it is *Cynocrambe minor*, *Dalechampius* and *Tabernæmontanus* call it *Sideritis prima graveolens*, *Matthiolus Tragium*, because it cureth a certain ague, *Besler* *Herba Sancti Eystettensis*, saith it was called with us *Cynocrambe vulgaris minor*, and *Gerard Marrubium Creticum nigrum*, yet it is not his *Prasium Galeni*, which we would make, which is more of so strong a scent as the leafe of this is long, our roote to *Stachys*.

The Vertues.

It is thought a good wound herbe, serving both to heale green wounds, and foule and filthy sores, the juyce taken in wine drunke an houre before the fit of an ague, will lessen and ease the fit, and at two or three times taking, quite it away.

CHAP. XV.

Conyza palustris major. The greater Marsh or water Fleabane.

THe roote hereof is thicke and diverslie spread, sending forth hollow and creeked stalkes three foote high with sundry joynts and branches, bearing two long leaves at each joynt, which are dented about the edges, greene on the upper side, and gray or woolly underneath, at the toppes of the stalkes and branches stand many small yellow flowers together, like unto those of Ragwort, which when they are ripe the seede flyeth away with the winde.

Conyza palustris. Marsh Fleabane.

Minor aquatica. There is another smaller and lower then this, growing in the like watery places, the leaves will be sometimes much lesse dented or jagged on the edges then in others, the flowers likewise stand not but one on a stalke for the most part and yellow.

The Place and Time.

The place is declared by the titles and description, and their time of flowring and seeding is the end of Summer.

The Names.

The former is the *Conyza aquatica* of *Gesner in horto*, *Conyza maxima serrati folia* of *Thalius*: *Lingua major Dalechamps* of *Lugdunensis*, called *Consolida palustris* by *Tabermontanus*, and *Solidago Saracenica* by *Gerard*, according to his figure, but not description. The other is called *Conyza aquatica* both by *Thalius* and *Bauhinus*, and that which hath more jagged leaves may be also the *Conyza Helenitis folijs lacinatis* of *Lobel*.

The Vertues.

This is as effectuall a wound herbe as any is used, and is also as available to all the purposes that the other *Conyza's* are applyed, whereunto I referre you for brevities sake.

CHAP. XVI.

Oenanthe aquatica. Water Dropwort.

THere are two sorts of this Water Dropwort, a greater and a lesser, both which are exhibited by *Lobel* in his *Icones*, under one title as one would thinke, but did misguide the one by *Oenanthe aquatica*, which is the lesser. the other which is the greater, by *Oenanthe quarta*. As also he confounded in his Observations, both titles being referred to one. Which confusion I would resolve, and shew you them both distinctly. The greater hath diverse large spread leaves next the ground, and lying thereon set into many divisions, some what resembling Parsley, or rather smaller, among which rise creeked thicke hollow stalkes, with leaves on them, cut into longer and finer divisions, bearing white flowers at the toppe, which turne into close umbels of small flat grayish seede, somewhat like unto Fennell seede, the roote hath sundry small white knobs growing among the fibres.

2. *Oenanthe aquatica minor.* The lesser Water Dropwort.

The lesser hath very finely cut small leaves lying on the ground before the stalke begineth to rise, which when being carryed up with it scarse seeme to be leaves but rather like the ribbes of leaves, of a darke and dusking greene colour, as the stalke is also, which resembleth a Rush very nearely, and below the toppe thereof, which is somewhat creeked like a Rush, (and not at the toppe as the figure expresseth it) it sendeth forth a small umbell of small white sweete flowers, which turne afterward into as small seede as Smallage but blacker, the roote hath many small kernels among the fibres, which are as small as haires or finer.

3 *Oenanthe altera minor Africana.* The small Water Dropwort of *Barbary*.

This other lesser sort being brought us by *Bocl* from *Barbary* doth most neerly resemble the last (small sorte the one

Chap. XVII.

Limonium. Sea Marsh Bugloſſe.

WE have divers ſorts of this *Limonium* to ſhew you, ſome whereof have beene ſet forth by former Authours, and ſome by none other before now.

1. *Limonium maius vulgare.* The greater ordinary Sea Marſh Bugloſſe.

This greater *Limonium* hath ſundry faire long thicke or fat greene leaves, riſing from the roote, ſomewhat like unto ſmall Beete leaves, from among which ſpring divers ſtraite naked ſtalkes without leaves, neere halfe a yard high, branched at the toppes into ſundry parts, whereon ſtand many ſmall blewiſh purple flowers, all on one ſide for the moſt part, ſomewhat like unto Bugloſſe flowers, but ſmaller, after which come long reddiſh ſeede incloſed in the huſkes, that the flowers ſtood in before: the roote is long & hard, and long like unto a ſmall red Beete roote.

2. *Limonium mediocre Anglicum.* The *Colcheſter* Marſh Bugloſſe.

This other ſort is like unto the former, but leſſe in leaves, and lower in ſtalkes, being little more then a foote high, the flowers are of the ſame colour with it, and almoſt as great, but the ſeare brane is much leſſe.

3. *Limonium Narbonenſe parvum.* The ſmall *French* Marſh Bugloſſe.

This ſmall *French* ſort hath much ſmaller leaves then the laſt, being little bigger then Graſſe leaves, lying neere to the ground, but thoſe on the ſtalkes, which are about a foote high, are very ſmall and fine like unto ſtraw or hay pipe, the flowers are ſmaller then the other, but elſe like unto them both for forme and colour.

4. *Limonium minus folio cordato.* The ſmall Marſh Bugloſſe of *Mompelier.*

This ſmall *Limonium* likewiſe differeth little from the laſt, but in growing lower, not above ſix inches high at the moſt, having a tuft of ſmall thicke ſmooth, and ſomewhat round leaves neere the ground, ſome of them having one pointed at all, and others having a deepe at the end, making them ſeeme like the forme of a harte, as is painted on the cardes. the ſtalkes are ſome higher and lower then others, bare or without leaves unto the toppe, where they ſpread into ſundry ſmall branches, bending a little backwardes, bearing a number of ſmall reddiſh flowers.

5. *Limonium minimum.* The ſmalleſt Sea Marſh Bugloſſe.

This leaſt *Limonium*, is ſcarſe foure inches high, having from a ſmall long reddiſh roote parted at the toppe into ſundry heads, a number of ſmall fat roundiſh leaves thicke ſet together, in forme and manner of a ſmall houſeleeke, the flowers are few and ſmall that grow on the ſmall ſtalke, of a fine reddiſh blew colour.

6. *Limonium Africum.* Sea marſh Bugloſſe of *Affrica.*

Of this ſort there are two or three differences, one low, ſcarſe an handbredth high, whoſe ſtalke is winged, like

1. *Limonium latifolium vulgatius.*
The greater ordinary Sea Marſh Bugloſſe.

1. *Limonium Narbonenſe parvum.*
The ſmall *French* Marſh Bugloſſe.

unto

of that of *Ranwolfius*, having leaves on one part, and late at another, which leaves are not long, or indented like it, but somewhat round and a little waved as it were on the edges. The other sort groweth halfe a yard high, with the like winged stalkes, full of branches which are hard rough and wooddish and the like leaves on them, as this other lesser sort hath, the flowers of both sorts are of a pale blew colour like unto that of *Ranwolfius*. Both these sorts we had from *Rydley* as formerly mentioned, taken from the sight of the dryed herbes: but we received from him at *Leftborne*, the seedes of two other sorts which were intituled *Lychnitis Caryophyllo folio*, and *Lysimachia Ferulæ folio*, but because neither of them sprung with us, we can as yet say no more of them.

7. *Linonia congener Clusii.*

The hollow leafed strange plant of *Clusius*.

This strange plant hath such strange leaves, as the like are to none knew to any other that we know growing, for they are one or two more, rising from the head of a small long stalke each by it selfe being small below, and growing greater upward, with a belly as it were bunching forth, and a hollow place, broad on the upper end, with a peece thereon like a tongue, and like unto the flower of *Aristolochia*, or Birthwort, and become as the mouth like a halfe circle, full of great veines, with veines on the inside: the whole stalke is of a darke tawny colour almost like unto leather, among these leaves springs a stalke but was broken short off, so that the flower or seed it bore could not be observed. This was sent to *Clusius* from *Paris*, by one that received it from *Chaine* in the same manner. But of late Master *John Tradescant* the younger, found this very plant in *Barbary* growing out of the rocks thereon, which he brought home and groweth with him, which I here shew you with *Clusius* figure. The leaves are longer narrower and not bellying out, and the flower is borne at the top of the rounder stalke well.

The Place and Time.

All these sorts grow in the wet fields neere the Sea, found as our owne land, as the first and second, the other sorts grow them in *France* about *Mompelier*, and *Marselles*, and *Ligorne* also, the first *African* kinde, and the other long thereof, were brought us by *Bocl* often before remembred, from that part of *Africa* that the *Spaniards* doe

hold about *Sophia*, and those parts, but the other two sorts there mentioned, hee gathered in Portugall. The last came assured from the West Indies, for so it was signified by him that sent it, but as I have shewed you in *Virginia* also. The first flower in the end of Summer, and their seede ripeneth not long after.

The Names.

It is taken to be the [illegible] of *Dioscorides*, in Greeke so called because it groweth [illegible] and *Limonium* also in Latine. The first is most frequent as well beyond Sea, as on our owne coasts, and these roots being dryed were sold in former times by counterfeiters, for *Rhubarbum* to the Apothecaries, as *Cordus* and *Gesner in hortis* say. *Dodonæus* calleth it *Valeriana rubra similis*, all other Authors call it *Limonium*. The second is of our owne Land found out by Doctor *Lobel*, in the fields neere the Sea by Colchester, and as *Lobel* saith, may be the same he found about *Valentia* in *Spaine*. The third is the *Limonium peregrinum Narbonense* of *Lobel*, *Lugdunense*, and *Lugdunense*. The fourth and fifth, are set forth by *Dodonæus* onely in his *Pemptades* and *Prodromus*. The sixth of both sorts were never published before by any. The last is as before said, remembred by *Clusius* in his History of Plants, and I have here amplified it: But it seemeth to meane *Lobels Thuris Limpidi folium* is this, The *Limonium peregrinum Lugdunense*, I have shewed you in my former Booke, yet I thinke good to give you the figure thereof here with the rest. *Plinie* referreth the *Limonium* unto the Beetes and calleth it a wilde Beete, but *Galen* saith there is no wild sort of the Beete. *Gerarde* called it in *English* Sea Lavender, but without any other good ground then that the colour of the flowers is somewhat neere those of Lavender. I have therefore as you see altered the title unto a more proper name as I take it, being in forme and colour most like unto Buglosse.

The Vertues.

The seede of *Limonium* as *Dioscorides* and *Galen* say, is astringent, and so is this *Limonium*, and stayeth the fluxe of the belly and the stomacke, the spitting of blood like wise, and the abundance of women's courses, the leaves are astringent also, and are good for burning by fire: the water wherein the roots have been sodden, doth take away the spots in garments as also in parchment.

CHAP. XVIII.

Anagallis aquatica. Water Pimpernell.

THere are divers sorts of this Water Pimpernell to shew you here, for of the Land sorts I have entreated in the fifth Classis of this Worke.

1. *Anagallis aquatica sive Becabunga.* Brookelime.

Brookelime sendeth forth from a creeping roote that shooteth forth fibres at every joynt, as it runs

2. *Anagallis aquatica vulgaris sive Becabunga.* Brookelime.

and sundry greene stalkes, round and sappy with some branches on them, somewhat broad, round, and fleshy and thicke leaves set by couples thereon, from the bosome whereof shoote forth long foote-stalkes bearing small blew flowers on them, like in forme unto the land Pimpernels, that consist of five small round leaves a peece.

2. *Anagallis aquatica sive Bacchumga major.* The greater Brooke-lime.

It differeth in nothing from the former, but in having larger and rounder leaves, and in the flowers which are pale blew colour.

3. *Anagallis aquatica folio longo crenato.* Great Water Pimpernell.

There is but little other difference in this sort from the former, but in the leafe which is longer pointed, and notched about the edges, and in the flowers, which are of a pale whitish blew colour. There is one alite or tiny *Minor*, differing in it, wherein consisteth the difference.

4. *Anagallis aquatica prima pulegii.* Small round leafed Water Pimpernell.

The leaves of this Water Pimpernell are small and round, like almost unto Pennyroyall, two alwayes at a joyne, upon stalkes, which are foure square, and beare blew flowers like the land Pimpernell: the white roote is small and round like the former.

5. *Anagallis aquatica tertia Lobelij folio subrotundo non crenato. Lobels* third Water Pimpernell.

The roote of this Water Pimpernell runneth not, but is a small bush of white fibres, from whence spring many pale greene leaves, small at the bottomes, and broad and round at the ends, the stalke is round about a foote and a halfe high, with divers smaller leaves thereon, set one by one up to the toppe, where breake forth many small spikes of white flowers.

6. *Anagallis aquatica angustifolia sive quarta Lobelij.* Long Chickweed leafed Water Pimpernell.

This small Water Pimpernell riseth not above halfe a foote high, with divers branches spreading from the rootie stalke, having two small leaves at a joynt some what like unto the greater Chickweede, but somewhat longer; the flowers are white, made of foure leaves a peece, standing on long foote-stalkes like the fruit-stalkes of small seede in round heads after them.

7. *Anagallis aquatica angustifolia tenuifolia.* Narrow leafed Water Pimpernell.

The roote of this Water Pimpernell is reddish, hairie, and creeping, the stalkes are smooth straked, jointed, and reddish, having two very narrow and long leaves at every joynt, pointed at the ends without any stalke unto them, at every joynt also with the leaves come forth small upright branches, winding themselves one with-in another, as they had clasped from whence spring smaller foote-stalkes on both sides, which sustaine small white flowers like unto Chickeweede, consisting of three leaves a peece, after which succeede small flat seede-pods like a shield, that is, two set together with a thred betweene them, on both sides whereof lie the seed.

7. *Anagallis aquatica tertia Lobelij.*
Anagallis aquatica non crenata.
Lobels third Water Pimpernell.

6. *Anagallis Aquatica angustifolia sive quarta Lobelij.*
Long Chickweed leafed Water Pimpernell.

Original from UNIVERSITY OF MICHIGAN

The Place and Time.

All these grow in small standing waters, the three first, and the fifth often found in our owne Land, the fourth and the last in *Germany*. The sixth by *Antwerpe*. And flower in *June* and *July* most usually, giving seede one moneth after.

The Names.

It is called in Greeke Ἀγγελικὴ λεπτόφυλλος, in Latine *Angelica aquatica*. The first is commonly called *Rauhenga*, from the *Germane* word *Rauhpunghen*, as is also all with them to frame Latine words from their owne appellations. *Anguillara*, *Brunfelsius*, *Ruellius*, *Cordus*, *Fuchsius*, and others, tooke it to be *Sium* of *Dioscorides*, but very erroniously: and thereupon *Tragus* and *Gesner* call it *Sium non odoratum*, *Turner*, *Dodonæus*, and *Lugdunenses* take it to be his *Cressa*, but generally now adaies called *Angelica aquatica*. and to *Lobel Dalechamp*, and others doe. yet *Tabermontanus* and *Bauhinus* call it *minor*, because he calleth the next *major*, and *Pholium folio maximo*. The third is called *Beccabunga major* by *Tabermontanus*, and by *Bauhinus Anagallis aquatica major folio oblongo*, as he doth the fifth of this kinde *minor*. The fourth is called by *Tragus Sium alterum*, and *Anagallis aquatica*, and by *Bauhinus Anagallis aquatica folijs pulegij*. The fifth and sixth is called by *Lobel Anagallis tertia & quarta*, *Dodonæus* did doubtfully thinke of the fifth, taking it one while to be *Alisma* of *Dioscorides*, and another while to be *Cardamine*, but neither truely. Some also tooke it to be *Sanicula* of *Plinie*, *lib.* 27. *cap.* 8. and *Bauhinus* calleth it *Anagallis aquatica folio rotundo non crenato*, but some of the others before have rounder leaves. The last is called by him as it is in the title. The *Italians* call it *Sorgo fresso*. The *French Birle*, from whence rose *Berula*, yet *Marcellus* saith that *Berula* is the *Greeke* Βήρειον, Cresses. The *Germanes* as is said *Rauchpunghen*, and *Wasserpungen*, or *Bungen* as *Tragus* hath it. The *Dutch Water punghen* and *Beckpunghen*. And we in *English* Brookelime usually for the first, and Water Pimpernell for the last following.

The Vertues.

Tragus saith, that Brookelime and Water Pimpernell, are both of a moist faculty, yet others say dry, being of lesse heating then Water Cresses, and are used both in meate and medicine, as Water Cresses are, yet weaker: Brookelime and Water Cresses are generally used together, much in diet Beeres and Ales, with other things serving to purge and cleanse the blood and body from those peccant humours, that would overthrow the health thereof, and the Scurvy also, for which they are very helpefull: they also helpe to breake the stone, and passe it away by urine, which it provoketh also being stopped: it helpeth likewise to procure womens courses, and to expell the dead birth, being dryed with bitter and vineger, and applyed warme, it helpeth all manner of tumours and swellings and Saint *Anthonyes* fire also if it be often renewed. Farryers doe much use it about their horses, to take away swellings, to heale the scab, and other the like diseases in them.

CHAP. XIX.

Nasturtium aquaticum. Water Cresses.

I Doe distinguish betweene *Sium* and *Nasturtium aquaticum*, as *Bauhinus* and *Gesner* in hortis doe, holding them to be differing kindes of plants and not *species eiusdem generis*, and therefore entreate of them in severall places, as I also must doe in severall Chapters, and speake of those sorts, that for their likenesse unto *Cardamine* Cresses may be called Κάρδαμον ὑδατικὸν, *Cardamine aquatica*, *Nasturtium aquaticum*: for of the *Cardamines*, which are Field Cresses, I have entreated in the seventh Chapter of this Worke, one of whose figures I give you here to shew their difference.

1. *Nasturtium aquaticum vulgare.* Common Water Cresses.

Our ordinary Water Cresses spreadeth forth with many weake hollow large stalkes, creeping downe at the joynts and upward long winged leaves, made of sundry broad tappy and almost round leaves, of a browne greene colour, the flowers are many and white, standing on long footed stalkes, after which come small yellow seed contained in small long pods like hornes, the whole plant abideth greene in the Winter, and taketh somewhat her and shape like Cresses.

2. *Nasturtium aquaticum Italicum*, Italian water Cresses.

This differeth little from the former, but in that the stalke is crested, the leaves are cut in a little here and there on the edges and dented, somewhat resembling Parsley leaves, and in the taste of both herbe and seede, more mild and pleasant, the roote likewise creepeth not as the others.

3. *Nasturtium aquaticum amarum.* Bitter Water Cresses.

This sort groweth greater then the first, with longer and more pointed leaves, which groweth upon stalkes, for the first leaves are very large and round, little differing else from the former, but in the same bitter taste none can away with it to eate it, unlesse it be boyled in water, and shifted againe into other fresh broths or water, to take away the bitternesse, and so some doe eate it: this is often found growing in *Germany* as *Thalius* saith, with the former, and knowne asunder by the greatnesse.

4. *Nasturtium aquaticum minus.* Sweete smelling Water Cresses.

This small Water Cresse hath a small long white roote, with some fibres thereat, from whence spring divers winged leaves made of many much smaller then the former, and somewhat hoare with the smallnesse, having reasonable well set the stalkes have divers white flowers upon them like unto the *Cardamine*, but smaller by much, the seedes are like in such slender pods and of the same taste.

The Place and Time.

All these grow in the small standing waters for the most part, yet sometimes in small creekes of running water: they flower and seede in the beginning of Summer.

The Names.

The first is generally taken to be the *Sisymbrium alterum* of *Dioscorides*, which as he saith, some called *Sium*, and others *Cardamine*, being so like in taste thereunto, *Matthiolus*, *Cæsalpinus*, and *Thalius* name it *Sisymbrium aquaticum*.

aquaticus Cordi, Veslingi and *Thalius Sisymbrium alterum, Fuchsius* and *Lugdunensis Sisymbrium Cardamine, Dodonæus* called it *Sium* and *Lauri, Gesnerus Cardus Cressæ Lauri odoratus*, and *Lobel Sium Creticum, Lauri folium*, *Anguillare* tooke it to be *Urticularia*, and *Tragus, Lonicerus, Dodonæus* and *Real* call it *Nasturtium aquaticum*, the second *Matthiolus* calleth *Sium vulgare*, which the *Italians* as he saith, call *Crescione*. *Lobel* and *Lugdunensis* call it *Sium Matthioli & Italorum*, and *Raulinus Nasturtium aquaticum crassum folio longiore*. The third *Pauline* remembreth in his *Florentia illust.* by the name of *Sisymbrij alterius species secunda*, and *Raulinus Nasturtium aquaticum minus & tenuius*. The last is called by *Lonicerus* in his Epitome of *Matthiolus* *Sisymbrium aquaticum minus tenuifolium*, and by *Lugdunensis Cardamine quarta Dalechampi*. The *Italians* as is beforesaid call it *Crescione*, the *French Cresson de eau*, the *Germanes Brunkersse*, the *Dutch Waterkerse*, and we in *English* Water Cresses.

The Vertues.

The Water Cresses are hotter in taste then Brookelime, and more powerfull against the Scurvy, and to clense the blood and humours, and for all the other uses whereunto Brookelime is before said to be available, as to breed the stone, to provoke urine and womens courses: the decoction thereof is said to be good to wash sore and surely Vlcers thereby to clense them and make them the fitter to heale: The leaves or the juice is good to be applyed to the face or other parts troubled with freckles, pimples, spots or the like at night, and also washed well away in the morning, the juice mixed with vinegar, and the forepart of the head bathed therewith is very good for those that are dull and drowsie, or have the Lethargy.

CHAP. XX.

Sium sive Pastinaca aquatica, Water Parsnep.

DIvers Writers have made divers sorts of herbes to suite with the *Sium* of *Dioscorides*, some whereof I have shewed you in the Chapter before, the other that are held by the most judicious to be the most and neerest thereunto shall follow in this.

1. *Sium Dioscoridis sive Pastinaca aquatica major*. The greater Water Parsnep.

This greater sort riseth up with great hollow and crested stalkes, two or three cubits high, parted into divers branches, whereon stand long wings of leaves made of many long and somewhat broad leaves, pointed at the ends and dented about the edges, smooth, thicke and sappy, every one whereof is as large as ones finger, the flowers are white and stand in tufts or umbels, after which follow the seede which smelleth well, and is bigger and rounder then Aniseede, the roote is blacke with many fibres at the joints thereof, and of the stalke under the Water neere the ground, the whole herbe is somewhat of a strong sweete sent.

2. *Sium minus sive Pastinaca aquatica minor*. The lesser Water Parsnep.

The lesser sort is very like the former, but lower and lesser, the leaves being long and narrow, and dented also

1. *Sium Dioscoridis sive Pastinaca aquatica major.*
The greater water Parsnepp.

2. *Sium minus sive Pastinaca aquatica minor.*
The lesser water Parsnepp.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

1. Sium minus alterum.
Another small water Parsnippe.

2. Sium majus alterum angustifolium.
Another greater Parsnippe with narrow leaves.

3. Sium minimum. Nasturtium aquaticum dictum sive, Impatiens: Nasturtij folijs folia.
The Quicke or Impatient Cresse.

Alterum minus.

some the edges, the flowers are white and the seede small like to former, the roote likewise is very fibrous, and both it and the leaves smelling strong like *Petroleum*. There is another of this a lesser then it, whose white flowers stand in rounder tufts then the others.

2. *Sium majus alterum angustifolium.*
Another Water Parsnep with narrow leaves.

The stalkes of this Water Parsnep are hollow like Hemlocke, a cubit or more high, whereon are set sundry winged leaves like the former, but divided into smaller leaves, and closer set together, each of them being dented about the edges, the flowers at the toppes of the branches, are of a pale yellowish greene colour, which turne into small seede like unto Parsley, but tasting like Common or Candy Daucus seede, and the Citron rinde a rather somewhat better then they all, the roote consisteth of a number of slender white browne fibres, wrapped among them fast fastened strongly in the mudde.

3. *Sium minimum. Nasturtium aquaticum dictum sive Impatiens Nasturtij folijs folia.*
The Quicke or Impatient Cresse.

This small plant spreadeth at the first upon the ground many small winged leaves, each about an inch long, which so soone as they have gotten roote, it springeth up all the Winter, and in the Spring growing somewhat bigger, hath the leaves a little dented about the edges, the end leafe for the most part being the biggest, and then rising up with a slender stalke, hath sundry leaves set at the middle thereof to the toppe, at whose ends grow very small white flowers with slender long pointels, and small yellowish seede within them, which ripeneth shortly, but is hard to be gathered, and impatient of touching, that the pod presently casteth it selfe upon the least touch of hand or any thing else, and the seed flyeth out presently with noise or no token of heate to it. Mr. *George Bonde*, A Gentleman of excellent knowledge in Herbarisme, gave me a kinde of another sort hereof, as he saith, which he had from another skillfull Gentleman a friend of his, but as I have not yet seene the same thereof, I can passe no further verdict thereon.

The

The Place and Time.

The first as it is thought groweth not with us unlesse the great one make the difference, but in *Germany*; the second which is very like it groweth in *Kent* in divers pooles, and watery ditches. The third neere *Antwerp* as *Lobel* saith that hath beene found in our Land also. The last likewise in our owne Land. They all doe flower in the end of Summer, and seede before the end of *August*.

The Names.

It is called *Sium* in Greeke, so called *Σιὸν ἀπὸ τοῦ σιαίνειν, ἀσκεπτεῖσθαι ἀπὸ τοῦ σιαίνειν ἀσκεπτεῖσθαι, περιττὸν ἀσκεπτεῖσθαι ἀπὸ τοῦ σιαίνειν ἀσκεπτεῖσθαι,

Chap. XXII.

Mentha aquatica. Water Mintes.

Having shewed you all the sorts of sweete Mintes, that grow in the dryer or Vpland grounds, there remaine yet two other sorts, that grow in Marshes, and wet places, which shall bee shewed here.

1. *Mentha aquatica rubra.* The Red Water Mint.

This Water Mint riseth vp from a creeping roote, running or spreading in the Muddy or watery places, with many brownish square stalkes, branched about from every joynt, with a couple of broad, yet pointed and dented leaves, many times brownish or reddish, and of a strong taste: the small flowers purplish, stand at the toppes of the stalkes in rundles, or bunches round about one above another.

1. *Mentha aquatica rubra.*
Red Water Mint.

2. *Mentha aquatica flore palustris minor.*
The lesser Water Mint.

This other Water Mint shooteth forth a square reddish hairy stalke, and sometimes a little hoary, about a foote high, whereupon are set soft hairy round and some what long leaves, two alwaies at a joynt, dented about the edges, of a dark greene colour on the vpperside, and grayish or hoary underneath: from the joynts with the leaves come forth unbranched stalkes with purplish flowers at the toppes of them, standing in round bunches: the whole herbe is of a strong taste.

The Place and Time.

They both grow by ditches and waterside, in the plashy grounds, where they joy best, and flower late in the Summer.

The Names.

The Greeke name Σισύμβριον, which *Dioscorides* mentioneth, and many doe call this by, doth more properly belong to the wild Mint *Mentastrum*, then unto this here: *Lobel* and others call it *Sisymbria Mentha*, for *Dioscorides* hath but one *Sisymbrium*, that is sweete and like Mint, and that he saith groweth in waste grounds, the other *Sisymbrium* called *Sium*, and *Cardamine*, and like *Nasturtium*, as he saith groweth in watery places as I have sayd before, so that as I said his *Sisymbria Mentha*, is no watery or Marsh plant: it hath beene and yet is beyond Sea called by some Apothecaries, *Balsamita*, as *Tragus* saith: and by others *Balsamita* as *Besler in horto Eystetensi* saith: But that last here set downe, is that which *Lobel* calleth *Aquatica Sisymbria Mentha*, and *Gesner in horto Sisymbrium aquaticum*, and *Columna Mentha aquatica*, *Matthiolus* and *Lugdunensis Sisymbrium sylvestre*, and *Sisymbrium* by many others. The other *Lugdunensis* onely acknowledgeth for the name of *Mentha rotundifolia palustris minor*.

The Vertues.

There is little set downe concerning these Water Mints, of anie other speciall properties, they hold from the rest: the More being seldomer used, because there are so many of the other sorts of Mints to be had almost at hand everywhere, yet their strong sweete scent, and quicke taste, doe argue them to be of vertue for many of the purposes before vnto the other Mintes doe serve, especially to kill the wormes, to warme and strengthen the stomacke, to expell winde and helpe those that are spleneticke.

Chap. XXIII.

Dracunculus aquaticus. Water Dragons.

Besides that Water Dragons that many Authours have written of, *Ruellius* hath given us the knowledge of another from *Bauhin*, which for the likenesse he referreth vnto the greater Dragons, but I have thought good to make mention of it in this place.

1. *Dracunculus minor aquaticus.* Our Water Dragons.

This hath a creeping roote full of joynts and fibres at every one shooting forth sundry long sheathes or leaves, with each a smooth long hollow stalke five or six inches high, with broad round leaves set on them, but the lowest bigger then the leaves by much, and of a shimmy greene colour, from among them also rise two or three smooth hollow stalkes of the same height with the leaves or not much higher, bearing at the toppe a spadix, with a rough long head encompassed with many short white threds, which are as the flowers, and with a sheath like a like leafe as the rest are, but lesse and white on the inside, enclosing the head before it breake open, which

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

which when it goweth toward ripenesse, becommeth cluster fashion like the seede head of *Arum* Wake Robin, greene at the first and red when it is ripe, containing divers huskes, with small and long browne seede therein: the taste of the leaves and stalkes, are very sharpe, hot, and burning the throate like *Arum* or Wake Robin, but not so fell at the first chawing.

2. *Dracunculus sive Serpentaria Brasiliana triphylla*
The three leafed Dragons of *Brasill*.

The stalk only of this Dragons with the leafe and flower on it, as *Bauhinus* saith was brought unto him, and therefore we can describe unto you no more, then that from a stalke that is reddish and creeled, riseth the stalke of the leafe which is of an handbredth long, and smooth, at the top wherof groweth a thin leafe of a whitish green colour, full of veines, and somewhat round, divided into three parts, ending in a sharpe point, the lower parts having each of them an hollownesse at the bottome of them, of two inches and a halfe wide apeece, and above foure inches long, the flower that stood on a three inch stalke was also like unto the greater Dragons, being five inches long, and an inch and a halfe broad, of a darke reddish colour, and striped with many white veines running through the middle, especially on the outside, having also a blackish long pestle in the middle, and twy forked at the end.

The Place and Time.

The first groweth in ponds, and lakes of standing waters, but never out of it, and not in any place that I can here of in our Land, flowring in *July*, the berries being ripe in the beginning of *September*.

The Names.

It is called by almost all Writers of Herbes, *Dracunculus palustris, or aquaticus*, yet *Lobel Aspasia aquatica*, and *Fuchsius Hydrosaspes fuscus*, differ in barke *Arum palustre*, and in *Plinie* his third *Dracontium*, with a joynted Reede like roote, having as many lower growing thereon as it is yeares old. and thereon *Bauhinus* calleth it *Dracunculus palustris sive arundinacea radice*. The other is named of *Bauhinus Serpentaria triphylla Brasiliana*. The Germanes call it *Wasser schlangenkraut*, and the Dutch *Water slangen cruyt*, and We Water Dragons.

1. *Dracunculus minor aquaticus*, Our Water Dragon.

The Vertues.

It is thought to have the same property that *Arum* hath, but yet lesse effectuall to any purpose.

CHAP. XXIV.

Plantago aquatica, Water Plantaine.

THere are three or foure sorts of Water Plantaine to be declared, some greater and others lesser.

1. *Plantago aquatica major*, The greater Water Plantaine.

The greater Water Plantaine shooteth forth sundry long thicke greene hollow stalkes, with large long greene leaves on them with some shew of ribbes in them, like unto Plantane, but are much greener, fairer, and longer, and with sharper ends from among which rise up divers tall three square pointy stalkes, parted into divers branches at the toppes, whereon stand a number of white flowers, composed of three leaves apeece, after which follow three square small greene heads, containing the seede: the roote consisteth of a great bush of many long fibres set together.

2. *Plantago minor aquatica*, The lesser Water Plantane.

The lesser Water Plantane hath sundry long leaves rising from the roote, five times smaller and narrower then the former, from among which rise divers bare stalkes a foote high, bearing a tuft of many bluish coloured flowers, made of three leaves a peece like the former, each standing on a long footestalke, and all rising from one head like an umbell, after which follow rough heads like unto those of the Crowfoote: the roote consisteth of many small white fibres.

3. *Plantago aquatica minor muricata*, The lesser Barre Water Plantane.

The Barre Water Plantane, hath divers small and long leaves, like those of the Ribbe wort Plantane, but much smaller, and turning themselves backewards: the slender naked stalkes which are halfe a foote high or more, beare at their toppes thicke set small tufts of white three leafed flowers, and after them prickly heads, standing full with seeds like unto a Barre, wherein lye the seede: the roote is a bush of long white fibres.

4. *Plantago aquatica minima Clusij*, The least Water Plantane.

This least Plantane spreadeth it selfe wholly upon the ground, bringing forth sundry small long and narrow leaves, standing on very slender footestalkes, among which came many slender stalkes lying downe on the ground, being not much above an inch long, and ending in a small head, which sending forth small fibres comprehendeth and

Original from UNIVERSITY OF MICHIGAN

2. *Plantago aquatica minor.* The lesser water Plantane.

1. *Plantago aquatica maior.* The greater water Plantane.

the ground againe, shooting forth other smaller leaves, among which spring five or six round buttons, that no flowers were observed standing on very fine stalkes, upon two parts, shewing small seede within them: from among these round buttons grow also other rowes or courses of small leaves, shooting forth other smaller leaves and buttons then the former, the roots are nothing else but very fine small threds.

The Place and Time.

They doe grow in many ditches, plashes and ponds of water. The first almost every where through the Land. The lesser also in divers the like places within this, for Lobel saith, Doctor Penny shewed it unto him. The first is commonly found in the ditches on the left hand of the High way from Hallowey to Highgate. The last hath not yet been noted where it grows.

The Names.

Most of our later Herbarists doe call it *Plantago aquatica, Fistula pastoris & Herba Stellaria*, although Tragus, Lobel, and divers others found it little to agree to, or resemble any Plantane, Cordus on *Dioscorides* assuredly meant

meant this by his *Potamogeiton*, although *Bauhinus* doubteth whether he meant not *Dioscorides Alisma* or *Damasonion* which is more likely to be *Hekeborine*, *Anguillara* tooke it to be *Limonium*, as *Bauhinus* noteth it, but Master *Johnson* in his *Gerard* from him, commenting thereon very seriously both on the foresaid Greeke names given to *Limonium*, as *Dioscorides* his text, and the severall parts of the description of this Plantane, concludeth this to be his *Limonium* and no other, being so answerable thereto in all parts as he saith: but (by a little, mee thinke) he triumpheth above the victory, and cannot so cleanely carry away the matter, but that there seemeth some blocke in the way to stumble at; and therefore he must give us leave to scan *Dioscorides* his description thereof, a little more thoroughly: for first hee saith *Limonium* groweth *in subjectis aquosis prati vel paludibus* (and therefore *Theophrastus lib. 7. c. 7.* calleth a kinde of *Anemone Limonia*, which *Gaza* translateth *Prati genus Limonium dictum*, and by *Cluſius* his judgement is the *Anemone ſylveſtris*, taken from the moiſt fields wherein it groweth) but he doth not say in *aqueis*, where usually this groweth, and I thinke Master *Johnson* never saw it, but in ponds or ditches of water, which were never dry: then he saith his *Limonium* hath longer and thicker leaves then Beetes, so thus Plantaine hath not so, and lastly he saith it beareth red seede, which Master *Johnson* would have found out, if it had beene the right *Limonium*, but he wisely concealed it, as making much against his opinion. Many plants may have some resemblance in forme or name, &c. yet faile in some one particular, which quite abroga the whole case, as is shewed in many places of this Worke, and especially in the Table of the *Dioscorides* in *Flandria*, taken to be the *Ægyptian Calcas*, and in *Lobels* opinion of *Tripolium* to be the *Aconitum Pardalianches*, and of divers others. And for the other Greeke names, *Neuradon* is a terme that may be given to any other herbe, whose leaves are full of ribbes or nerves. *Potamogeiton & Lanchitis* are severall other herbes, mentioned in *Dioscorides*, and cannot be applyed to this, besides the most judicious Translators and Commentors on *Dioscorides* have judged that multiplicity of names added to the text, to be none of *Dioscorides* his Worke, but should in processe time some other Authour, who might be as barbarous as the names. I leave the rest to the judicious censure of the learned. *Lobel* also, and *Lugdunenſis* from him taketh this Plantane to be *Alisma* of *Dioscorides*, and saith it doth better agree thereto then either *Bofolaro* or *Saponaria*, or *Calceolus Mariæ*, or *Biſſorta*, or *Limonium*, which Master *Johnson* thought he had forgotten or *Matthiolus* his *Alisma*. The second is called by *Lobel Plantago aquatica latifolia*, and *Plantago aquatica minor* by *Cæſalpinus* and *Tabernæmontanus*. The third is by *Lobel* also called *Plantago aquatica minor altera*, and *Alisma puſillum angustifolium muricatum*, by *Lugdunenſis Damasonium Lobelii*, or by *Bauhinus Plantago aquatica ſtellata*. The last is called by *Cluſius Plantago aquatica minima*, and by *Bauhinus Plantaginella paluſtris*.

The Vertues.

It is found to be cold and dry by the astringent taste it carryeth with it, but yet is not knowne to be used in Physicke to any purpose, either of greater or lesser respect.

Chap. XXV.

Sagitta ſive Sagittaria. The Arrow headed water plant.

Of this *Sagittaria* there are three sorts observed by most writers as shall be shewed.

1. *Sagittaria major latifolia.* The greater Arrow headed water plant.

This greater sort sendeth forth sundry thicke square and sappy stalkes from a thicke lothy roote of many strings, with great broad greene leaves on the toppes of them, divided at the bottomes into two long and pointed parts, so that the whole forme of the leafe resembleth very well the head of the broad Arrow as wee call it, which parts stand but little above the waters wherein they grow, be they deeper or shallower: from among which rise up other thicke round spongy stalkes, higher then the leaves bearing divers rowes of flowers at the joynts, one above another, and three in a row for the most part, each whereof is composed of three large white leaves with sundry reddish threds in the middle, after which come in their places round rough burres, that are greene when they are ripe, and like those of *Sparganium*, the Bure reede.

2. *Sagittaria minor latifolia.* The lesser broad arrow head.

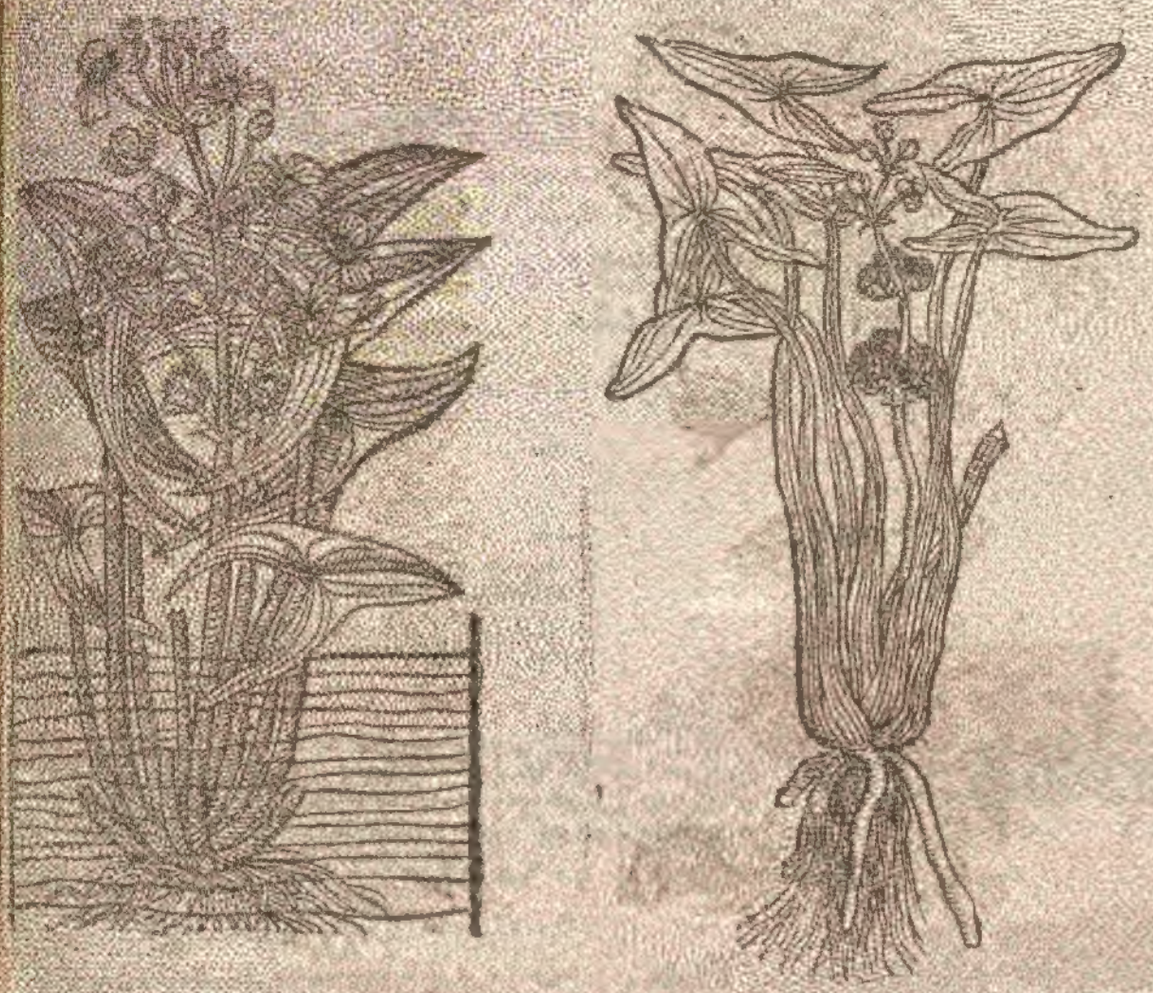
This lesser sort hath onely lesser leaves, and flowers, yet broad and of the same forme with the *precedent*, the burres and roote growing as great or greater then they.

3. *Sagittaria minor angustifolia.* Narrow leafed broade arrow head.

This likewise differeth not from the two former, in the manner of growing, but in the narrownesse and length of the leaves which are not of halfe the breadth with the former, yet hold their length, the two lowest sucker-like being almost as long as the forerightleafe, the flowers also are lesse, as are the burres and roote.

The Place and Time.

All these sorts may be seene sometimes together, in the same ditches and waters where they grow, yet elsewhere in sundry places of this Kingdome, and doe flower about Midsummer, their burres being ripe in the beginning or middle of *August*.



The Names.

It is called in Greeke [illegible], and as *Pliny* saith, *lib. 25. c. 13. Magopiſtos* or *Piſtum Marinum*, in Latine *Sagitta*, *Sagittaria*, and *Sagittalis*. *Lobel* hath a *quere* on the first, if it bee not *Stebe ſemina*, but calles *Phleos* [illegible] by *Lugdunenſis*, as he doth the other *Phleos ſive Stachys Theophraſti angustifolia*: but as I have shewed in sundry places before in this Worke, that *Phleos* and *Phleum* in *Theophraſtus* be differing plants. *Phleum* being a rough plant, growing in the Lake *Orchomenus*, and *Phleos* I have set downe in the Chapter of *Veronica*, as preserved it I thinke sufficiently to be the *Stachys* of *Theophraſtus* and *Dioscorides*. *Cæſalpinus* called the great sort *Sagittaria*, and *Dodonæus* saith that some did call it *Lingua ſerpentis*, and thereupon the *Dutch* called it *Slangen tongen*, and the *Italians Guerra*. But wee in *English* Water Archer, Arrow head or broad Arrow head we call it.

Public Domain / http://www.hathitrust.org/access_use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

1. Sagittaria major latifolia.
The greater broad Arrow-head.

2. Sagittaria minor latifolia.
The lesser broad Arrow-head.

The Vertues.

They are held to be of the property of Water Plantane, that is, cold and dry, but *Lugdunensis* saith they are cold and moist.

Chap. XXVI.

Tribulus aquaticus, Water Caltroppe.

There is a greater and two lesser sorts of this Caltroppe to shew unto you, which are these.

1. *Tribulus aquaticus major.* The greater Water Caltroppe.

This great Water Caltroppe hath sundry broad, and more then halfe round leaves, in some places pointed at the under side, and dented about the edges, set on long footestalkes which rise in the Water from the head of the roote, every one by it selfe, being smaller at the lower end then they are next unto it, among which rise up soppy round stalkes, no higher then the leaves, bearing whitish flowers at the tops, after them thicke, hard and wooddy, almost round heads, with three or foure sharpe points sticking forth, like unto those of Hasell nuts in some places and blackish in others, as bigge as a great Wallnut, having a sweet Kernel within it like unto a Chesnut: the roote groweth somewhat long and full of joynts with a tuft of threds at each of them.

2. *Tribulus aquaticus minor prior.* The former small Water Caltroppe.

The leaves of the two lesser sorts, from a long creeping joynted roote feeding forth tufts of fibres at the joints, have some stemmes of the stalkes shoote forth very long flat slender and knotted stalkes, two or three cubits according to the depth of the water wherein it groweth, (which being dryed are pliant and flexible, and serve for workes) divided towards the toppe into many branches, carrying single leaves at the lower joynts, which are about two inches long and halfe an inch broad, thinne and almost transparent, so waved on the edges that they seeme to be cut, of a reddish greene colour for the most part; but those on the branches upwards are parted by couples from the joynts with the leaves come forth small footestalkes, bearing at their ends three or foure small flowers, set together in manner of a cluster of Grapes (others have found it with flowers at every of which when they are falne, succeede for the most part foure sharpe pointed graines or seedes, each containing a small soure kernell within them.

3. *Tribulus aquaticus minor alter.* The other small sort of Water Caltroppe.

This is another small sort hereof, growing mutually in the ditches of cleere Water, whose stalkes is not flat, but round, bearing leaves at every joynt, shorter and more pointed at the ends, and not crumpled or waved at the edges, with three or foure small flowers at the ends of long footestalkes, somewhat like to those of *Mes-*

Original from UNIVERSITY OF MICHIGAN

1. *Tribulus aquaticus major.*
The greater Water Caltrope.

2. *Tribulus aquaticus minor.*
The lesser Water Caltrope.

Castelli Cordi: the fruite or head that succeedeth, groweth to be five square: the roote is not much unlike the former.

The Place and Time.

I cannot heare as yet that the first is found in any countrey of this Land, as the two others are: but in sundry Lakes in *Germany*, as also in *Brabant*, and in many places in *Italy* and neere the Sea also, as *Matthiolus* saith, but flower there and give their fruite in Summer.

The Names.

It is called in Greeke τριβολος ὑδατιος, and *Tribulus aquaticus* in Latine, *Dodonæus* taketh the fruit to be *Cornu mus Dioscoridis*, all other Authours call it *Tribulus aquaticus* or *Lacustris*, as *Cordus* doth, and the Apothecaries or *Venice* and other parts beyond Sea *Tribulus marinus*, and the nuts *Castanea aquatilis*. The other two sorts are called by *Clusius Tribulus aquaticus minor* and distinguished by him, and by *Ruellius* referred to the *Pastinaca*, calling them *Pastinaca folijs crispis sive Lactuca vranaria*, and yet his next lines verily the former of these two sorts, as by comparing his words may be seene. *Lobel* calleth it *Pastinacha palustris*, and *Tragus* maketh it his second *Aipa*. Master *Frost*, a *London* Merchant travelling in the *Mogols* Country, in the East Indies, saw the greater sort growing like a weede, abounding in moist ponds or pooles there, whose fruite hee tooke to be the *Ficus indica*, but was much therein deceived: the kernell of the nut as he saith is much eaten by the Natives and others, called *Singara* by them, himselfe finding them very cold in his stomacke that he alwayes after the eating of them desired some *Aqua vitæ* to warme it againe. You shall find this relation and that of the *Fabæ Ægyptiacæ* as it is extant before in this worke *folio* 376.] in the fourth Booke of Master *Purchas* his Pilgrims, the fourth Chapter and fifth Section, *folio* 429. The worthy relations of those travailes there extant doth not onely in this but

3. *Tribulus aquaticus minor alter.*
The other small sort of the Caltrope.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

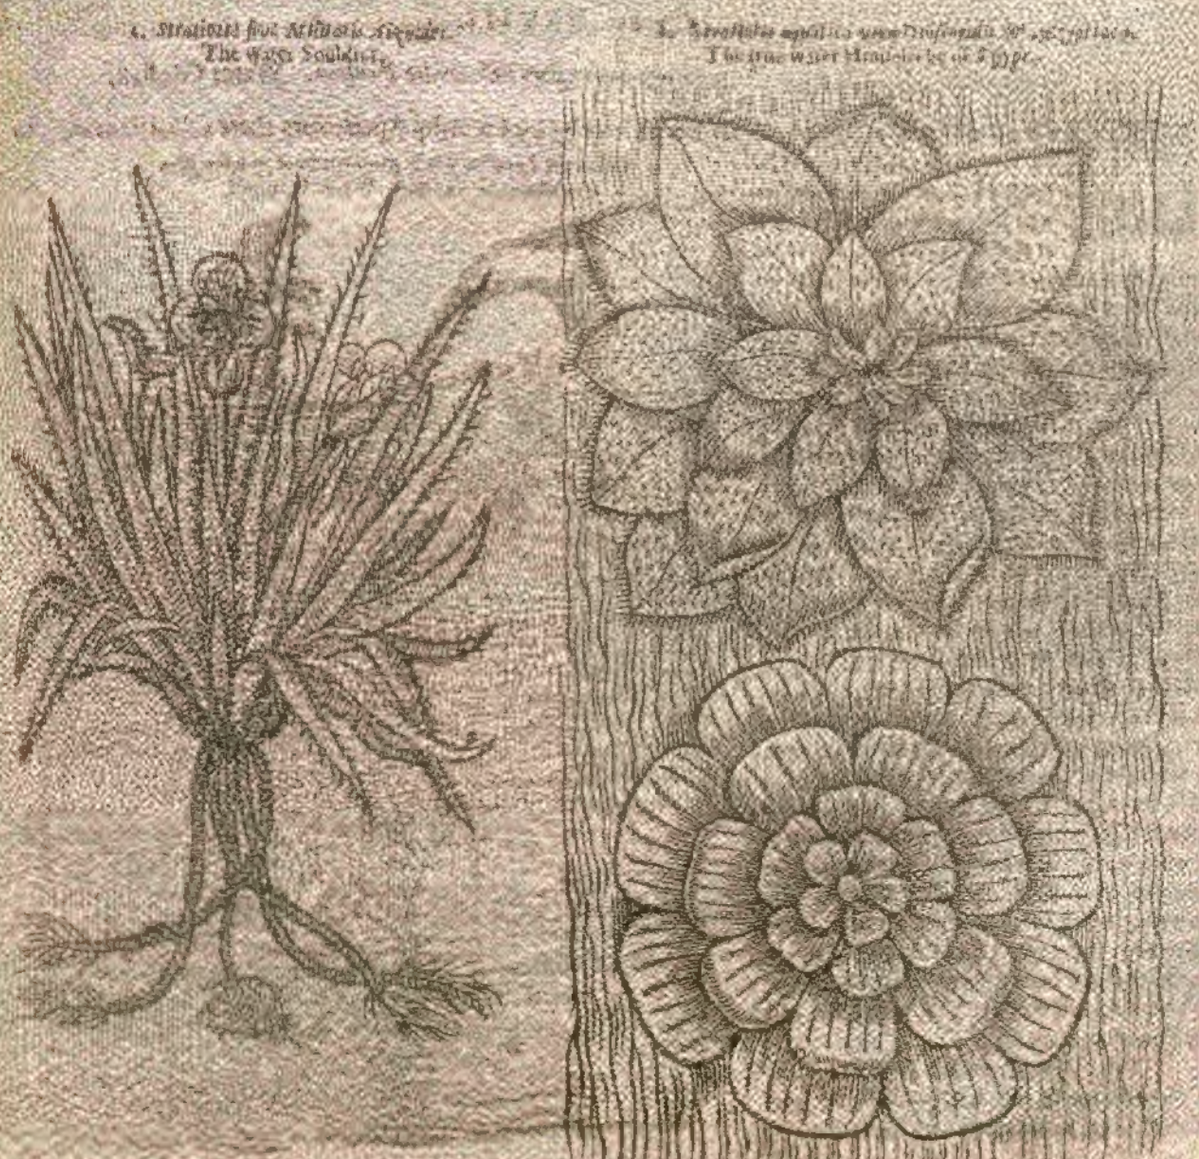
Original from UNIVERSITY OF MICHIGAN

many other excellent matters declare his industry, whereby may have reaped much profit thereby. I would we had many more such worthy Merchants continually. The *Italians* call it *Tribolo acquatico*. The *French Men* and *Sailers*, The *Germanes* *Wasserneff*. The *Dutch Water nuts* and *Minckgers*, and we in *English Water Caltrops*, or Water nuts or *Sailers* after the *French*.

The Vertues.

The leaves are cooling and repressive, inflammations being made into a poultis and applyed: the juice mixed with honey cleanseth the Cankers and sores of the mouth and throate, and the ranknesse of the gummes being gargled, doth the like. The *Thracians* that inhabite about the rives *Strymon*, do farce their hostes with the leaves and make bread of the nut kernels to feede themselves which doth binde the belly.

Chap. XXVII.



1. *Stratiotes seu Militaris secunda.* Water Souldier.

THe Water Souldier hath divers and sundry long narrow leaves sharpe pointed set close together somewhat like unto the leaves of Aloes for the forme, but much lesse and sharpely toothed about the edges like a saw, from among which rise up short stalkes not much higher then the leaves, and sometimes lower bearing one greene three forked head only at the topps much like unto a Soldiers claw, which is the huske, out of which commeth a white flower, consisting of three leaves with divers yellow hairy threds in the middle: under these leaves there is a small short rounded seed next unto the leaves and smaller downewards, from whence doe proceede sundry long strings, or rootes (Where-with as *Dodonæus* saith, some craftie men and women leeches putting them into children to make them shew the greater, make others beleeve that they are wormes which came out of their sicke bodies, they have given medicines for that purpose) which take roote in the middle under the Wa-

2. *Stratiotes Aquatica vera Dioscoridis, & Ægyptiaca.*

The true Water Houseleeke of Egypt.

The Water Houseleeke hath divers large and broad thicke, hard and fatty or fleshy greene leaves lying on the water three or foure rowes, round compassed together, like unto those of the great ivie Houseleeke, but greater, the outmost row of them being broadest, and the inner smaller and smaller, whose brimmes seem them to be pricked,

but *Veslingius* round and plaited, and the ends a little foulded backwards as *Veslingius* hath it, which I give you both together, this hath not beene observed by either of them what stalkes or flowers it beareth, the roote also is such as is a small thin peece of wood that hangeth downe from under the leaves which lye on the water like Duckmeate, but *Veslingius* saith it hath small threddy fibres falling downe to the ground, although *Dioscorides* said it had no rootes, the leaves are of a drying lipricke or astringent taste no lesse then *Acacia*.

The Place and Time.

The first groweth in *Germany* and the Low Countries also plentifully, and in *Italy* and other Countries also, the other hath beene observed in *Egypt* by *Alpinus* and *Veslingius*, and no where there but in the watery ditches, called *Damiata* or *Nilusium*.

The Names.

Dioscorides his *Bromelitis*, whereunto is added *Nymphæa herba*, that it may be knowne from his *Nymphæa*, is called by *Matthiolus Stratiotes aquatica* in Latine, and so also by *Lugdunensis*, and is my second sort, here expressed in my judgement rather then the first because the leaves and the posture also doe more resemble Houseleeke then the former, which is like unto Aloes, although it be called also *Sedum maximum*, and againe, because it hath not beene observed any where but in *Egypt* as I said by *Alpinus* and *Veslingius*, however *Lobel* calleth the former *Stratiotes sive Aloides*, and *Dodonæus Stratiotes pygmæa & Sedum aquaticum*. *Bauhinus* placeth the former with the sorts of Aloes, and calleth it *Aloes palustris*, and the other he placeth among the *Lentibula*, and calleth it *Lentibula palustris Ægyptiaca sive Stratiotes aquatica folijs Sedo majore latioribus*. *Alpinus* saith that the *Egyptians* call it with them *Hayhalemel enaeli*, that is as much to say as *Sedum aquaticum*. It is probable that *Serapio* also meant this plant, whereunto he giveth no name, speaking thereof in the end of the ninth Chapter of his fourth Booke, growing in ponds like a Lilly with many leaves of a greene colour, &c.

The Vertues.

Each of these are very cooling and drying, and altringent withall, but *Galen* saith it is cold and moist, and so *Pliny* and *Dioscorides* say it stayeth the fluxe of blood that passeth from the kidneys, if it be taken in drinke. *Pliny* adjoyneth thereunto some *Olibanum*, it stayeth likewise the swellings of wounds and easeth that they be not enflamed, it helpeth other inflammations called Saint *Anthonies* fire and swellings in other parts, it healeth also all wounds and vlcers, and is good for fistulaes or hollow vlcers. *Alpinus* saith that the *Egyptian* women use the juice decoction or poulther of the herbe, a dramme every morning to stay their courses, or other issues of blood in any other part of the body: as also the Country people use it to heale any wound, in bruising the leaves and laying them thereon, which wonderfully healeth them.

CHAP. XXVIII.

Gladiolus Lacustris Clusij sive Leucoium palustre flore subcæruleo Bauhini. Water Gladioll.

THis plant that was sent to *Clusius* from *Groning* by a worthy Apothecary there called *Dorneus*, found by him in a great pond or lake of water where no other herbe did grow, besides in the Country of *Drenthe*, neere unto a small village called *Norde* and *Westerwelde*, as set downe by him with this description. The leaves doe seldome exceede the length of nine inches, being thicke and hollow severed with a partition like the ribs of Stocke-Gillofloweres, of the like, but greene and sweete in taste, being an acceptable food for the Duckes that dive to the bottome of the water to feede on it, which is the very cellis depth under the water: yet the stalke that springeth from among those leaves is seene to rise above the water, furnished with white flowers, larger then those of Stock-gillofloweres, the hollow and lowest part, which is next to the stalke, being of a blewish colour, somewhat resembling the forme of a *Gladiolus*, or Corne flagge, but yet not much like in condition of his leaves, the two upper most whereof doe turne backeward to the stalke, the other three which are the larger hange downe: unto their flowers succeede round heads or seede vessels broad below and pointed at the end full of red seeds. This was observed in flower in the end of *July*.

Gladiolus Lacustris Clusij sive Leucoium palustre, sive subcæruleo Bauhini. Water Gladioll.

The Place, Time and Names.

Are related in the foregoing title and description, as much as can be found of it,

for although Lupin would not alter the same thereof, whereby it was seen, that others might know with what they had to deale. Yet Lobelius thinking it better to agree in leafe and flower unto the Leucoium, rather chuse to call it Leucoium peregrinum flore subceruleo, but I dare not herein follow him, for it hath as little correspondence with the Stocke Gilloflower, as with the Gladiolus or Corne Flagge, neither leafe nor flower being like a Stocke Gilloflower: but in that the leaves are made like the double huske or seede vessell of Leucoium, which maketh little resemblance of a plant, but the flowers doe more answer to the forme of the flower of Gladiolus, and therefore I assent it. And for the Vertues there is none knowne or made to appeare, that the neighbouring people make any use of it in medicine, or any other wayes more then is before said, for the Duckes to feede on.

Chap. XXIX.

Nymphæa. The Water Lilly.

There are diverse sorts of Water Lillyes both great and small, both white and yellow, as shall be shewed.

1. *Nymphæa alba major vulgaris.* The great common white Water Lilly.

This Water Lilly hath very large, very round and thicke darke greene leaves lying upon the water (like unto those of *Faba Ægyptia* as *Dioscorides* saith, and that very truely as I have shewed before in the Chapter of *Arum*) sustained by long and thicke footestalkes that rise from a great thicke round and long tuberous blacke roote, spongy or loose and with many knobs thereon like eyes and whitish within, from the midst whereof rise other the like thicke and great stalkes, sustaining one large white flower thereon greene without but exceeding white on the inside, as pure snow consisting of divers rowes of long and somewhat broade and narrow leaves, smaller and shorter, the more inward they be, encompassing a head within, with many yellow threds or thrummes in the middle, where after they are past stand round Poppy like heads full of broad and bitter seede.

2. *Nymphæa alba major, Ægyptia, sive Lotus Ægyptia.* The great white Water Lilly of *Egypt*.

This other great white Water Lilly, that is entituled of *Egypt*, tenderith up out of the Water divers faire broad leaves like the former, but somewhat lesser, and more waved about the edges, and with more veines in them lying upon the superficies of the water, as they doe upon severall footestalkes also, the flowers also are faire large, and double, that is of many rowes of leaves in the like manner, inclosed in a huske, consisting of foure leaves, greene on the outside, and white within, the middle leaves of the flowers are often upon the full opening somewhat bended inwards at the ends, but growing elder grow straight forth, all of them being white in the middle and yellow towards the brimms of a sweete scent like a Violet, in the midst of which when they beginne to

1. *Nymphæa alba major vulgaris.*
The great common white Water Lilly.

2. *Nymphæa alba major altera sive Lotus Ægyptia.*
The great white Water Lilly of *Egypt*.

decay

3. Nymphæa alba minor.
The small White Lilly.

4. Nymphæa alba minor, store plenissimo.
The small white Water Lilly with double flowers.

5. Nymphæa lutea major.
The great yellow Water Lilly.

6. Nymphæa lutea minor.
The little yellow water Lilly.

Original from UNIVERSITY OF MICHIGAN

...ceiveth not a small head, which growing greene becommeth the seede vessell, not much unlike unto the other ... a good handfull, parted on the inside into two long waies containing round seede like unto those of Colewort, the roottes not altogether so great as the former, but small round and almost paire fashion, of the bignesse of an hens ... on the outside and yellowish within, with many small fibres thereat, the inner substance being fleshy ... and hard, somewhat sweete and tasting well all, which when it is boyled, or rosted under Embers, becommeth of a yellow as the yolke of an egge, which the Egyptians familiarly eate with broth or without, raw also often-times as well as rosted, the leaves both leaves and stalkes after seede time, especially upon the decay of the water wherein it groweth, the seede abiding in the ground, which thereupon was called annuall, but I would rather call it ...

2. *Nymphæa alba minor.* The lesser white Water Lilly.

This lesser Water Lilly differeth not from the former, but in the smallnesse both of roote and leafe, and in the ... of the flowre, which consisteth but of five small and pointed leaves, spread open and laid abroad, with ... threds in the middle, and small heads with small seede in them.

3. *Nymphæa alba minima seu Morsus ranæ vulgaris.*

Small white Water Lilly, called by many Frogge bit.

The roote of Frogge bit is long and creeping, set full of joynts, sending downe from thence long fibres, and ... ing divers small round leaves very like the last small water Lilly, but much smaller, from which rise ... stalkes bearing on each head one small white flower, made of three small and round pointed leaves with ... yellow threds in the middle: the heads and seede are small. This is in all the parts nearer resembling the ... white Water Lilly, then any pond weede, whereof some have made it a sp..., and therefore I have placed ... with them.

5. *Nymphæa lutea major.* The great yellow Water Lilly.

The greater yellow sort groweth much like the great white, with leaves almost as large as they, but some-what longer, and standing on cornered stalkes, the flowers also that stand on the toppes of the crested stalkes are as thicke of leaves as the white (although *Lugdunensis* doth so describe it, and giveth a figure answerable) in any that ever I saw, but made of five large round shining yellow leaves, with a round greene head in the middle, ... with yellow threds, which head when it is ripe, containeth within it greater seede then those of the ... and more shining: the roote is great and very like unto the former, yet not blackish, but somewhat white ... inside and outside as well as within; each of them being somewhat sweete in taste, and this more soft or spongy ... then.

6. *Nymphæa minor lutea.* The smaller yellow Water Lilly.

The leaves hereof are round, but larger then those of the lesser white sort, and so are the flowers larger also, but ... the roote hath many strings fastened to a bigge head, and taketh hotter then the other.

7. *Nymphæa lutea flore minore.* Small yellow Water Lilly with lesser flowers.

There is no other difference betweene this and the last, but in the smallnesse both of leaves and flowers, the roote ... with with long stringes strongly fastened into the muddie.

The Place and Time.

All these sorts except the second are found growing with us in sundry places of the Land, some in great pooles ... standing waters, and sometimes in slow running Rivers, other in lesser ditches of water, as the Frogge bit, in many ditches about *London*, as well as in the ditches on the Bankes side, in Saint *Georges* fields. They flower ... commonly before the end of *May*, or soone after, and their seede is ripe in *August*.

The Names.

Nymphæa in Greeke, and *Nymphea* in Latine, *quod loca aquosa amet*, be the chiefe appellations of these plants ... their severall adjuncts, of *alba* and *lutea*, white and yellow, and called *Nenuphar* in the Apothecaries shops, ... both also divers other names by divers Authours: *Apuleius* calling it *Herba Herculiana*, *Aigyptos*, *Plinie* ... *Venerea*, *Lotus Veneris* and *Dionæa Veneris*, and *Aurelius* an old Writer, saith it was called *Cinara Heraclea*, and *Basnia* in *French*, but the *French* at this time call it *Blanc d'eau*, and *Lis d'eau*, the *Arabians Nilufar* and *Nilufar*, the *Italians Ninfea*, the *Spaniards Esfundetes de Agua* and *Higos de Inglo*, the *Germanes Seerblumen*, ... *Seelilgen*, the *Dutch Plompen*, and the Water Lilly. There hath beene great controversies among the ... Herbarists, whether this *Nymphæa* be not the *Cuamos Aigyptia* of *Dioscorides* and *Theophrastus*, because the ... of the one so nearely resembleth the other, which made *Cluisius* confident upon *Alpinus* his Allega-tions in his booke *de plantis Aigypti*, to determine them both one: when as there is shewed two maine differences ... them, besides that *Dioscorides* describeth them both in two severall Chapters, the one in the roote, that the ... was called *Cyamos*, and was round at the bignesse of a Quince, which was used to be eaten, either ... or rosted under the fire, which the roote of *Nymphæa* faileth in: (this is most probable to be the *Lotus* ... of *Diodorus*.) And then againe in the seede, which as *Dioscorides* saith, is set in the head of the ... and like *Millium*, that is round in the form: that the leaves and flowers in both being so like, the other ... and under the water called *Alcion*, as he saith himselfe to take no further knowledge or marke any other ... then them of a *Nymphæa*; (and I am halfe perswaded the like neglect hath happened to the *Faba Aigyptia*, ... not yet found in the waters of *Egypt*, because the leaves thereof also are round like the *Lotus* or ... but neere to his Booke of *Exotick* plants, he changeth his note, and shewes there that this is the true ... and all the parts thereof particularly described. All these sorts of Water Lillyes are so called ... and therefore need no further explanation or amplification. But hereby all ... may see how great errour they are too forward, either to condemne the Text of the ancients as judging it er-roneous, or to confide in their owne judgement, without well considering all parts: For the like here-upon happened unto the *Faba Aigyptia*, which formerly was confidently supposed to be *Colocasia*, ignorance being the ground of error, which knowledge since by industry hath corrected.

The Vertues.

The leaves and flowers of the water Lillies are cold and moist, but the roote and seede is cold and dry: the ... doe coole all inflammations, and both outward and inward heates of agues, and so doe the flowers also ... by the Syrupe or Conserve, the said Syrupe also helpeth much to procure rest, and to settle the braines of ...

franticke

Original from UNIVERSITY OF MICHIGAN

frantick persons for it wonderfully helpeth the distemperature of the head arising from heate: the herbe is sometimes used to stay fluxes of blood or humours, either of wounds or of the belly, yet is as effectuall as the roote, but the roote is of greater use with us, some taking the white roote (which is of the yellow sort) and some the roote of the white Water Lilly, which hath the blacke roote, to be the more effectuall to coole, binde, and refell raine all Fluxes or defluxions in man or woman, as also the gonorrhea or running of the reines, and the involuntary passage of sperme in sleepe, and is so powerfull that the frequent use thereof extinguisheth Venereous actions: the roote likewise is very good for those whose urine is hot and sharpe, to be boiled in wine or Water, and the decoction drunke: the blacke roote which beareth the white flowers, is more used with us in these times then the other, because it is more pleasantly to be had, then that with yellow flowers: but the white roote of the yellow kinde is lesse pleasant, and more astringent and harsh in taste, and therefore not without just cause doe moll prefer it before the other to stay womens courses and mens spermaticall fluxes. The distilled water of the flowers is very excellent for all the diseases aforesaid both inwardly taken and outwardly applyed: it is much commended also to take away freckles, spots, sunburne, and Morphew, from the skinne, in the face or any other part of the body. The oyle made of the flowers, as oyle of Roses is made is profitably used to coole hot tumours, and the inflammations of ulcers, and wounds, and ease the paines, and helpe to heale the sores. The Frog bit as being a *species* as I said of the *Nymphæa minor*, and so likewise these lesser sorts, have generally a cooling quality in them, yet in a weaker measure then the greater sorts. But let no man mistake the yellow Marsh Marigold, instead of the yellow Water Lilly, as it is likely, *Serapion* in *Simplicium cap.* 249. and some other *Arabians* Authours did, that said there was another kinde of *Nenufar*, which was sharpe and hot, and of subtill parts, and is fit to warme and give heate to cold griefes, for assuredly they meant hereby the *Caltha palustris*, which they mistooke to be a kinde of *Nenufar*, as is evident by this their relation.

CHAP. XXX.

Potamogeton sive Fontalis. Pondweede.

OF the Pondweedes there are divers sorts, more found out and referred to them then was in former times, which are these that follow.

1. *Fontalis major latifolia vulgaris.* The greater ordinary Pondweede.

This greater Pondweede riseth up with sundry slender round stalkes full of joynts and knottes, and faire broad round pointed darke greene leaves with long ribs in them like Plantaine, one stay at the joynts and lying flat on the toppe of the water: at the toppes of the stalkes and branches usually, and seldome

Potamogeton sive Fontalis major & minor latifolia vulgaris.
The greater and lesser broad leafed Pondweede.

2. *Fontalis major longifolia.*
The greater long leafed Pondweede.

Original from UNIVERSITY OF MICHIGAN

flowers joyning come forth long spiked heads, of bluish coloured flowers upon long footestalkes like vnto Water Wheate or Arimart, whereon after they are past stand chaffie huskes, containing within them blackish seede: the roote creepeth to and fro in the middle, with divers joynts and tufts of hores at them, whereby it taketh hold to the ground. There is another of this sort that is lesser, not much differing in any thing else. *Mont.*

2. *Fontalis major latifolia.* The greater long leafed Pondweede.

This other greater sort differeth little from the former, but in the leaves which are longer and narrower, and more running acrosse in them, and not at length as the former doth, the spiked heads of flowers hereof are of the same whitish, and to others as faire a bluish colour as the former, and come as well from the vpper joynts as the toppes of the stalkes and branches. There is another sort hereof also, with leaves not altogether so long as *Alpin.* these.

3. *Fontalis serrata longifolia.* Dented Pondweede.

The roote of this is joynted and creepeth like the former, bringing very long and narrow leaves at the joynts like stalkes, and dented about the edges without any order on both sides, and beareth at the toppes such like spiked tufts of flowers and seede after them as the others doe.

4. *Potamogeton graminea vel angustifolium.* Grassie Pondweede.

The stalke hereof is a foote high or more, being very slender round and whitish, parted into sundry branches with many small grassie round darke greene leaves not set together, but by spaces a good way in sunder, which hold in other leaves, that are almost as small as haires, yet notwithstanding from the wing of the first leafe, commeth forth a stalke with the like leaves at the end, and thereat a small footestalke three inches long, sustaining some small flowers, dispersedly set in a spike and not in a cluster, and small rough graines succeeding them.

5. *Potamogeton minimum capillacee folio.* Small fine Pondweede.

This fine leafed Pondweede hath a very fine slender stalke, with small long pale greene and haire-like leaves, thereon without order, at the toppe whereof spring forth one or two small footestalkes, which sustaineth a very small and pointed head, like unto the *precedent*, followed by very small pale coloured flowers, whereof one is all open, and another is inclosed in a skinny huske, ending in a point.

6. *Potamogeton capillaceum capitulis ad alas trifidis.* Triple headed Pondweede.

This Pondweede hath a stalke an handbredth long, no thicker then an haire, yet joynted and branched, and two small long leaves at every joynt which are smaller then any haire, and thereat likewise stand very small pale coloured flowers, which growing close, do forme a knot or head, which being ripe appeareth as made of three semicircular chaffie parts ending in a sharpe point, yet from the bosome of the former leaves, riseth a small footestalk diuided into three or more small leaves, the like knot or head being set in the middle, for at the top there is no head set.

The Place and Time.

The two first sorts are to be seene in many places of the Land, no Country almost being without the one or the other, the third is more rare, and seene but in very few places with us, the three last are strangers and doe all shew their flowers in the end of *August* or seldome sooner.

The Names.

It is called in Greeke πολυγονον γραμμωδες φυλλοις ὁμοιοις εἰρινοις, and πολυγονον φυλλοις ἐριοις ὁμοιοις στοιχηδον, *quasi spicata Fontalis.* The two first are generally called by all Writers *Potamogeton*, and by *Lobel Fontalis spicata*, who it is very likely intended this last to be and not a different kinde from it, although his figure have more pointed leaves, for the veines goe long wise, as the former, which doe not in any other sort, although it doth expresse many small round heads on a long stalke, and saith the flowers are white, and the seede like *Aphaca*, and that his first sort is another *species* of the *Fontalis*, not the same, for we have seene some variety hereof in the Ponds and Waters of our owne Land. The third is called *Oxylapathum aquaticum* by *Lugdunenses*, and by *Gesner in horto, Lapathi genus tyrsiflorum.* The three last are mentioned onely by *Bauhinus*, by the same titles they here hold. The *Italians* call it *Potamogetto.* The *French* Tricon. The *Germanes* Sambenut. The *Dutch* Fonuitsuerwt, And we in *English* Pondweede, Water Spike, and Water Nuts.

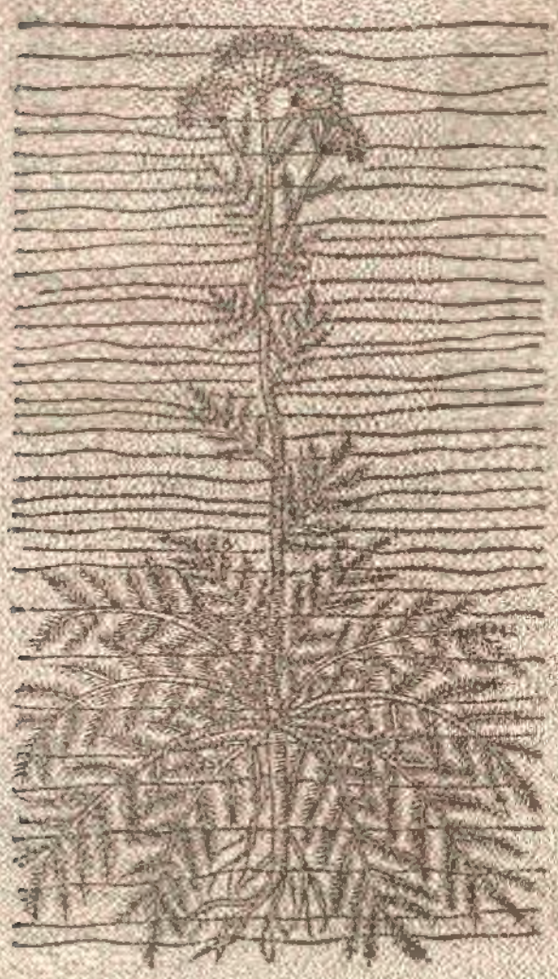
The Vertues.

Pondweed is cooling and drying as *Galen* saith, like unto Knotgrasse, but of a slicker essence, the decoction of the leaves in wine, stayeth the laske, and griping paines of the belly, and being bathed, is good to helpe riches, all ulcers and corroding cankers and sores, the leaves applyed allwageth inflammations, and saint *Anthonies* fire, the boiles and heate in the face: if the leaves be boiled with oyle and vinegar, and applyed to the place pained with the Gout, it doth give present ease: it is probably also applyed with honey and vinegar to helpe those that have hore tetters in their legges, the roote helpeth to dissolve knots and kernels.

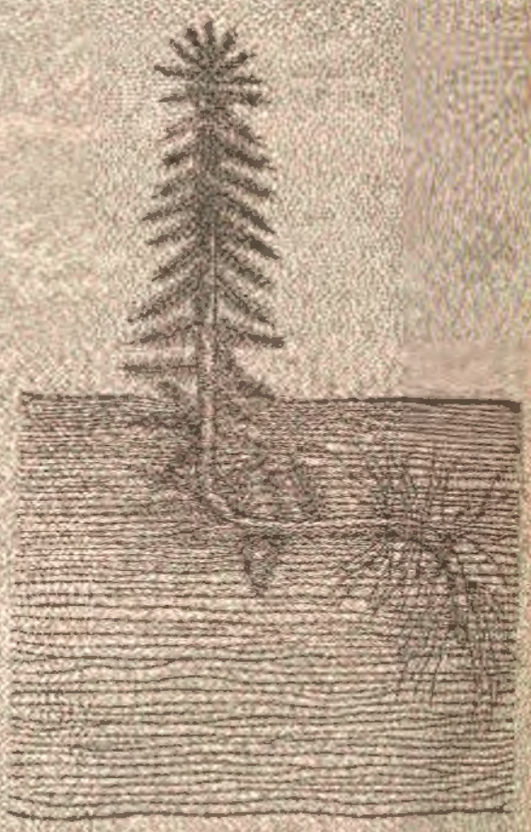
Chap. XXXI.

Millefolium aquaticum. Water Yarrow.

There be sundry sorts of herbes that for their fine Fennell like leaves, and growing in the waters, so nearely resemblinge Yarrow or Fennell, are called *Millefolium*, and *Fenticulum aquaticum*, yet differing each from other in some notable part, all which I meane to comprehend in one Chapter.



1. *Millefolium aquaticum vulgatius.* Ordinary water Yarrow.



This Water Yarrow which groweth most plentifully within about *London* riseth up with a round stalke, having divers long winged leaves at the bottome of it, cut and diuided into many fine small leaves on both sides of the middle ribbe, like unto the land Yarrow, but much tenderer and with as fine leaves almost as *Fennell*, at the stalkes likewise grow such fine leaves up to the toppe, where stand on branches small white flowers set close together, the roote is somewhat long white and slender with divers strings.

2. *Millefolium Coriandri folium.* Broad leafed water Yarrow.

The leaves of this Yarrow are somewhat like in the forme and diuisions of them unto the lower leaves of

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

but much smaller and of a fresh yellowish greene colour, but those that grow from thence upwards are smaller and more finely cut in like unto Fennell, bearing umbels or tufts of yellowish flowers.

3. *Millefolium aquaticum minus.* Small Water Yarrow.

The small Yarrow spreadeth many long round greene stalkes full of joynts, and thereat sundry fine small fibres take hold of the ground as it creepeth: the upper part of the stalke that rideth above the water, hath no joynts, and at each of them sundry fine final green leaves fearfe an inch long, triglelie and lesse upward, the toppe of the stalke seemeth to be steeple fashion, which beare at the toppe so many very small flowers, consisting of eight small white leaves apeece, joyned together and not opening themselves, as there are leaves at first, which afterwards paste into certaine round heads, which have foure spokes or points apeece.

4. *Millefolium aquaticum floridum sive Viola aquatica.* Water Gillovers.

The roote of this Water Gillover is very small and creeping, shooting forth fibres every where, from which rise many fine winged leaves, consisting of many small leaves set on each side of a middle rib, which are larger and greener then those of the first sort here set forth, of a sad greene colour, the stalkes that rise up among them are like leaves, from the bottome to the upper joynts, where about stand divers small whitish and tweere flowers, consisting like unto Stocke gillowers, of five leaves a peece, one row above another, with yellowish threds in the middle. There is another sort hereof very like it, but that it hath larger wings and finer jagged leaves. *Matthiolus.*

5. *Millefolium aquaticum Ranunculi flore & capitulo.* Crowfoote Millfoile.

This is a tall herbe then any of them that goe before growing only in shallow waters, where it seldome riseth above a handfull high, with very many and very fine short leaves, as small as Camomill, and of a yellowish greene colour, the short stalke among them carry single small white flowers, resembling the water Crowfoote in the flowers, and in the fine leaves, but hath no broad leaves at the bottome as it hath, and might as well be called a Crowfoote, as a Water Millfoile, but that all Authors that write of it doe number it among them, and withall because that it beareth a head of seede after the flower is past, very like unto those of Crowfoote, that is a bunch of seedes set close together.

6. *Millefolium aquaticum multiplici Ranunculi flore.* Fennell leafed Crowfoote Millfoile.

The roote hereof is very long and creeping, the stalkes grow much higher then the last, the leaves are much larger and greener, very like to those of Fennell, the flowers are white but much larger then the last, the head of seede long somewhat like unto it.

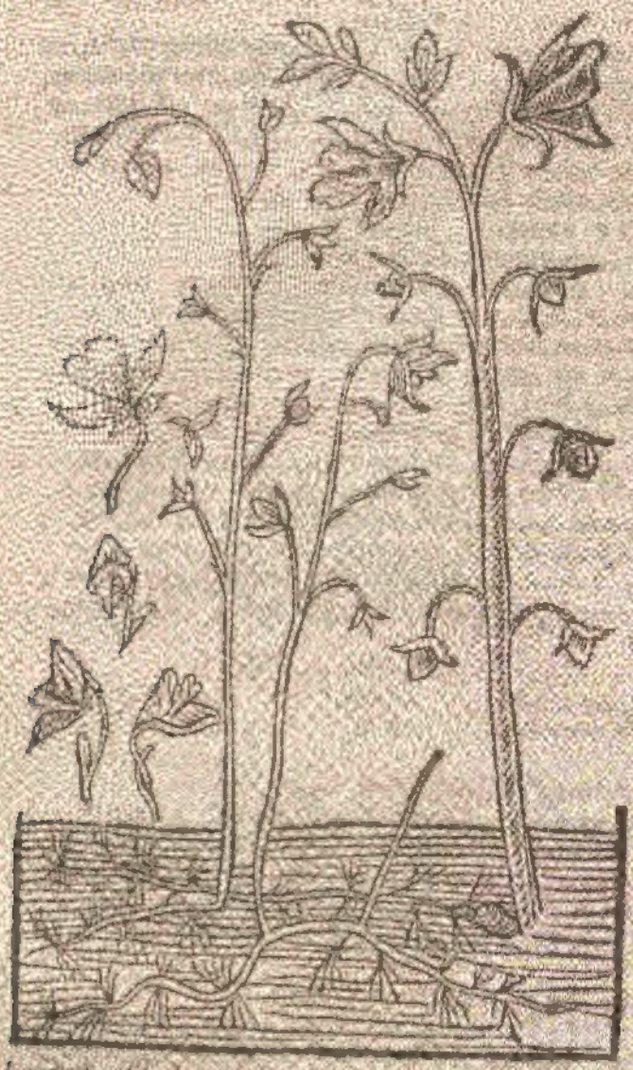
7. *Millefolium aquaticum pennatum spicatum.* Feathered Millfoile.

This Millfoile tendeth forth from a bushy fibrous roote divers round joynted stalkes, hollow, striped and translucent toppes, swimming on the water a cubit high, and at each three or foure leaves so finely cut that they seeme like feathers, of a browne greene colour: at the toppes of the stalkes come forth long purplish spikes, which were containing sundry knots of small yellowish flowers, set one above another by spaces, after which come small blackish and very hard heades, foure or five together about the joynt, in the hollow part whereof lye the seede.

8. *Millefolium aquaticum cornutum majus.* The greater horned Millfoile.

This likewise hath sundry slender and brittle joynted stalkes swimming upon the water a cubit high, with thinne and small leaves compassing them at the joynts, whereof the lower most are jagged like a Harts horne, but upwards they are finer, from the joynts also rise small slender footestalkes, three or foure inches long,

7. *Millefolium aquaticum pennatum spicatum.* Feathered Millfoile.



8. *Millefolium aquaticum cornutum majus.* The greater horned Millfoile.

γ. *Millefolium aquaticum flore luteo galericulato.*
Water Milfoile with a yellow hooded flower.

ιο. *Sisarum aquaticum.*
Water like Water Fennell.

somewhat like horns, bearing at the toppe of each a small white flower, made of foure leaves a peece, and after them a small head, with divers seedes set together like a Crowfoote. *Tauhinus* in his Appendix to his *Pinax*, maketh mention of a sort hereof, much lesser then the other, with small leaves like haires and short, so that the whole wing of leaves set together, doth not exceede one scale of a Lentill.

γ. *Millefolium aquaticum flore luteo galericulato.* Water Milfoile with a yellow hooded flower.

This hooded water Milfoile hath divers long leaves rising from the roote lying within the water, made of many paires set on each side of the middle ribbe, each paire consisting of many very fine and short greene Fennell-like leaves, set as it were in cuts, one against another: the stalkes rise up some what high, and round, without any leafe on them, but with fundry pale yellow flowers, set in a good distance one from another, from the middle almost to the toppe: which flowers consist of three leaves, the middlemost whereof is as it were hooded, before it be blowne open, but then is the broadest, and round at the end with a dent in the middle thereof, making it represent the forme of an Hart as it is usually expressed on the cardes.

ιο. *Sisarum aquaticum.* Starre-like water Fennell.

Next these Water Milfoiles is adjoyned by *Lobel* and others this water Fennell, that from a long shoote creeping forth sundry weake slender and flexible stalkes, bending to and fro in the water, full of joynts, bearing at every joynt two small fine leaves like those of Fennell almost, or as every one of them, and at the toppe of each a small white flower, consisting of eight leaves, laid open like a starre from whence it tooke the name.

The Place and Time.

All these grow in the very waters, divers of them being often found in our owne land. The first whereof is the most frequent and the fourth and fifth next unto it, but the second and third are strangers as yet, and seldome are, and doe all flower for the most part in the middle or in the end of Summer.

The Names.

Dioscorides and *Galen* call it in Greeke ὑδροφυλλον *Myriophyllum* from the abundance of leaves that it hath, even a million as the word importeth, and *Millefolium* in Latine. Some as *Matthiolus* the with, would referre *Millefolium* which is a Land herbe unto this *Myriophyllon* of *Dioscorides*, but he there sheweth himself to be the fault here set forth in *Matthiolus* his first *Myriophyllum*, and called by *Dodonæus Millefolium aquaticum*, by *Lobel Myriophyllum* and *Macaronifolium*, and by *Tauhinus Millefolium aquaticum umbellatum capitulo rotundo*. The second is *Matthiolus* his *Millefolium aquaticum*, set to the Chapter of *Stratiotes*, in his Dioscorides, which *Dodonæus* calleth *Stratiotes millefolium aquaticum*, and *Tauhinus* doubteth that it was a figure made of two sorts and sent to *Matthiolus*, for *Lobel* in calling it *Millefolium aquaticum alterum Coriandrifolium*, doth referre one of it to the upper fine leaves then the lower of Coriander. The third is called by *Clusius Myriophyllum aquaticum minus*. The fourth is the *Viola aquatilis* of *Dodonæus*, the *Myriophyllum alterum* of *Matthiolus* and *Lobel*, and

the *Myriophyllon aquaticum floribus luteis* of *Lobel*. The fifth is called by *Lobel Millefolium maximum myriophyllon aquaticum* by *Tabernæmontanus Ranunculi aquatilis Hepaticæ facie*, and by *Clusius Millefolium aquaticum flore albo, Geranium humile folio, Aconiti palustris vel flammulæ*, and is the first *Alga* of *Tragus*: The sixth is the *Myriophyllum maximum palustre alterum* of *Lobel*, & is the *Ranunculus aquaticus Dalechampij* of *Lugdunensis*, but badly figured, and the *Ranunculus aquaticus* of *Tabernæmontanus*. The seventh and eighth, are onely mentioned by *Bauhinus*. The ninth is called by *Lobel Millefolium aquaticum flore luteo galericulato*, and *Ranunculus aquaticus galericulatus* by *Tabernæmontanus*. The last is the *Sedum aquaticum* of *Lobel*, and the *Ranunculus aquaticus Stellatus* of *Tabernæmontanus*. The Italians call it *Arcechio*, the *French Cresson de eau*; the *Dutch Water Vickeren*, and we in *English* Water Cresses, water Millfoile, water Gillovers, and water Fennell.

The Vertues.

The Water Millfoile is of such a binding and astringent cold quality as *Galen* saith, that it healeth wounds and stayeth the heate and inflammations of them, and as saith *Dioscorides*, it freeth wounds from inflammations, and applyed fresh or dryed with Vinegar, it is also given with vinegar and salt, to them that have had shrewd falles from some high places: it is likewise taken with vinegar to helpe them that cannot make water, and other griefes in the bladder, easeth sighings also and the Toothache.

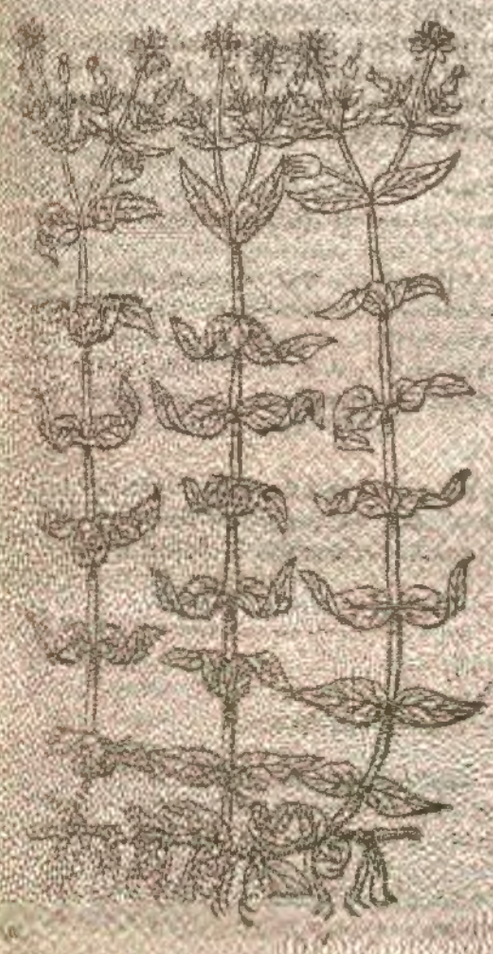
Chap. XXXII.

Alsine aquatica. Water Chickweede.

There are divers sorts of Chickeweedes that grow in or neere the waters, that were reserved for this place, and there are others that are left for the Sea, to be entreated of there.

1. *Alsine aquatica major.* The greater water Chickweede.

This greater Chickeweede hath a creeping roote, shooting out fibres in divers places, from whence spring up sundry upright stalkes, jointed from the bottome to the toppe, and two somewhat long leaves at every joynt, somewhat like those of Pellitory of the Wall and at the toppe divers white flowers like Chickweede, having many small and pointed leaves in each flower.



2. *Alsine aquatica media.* The meane Water Chickweede.

The meane Chickweede hath from a fibrous roote sundry stalkes rising upon a yarde height full of braunches and long leaves set them, of a pale greene colour, the flowers are many, small and white, made of five leaves a piece standing at the toppe of every branch.

3. *Alsine aquatica minima.* The least water Chickweede.

The least Chickweede hath a number of small tender branched stalkes, and small leaves growing on them, much like them in the former, but lying for the most part on or neere the ground or in the water where it grow-

1. *Alsine aquatica flore pallescente major.*
The greater water or Moth Chickweede.

3. *Alsine aquatica minima.*
The least water Chickweede.

4. Alsine aquatica minor folio oblongo
sive Portulaca aquatica
Water Purslane.

5. Alsine palustris minor
Serpillifolia. Small
Marsh Chickweede.

6. Alsine erecta flore carneo.
Vpright blew Chickweede.

eth, the flowers are thrifter and white, and the roote a tuft of many fibres.

4. *Alsine aquatica minor folio oblongo*
sive Portulaca aquatica.
Water Purslane.

This small Chickweed or Purslane groweth like the last Chickweed, with many trailing branches, that take roote as they spread, but not so thicke set with leaves, which are somewhat long narrow and round pointed, of a pale greene colour, two alwayes growing at a joynt, the flowers are small and white, set in long clusters together, on small foorestalkes, with very small seede following them, the roote are nothing but small threds.

5. *Alsine palustris minor Serpillifolia.* Small Marsh Chickweede.

From a small fibrous roote springeth up sundry slender stalkes and branches, rooting againe as they lye, and spreading, with very small leaves thereon by couples, lesser then those of *Serpillum*, or Mother of Time: after the small white flowers are past, succeede small flat pouches, one on each side of the stalke, with small seede therein.

6. *Alsine erecta flore carneo.* Vpright blew Chickweede.

This Chickweede riseth up for the most part with divers upright stalkes joyned in sundry places, and divers small leaves growing thereon at the severall joynts, somewhat divided like unto the leaves of Rue, somewhat resembling a Trefoile leafe, at the toppes, as also at the joynts come forth small blew flowers, consisting of foure leaves apiece, after which come small round Chickeweede like heads with seede, the roote white and long, with some fibres thereat.

The Place and Time.

All these sorts grow in or neere Waters, and are found in sundry places of the Land, flowring in the heate of Sommer.

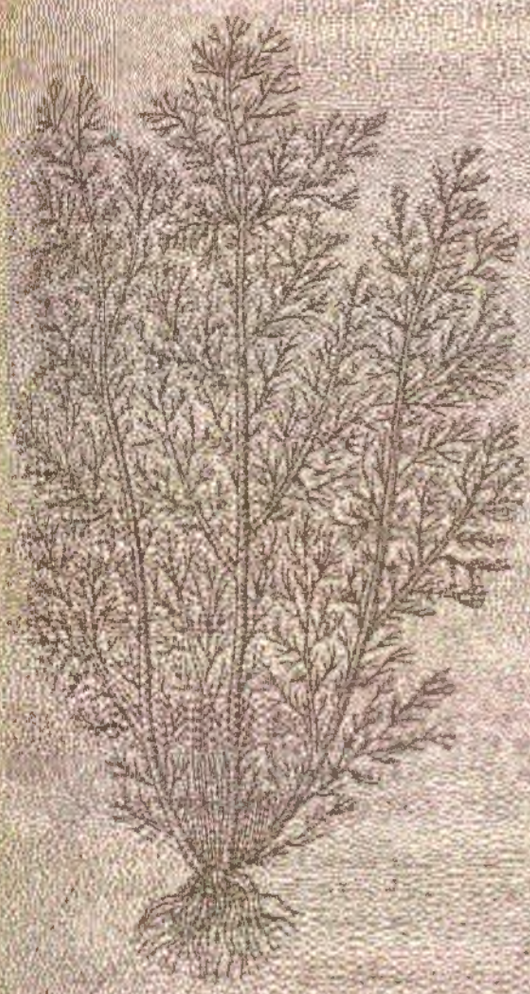
The Names.

Tabermontanus and *Gerard* from him make mention of most of these sorts. The fourth *Lobelius* saith was sent him by the name of *Portulaca aquatica*, yet calleth it *Alsine palustris minor folio oblongo*. The fifth he also calleth as it is in the title. The last was called by *Tragus Handlekraut*, not well knowing what name to give it, having the leaves divided somewhat like to crowes hand, and that made *Thalius* also to call it *Ranilla Bohemica cordis heri*, *Lugdunensis* saith that some in those parts called it *Elatine trifolium*. *Tabermontanus* called it *Alsine rotunda*, and so doth *Gerard* also, but *Lobelius Alsine trifolia cordata*.

The Vertues.

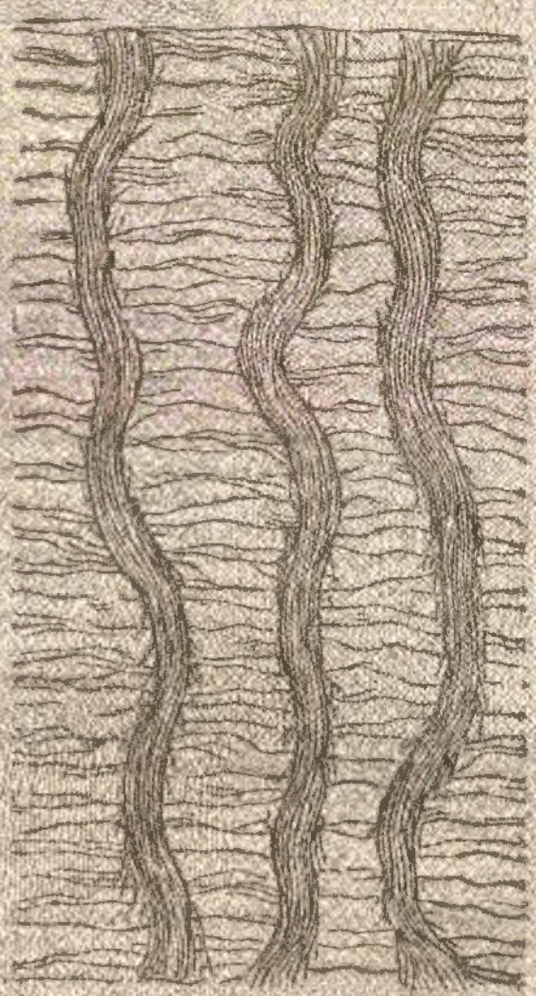
The properties of these Chickweedes, are no doubt like unto the other Chickweedes, their place of growing forme and taste being insipide, watery and cold, declaring the same, and therefore whatsoever may be said of these is to bee found among the others, and therefore to avoid repetitions, I referre you to the rest spoken of before, where you may be abundantly satisfied.

CHAP. XXXIII.



Alga aquatilis & Conferva. Fresh Water Excrescences.

There are an infinite number as I may so say, of Sea Excrescences, called by sundry names as you shall further understand when I come to speake of them, which I would separate from those that grow in the fresh waters and entreate of these in this Chapter, which although few, have yet several names whereby to be called.



1. *Alga sive Conferva fontalis trichodes.* Water Maidenhaire.

The water Maidenhaire groweth upon the stones in the bottome of springs, fastening it selfe there to, and from thence,

1. *Alga fine Conferva fontana vulgaris.*
Water Maiden-hayre.

2. *Alga aquatilis Capillacea fine Conferva flava, alga Linum aquaticum.*
The Hatfield or hairy water weede.

...with smooth tooth'd sundry fine greene stalkes with pithy fine threds in them, of a sub as length sometime, growing smooth out at length, and sometimes foulded one within another, without any other leaves upon them which when they are dry turne to be somewhat browne, and are of little or no valle at all.

3. *Alga aquatilis Capillacea fine Conferva flava, alga Linum aquaticum.*
The rhteddy or hairy Water weede.

This Water weede groweth from the mudde in the bottome of lakes and other standing waters, and sometimes in slow running Rivers, which is wholly compofed of a number of greene browniſh threds or haires joyned together floting thereon, falling and waving to and fro all the length thereof, as the current of the ſtreame runs whot the weede driveth them, and are ſometimes a yard long or more.

4. *Filum aqueum Scoticum ſive Germanicum.* The *Scottiſh* or *Germane* blacke ſtringy plum.

This likewiſe prowerth from ſome ſmall ſtone in the bottome of the crauckes of water neere the Sea thereof is of two inches in length, being nothing elſe then a number of thicke ſome ſmooth, and blackiſh long ſtrings, folded one along another, and hath neither roote leafe nor flower.

5. *Alga Bombycina.* The Water Cotton plant.

There groweth ſome like unto a long and much ſpread locke of ſoft Wooll or Cotton, growing thicke together, ſometime ſome inche in breadth of a pale greene colour on the upperſide, and whitiſh underneath, and ſwimmeth on the tops of the water in pooles &c.

The Place and Time.

The firſt of theſe doe grow in rivers and poinds, I one not farre of this City, and others in other places, and are to be ſeene in the Summer time onely floating upon the Waters. *Lugdunenſis* ſaith that the ſecond was found in the greater Lake of *Lombardy* neere *Millane*.

The Names.

The firſt is called by *Lugdunenſis Conferva tubulata, vel Trichomanes aquatica*, and *Gerardus Alga fontalis erecta*. The ſecond is the *Conferva* of *Pliny* by *Lobel, Lugdunenſis* and *Anguillara* declare them and as *Lugdunenſis* called them by the *Florentines*, *Imperatus* called this *Linum aquaticum*, as he doth another very like this *Linum aquaticum*. *Bauhine* calleth it *Alga viridis capillacea folio*. The third *Bauhine* calleth *Alga viridis capillacea folio*, *Plinij* *Conferva*, ſaying it was ſent him out of *Scotland*. The laſt he alſo ſaith that he had from the Sea and giveth it the ſame title that I have preſixed before it. I have alſo given them their *Engliſh* names, as nearing unto them as I thincke.

The Vertues.

It is recorded that he knew one cured incredible quickly with his *Conferva* of a fall from a tree, while he ſtopped the blood, which had brake almoſt all his bones, by having the herbe bound to his whole body when it was waſhed moiſtned with the water thereof, as often as it grew dry, and but ſeldome changed.

CHAP. XXXIIII.

Lens palustris, sive Lenticula aquatica. Water Lentils.

THere are three or foure herbes to be referred to these Lentils, which are differing one from another, their place of breeding being their chiefest cause of affinity.

1. *Lens palustris sive aquatica vulgaris.* Duckes meate.

This small water herbe consisteth of nothing but small round greene leaves, lying on the toppe of standing waters, in ponds, poules, and ditches, without either flower or seede that ever could be observed, onely from the middle of each leafe on the underside, there grow certaine small threds finer than haires, which passe downe into the water, but are not thought to descend to the ground from thence to draw nourishment. *Matthiolus* (and from him *Lugdunensis*) reporteth a strange narration, and I may say incredible; That if it should happen (as sometimes it commeth to passe) by inundations, that these small Lentils or Duckes meate be carried away into running rivers, as soone as they cleave to the shore, they are wonderfully increased: for by the rootes that will grow from them like threds, they fasten themselves into the ground, and then growing, become to be plantes like unto *Nasturtium* water Mintes, or Ladies smockes; and that this thing hath been observed by diligent searchers of nature, not without much wonder of the matter: *foilets.*

2. *Lens palustris sive aquatica quadrifolia.* Crosse leafed water Lentils or Duckes meate.

This other *Lens* hath a small long slender roote shooting forth square slender weake and trailing stalkes, with sundry small leaves upon severall long foote stalkes, standing together at the joynts distinct one from an other, which are parted into foure leaves a peece, and sometimes it hath been observed with six leaves, each end being round and lying in a square forme like a crosse upon the water: at the joynts likewise with the leaves, come forth diverse small heads or seede in chiliers, wherein are enclosed small blackish seede like unto the seede Lentils, but not so flat, being thicke and hard. *Lugdunensis* setteth forth this kinde of water plant, by the name of *Lemna Theophrasti*, in a much differing manner.

3. *Lens palustris latifolia punctata.* Broad leafed spotted water Lentils.

This water Lentill hath sundry round leaves set by couples on long stalkes, of an excellent greene colour on the upperside, pricke very full of very fine spots, and under them many small Lentill like heads cleaving unto them, some having but one, others two three or foure at a place, covered with a rough or rugged thin huske, very full of fine small yellowish seede: at the bottome of these winged stalkes of leaves grow the rootes, which are full of long strings and fibers: it is onely of a watrish taste.

4. *Lenticula aquatica bifolia Neapolitana.* Neapolitane water Lentils.

The water Lentils of *Naples*, hath very fine long slender stalkes, with leaves set together by couples, lying long upon the water, having seede vessels growing hard unto them, foure usually joyned together.

The Place and Time.

The first onely of these is familiar in our land as I take it: the third *Bauhinus* saith, groweth in the watery ditches at *Padua*, in the river *Amene* by *Pisa*, and in *Silesia* neere unto *Vratislavia*, the rest are all strangers, and not in their freshest beauty in the beginning of the yeare.

1. *Lens palustris sive aquatica vulgaris.* Duckes meate.

2. *Lens palustris quadrifolia.* Crosse leafed water Lentils, or Duckes meate.

The Names.

It is called in Greeke ἀκιδοειδὲς τὸ πετραῖον, some take it to bee one of *Theophrastus*: in Latine *Lens palustris*, and *Lenticula palustris & aquatica*, and so do all Authors call the best sort: the second is the *Lens palustris altera* of *Matthiolus*, and *Lemna Theophrasti* by *Lobelius*: as also the *Lenticula alterum genus* of *Cæsalpinus*, which *Lobelius* calleth *Lenticula palustris quadrifolia*: the third called by *Bauhinus* in his *Pinax*, *Lens palustris latifolia* quibusdam, being better expreſt in his *Matthiolus*, then in his *Theophrastus*, and by *Cæsalpinus* taken to bee *Stratiotes altera Dioscoridis*: The last is mentioned by *Columna* by the name of *Callitriche* of *Pliny* lib. 25. c. 11. mervailing it did (or supposing the *Corydalos aquaticus*, as it is erroniously called (being a marsh Crowefoote, as the hot taste of the thereof doth testifie) not be *Callitriche* of *Pliny*; but saith this of his is not the right, but taketh that *Pliny* meant the *Trichomanes*, by his *Callitriche*, which I thinke cannot hold good, neither the one nor the other, for his words in the place before cited are these. *Fit ex Callitriche floris initio purpura, folia sunt Lenticulæ similia, coloris pene viridissimi, radice mitissima nascitur in aquis & lutosis locis aquarum fervens*; thus much *Pliny*: which it is likely that *Columna* comparing his with this of *Pliny*, both for time and quality, not to dare to affirme it the same, because with *Pliny* it is *post ferventes*; which neither his nor *Trichomanes* is. *Bauhinus* calleth it *Lenticula palustris bifoliata vel angulosa*. The *Arabians* call it *Tahalab*, and *Thalab el Lahana*, *Lentè de palude*, and *Lenticularia*; the *Spaniards*, *Lenteille del lagua*; the *French*, *Lentille d'eau*; the *Germans*, *Wasser linsen*; the *Dutch*, *Water linsen*, but more usually *Eenden gruen*, that is Duckes herbe; and so we in *England* Duckes meate, and of some, Water Lentils: the leaves is called by the *Italians*, with whom it is plentifull, *Lenne palustre del seme*.

1. *Lens palustris latifolia punctata & Lenticula aquatica Neapolitana.* Broad leafed spotted Water Lentils, and that of Naples.

The Vertues.

It is cold and moist as *Galen* saith in the second degree, and is effectuall to helpe inflammations, and Saint *Anthonies* fire, as also the Goute, either applied by it selfe, or else in a pultis with barlie meale: it is also good for ruptures in young children. Some saith *Matthiolus* do highly esteeme of the destilled water of the herbe against all inward inflammations and pestilent feavers, as also to helpe the redneſſe of the eyes, the swellings of the eods, and of the testes before they be growen too much, for it doth not weakely repell the humours: the fresh herbe applied to the forehead, easeth the paines of the headache comming of heate. Duckes do greedilie devoure it, and so will Hens if it be given them mingled with branne.

Chap. XXXV.

Pseudocyperi. Ballard or unsavoury Cyperus.

Whereas in the end of the first Classis or Tribe of this Worke, I have shewed you sundry sorts of sweete smelling Cyperuses, but there are many other sorts that smell not at all, called either ballard or unsavoury Cyperus, somewhat resembling the sweete sorts, both the round and long rooted Cyperus, and there are likewise also growing in the moorish places like unto them in roote or leafe, and therefore called Cyperus fooles. Of the former sorts called Unsavoury Cyperus, I meane to entreate in this Chapter, and of the other in the next following.

1. *Cyperus longus inodorus vulgaris.* Unsavoury Cyperus with long rootes.

The long rooted Cyperus hath divers long and narrow rough three square leaves rising from the roote, enclosing one another at the bottome, from among which riseth up a three square stalke foure or five foote high, with some such leaves thereon, but smaller to the toppe, at each of whose upper joynts breake forth three rough and almost round burres upon short footestalkes, the roote creeperh under ground somewhat like as the sweete long Cyperus, but blackish and with many more fibres thereat, and without any sent in it.

2. *Cyperus longus inodorus sylvestris.* Mountaine or Wood unsavoury Cyperus.

The other long rooted Cyperus hath long joynted reddish rootes, and many long and narrow rough greene leaves rising therefrom, compassed in the beginning with a reddish skinne: neither stalke nor head hard as yet have observed.

3. *Cyperus rotundus sine odore Anglicus.* English round rooted unsavoury Sea Cyperus.

This round rooted Sea Cyperus hath divers round rootes fastened together by strings, almost after the manner of Asphodill rootes, shooting forth sundry heads of leaves that are long and narrow, three square and cornered, the stalke

1. Cyperus longus radicosus.
Valerian Cyperus with long roots.

3. Cyperus rotundus [illegible]
Bagillo [illegible]

4. Cyperus rotundus [illegible]
Valerian rooted with Cyperus

2. Cyperus rotundus litoreus radicosus dactylitus alter
Another round rooted sea-wort; Sea Cyperus.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

...as a three foot or five foote high and more, at each upper joynt whereof with the leaves come forth long ...heads, the whole plant is utterly without sent at all.

...*Cyperus rotundus fatidus inodorus Anglicus alter.* Another round rooted *English* Sea Cyperus.

...Another *Cyperus* like that is very like the last, both in rootes and leaves, but differeth from it in this, that it hath at ...the stalkes three or foure blackish scaly heads set together at severall places with the leaves.

...*Cyperus rotundus inodorus aquaticus.* Vnsavoury water round rooted Cyperus.

...Another Cyperus hath sundry blackish round rootes, set with many small fibres as they spread in the ground ...whence rise such like couered leaves and stalkes, as in the former, at the tops whereof with the leaves, ...are set long panicles.

Cyperus rotundus inodorus aquaticus alter.

Another Vnsavoury water round rooted Cyperus.

C. Cyperus rotundus inodorus aquaticus alter.
Another Vnsavoury water round rooted Cyperus.

That Cyperus is very like the last sort in the rootes, being somewhat long and round, like Olives, and many fibres at them, but the leaves are much longer, and the stalkes farre higher, though beside like unto it panicles are there set more eminent, with some long leaves amongst them.

The Place and Time.

The first is often found with us in the borders of fields and woods; the second in *Germany*, the third and fourth in the Sea ooze, in divers places both of *Shepey*, and *Thames* side, and in other places, the fifth on the banckes and ...sides of the river *Scheld* by *Antwerpe*, and the last plentifully in the low marshes beyond *Ratcliffe*, and ate in seede ...time of *August*.

The Names.

The first is called by *Lobel Cyperus longus inodorus sylvestris*, and by *Bauhine Cyperus longus inodorus Germanicus*; the second he calleth as it is in the title. The third *Lobel* calleth *Cyperus rotundus inodorus litoreus*, *Caesalpinus Pisanus*, saying the *Florentines* call it *Nodo*, and *Bauhine Cyperus rotundus inodorus Anglicus* as I doe, but that I adde ...thereunto, and terme both it and all the rest *Cyperus* ...the weed before in the first Classis. The fourth ...of the last, chiefly differing in the toppe heads, ...calleth *Cyperus rotundus inodorus Germanicus*, ...saith that because the figure of *Lobels aquaticus* ...*septentrionalium*, which in my mind was false, he set out this ...right, but this differeth both in rootes and heads from ...agreeing better with the former, which is my third ...*Lobel* saith his *aquaticus Septentrionalium* hath long panicles which this hath not. The fifth is termed as I said by ...*Cyperus aquaticus Septentrionalium*, by *Camerarius* ...*rotundus nigras inodorus radices habens*, being a different sort also from the next, especially in the heads, the ...which not beene published by any before.

The Vertues.

All these sorts of unsavoury Cyperus, doe declare that they are as defective in heate and dryenesse, as in sent ...the sweete kinder, and therefore for any thing I can learne are not used for any purpose in Physicke.

Chap. XXXVI.

Gramina Cyperoides. Cyperus like Grasses.

There are so many sorts of these Cyperus like Grasses that I know not well how to divide them, and ...therefore must set them all together in one Chapter, and speake as briefly of them as I can.

1. *Gramen Cyperoides majus latifolium.* The greater sort of Cyperus Grasse.

This greater Cyperus Grasse hath sundry large and long leaves like unto those of Weedes, (*Lobel* ...compareth them unto those of Gilloflowers) among which rise up divers three square stalkes, bearing three ...or foure little spiked brownish heads thereon one above another: the roote is brownish and foulding it selfe one ...within another with many fibres at them. Of this sort there is another, called by *Bauhine*, *Gramen Cyperoides ...alterum*, whose rootes are more bushy and fibrous, and the spiked heads more greene, having ...a narrow leafe under the lowest head.

2. *Gramen Cyperoides majus angustifolium.* A great sort of Cyperus Grasse with narrow leaves.

This differeth little from the last, but in growing lower, with narrower leaves and spiked heads, that are ...lesse and longer, but of the same brownish greene colour with it.

3. *Gramen Cyperoides minus angustifolium.* The lesser narrow leafed Cyperus grasse.

This hath narrower leaves and three square stalkes, bearing smaller and more spiked long heads, set ...more loosely together one a little from the other more stiffe also and upright, the roote hath long ...strings and fibres thereat, shooting forth like Cyperus.

4. *Pseudocyperum spica brevi pendula.* Ballard Cyperus with short pendulous heads.

The Ballard Cyperus groweth somewhat like unto the true long Cyperus, having large and long grasse leaves

in

1. Gramen Cyperoides majus latifolium.
The greater broad leaved Cyperus Grasse.

2. Gramen Cyperoides minus spicatum angustifolium.
The lesser Cyperus Grasse with long spiked heads.

4. Cyperus sive Gramen Cyperoides spicatum latifolium.
Broad leaved Cyperus with spiked heads.

6. Gramen Cyperoides spicatum latifolium &c.
Marsh C. grasse spiked with broad heads.

9. Gramen Cyperoides paniculatum majus.
The greater Panick Cyperus grasse.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

1. Gramen Cyperoides latifolium.
The leſſer Marſh Cyperus graſſe.

2. Gramen Cyperoides Dioicum glabrum.
The Dantſh Cyperus graſſe.

3. Gramen Cyperoides paluſtre panicula ſparſa.
Marſh Cyperus Graſſe with ſparſed heads.

4. Gramen Cyperoides paluſtre panicula longiore.
Another ſort of Ballard Cyperus graſſe.

5. Gramen Cyperoides paluſtre maius.
The greater Marſh Cyperus Graſſe.

6. Gramen Cyperoides paluſtre minus.
The leſſer Marſh Cyperus Graſſe.

2. Graman

13. Gramen Cyperoides palustre Bayonense.
Marsh Cyperus Grasse of Bayon.

14. Gramen Cyperoides Bayonense spicis longis pannicula.
The Cyperus Grasse of Bayon with long spikes in panicles.

9. *Gramen Cyperoides spicis minus compactis.* Marsh Cyperus Grasse with more open heads.

The roote hereof is somewhat hard or woodey and full of fibres bearing many long and narrow leaves like to Grasse, among which riseth a rough three square stalke bare of leaves for the most part unto the toppe, whereupon stand severall small rough heades or spikes, more loose or open then the former, having sharpe prickles likewise within them.

10. *Gramen Cyperoides paniculâ sparsâ subflavescente.* Yellow with open headed Cyperus Grasse.

This yellow headed Grasse hath smaller and shorter leaves and naked stalkes then any of the former, bearing at the toppes betweene two small long leaves, a head severed into many small parts or spikes of a yellowish colour: the roote is great at the head with divers fibres thereat. Of this sort there is another differing little from it, but in the colour of the small spikes which are blackish. *Planula nigricans.*

11. *Gramen Cyperoides Dancum glabrum folijs Carjophylleis.* A Danish Cyperus Grasse.

This Danish Cyperus Grasse hath divers stalkes with sundry narrow stiffe and smooth leaves, three or foure inches long apeece, set together at the middle of them, from among which rise naked short stalkes, bearing at the toppes from betweene usually two long leaves, diverse small long spiked heads, spread like those of Rushes, all brownish greene colour: the roote is slender creeping under ground, shooting forth in divers places.

12. *Graminis Cyperoides spicato fusca elegantissima panicula Bayonensis.*

A fine browne spiked Cyperus Grasse of Bayon.

This fine spiked Cyperus grasse hath sundry long and narrow leaves among which rise up three square stalkes, jointed in divers places and long leaves at them, with whom towards the toppes come forth long bushing spiked heads, somewhat hard but not pricking each being two or three inches long of a very fine pale brownish colour: the rootes are a bush of many thicke strings.

13. *Gramen Cyperoides palustre Bayonense.* Marsh Cyperus grasse of Bayon.

This Cyperus grasse of Bayon, hath divers narrow long leaves, both below and on the small stalkes, which are about two foote high bearing at the toppes sundry long and sharpe prickely heads with long leaves at them: the roote is compoled of sundry long thicke strings and fibres.

14. *Gramen Cyperoides Bayonense spicis longis in panicula fusilis.*

Cyperus grasse of Bayon with browne Corkes roote panickles.

This Grasse of Bayon hath three square stalkes almost two foote high, and very long narrow leaves even to it and a halfe a peece at the bottome of them, and the like also at the joynts, with wings towards the toppes: from forth very long and slender pannickles of a brownish colour, being three or foure inches long and of the bignesse of a Mouse taile, somtimes but one at a joynt, but usually two, and sometimes three, the rootes are full of many greater strings and fibres at them.

The Place and Time.

All these sorts of Grasses grow in low moist and moorish grounds many of them as well in the corne fields as others, divers also have their severall places expressed in their titles, and do all flourish and grow in the Summer.

The

The Names.

From the like reason as I said unto both Cyperus and Grasse in leaves or roots, be all these sorts entituled *Cyperomorum*. The first whereof is the *Gramen Cyperoides* of *Lobel*, *Camerarius* and others, *Bauhinus* taketh it for the *Gramen quartum genus* of *Tragus*, which *Lugdunensis* calleth *Carex Tragi*: but in that *Tragus* saith, his grew in dry sandy grounds and fields, and having the spiked heads more dispersed then that of *Lobel*, I presume cannot be both one plant. The second is by *Bauhinus* called *Gramen Cyperoides angustifolium spica spadicea*, as the other sort of the first he called *Latifolium majus*. The third hath not beene described by Authors. The fourth is the *Blendosperum* of *Lobel*, *Gesner* and *Dodonæus*. The fifth is described by *Bauhinus* under the twelfth title. The sixth is the *Gramen Cyperoides aquaticum vulgatius* of *Lobel*. The seventh is called by *Lobel* as it is in the title, but *Thalius* calleth it *Gramen Juncum triquetrum*. The eighth is the *Lobel Gramen Cyperoides parvum aquaticum*. The ninth is so called by *Bauhinus* as it is in the title, and so is the tenth also, but *Tabernæmontanus* saith it is the *Carex minor* of *Lonicerus*, and the fourth the *Alopecuroides* of *Tragus*, which *Lugdunensis* setteth in the third place and figure, as also his *Juncus exiguus pratensis*, and the *Gramen marinum spicatum Lonicerij*. The foure last sorts have not beene set forth before now.

The Vertues.

There is none of these Grasses used for man or beast that I can learne, being most of them sharing or cutting Grasses especially unprofitable for any Physicall use.

Chap. XXXVII.

Gramina Juncea palustria, aquatica, &c. Rush-like Grasses of the Marshes, Waters, &c.

AS in the former Chapters I shewed you divers sorts of Rush-like Grasses, that grew on the upper grounds, in like sort I meane to exhibite those of the lower, and indifferently dispose them together, whether they be naturall to the Marshes, or Moorish grounds, the waters, or the Sea sides.

1. *Gramen Junceum palustre viscernosa semine.* Marsh Rush like grasse with seedes in clusters.

This Rush grasse hath but few small Rush like leaves, rising from the blackish threddy roote: from among which leaves rise up divers stalkes a cubit high, bearing at the toppes betweene small long leaves a small head, formed like unto a bunch of grapes, wherein lie the seede.

2. *Gramen Junceum minimum aquaticum capitula squamosa.* A very small water Rush like grasse.

This small water Rush grasse hath as few, but smaller leaves then the former, being about two inches long: the slender stalkes are foure or five inches high, each of them bearing a small scaly reddish head, with the toppe of the same appearing above it: this is not that sort as expressed in the former Chapter among other Rush grasses.

There is another somewhat like hereunto, but that the stalke appeareth above the head, which is not scaly.

3. *Gramen aquaticum Junceum vulgare.* The Common Water Rush grasse.

4. *Gramen Junceum aquaticum magis sparsa panicula.* Another water Rush grasse with joyned leaves.

3. Gramen aquaticum Rubrifolio ... Rubrum
The double worme of Water Rush grasse

4. Gramen ... latifolium ...
The great Sea Rush like Grasse

7. Gramen ... marinum ...
Sea Rush Grasse

9. Gramen ... Plantaginis
Small Rush grasse of Plantaginis

10. Gramen ... aquaticum ...
Rush like Grasse with pen leaves

11. Gramen ... aquaticum ...
The great Rush Grasse

3. Gramen ... aquaticum vulgare. The common water Rush grasse.

The common water Rush grasse shooteth forth sundry jointed stalkes, from a long thicke spreading ... at each joynt a narrow Rush like leafe, at the toppes of whom stand divers small heades ... like unto those of Rushes

4. Gramen

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

4. *Gramen Iuncinum aquaticum magis Sparganij folio.* The other water Rush grasse with joynted leaues.

The other water Rush grasse is very like in the growing vnto the last, the chiefest differences be in the stalkes, for it groweth and rise higher, in the leaues which are joynted like vnto the wood Rush grasse, and in the tops which are more spread with small heads.

5. *Gramen Iuncinum aquaticum Bauhini. Bauhinus* his double formed water Rush grasse.

Bauhinus added this double formed kinde of Rush grasse of *Bauhinus*, called *aquaticum*, whereby he did couch that *Gramen aquaticum alterum* which *Lobel* and *Tabermontanus* set forth, because the leaues had no ioynts in them, as the true sort should haue, (but is rather another sort as I thinke,) for having gotten figures with many small rules or heades, such as it beareth in the Summer time, he sheweth another, that the yeare he saith after hay harvest, shooteth forth another hand-high stalke with certaine chaffie heades, parted into three rods, and seldome beareth then any such like heads as the former, not having seene his sort, I cannot further iudge thereof, but giue you my opinion.

6. *Gramen Iuncinum maritimum majus.* The greater Sea Rushlike grasse.

The greater Sea Rush grasse hath many hard smooth leaues, like Rushes, rising from the rafted roote, and among them sundry slender naked stalkes about a foote high, with Rush like heades growing at the toppes, but not so small.

7. *Gramen Iuncinum maritimum densè spicatum.* Thicke set Sea Rushlike grasse.

This Sea grasse hath long hard leaues like Rushes, growing thicke and close together, the stalkes are slender and much longer than the leaues, euery one bearing a small head at the toppe like vnto a Rush, whereunto the leaues are like also.

8. *Gramen Iuncinum maritimum minimum Zelandicum.* The least Sea Rushlike grasse of *Zeland*.

The whole plant (for it exceedeth halfe a cubit in height, but spreadeth like a small rudocke from each seuerall roote whereof riseth a single small stalke, with small hairy like leaues therewith, & a small thicke head at the top.

9. *Gramen Iuncinum maritimum exile Plimothj.* Small Sea Rush grasse of *Plimmouth*.

The leaues of this small Rush grasse are many, growing thicke together, and as fine almost as haire or threds, among which rise vp sundry slender vnioynted stalkes, bearing exceeding small sharpe pointed heades thereon, the leaues appearing aboue them, and pointed: the roote is many small long fibres. This was found as well at *Dunnab* as *Dower* in their wet grounds.

10. *Gramen Iuncinum magnitudi pusillum.* A lesser Rush grasse with fewer leaues.

This small grasse hath fewer and shorter stalkes and leaues than the last, more soft also and delicate, whose heads are little bigger and prickly, and the stalke rising aboue them as in the other: the roote is small and slender.

11. *Gramen Iuncinum minimum Helosto Matthioli congener.* The smallest Rush grasse, like the former Toad grasse.

This little grasse groweth with sundry small thred like leaues, scarse an inch and a halfe long, with smaller vnioynted stalkes, which are about twise their length, at whose toppes stand two or three small heades like to shotes of Rushes but with rounder graines or seedes therein, and closer set together, the roote is very small and threddy.

The Place and Time.

All these grasses are sufficiently declared in what manner of places they grow, flourishing in the Summer time, and tell thus.

The Names.

The first, second, fifth, and eight, are of *Bauhinus* mention. The third of *Tabermontanus* and *Lobel*, and so also the last and seuenth, the rest haue not beene exhibited by any before.

The Vertues.

There can as little be said of these Grasses being hard and vnpleasant, that no cattle will feede thereon as of others before, nor hauing in them any medicinable quality for man.

Chap. XXXVIII.

Gramen Iuncinum lanatum siue Bombycinum, vel Iuncus Bombycinus. Cotton Grasses or Rushes.

Haue heere set downe fiue sorts of these woolly or Cotton Grasses to shew you in this Chapter, which although they grow not all in wet grounds, yet resembling one another so neerely, I did not thinke it good to separate them, but set them altogether.

1. *Gramen Iuncoides lanatum siue Iuncus Bombycinus vulgaris.* Common feather or Cotton grasse.

The ordinary Cotton Grasse hath a few long slender leaues, almost like Rushes rising from a small creeping threasill or root somewhat deepe into the moorish ground, wherein it usually groweth, and among them rise vp sundry stalkes, about a foote high, sometimes with a leafe or two thereon, and sometimes without either leafe or ioynt, bearing at their toppes a fine soft woolly or rather white silkelike head, finer then the finest white wooll of the bigneffe usually of a Wallnut, with the outer huske, which is so eminent in once eye a faire obiect, giuen much delight and admiration to the beholders, which passeth away into the winde being full ripe, what seede it hath is not obserued.

2. *Gramen Iuncoides lanatum alterum Danicum.* The Danish Cotton Grasse.

This Cotton Grasse hath many more and narrower Rush like leaues growing from the roote, then the former, the stalkes are nothing so high as it, and the fine Cottony head is smaller and not so pure white: the rootes are small stalkes.

3. *Gramen Iuncinum lanatum minus.* Small *French* Cotton Grasse.

Although this hath many more Rushy leaues then any of the former, yet doe not the stalkes rise much higher, but carry their rootes of great a tuft or Cottony head, but are small and somewhat long, flying away with the winde being ripe, leauing a small head like a Crowfoote head of seede behind it: the roote is somewhat small, and not much vnlike the former.

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

4. *Gramen tomentosum Alpinum minus.*
Small mountaine Cotton graſſe.

From a ſmall unprofitable roote riſeth a ſmall ſtalke halfe a foote high, with two or three leaves thereon, at the toppe whereof ſtandeth a ſmall round head of Cotton.

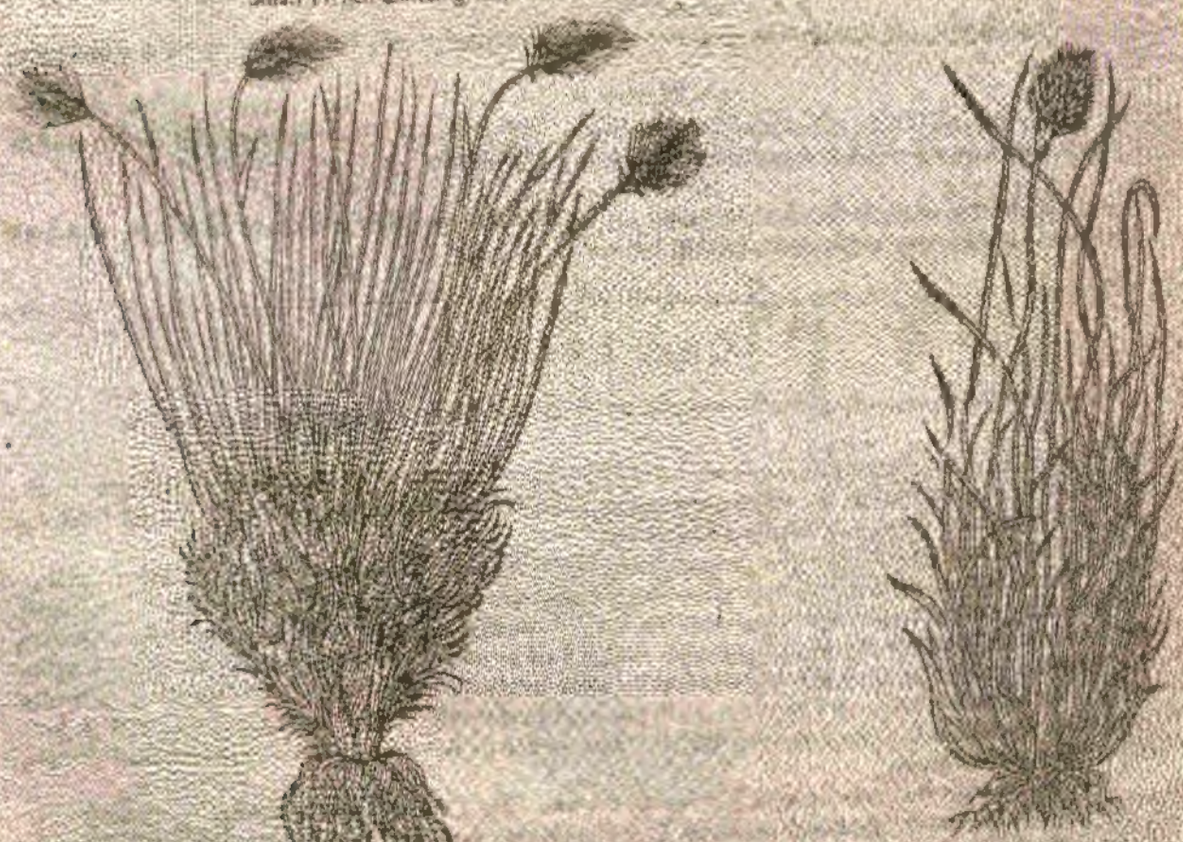
5. *Iuncus Alpinus Bombycinus.*
Mountaine Cotton Ruſh.

This alſo ſendeth forth from a Ruſh like roote, divers Ruſhes, and among them ſundry ſlender ſtalkes an handbreadth high, bearing a ſmall white head of wooll or cotton like the reſt.

The Place and Time.

The firſt groweth in many places of this Kingdome, and on *Hampſtead* heath neere *London*, about a bogge there, the ſecond at *Alpnach*, in great abundance, and in *Germany* alſo: the third about *Mompelier*, the fourth in ſome moiſt places of the *Alpes*, the laſt in *Moravia*, and flourith chiefly in *July*.

The Names.



The firſt is diverſly called by divers Authours, according as their knowledge and opinion thereof led them, for *Tragus* tooke it to be the *Gnaphalium* of *Dioſcorides*, *Auguillara* his *Typha*, *Geſner* and others *Linum gracile*: the *Germane* name being *Maſien ſtarbt*, *Lobel Iuncus Bombycinus*, *Dodonæus Gramen Scirpheum*, *Thalius Gramen Iunceum latifolium*, *Tabernæmontanus*, *Gramen tomentoſum & Linagroſtis*. The ſecond is the *Iuncus Alpinus capitulo Longiſſimo* of *Bauhinus*, although

1. *Gramen Iuncum Lanatum minus.*
Small Finnell Cotton graſſe.

1. *Gramen tomentoſum Iuncifolium Alpinum.*
Cotton graſſe like Ruſh, another of Denmarke.

5. *Iuncus Alpinus Bombycinus.*
Mountaine Cotton Ruſh.

the figure exhibited was taken after the manner of the Daniſh growth, the fourth was ſent by the right honorable The laſt is entituled as *Bauhinus* giveth it.

The Vertues.

Cordus onely ſaith of the firſt, that the decoction thereof in wine, and taken warme, eaſeth the griping paines of the belly. The woolly heads are gathered by divers, to ſerve both to Ruſſe beds and cuſhions, and the diſh for the ſoftneſſe and goodneſſe farre excelleth any Thiſtle downe.

Cha-

Chap. XXXIX.

Gramen Arundinaceum palustre. Marsh Reede Grasse.

HAue shewed you in the last Chaffis before this, these sorts of Reede grasses, that mostly grow on the upper grounds, with high Culmes in the lower also. In this I shall entreat of such as grow in wetter or marshy places.

1. *Gramen Arundinaceum maximum Theophrasti.* Great Marsh Reede grasse of Lugd.

This great Reede grasse doth vsually bring forth great Culmes and very tall stalkes as high as any man, growing vp to the tops, with long & somewhat broad hard rough and sharpe leaues like the former, set here and there below, towards the toppes of the stalkes, with diuerse leaues come forth many spiked tufts of chaffie heads, long, small long roses like alles, the whole pannicle being a foote long and more: the roote creepeth farre vnder the watery ditches and places neere at Tabe or Lake, where it groweth.

2. *Gramen Arundinaceum maximum spica villosa.* Our great Reed grasse with chaffie heads.

This sort of Reedegrasse hath many faire large Reedelike leaues, growing from a jointed reddish roote, and is very much vnlike to those of Millet grasse, but harder rougher, and sharper at the edges of them, hauing great Reedelike stalkes three cubits high, jointed also and branched, and towards the toppe bearing large, and somewhat hard pannicles of spiked chaffie heads each of them about a spanne long, of a whitish colour in some places, and reddish in others, wherein lye small seede.

3. *Gramen Arundinaceum spica molliore lanuginosa.* A softer soft headed Reede grasse.

This other Reede grasse is somewhat like the last, but softer, with narrower and shorter leaues, and lower stalkes with but few joynts and leaues on them, the curled heads that stand at the toppes are somewhat like to the Rabbit that is called ballard *Leporinum*, and turne into downe that is carryed away with the winde: the roote are many long strings set together at a head.

The Place and Time.

The place of the first hath beene expressed in the description, the two other grow in like wet moist grounds by waters sides, *Lodon*, and flourish in the Summer time.

The Names.

Kexpos was in Greeke, and so also *Calamus*, *Arundo*, or *Gramen Arundinaceum* in Latine, are so fitly applyed to this kinde as the former, all these being of later inuention, none hauing published any of them before.

1. *Gramen Arundinaceum maximum Theophrasti.*
Great Marsh Reede grasse of Lugd.

2. *Gramen Arundinaceum maximum spica villosa.*
Great Reede grasse with chaffie heads.

The Former.

We have not yet heard or learned of any good property they have for medecine.

CHAP. XL.

Gramen aquaticum. Water Grasses.

THere are some other sorts of Grasses that properly grow in the Water, rehearsed of sundry Authors, which I thought good to adde to the rest of the Sea plants.

1. *Gramen aquaticum majus.* Great water Grasse.

This great Water Grasse hath great and tall stalkes full of joynts with large Reede like leaves thereupon set with white and greene, like Ladies laces, but not so vidrunke as those except in the ages almost, where standeth a large and long rufted pannicle of many parts and branches like the rest: the roote is long and spread farre shooting up in sundry places.

2. *Gramen aquaticum arundinaceum minus.* Least Water Reedegrasse.

The stalkes of this are great and high, having broader and longer leaves then the former, and more rufted pannicles also, the joynes also lower, and the rufted pannicle more spread and soft in handling, and of a pale greene colour, whose bloomings are white, the roottes creepe not so much as the former.

3. *Gramen aquaticum paniculâ sperosâ.* The thin headed water Grasse.

This Grasse riseth to be two cubits high, the leaves are broad and a foote long, but slenderly set on the stalke, somewhat rough on the edges, joynts whereof will be hollow like a quill: the stalke will grow strong in the way, the toppe pannicle is made of many fine soft scaly rufte very beautifull.

4. *Gramen aquaticum parvum minus.* Small bearded Water Grasse.

This Grasse sendeth forth from a thicke hard white fibrous roote, a round streked stalke, about two cubits high compassed with sundry broad rough pale greene leaves, three foote long. The toppe pannicle is set, some thinnely or sparsedly placed, made of many whitish heads, compassed with long smooth beardes.

5. *Gramen Echinatum aquaticum majus.* The greater prickly headed water Grasse.

The stalke of this Grasse riseth up two or three spannes above the water, in the ditches where it groweth, of divers long and narrow leaves, bearing at the toppes of the stalkes divers small prickely heads with long awes at them, the roottes thrust deepe in the mudde.

6. *Gramen echinatum aquaticum minus.* The lesser prickely headed water Grasse.

This other Grasse is like to the last both in the leaves and prickely heads but smaller, and have no leaves standing with them as the former hath.

1. *Gramen aquat. commune.* Great Water Reede.

2. *Gramen Arundinaceum majus vel vas.* Great Water Reede grasse.

7. *Gramen aquaticum spicatum.* Spiked Water Graſſe.

The Water ſpiked Graſſe hath ſundry weake ſtalkes, leaning every way, full of joynts which are ſomewhat knobby or round, taking roote againe in divers places having long and narrow leaves upon them, which growing upon and under the Water, that part that groweth up hath ſome leaves like unto the reſt, and a long tender browne ſpiked head at the toppe, the roote is thicke ſet in the middle with many ſtrings and fibres thereat.

8. *Gramen fluviatile.* Flote Graſſe.

The Flote graſſe groweth in the very like manner to the laſt, with leaning ſtalkes, and rooting at the joynts, but hath more ſtore of leaves on them, the toppes being furniſhed with ſundry ſpiked heads, two or three together, a joynt upwards.

9. *Gramen aquaticum album.* Another Water or Burre Graſſe.

The leaves of this Graſſe are long ſmooth and rounder, among which ariſeth up a ſtalke about halfe a yard high with a few leaves for the moſt part, and at the toppe a many ſmall rough heads like burres.

10. *Gramen Plantaginis cornutum.* Horned Flote graſſe.

This ſtrange Graſſe hath a very ſlender ſtalke about two foote high, joynted at ſundry places, and two ſmall ruſhy leaves for the moſt part ſet at each of them, growing ſomewhat broad, and compaſſing it at their ſetting on with a large ſkinne, from whence alſo ariſe one or two ſtalkes ending in a downy head, which hath at the roote three or foure very narrow leaves, turning downewards, and ſeeming like hornes: the roote is ſmall and chreddy.

11. *Gramen bulboſum aquaticum.* The Water bulbed Graſſe.

This Graſſe hath many ſmall bulbed roots ſpotted with yellow markes, and white within, not unlike garlicke, from whence ſpringeth up between two eares as it were a ſmall ſtalke about two inches long, with another longer ſtalke thereout, at the toppe whereof ſtandeth forth divers fibres, and from them divers long graſſie leaves even as the ſtalke or flower it bore, we are yet to learne, being thus rooted finely brought and chardy deſcribed.

The Place and Time.

The two firſt do grow in ponds and lakes, in ſundry places, as well of this Land as of others. Neere unto watery places about *Paſſe* and in *Hatfield* alſo. The fourth in the waters about *Aſhridge* by *Tring*. The fifth, ſixth, ſeventh, eighth and ninth in watery ditches and ponds in divers parts of the land. The laſt in the lakes neere *Hampſher*, and doe all flower in the Summer time.

The Names.

The firſt is the *Gramen aquaticum vaginis paniculatum* of *Tabernamontanus*. The ſecond the *Gramen aquaticum* of *Lobel*. The third and fourth are called by *Bauhinus Gramen paluſtre*, &c. but I have ranked them both under the title of *aquaticum*. The fifth and ſixth are not mentioned by any before. The ſeventh is ſo called by *Lobelius* as it is in the rude. The next hee calleth *Gramen unguis ſimile*. The ninth is called by *Lobelius Gramen aquaticum album*. The laſt is ſo called by *Bauhinus* as it is in the rude.

The Vertues.

Moſt of theſe Graſſes will ſtraſſes eare of, although we know not any uſe they have for any humane griefe.

CHAP. XLI.

Lythoxylon ſive Lignum lapideum. Stone Wood.

Lythoxylon poſticum Lapidem.
Stone wood, or Wood made Stone.

TIme yet addeth this Word made Stone, in the end of theſe freſh Water plants, ſeeing diverſe waters in this Kingdome as well as others have that property, that what ſhould forever greater or leſſer, groweth or ſinke ought, by letting it abide in the water, in the Summertime or Spring, for ſome time, according as the thicknelle will give time to penetrate it, the branches of trees and greene herbes, yea leather gloves, and many other have beene metamorphoſed into ſtone, keeping that forme or ſhape before it was put in, by the chilling quality of the water.

CHAP. XLII.

Gramina marina. Sea Graſſes.

THeſe Sea Graſſes as I ſaid before, are fitteſt to be joyned next unto the former Water Graſſes, wherein theſe I may ſhew you the reſt of the plants that grow in or neere the Sea, or within the ayre thereof, which are properly called Maritime plants.

1. *Gramen Caninum paniculatum maritimum ſpicatum.* Sea ſpiked Dogs graſſe or Quich graſſe.

This Sea Graſſe hath divers joynted ſtalkes about a foote high, with hard leaves thereon, a ſpanne long, and like the other quich graſſe, the ſpiked heads are ſhorter by much and harder, but the common ſtalke or roote is full of joynts and creepeth under ground like it.

Original from UNIVERSITY OF MICHIGAN

3. Gramen Caninum maritimum latifolium, Sea Dogs grasse with long rootes.

4. Gramen Caninum maritimum hirsutum, Rough Sea Grasse.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

2. *Gramen maritimum vulgatius Canarense simile.* Sea Quich graſſe.

The other Sea graſſe is a ſlenderer, harder, and lancker Graſſe then the ordinary quich graſſe, and of a more ble with greene colour, and differeth not in any thing elſe. But there are two other differing ſorts herein obſerved, the one in the rootes, which at the ſeverall joynts as it runneth, doth ſhoote up the like ſtalkes, leaves, and ſpiked tufts, and will be ſometimes twenty foote in length, with a number of thoſe tufts of ſtalkes and leaves at them: the other in the ſpike, which will have two rowes or orders in them.

3. *Gramen Caninum altrum maritimum longis radicatum.* Sea Dogs graſſe with long rootes.

This long rooted Sea Graſſe differeth little from the former, either in the hard leaves or in the running roote, but that they ſpread more, and inſtead of ſpiked heads at the toppes of the ſtalkes, this hath chaffie heads among the leaves.

4. *Gramen Caninum maritimum ſpicatum Monſpelienſe.* Sea ſpiked Dogs graſſe of Montpelier.

This *French* Sea graſſe hath ſlender woodly rootes, with but few fibres ſet thereat, from whence ſile divers trailing ſtalkes a foote or more high with ſundry joynts and branches at them, and ſhort narrow reedelike leaves on them, at the toppes whereof grow ſpiked heads of three inches long apeece, of a darkiſh aſh colour.

5. *Gramen Caninum maritimum aſperum.* Rough Sea graſſe.

The roote of this graſſe is a buſh of long white fibres, from whence ſpring many reddiſh round ſmall ſtalkes, which at the firſt leane downewards, about a foote high, compaſſed with hard ſhort and ſharpe pointed leaves, ſtanding as it were in a tuft together, with hard rough dents about the edges: the ſpiked heads are ſomewhat like unto ſmall rough hard burres, breaking out of a skinne wherein they were firſt enclоſed.

6. *Gramen exile viennense maris aggerum.* A ſmall graſſe of the Sea-ſervues.

This ſmall Sea graſſe ſhooteth forth divers ſhort ſtalkes of two inches long, full of ſmall long leaves like haire, ſet cloſe together, and among them at the toppes ſmall heads, like the catkins of the dwarfe Willow, the roote is ſmall and threddy.

7. *Oxygraſſis maritima Valentinæ.* Sharpe pointed Sea graſſe.

The buſhy ſtalkes hereof are about two foote long, full of joynts, with two long and narrow graſſe like leaves at every one of them, of a darke greene colour, and ſo ſharpe at the points that they are ready to pierce them legges that paſſe by it unawares.

8. *Gramen Iuncoides maritimum.* Sea Ruſh graſſe.

The Sea Ruſh graſſe hath from a blackiſh brownie ſingle roote, pleaſant in taſte and full of hairy fibres, ſundry ſhort ſtalkes about a foote long with ſlender limber Ruſh like leaves thereon, twiſt as long as the ſtalkes, and at the toppes three or foure leaves a ſpanne long, encompaſſing a rough head like a Ruſh which is full of chaffie ſeedes.

7. *Oxygraſſis maritima Valentinæ.*
Sharpe pointed Sea graſſe.

9. *Gramen maritimum ſpicatum.*
Spiked Sea graſſe.

9. *Gramen*

Original from UNIVERSITY OF MICHIGAN

10. *Gramen marinum spicatum alterum.*
Another sort of spiked Sea grasse.

9. *Gramen marinum spicatum.* Spiked Sea Grasse.

The roote of this Grasse is composed of a bush of many long [illegible] from whence rise many long hollowed or gutter leaves, compassing one another at the bottome, from whose spring two or three stalkes bare of leaves unto the tops where they beare long spiked heads of greenish [illegible] set thicke together.

10. *Gramen marinum spicatum alterum.*
Another sort of spiked Sea Grasse.

The leaves hereof are slender long narrow hard and sharpe pointed growing often on the low places nere the Sea, that commonly washeth over it, which no cattle will eate willingly, being reddish dry low stalks with small long and round heads thereon.

11. *Gramen marinum mediterraneum magni Scatitis spicibus.* Great Sea Thrift.

Although I have in my former Booke described and pictured both the sorts of Thrift, the greater and lesser, yet because I must shew you another sort of the greater kinde, I will here againe briefly remember them, and shew you that the greater of them groweth with many fat & long and somewhat round whitish greene leaves, lying close together upon the ground, from whence rise slender stalkes naked unto the tops, except in one place toward the middle, where it hath two small leaves growing downwards contrary to almost all other herbes: but these tops a tuft of bluish coloured flowers [illegible] degrees.

12. *Gramen marinum.* Lesser Sea Thrift of *America.*

The lesser sort of Sea Thrift of *America*, hath likewise many [illegible] but they are of a sadder greene [illegible] with five ribbes in each, and [illegible] stalkes beare also such a tuft of [illegible] white and breake out of a skinne which [illegible] the stalke, the roote is long and with but [illegible] thereat.

11. *Gramen marinum minus.* Small Thrift or Sea Cuddion.

This other smaller sort is well knowne to have many small hard short greene leaves thicke growing together and

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

and spreading on the ground, the stalkes are many of a spanne high, without any leaves thereon, but at the tops a small round tuft of bluish coloured flowers.

The Place and Time.

The three first sorts, the first and the last, have beene observed on our Sea coasts, especially in *Kent*, the fourth and the eighth about *Mompelier* and *Narbone*, and the fifth both on the *Venetian*, *Ancomitane* and *French* shores also about *Mompelier*, the eleventh as well on the hils as neere the Sea, and hath beene often sent us from *France*, all the rest are found neere the Sea coasts in many places, and are in flower and seede in the end of Summer.

The Names.

The first and third sorts are mentioned by *Lobel*, the second sixth and eighe have not beene remembred by any other Author before, the fourth and fifth are mentioned by *Bauhinus*, by the names of *Gramen [illegible] maritimum spicatum*, and *Gramen Caninum maritimum asperum*, the seventh is so called by *Lugdunensis* as it is in the house, the ninth and tenth are mentioned by *Lobel*. The eleventh *Clusius* hath called *Gramen maritimum minus*, and so doth *Tabermontanus* also, but afterwarde in his history of Plants he calleth it *Arnoseris montana tenuifolia minor*, *Alsine Caryophyllus montanus*, *Lugdunensis* saith it is called *Stellaria* by some from the present help in stanching blood of the body where it doth grow, and so by *Camerarius* also, but differeth from the *Stellaria* of *Plinie*, and as divers from *Camerarius Fabrica* although *Camerarius* taketh it to be the *Consolida* of *Augustanus*, yet surely it is called *Stellaria* by divers more adayes and as *Lugdunensis* saith, divers herbarists of *Paris* called it *Caryophyllus alterum genus*, but we turne also *Caryophyllus montanus alter* or *minor*, as *Bauhinus* also doth adding thereto *flore globoso*, and others *Gramen [illegible] maritimum*, as they doe the last *Gramen maritimum minus*, and others *Caryophyllus marinus minimus*, but *Clusius* *Arnoseris montana tenuifolia minor*; *Dodonæus* calleth them both *Gramen polyanthemum majus & minus*, and the other *Fraudmolly* in his *French* Herball, as *Gesner in horto* doth also, the twelfth is called *Stellaria flore purpureo* by *Cæsalpinus*.

The Vertues.

It is generally held that the roote of the Sea Quich grasse is as effectuall as the ordinary or common sort, and therefore for the qualities, I must referre you to be informed there where I speake of it, that so I may avoide double repetition of the same things, the rest are not put to any use in Physicke that I know. This difference I weene these and those of the Land hath beene observed that cattle will not feede on the leaves of these by reason of their hardnesse, roughnesse, and sharpenesse, when as they refuse not the other.

CHAP. XLIII.

Alsine marina. Sea Chickweede.

THere are some sorts of Chickweede that are reserved out of the family of the former Chickweedes to be entreated of in this place,

1. *Alsine marina.* Sea Chickweede.

2, 3. *Alsine maritima Neapolitana & Cornuti* called in English Rush Chickweed of Naples, and [illegible]

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

2. *Alsine marina.* Sea Chickweede.

This Sea Chickweede groweth for the most part with the branches lying on the ground, very like unto the lesser of Chickweede, but that the stalkes are shorter and thicker, and closer joynted with such like leaves somewhat thicker and whiter, the flowers are compacted of many small leaves standing like a starre: the seede also that follows, are not long and round like the other, but flat and somewhat broad, wherein are contained very small greater seedes: the roote is threddy. Another like hereunto is that Sea Chickweede that *Clusius* hath named with thicke leaves, like unto a Purslane, growing on the sandy hills neere the shore in *Holland*, but with smaller flowers as he saith then greenish. *Altera.*

3. *Alsine marina Neapolitana flore rubente.* Blush Chickweede of Naples.

The stalkes of this Chickweede are exceeding small, lying on the ground, round about the rootes, with as fine small leaves almost thereon, two always or more set crosse wise at the joynts, being of a fingers length also are the flowers set at the toppes, as in the former Sea Chickweede, but of a bluish or pale purple colour, wherein the seede is contained in the like long heads as other: the roote is threddy as the rest. With the figure hereof set forth in the same table that small Sea Buckes horne of Naples set forth by *Columna*, the description whereof is to be found before in *pag.* 701. and might very well have beene brought hither among these other Sea plants.

The Place and Time.

All of these declare their places of breeding, and their time is with the others.

The Names.

The first is called *Alsine marina* of *Dodonæus* and *Tabermontanus*, but *Lobel* calleth it *Alsine flos Veneris major*, and *Camerarius*, the other kinde whereof *Clusius* calleth *Alsine Veneris peloponnesiaca*. The second is called by *Lobel*, *Alsine marina Neapolitana*.

The Vertues.

No profite are made of these Chickweedes in Physicke, and yet their taste as well as their forme, declare their cold temperature with the other sorts.

Chap. XLIV.

Lenticula marina vulgaris. Ordinary Sea Lentils.

Lenticula marina vulgaris flore & semine.
Ordinary Sea Lentils.

Scarce any trauell to the *Tyrrhene* and *Adriatick* Sea, between the *Florentine* and *Venetian* Dominions, but there groweth this plant, which *Lobel* calleth *Gramen Plinii*, very like the long and narrow leaves of *Scoparia* or Broome Flix, very thicke set upon weak bending stalkes, with short long and full of empty round skinny berries, like Lentils, from whence it came to be so called. There is another sort hereof called *Lenticula marina foliis rotundis*, very like it differing onely in that it hath broader and rounder leaves, dented about the edges.

The Place, Time, Names and Vertues.

The Place is declared, and Time to be understood the same. *Lobel* called it *Lenticula marina Sedanensis* and *Gramen Pancratium* and *Lonicerus* after him, who saith it is called by some *Herba marina*. *Daubenton* calleth it with plaine leaves *Scoparia folio planiore Linariæ*, but with that *Imperatus* called it *Acetosa marina*, but the other with purgot leaves, he calleth it *Scoparia folio acuto*, and of *Imperatus Salsola marina*, but why so many names, but to what use it may serve in Physicke hitherto beene observed. *Clusius* in his *Scholia* upon the Chapter of *Acosta* his booke of simples putteth the question whether that with dented leaves, mentioned there that is called *Tangasia*, but *Bauhinus* thinketh it doubtfull as it well may, as if it were certaine. Now this plant growing like a fearne, as layling to and fro upon the waters betweene *Virginia* and thirty foure degrees of Northerly Latitude, which by hindering the speedy passage of the Saylers in cleering the sides of their ships, and while it was fresh and greene it could runne and boyled, but grew hard and stony when dry, and was of a cleansing property when as the Saylers troubled with foule humours, found to their ease that did eate thereof. *Acosta* his description thereof is as followeth. This plant groweth in a large smooth Sea covered therewith, as farre as the eye could discerne, whose bottome could not be reached unto by our plummet line, yet very likely to rise from the bottome, as might be discerned by the leaves wrapped together thereon on the branches, and being pulled up was of an herbs nature, the leaves halfe an inch long, dented about the edges, and of a reddish colour, without taste but while it was in the water, at every leafe it bore a berry like a pepper corne, but hollow full of salt water, and of a blew colour, or mixt of white and red: being fresh and new taken up it is tender, but brittle and hard when it is dry.

Chap. XLV.

1. *Parthenium marinum.* Sea May weed or Featherfew.

This spreadeth many short branches on the ground about an handbredth long, having divers long and narrow leaves set about them, cut in on the sides like to the greater Daisy leaves, of a strong in thing savour like unto the ordinary Mayweede, and having flowers not much unlike it also, the roote is long and slender, and shooteth forth divers fibres from it.

Parthenium marinum
Sea Mayweed or Featherfew.

2. *Chamæmelum maritimum.* Sea Camomill.

The roote hereof is blackish spreading into many long fibres, sending forth sundry weake stalkes lying on the ground, set on both sides with larger leaves then are in the ordinary May weede, having a large white flower, and a yellow thrum in the middle.

The Place and Time.

The first groweth neere the Fishers Cottages at the foote of the hill *Cæsius* in *Narbone* in *France*, the other in the sandy grounds neere the Sea shore, and flowers in Summer.

The Names.

Lobel calleth the first *Cotula sive Parthenium marinum minimum, Lugdunensi, Parthenium marinum minimum, Bauhinus Matricaria maritima*, and thinketh that it is the *Chamæmelum maritimum Dalechampij*, set downe in the second place and called *Cotula marina* by *Lobel*.

The Vertues.

The first hath neither weaker, (saith *Lobel*) nor differing properties from the ordinary Mayweede which for to avoid a double repetition of one thing, I referre you to the Chapter of Mayweede in the first Classis of this Worke. Of the other there is no particular property recorded.

Chap. XLVI.

Conyza marina. Sea Fleabane.

This kind of *Conyza*, that groweth in the fields neere the Sea Coasts, hath a long dry hard roote, and from thence riseth a round stalke, about a foote high, branched into sundry parts, set with long and narrow leaves somewhat like unto the smaller Rib-wort Plantane, almost without taste yet a little bitter: the flowers are yellow, standing in a close tuft together, and are blowne away with the wind when the seed is ripe.

Conyza marina Sea Fleabane.

The Place and Time.

The place is declared before, and the Sommer is the time of its flowring.

The Names.

Lugdunensis calleth it *Conyza marina*, and *Bauhinus* as I said in the six and twentieth Chapter of the first Classis here before, would referre it to the *Chondrilla altera Theophrasti Ruellio*, which I there said, I thinke to be erroneous for the reasons there alledged.

The Vertues.

It is thought to have the same properties that the other Fleabanes have.

Chap. XLVII.

1. *Glaux maritima.* Sea Milkewort.

Our moderne Authours have mentioned divers forts of *Glaux*, whereof that of *Cluſius* and another called *Vulgaris*, have beene formerly handled before in this Worke. *Dodonæus*, *Lobel* and others, have exhibited one that I meane to entreate of in this Chapter, which is the leſſer, *Cordus* and *Camerarius*, a greater, and *Gesner* one differing from them both, each ſuppoſing theirs to be the neereſt unto *Dioſcorides* his *Glaux*.

1. *Glaux maritima major.* The greater Sea Milkewort.

The greater of theſe Milkeworts hath ſundry ſlender weake ſtalkes ſpread on the ground, beſet with diverſe ſmall like leaves, yet a little larger, and of a grayiſh greene colour on the upper ſide, and more grayiſh underneath, the flowers are purple ſet at the joynts with the leaves, after which come ſmall huttons with ſeede in them, the roote ſhooteth downeright, but the branches as they ſpread take roote againe. *Bauhinus* ſaith there is one variety obſerved herein: the greater ſort having ſometimes much larger leaves, and ſometimes narrower, and the leſſer ſort having the ſtalkes thicker ſtored with leaves, eſpecially upwards, the lower being taine away, leaving them bare, and as if they had great joynts.

2. *Glaux maritima minor.* The leſſer Sea Milkewort.

The leſſer ſort differeth little from the former in the manner of growing, but in the ſmallneſſe both of ſtalkes and leaves, and that this is found growing in places neere the Sea or ſalt Lakes, and the other as well on the hills, as neere the Sea.

3. *Glaux maritima Veneta Alpino.* The *Venetian* Sea Milkewort of *Alpinus*.

This *Venetian* Sea Milkewort ariſeth up from a ſlender long woody branched roote, with foure or five ſlender ſtalkes a foot or more high, ſet at equall diſtances with ſundry ſomewhat long and narrow leaves, greene on the upper ſide and hoary white underneath, and at the toppes foure or five flowers ſtanding together, as it were in an umbell in forme and bigneſſe, being very like unto the baſtard Scorpion like podded *Sena* of *Candy*, but of a white yellowiſh colour, and are ſucceeded by ſmall ſhort round pods, having ſmall hard round ſeede within them, reſembling thoſe two-fold.

The Place and Time.

The firſt groweth in many places of *Germany*, and was ſent as *Bauhinus* ſaith, to him from out of *Scotland*, but is alſo often found both on the *Kentiſh* and *Eſſex* ſhores, and the laſt as *Alpinus* ſaith in the ſalt marſhes neere unto *Padua*, a City of the *Venetians*, flowring and ſeeding in the end of Summer.

1. *Glaux vulgaris minima.*
Small Sea Milkewort.

2. *Glaux maritima Veneta Alpino.*
The *Venetian* Sea Milkewort of *Alpinus*.

The Names.

The Greeke name γλαυξ is taken from γλαυκος or γλαυξ, which is milke, and the Latines follow the Greeke name *Glaux*, and not as some thinke a *glauco colore*, for the Latine derivation cannot suite with the Greeke word. *Fuchsius* saith it is called also γλαυκιον, because it restoreth the decayed milke in Nourses breasts. *Cordus* on *Dioscorides*, and *Camerarius in horto*, mention the first, which *Bauhinus* calleth *Glaux latiore folio Thuringiaca*. The second *Matthiolus*, *Lobel*, *Camerarius Tabernamontanus* and *Lugdunensis* speake of, and call it *Glaux exigua maritima*. The third is mentioned by *Alpinus* in his Bookes of *Exoticke* plants, by the name of *Glaux in maritimis*, but *Bauhinus* would referre it to *Cluſius* his *Dorycnium congenere*, as if they were both one plant, and of the Family of the Trefoiles or Lotus, yet surely howsoever they be in some things alike, they are most likely to bee different plants, and therefore I have placed it here, being of *Alpinus* his judgement, that it doth come as neerely if not more, unto *Dioscorides* his *Glaux* then any others.

The Vertues.

It was used to be eaten after it was boiled as a pallet herbe, with oyle and salt, in generall by all, but in especiall by Nourses that wanted milke in their breste, to helpe to encrease it, for which purpole also it is used nowe-dayes.

CHAP. XLVIII.

Kali. Glaſſe wort.

Asking by I know not what chance leſt out ſome ſorts of *Kali* from the other formerly obſerved, let me place them here among theſe ſea plants, rather then leave them out altogether,

1. *Kali ſpinoſum.* Prickly Glaſſe wort.

This ſort of *Kali* or Glaſſe wort riſeth up with one hard ſtalke, three or foure foote long, ſometimes branched from the very bottome, each of them three foote long for the moſt part, whereon are ſet narrow leaves, without order, in ſome places but one at a joynt, at others two or three, the ſame growing oppoſite all along, and others two or three together, ſome longer then others, the longeſt being about two inches long, at ſeverall joynes with the leaves, both on the ſtalk & branches come forth certain hard huſkes, pointed out into five ſharpe prickely ends, formed ſomewhat like a Starre, with a ſmall white flower in the middle, which abideth not long, that middle part afterwards ſwelling ſomewhat higher, hath a ſmall pricke thereat, in which head lyeth one ſeede almoſt like a graine of Wheate: the roote is ſpread into ſome branches, and periſheth or withereth at the firſt approach of Winter with us, although it will abide in the ſame as it grew a great while after it is withered and dry.

1. *Kali ſpinoſum.* Prickly Glaſſe wort.

2. *Kali floridum repens Neapolitanum Columnæ.*
Columna his *Neapolitan* Glaſſe wort.

This ſmall creeping or ſpreading Glaſſe wort, ſhooteth forth ſundry weake branches, lying for the moſt part upon the ground, and raiſing it ſelfe up but a little, parted like wiſe into branches, ſet confuſedly with ſmall, thicke, round leaves, at the toppes of the ſeverall branches whereof ſtand many ſmall white flowers cluſtering together, made of five or ſixe ſmall pointed leaves a peece, after whom ſucceede ſmall heads opening into five parts, each being pointed at the ends, containing within much very ſmall browniſh ſeede, the more is compoſed of many ſmall long ſtrings and fibres at them: the whole plant is very ſalt and covered with a rough mealineſſe, as many Sea plants are, which although in its naturall place or in the warmer climates, it will abide in Gardens, yet will it not doe ſo in our Country.

3. *Kali longiſſimum ſalſum Ægyptiacum.*
The longeſt ſtaled *Kali* or Glaſſe wort of *Egypt*.

This *Kali*, that *Alpinus* ſaith is more proper to *Egypt* then to any other place, riſeth up with a long weake and a little hairy bending ſtalke branched forth into divers parts, having the lower leaves very long and narrow, a little bowing backe-wards and hairy with all, thoſe on the ſtalke and branches, upwards, being like unto the other, but ſomewhat ſhorter, and at the toppes foure or five ſmall ſtalkes bowing or bending downewards, from the middle of whom come forth many flowers, like unto thoſe of the Authour: the whole plant hath a ſalt and ſharpe taſte, being ſmart upon the tongue.

Original from UNIVERSITY OF MICHIGAN

3. Kali longissimum siliqua Ægyptium.
The long leafed Kali or Glasswort of Egypt.

4. Kali Arabicum genuinum genus Raiowolfij.
Raiowolfius his first Arabian Kali.

4. Kali Arabicum genuinum genus Raiowolfij. Raiowolfius his first Arabian Kali.

...leaf small pointed, fat, & the stalk of tender substance very orderly set or placed together, sending forth many small ...ing stalks, diversifie therewith as them sundry small narrow tender and pointed leaves, being of an ash-... the upper side and whitish underneath, as the stalkes and whole plant is also.

The Place and Time.

... Kalis grow neere the sea side, the former both in *France* and *Italy*, the other *Columna* first found ... Riviere Rome of *Naples*, and flower and seede late in the yeare, the third *Alpinus* saith is most proper to ... and the other to *Syria*.

The Names.

... Kalis have been taken for *Tragum Matthioli*, but his leaf always found growing lower and first-... and without leaves, and this never without, whereby it appeareth plainely that they are two several plants, ... both *Antonius Denuti* of *Venice* account them. *Bauhinus* in making two sorts of *Tragum*, calleth one *Kali*

spinosum cochleatum, but why *cochleatum*, I see no cause, for it is not *Lobel*'his *Kali cochleatum foetidum*, for that he made the first of his *Kalies* in the foregoing Paragraph, and I thinke there is no other *Kali cochleatum foetidum* besides, the other he calleth *Kali spinosum asinum*, referring it to the *Tragum* of *Matthiolus*, as all Authours since him have called it, and saith withall that because *Dioscorides*, gave no leaves to his *Tragum*, therefore *Matthiolus* and *Tabermontanus*, did enforce their *Tragum* without leaves: but *Lobel* let leaves to his *Tragum*, as he himself saith he found it on the *Venetian* Iland called *Lio*: but *Dioscorides* as I said before, saith he found that sort also without leaves in the same Iland. The second *Columna* called *Kali spicatum repens foetidum Neapolitanum*, and *Kali Creticum Kali Crassifolio minus folio*. The third is the third *Kali* of *Alpinus* in his Booke of *Egyptian* plants. The last called by *Rauwolfius Kali Arabum primum genus*, such as he saith is called *Usnea* by the *Arabians*, but by the Natives where it groweth *Achiran*.

The Vertues.

The ashes of all these sorts, as well as of the former sorts are both used to make Sope and Glasse, and to purge the belly also, from a dull choller as *Alpinus* saith, especially of his sort, either the juice of the leaves or the graines of them taken in Wine.

Chap. XLIX.

Crithmum maritimum. Sampire.

IN this Chapter I must joyne, for the name and places sake, three or foure other plants, because I would not make many of them.

1. *Crithmum maritimum vulgare.* Rocke Sampire.

The Rocke Sampire groweth up with a tender greene stalke, about halfe a yard or two foote high at the most, branching forth almost from the very bottome and stored with sundry thicke and almost round, somewhat long leaves of a deepe greene colour, sometimes three together, and sometimes more on a stalke, and are sappy, and of a pleasant hot or spicy taste: at the toppes of the stalke and branches stand umbels of white flowers, and after them come large seede bigger then Fennel, or Cow-wheate: the roote is great, white and long continuing many yeares, and is of a hot spicy taste like wise.

2. *Crithmum maritimum majus.* The greater Rocke Sampire.

This greater sort differeth little in forme from the precedent but in the largeneſſe, and in not being so good a relish or spicy taste as it, but smelling somewhat strongly of Smallage, and tasting more bitter.

3. *Crithmum maritimum spinosum sive Pastinaca marina.* Sea Parsneppe.

This Sea Parsneppe is very like the former Sampire, but it groweth greater and higher with thorny and ra-

1. *Crithmum maritimum vulgare.* Rocke Sampire.

3. *Crithmum maritimum spinosum sive Pastinaca marina.* The Sea Parsneppe.

...small roote diuided, and sharply pricking at the stalke are more lappy and of a fresher greene ...ring into fiue or foure branches couered the ...hole and large tuncle of white flowers, and ...ment like vnto a Parsnippe, but ...ished into perfumed ...ot a good reliih, some what ...ling a Parsnippe.

...

...golden flowred Fennell.

...and other things hath bodily hardy and leaues ...ewhat like the leaues aforesaid, but ...ished with very narrow long ...ke leaues set in at the vnder ...at the ...ing stalke small single flowers, like vnto *Asser* or ...ome, of a holly yellow, both the border and the ...ne in the middle, wherein lye the seede when they ...are ripe, which driuen away with the winde ...the roote ...dieth in many strings.

The Place and Time.

...which grow in or neere the Sea. The two firſt ...kinds but are often manured at the leaſt, if not ...ed with the Sea water, the other in grounds not ...ed from the ſame, and doe all flower and ſeede in the ...ſt and *Auguſt*.

The Names.

...*Fœniculum* ...*Fœniculum* in *Galens* ...and the ...*Fœnum*, is generally not onely given to the two ...mentioned ſorts, but to the wilder ſorts alſo, of ...*Dioſcorides* is the firſt Author as I take it, ...whom all others haue deduced the title: but *Lobel* ...hath put in the double and corrupted another ...that did more rightly as he ſaith, agree to *Dioſcorides* ...deſcription of *Cachrys*: thus ſaith, namely the *Fœ-* ...*nigreum*, for as he ſaith, thus hath no reſpondence with ...*Cachrys*: *Dioſcorides*, which he deſcribeth with ...leaues then Parſley, and ſuch ſeede he hath the *Fœniculum ordinarium*, but ſuch hath not this *Cachrys* ...*nigra* ...and nothing ſo large as Parſley, and may more likely be called, ...as the very common ſort of ...the *Fœniculum marinum* ...Fennell, for as in the vmbels and whole face ...it doth reſemble a Fen- ...What it may be ſo bold to ſeeme *Dioſcorides Cachrys*, I beleeue it will be found as defective in ſome ...as in the former: but although *Fœniculum marinum* agreeth with *Dioſcorides* his *Cachrys* in the leaues, yet ...not in the ſeede, wherein it muſt alſo agree if it be the right: but the ſeed of *Fœniculum marinum*, is flat ...ſtriated, and hath rib in the kernell like vnbeaſe, as *Dioſcorides* deſcription doth enforce it, and therefore ...muſt conclude that neither this nor the other doth anſwer *Dioſcorides* his Text in all points: this is therefore not e- ...to be called *Fœniculum marinum*, vntill it can be better determined whereunto it may be appropriated: ...would alſo make it to be *Fœniculum Dioſcoridis*, but *Matthiolus* hath diſſolued the doubt, ſhewing that this ...hath no purging quality there in it all, and that it was neuer found naturally growing ...in this ſide. *Cæſalpinus* onely, and *Caſtellus* from him hath mention of the firſt *Cachrys* here, adding it ...*Fœniculum* ...*Sicilia*, as he doth the ſecond *Fœniculum paruo Bæticum*, for it is thought to be that ...*Bæticum*, as *Gerard* in his doth, and *Cachrys nigra* alſo. Yet the firſt *Cachrys* or *Mat-* ...ſince all other Authors doe follow, who alſo ſaith the *Italians* his Countrymen called it *Cachrys* ...and I from thence *Germans*, and the *French* hereafter, *Lee Fenes*, and we from them, being our ...*Fœniculum* ...*Cachrys* alſo born the firſt ſort *Cachrys* ...*Fœniculum* ...*Cachrys* ...*Fœniculum* ...*Cachrys* ...*Fœniculum* ...*

provoking urine and helping thereby to wash away the gravell and stone engendred in the kidneys or bladder.

Many other Sea plants might have beene put into this Classe, which I have dispersedly handled and spoken of throughout this whole worke, because they were so like unto those plants, whereunto I have joyned them, that they could not well be seperated. I thought them therefore fittest to be entreated of there, and referred only these few for this place.

Chap. L.

Bulbus Crinitus marinus. The Sea Bulbe with hairy bush coppes.

BEfore I come to the Sea Mosses, let me adde this uncouth, unheard of, and peradventure untrue, or at least uncertaine Sea plant, in that we have not yet read or heard of any found Authour that hath mentioned it, but *Lugdunensis* and he, as he saith out of certaine Navigations in the *Indian* ocean, but neither persons that saw it, nor place of the Sea where it grew but onely among certaine Iilands, nor time when it was found, are expressed in the declaration thereof: which maketh it the more fabulous: but as *Lugdunensis* hath left it unto me, so I will give it you to cause others to finde out the truth, or folly of the matter. Among certaine Iilands doth grow so great abundance of this finely expressed plant, that shippes being forced to paile over it, are often stayed in their course: it groweth in the bottome of the Sea, to the length of fourteene or fifteene fathome (or braces) and rising foure or five above the water, of the colour of yellow waxe, with a reasonable bigge stalke, from whence at certaine spaces are set divers bulbes, sending forth at their ends certaine bushes or tufts of haires, the roote is bulbous also, but thicker and greater then the others on the stalkes, and bulbing out many hairy fibres: Thus much hee. *Bauhinus* saith hee knoweth not what it is, and surely I thinke if there were any such thing, *in rerum natura*, others besides *Lugdunensis* might have the fortune to light upon that unnamed Authour to certifie us of his honesty and knowledge, I can goe no further, not having any further limits allowed me.

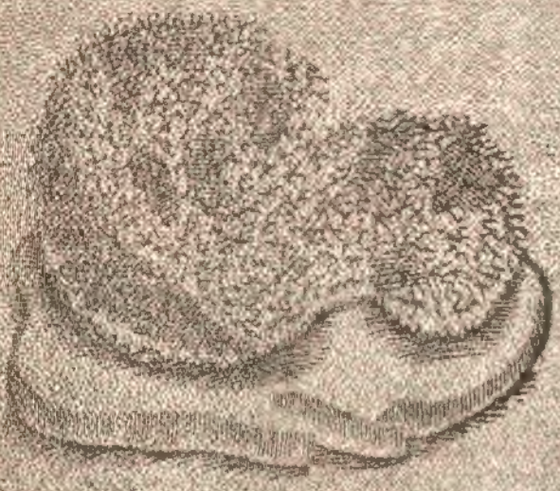
Bulbus marinus crinitus. The Sea bulbe with Bushe tops.

Chap. LI.

Muscus marinus. Sea Mosse.

SEa Mosses I am next to speake, which are of many sorts, some of the Ylands, and others of the Sea which must be joyned next to those other Sea plants, and those of the Land afterwards, and because these also are of divers sorts, I thinke fit to distribute them into three rankes, the first to be of those that are of an herby substance, the second of an harder stony, and the last of a stony matter: Each sort also is to be divided into these plants, that beare fine cut leaves, like Mosse or Feane, and those that have broader leaves, of those with fine cut leaves I shall entreate in this Chapter, and of the rest in the next.

1. *Muscus marinus capillaceus Dioscoridis.* The soft Sea Mosse.



This soft Sea Mosse is not *Coralline*, which is hard and hath a branched stalke, but is like unto those that grow upon the ground or trees without any rootes, onely growing upon the rockes, or upon the stalkes of dry fishes, being a soft herbe composed wholly of woolly white haires, without any base or stalke, and rather found white then reddish or grey, but is not greene. There is another small sort hereof, never growing upon the stones by the Sea side, as also sometimes upon wood, and is likewise sometimes cast up by the Sea among the *Alga* of divers sorts, growing somewhat like the former or ground Mosse, but that it is white and smelleth a little salt-ish and binding.

2. *Muscus marinus Neapolitanus.* Sea Mosse of *Naples*.

This Sea Mosse likewise groweth unto some rocke or stone, rising with a stalke more then foure inches high, with

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

with sundry branches on both sides, and they againe divided into lesser, all of them plentifully flowed with very fine leaves, or smaller Camomill leaves, or finer then they, by other diuers, with whom dling at the first, easie to be bended, and translucent if they be interposed to the light, greene below at the lower part, and purplish above: this is not so brittle as Coralline when it is dried, yea grow with more roughly if dryed, although it may well be reduced to form a large it creeps, and retaineth a very little salt, with for being put into water or a while steeped therein it will grow soft againe.

3. *Muscus marinus tinctorius sive Alga ruscifolia Lugduni, &c.*

Dying red Sea Moss.

This smutted Sea Moss is somewhat like the last, but with more

with small stalkes and lower branches, and with as fine small leaves on them like unto Fennell of a reddish colour with some wheresoever mixed together, this is called by divers to strike a deepe crimson, or reddish purple colour, which will last long.

4. *Muscus marinus exilis Fœniculaceus.* Short Fennell like Sea Mosse.

This short Fennell like Mosse groweth up from blackish round and fibrous roots, with divers fine short leaves like Fennell, of an herby or greene colour, among which an herby stalke riseth also with such like leaves on it, and having sundry fewbie excrescences thereon.

5. *Muscus marinus Fœniculaceus.* Long Fennell like Sea Mosse.

The leaves hereof are very long and fine like unto the *Ferula*, or Fennell giant, growing from stalkes neere a foot long, divided into branches, this springeth from Rockes or the like.

6. *Muscus marinus Abrotanoides.* The Southernewood like Sea Mosse.

This also riseth up from the Rockes with thicke stalkes and branches, with fine cut leaves on them, somewhat like unto Southernewood, but much bigger, and of a brownish red colour.

7. *Muscus marinus argenteus plumiformis.* The silver like Sea Feather.

This most beautifull Mosse groweth on the Rockes in the Sea, upon the dry shels of Fishes, and is also often times wrapped amongst the wrake or Sea weede, cast upon the shore, growing up as the figure sheweth, into many particular parts or branches, made as it were all of haires like other Mosses, but verily representing fine and slender Feathers, of so pure a white silverlike colour, that it is to be wondered at, that any Sea Mosse should become so white by nature, or made by Art, the property whereof is to wash the Spleene applyed with vineger, it quickly also dissolveth the scrophules or kernels in the throate, or elsewhere: it helpeth the Dropsie for it doth abundantly provoke urine: it cleanseth likewise the reignes, and gravell or stones engendred in the kidneyes, if a dramme of it in powder be taken in the distilled water of *Eryngium*, Hedge Mustard or Sea Bugle with an equall proportion of the iuice of Lemmons.

8. *Muscus marinus Veneris Coffi Indici radicis facie.* The Venetian Coffus like Mosse.

This Venetian Mosse groweth on rockes in the Sea, which by the often agitation of the water, is broken off and carryed to the shore, not having any roote, but being made as it were of a knit of small stickes set together and being dry resembleth the roote of *Coffus Indicus*, but whiter, and being moistened againe, spreadeth it selfe abroad the more aforesaid, and as it is expressed in the figure, it is very tuft, and full of it like land.

9. *Muscus marinus corni.* The goulden Sea Feather.

This Sea plant that for the beauty and excellency thereof, doth worthily deserve his name, although some call it as it were, being but a peece as it is likely, of what it was when it grew, yet such as it is I here offer to your view, being of a most shining gold colour, both stalke and leaves, which very neerely resembleth the figure and description of *Clusius*, which we call the Feather grasse.

The Place and Time.

These places are all declared by their titles to be the stones on the shore, or Rockes in the Sea, and the shelfish also, whereon many of them breede, and but few spring out of the ground as the fourth doth, some in our Countries, and some on our owne coasts, and perish not in Winter or Summer.

The Names.

The Goodyeare is *Spica Septentrionalis*, and *Muscus marinus* in Latine, yet some promiscuously call these *Fucus marinus* as well as *Muscus*, but *Dioscorides* distinguisheth betweene them, entreating of them in two sundry Chapters, and although *Pliny* be inconstant herein, making Mosse sometimes an herbe, sometimes a shrubbe, and sometimes confounding both *Muscus* and *Fucus* together. The first of both sorts is mentioned by *Antonius Donatus*, in his description of the Ile of *Leo* of the *Venetians*, and is also the *Muscus marinus* of *Dioscorides* according to *Cordus*, his more exact consideration, as *Lugdunensis* doth relate it, and the *Fucus capillaceo folio* of *Theophrastus*, as is thought. The second is *Clusius* his *Muscus marinus*, which he received from *Imperatus* of *Naples*, and sent him the name of *Palmula marina*, but nothing agreeing with that of *Theophrastus*. The third is the *Fucus sive Alga marina* of *Lugdunensis*. The fourth is the *Muscus marinus corni*, which *Cæsalpinus* calleth *Muscus marinus pinnatus pauloior*. The fifth the *Fucus Fœniculaceus* of *Lobel*. The sixth is his *Fucus marinus folijs Abrotani mari*. *Lugdunensis* followeth, calling it *Muscus marinus folijs Abrotani*. The seventh and the last are so called by *Lugdunensis* as their titles declare them, and the eighth is mentioned by *Fuchsius* in his *Italian Fields*. The *Arabians* call the Sea Mosse *Tachalab* and *Thalab*, the *Italians Musco marino*, the *Spaniards Mathoga marina*, the *French Mousse de mer*, the *Germanes Meermoss*, the *Dutch Zeemoss*.

The Vertues.

Most of these Sea Mosses doe binde much, and coole inflammations, and being applyed while they are fresh, give ease to those are troubled with the hot Gout, they have an especiall property in drying, thickning & cooling, as the pure Saracen Frankincense in weede at any of these qualities: both the sorts of the first, killeth wormes in the body, and the second of them is very effectuall for watering red eyes, if the powder mixed with some Fennell Water be put into them: the same powder taken with Vineger stayeth vomiting, and strengtheneth the stomacke, and the decoction there of in wine be injected into the bladder by a siringe, it cleanseth the carnosity in the neck of the bladder and ulcers therein, prooved effectuall to helpe one troubled with that disease in a short space: the eighth likewise is said to helpe to cleanse foule ulcers of all sorts, either inward or outward, being made into powder and given in wine, and cleanseth the stone in the kidneyes: the vertues of the seventh are declared in the description.

Chap. LII.

Fucus marinus sive Alga marina. Sea wrake or Sea weede.

Of this kinde of broader leafed Sea excrescences, that are soft and herby, some more and some lesse, there are many sorts, as they shall be here expressed.

1. *Fucus marinus sive Alga marina grandior.* Wrake or Sea weede, or Graile.

The roundish rootes hereof are hairy, and blackish on the outside, from whence rise up small and round

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

round and long white hairy heads, breaking out at the sides as it were into branches, on the toppes whereof stand three or foure very long and narrow lobe green leaves, some being an ell or more long, and about an inch broad; this hath neither seede nor stalke, but lyeth on the ground untill the tide raise it on the water, which being broken by the force of the waves, is carryed to the shore, where it is kept for many things.

2. *Fucus marinus vvagæ latifolius.* Broad and thicke Sea girdle.

This differeth from the former in that the roote is wholly fibrous, the stalke rising from thence thicke and round two or three inches high, and the leafe which is sometimes but one, and seldome two of a very great length, even divers foote or ells long, and above foure inches broad, equall from a little above the setting on to the end, but somewhat waved or crumpled on the edges, being thicke and of a deepe greene colour, so soft and moist while it is fresh, that it is like unto moist glue or gelly, and will hardly dry unlesse it lie long in the Sunne, and will scarce be to be kept without rotting untill after many dayes drying.

3. *Fucus marinus latissimo tenuifolio.* Broad and thin Sea girdle.

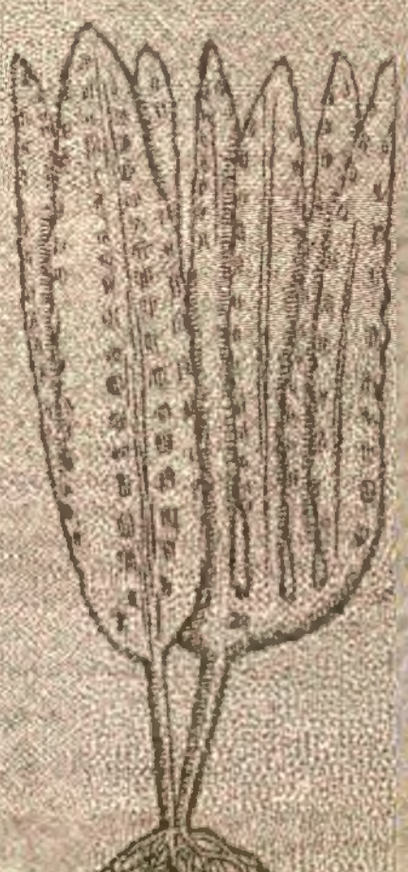
This is in all things like the last, but that the leaves are thinner broader and shorter, yet crumpled on the edges, and of a paler greene colour, and is like unto thin parchment.

4. *Fucus alatus sive pectinoides.* Winged Sea girdle.

This cleaveth unto Rockes, and shels of fishes likewise both in the deepest and shallowest places of the Sea, having a round darke reddish stalke of the bignesse of a Goose quill, which being growne to the full length is very weake, lying on the ground, unlesse the water raise it, and an ell long; on each side whereof groweth a wing, all the whole length of it, like unto a skinne or parchment with veines therein, which being like the feather of an arrow, is small below and broader above equally to the toppe, of two or three inches breadth: the leaves that grow next the ground are many (and some are set also on the stalke) of a yellower greenish colour, and of an hand breadth, being foure, six, or eight inches long, lither or of a skinny substance like unto the other girdle: the stalke doth very well resemble a two edged sword: and is used to be dressed and eaten by the inhabitants of the Sea coasts, where it groweth after it is cleared from the skinny wings, and hath a little sweete salt with the jelly nesse which maketh it the more acceptable.

5. *Fucus maximus polycbides.* Great Sea girdle with many Labels.

The manner of growing hereof, and the use likewise is alike with the last, but is the greatest of all these sorts of Sea weedes, having a stalke as thicke as that of *Angelica*, of a browne colour like a Chestnut on the outside, and so are the round leaves likewise, which are three or foure cubits long, being not so thicke as ones little finger, and ending in divers broad and short skinny Labels, in like manner as the lower part of the sword hangers, which are of a yellowish colour. Both these last sorts were sent unto *Bankius* from *Aberdene* in *Scotland*, to the Lord *Cargillon*, and as it seemeth this and the second are somewhat differing from Mr. *Johnsons* figure and description, which containeth both of them in one, yet I have thought good to give you his figure, for worst of them (verily), although he groweth from a roote, and this from shels, &c.



6. *Fucus marinus secundus Dodonæi.* Narrow long and thicke Sea girdles.

The roote hereof is round and fat, from whence spring two or three narrow thicke leaves, about a foote and halfe long, divided into sundry flat thicke thongs like leather, some long and some shorter, and they ingine and

1. *Fucus vesicas seu alge marine premens.* Wrack or Sea weede or Crulle.

5. *Fucus maximus polyphides.* Great Sea girdles with many Labels.

16. *Opuntia marina.* The Sea Garland.

8. *Furcellaria marina Gallipavonis pennas referens.* The Peacockes Feather.

This also is of a skinny substance, increasing it selfe by little and little while abroad out into many diggs, which end in halfe circles lying sometimes one upon another, whereon are set sundry semicircular spots, and those of divers colours, and of differing bignesse one from another, like as is seene in the Peacockes feathers: you may see it in the Rockes in the Sea: somewhat like hereunto is there also a certaine barke taken from Scallops, that breede on the same Rockes.

9. *Fucus marinus Lactuca marina dictus.* Oyster greene, or Sea Lettice.

The Oyster greene, as all know is a soft tender herbe growing on Rockes, with thicke crumpled, and darke greene leaves, somewhat like unto the curld Lettice, and hath neither stalke nor roote, but growing out of theise Sea weedes doe upon Rockes or stones.

10. *Fucus sive Alga Intubacea.* Sea curled Endive.

The Sea curld Endive, hath divers long and round leaves lying on the ground, and shooting forth often on all sides, as it runneth thereon, sending out small fibres from the joynts under the leaves, which are dented round the sides, making the proportion of a ragged staffe, as it is painted on every leafe.

11. *Quercus marina.* Sea Oake, or Sea Wrake.

This likewise in the same places, and after the same manner groweth on the Rockes, and hath thereon, when the water is falne thereon, flooting forth many long stalkes of leaves, to a great length, cut in and divided some what like vnto Oaken leaves, set here and there with blisters, as it were berries full of winde, and some full of water, which being broken or will give a cracke, the whole herbe is of a very greene colour, soft and tough, which while it is wet is like wet skinnes, some doe call this herbe *Quercus marina buccifera*, by reason of the small round knots, which is like hollow berries, and is blacke being dry. Another sort is called *Glandifera*, which is that being somewhat like the other but with shorter leaves, and some also growing from the middle ribbe: both have knots or blisters on the branches, but at the ends thicke small long bunches like small Acornes, and is worst when it is dry. And a third sort called *Quercus marina barbata*, because the ends of the leaves are very finely cut into long hairy threds, representing a beard.

12. *Opuntia marina.* The Sea Garland.

This dainty plant groweth up from some Rockes or stones, in or neere the Sea, spreading sundry flat, thicke short and round leaves, one set on the toppe of another, and some also growing from the sides, forming branches of leaves leaning downewards, each being as it were strung on a thred which yet is scarce to be discerned, like as Country Garland of field and corne flowers, are vsed to be made to decke the Countrey houses, and their sheaves of corne, so that the whole plant seemeth to be made of nothing but strung leaves, bearing a large yellow flower at the toppe saith *Lobelius*, but I much doubt he taketh that supposition from the *Fucus Indica Opuntiæ* folio: the lower leaves are somewhat browne, the rest are whitish greene, and those that are new spring are greene, and all of them smooth and shining, even kept betweene papers for a long time, and of a feltie tedie, yet so long now growing rougher and full of wrinckles, but full tough and not brittle like Coralline or Corallina, and growing vp againe steeped in water, yet still very tough.

The place and Time.

Divers of these are found on our *English* and *Scottish* coasts, but some in the warmer Countries, their chiefe time of beauty and vse, is the end of Summer.

The Names.

It is called in Greeke φῦκος θαλάσσιον, and in Latine *Phycos* or *Fucus*, or *Fucus marinus*, marine being added thereunto to distinguish it from the *Fucus herba*, which is *Anchusa*, and *Alga marina* also, because diverse Authors have called diverse water herbes by the name of *alga*, some *aquatica*, some *palustris*, *Plinie* but inconsiderately as is shewed in part in the last Chapter, appeareth plainely herein, for that in one place, *lib. 13. c. 20.* he saith that the Greekes *Phycos*, hath not found another name in any nation whereby it may be called, because also it is the name of herbes, and *Phycos* is of a shrubbe, and yet in another place *lib. 31. c. 6.* he translateth *Theophrastus* and *Dioscorides* that saith it is the Twistle of the Sea to be *Alga*, and say there are many kindes thereof, as they doe here: and thereupon *Gesner* doth alwayes translate *Theophrastus* his φῦκος, to be *Alga*. The first of these is the *Fucus marinus alter* of *Dodonæus*, the *Fucus sive Alga marina graminea* of *Lugdunensis*, called by those of *Montpelier Fucus marinus*, being vsed by them both for litter for their cattle, and for the best sort of dung for their fields, but *Lobelius*

Alga

Alga marina, and by *Bauhinus Alga angustifolia variorum*, the broader sort is called by *Imperatus Fucus gigas*, and *Fucus folijs gigantea*. The second, third, fourth, fifth, seventh, and eighth are set downe by *Bauhinus* in his *Prodromus* by the same names in their titles, or very little differing. The sixth is likewise set downe, in the title, and is likely to be the *Fucus Exter*, by *Lugdunensis* to whom it doth belong, which *Bauhinus* in his *Prodromus* calleth *Fucus longo angusto & crasso folio*. The ninth is the first sort of *Fucus marinus* by *Dioscorides*, and called *Ireos Lactuca folio* by *Pliny* and *Lobel*, by *Matthiolus Muscus marinus alter*. *Dodonæus* calleth it *Fucus marinus prior*, *Lugdunensis Muscus marinus Theophrasti*, and by *Bauhinus Fucus marinus primus Dioscoridis & Theophrasti*. The tenth is called *Fucus sive Alga latissima* by *Lugdunensis*. The eleventh with the varieties thereof are mentioned by *Lobel* and *Clusius* calling it *Quercus marina*, by *Dodonæus* and *Bauhinus Fucus marinus*. The twelfth set forth by *Lobelius* under the name of *Lichen marinus*, and saith he received it first from *Imperatus* of Naples, by the name of *Herculeus*, and after from *Corcyra* by the name of *Hyssopus marina*, and *Coralloides latifolium*. *Bauhinus* calleth it *Fucus folio rotundo* in his *Prodromus*, but *Fucus teretinus* in his *Theatrobotan*.

The Vertues.

All the kinds of Wrake, saith *Dioscorides* and *Galen*, doe coole and dry, and is good to ease the Gout, and inflammations, being used fresh, but *Lemnius* correcteth the cooling word in *Galen*, and saith it doth better agree with fresh plants, so dry rather then to coole, by reason of their saltnesse, which doth binde and constringe, but not coole. *Nicander* in *Theriacis*, commendeth the red sort of *Fucus* to be good against the venome of Serpents, and other venemous creatures. The first sort is much used by the *Venetians* instead of hay or straw, to packe up Glasses to preserve them from breaking, but at *Montpelier* and other places, they use it as litter for their horses, and being cast into compost is excellent good manure, to refresh their barren or out eaten grounds. divers of the other sorts are eaten as sallet herbes, as the fourth, fifth, and twelfth, the seventh as is said, is good to represse the hurtfull longings of women with childe, and *Clusius* saith that *Cornutus* signified unto him that the common people of *Corsica* use the salt, instead of *Coralline* to kill the wormes in children.

Chap. LIII.

Muscus marinus Coralloides dictus, Hard Sea Mosse or Coralline.

According to the method before prescribed I am in this Chapter to shew you all those sorts of hard Mosses that are either Coralline or come nearest to them.

1. *Muscus marinus sive Coralloides albus officinarum*. Common white Coralline.

The ordinary Coralline which is used in the Apothecaries shoppes, is a sort of white, hard or stony Mosse, growing usually on the Rocks not neere the Sea, rising either from the stones thereof, or from the shells of Scallops, Oysters, or the like, and groweth not above an handfull high, spreading under small branches like a greene herbe, with divers small short leaves, like haires thereon, which is soft, under the water, but taken forth groweth as hard almost as a stone. This is our ordinary Coralline, which is gathered in all the Coasts Westwards, and in these Northerne parts of *Europe*, as yet I can learne but some have affirmed that it hath beene found somewhat reddish, growing upon the Corall it selfe, which is not found but in the deeper *Mediterranean* Seas, on the rocks under water.

1. *Muscus marinus sive Coralloides albus.* Common white Coralline.

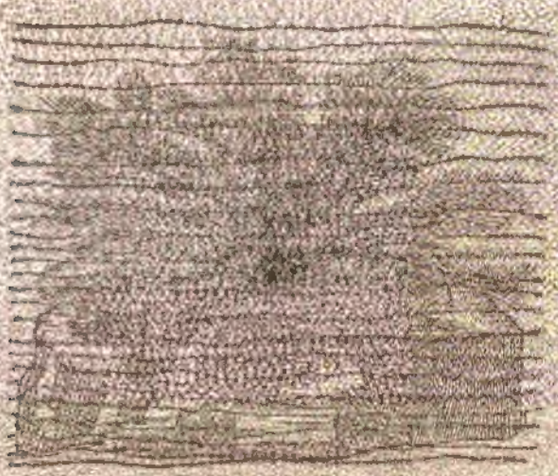
2. *Muscus marinus niger Germanicus sive Coralloides nigra.* Blacke *Germane* Coralline.

This groweth like unto a Coralline, with branches and fine narrow leaves, but blackish of colour, which is a sort seldome heard of before, and creepeth as it groweth.

3. *Muscus marinus sive Coralloides rubens.* Reddish Coralline.

This sort of Coralline hath no branched stalkes like the former, nor spreading much, but growing more upright, hath long and slender stems then the same, as fine as fennell, and of a red colour.

4. *Muscus marinus latifolius sive Coralloides latifolia.* Broad Coralline.



The broad Coralline spreadeth leaves as it were on both sides of the stalke, each whereof is broad, and parted into sundry divisions.

5. *Muscus marinus longifolius sive Coralloides longa.* Long Coralline.

This Coralline hath divers upright stalkes set with two, three or more long leaves by spaces, one above another, in three or more rowes, each whereof is somewhat flat, and dented or cut like a saw on the edges.

6. *Muscus marinus squammatus sive Coralloides squammata.* Scaly Coralline.

This sort of Coralline hath sundry long, with joynts as it were unto scales, and small hairy Mosse like leaves on each of them, being wholly white.

The Place and Time.

All these Mosses are expressed to grow on the Rockes and stones in and by the Sea, and are to be found growing at all times of the yeare.

The Names.

All these sorts may be referred to the *sicke Muscus marinus* before set forth, both their place of breeding and manner of growing declaring it, and came to be called *Coralline* chiefly from that sort that growes like Corall is selfe. The first is the *Muscus marinus* of *Matthiolus, Dodonæus, Lugdunensis* and others, *Lobel* calleth it *Coralline*, and *Lugdunensis Fucus capillaceus*. The second *Bauhinus* onely remembreth in his *Pinax*, to have received it from the *Baltick Sea*, calling it *Muscus capillaceus matthioli niger*. The third is the *Muscus marinus vulgatissimus* of *Lobel*, and the second *Muscus marinus* of *Dodonæus, Tabernemontanus* and *Gerard*. The fourth is the *Muscus Corall-formis* of *Lobel*. The fifth is the *Coralline minima* in the new *Gerard*, whose description doth nothing answer the figure, for *Gerards* figure is quite differing from this, yet it answereth to his description. The last is called by *Lobel Muscus candidus Coralloides squamosis foliosus*, and in the third *Muscus marinus* of *Dodonæus*, although the new *Gerard* doth exhibit another figure by that name, and giveth a description differing from his figure.

The Vertues.

Coralline is in a manner wholly spent among us to kill the wormes in children, or in rides per lotum, and to the manner, not knowne but in these latter times to be hoarse, but by what quality it worketh this, and is not declared by any, for it is altogether insipide, or without taste of heate or cold, as Corall is selfe is, and if Corall be so much commended against the stone and stones, cramps, the falling sickenesse, and melancholy &c. as you shall heare in its proper Chapter, doe not thinke but these may conduce somewhat thereunto also.

Chap. LIV.

Frutices Coralloides, sive Coralline frutescentes. Shrub Corallines.

Now the Corallines mentioned in the last Chapter, I must adjoyne sundry sorts of woodly, gritty, or stony shrub like Corallines, as I may so call them, of severall differing natures and formes, which could place in a Chapter by themselves, and neither mingle them with the former Corallines, nor with the next Corals, because different from both.

1. *Coralline frutescentes albæ.* The white crusted shrub Coralline.

This white shrub Coralline groweth up from the Rocke or stone shell, in forme of a small bush or tree a cubits height, more or lesse, with a flat stemme or trunke below, and sundry flat branches also rising from both sides, and not round like an ordinary shrub or tree, which branches are divided into other smaller ones above, and those againe into smaller, it is wholly covered over or crusted with a white hard coat like unto Coral, or white Corall, but rough or rugged, the middle part or heart being woodly and bending like the stemme of a tree, yet very hard also.

2. *Coralline frutescentes rubræ.* Red crusted shrub Coralline.

This red Coralline is like the former in all things, saving that the colour hereof is in some sorte red, and in others the branches part white, and part purplish. And another [illegible] yellow fronted, which is I take it *Bauhinus* calleth *Coralline pallidæ flaveſcentes* [illegible] I thinke them both one.

3. *Coralline brunea ruffeſcens Ericæ facie.* Brownish woodly Coralline in the Heath.

This sort also groweth flat like the former, and from some stone or Rocke riseth halfe a yard higher, with diverse spread branches, divided againe into other smaller ones, some what like unto Heath, [illegible] yard in breadth, all covered with a thinne brownish barke, and a very hard woodly substance within, with small knots or bunches, as if they were the buds of flowers, richly rubbed to gold, [illegible] of a saltish taste.

4. *Coralline plumata sive Myriophyllum Pelagicum Cortusi Clusio.* The Sclavonian Sea Feather.

This Sea Coralline (for so in substance it is not unlike, and *Cortusus* found the effects to be alike also) groweth not

as the former, is not any stone or shell, but out of the ground in the Sea, from a roote fastened therein, with very many fibres, growing up with a slender stalke, (as *Clusius* setteth it by the figure about a cubits height) which sendeth forth branches of long leaves, very finely cut into many long parts on both sides and bending the toppe downeward, very like to the branches of the Date tree, or as I may resemble a Feather, of a pale or whitish colour: the upper leaves are smaller then the lower, alle alike, and the toppe of the stalke endeth in a creasine head, compoled as it were of many scales wherein is no seede, their scales being as it were young plants, which falling to the bottome of the water roote thereto, and grow up like the mother plant, because it groweth in the water, or is fresh new taken out thereof and plant to see bended any way, but when it is dry it is as hard as Coralline or Claile, and as brittle.

2. *Coralline alba rudefa.*

The knotted white Coralline or Barbary Feather.

The stalke hereof is a foote high, white, hard, and woodie, covered with a rugged white barke, having sundry small and weake branches, rising out on all sides without order first of foure inches long apeece, and some parted into smaller, not above an inch long, on each stalke there are divers, even thirty or forty small knots or buttons, for the most part bored through, compoted of two halfe circles ioyning it seemed about: this was brought out of Barbary. Here also and there were in hairs like feathers.

3. *Coralline duplex & minus rugosa.*

Two sorts of rough Coraline and a smooth.

The one of these is of a hard woodie substance, without any barke, of a brownish colour, crusted over with a very knotted or bunched crust or barke, of an ash colour, which a little eafie to be rubbed to pouther, from whence doth arise crooked or bending stalks, and smaller branches from them all of them crusted and knotted towards, as the stalke and branches, to a blunt point, or end. Another is both white and smoother, but alle not like it in stalkes and branches. There is another the whole crusted coate is pale yellow.

4. *Coralline reticulata plana, pavonaceus.*

The red Sea Fanne.

This pleasant and delightfull Coralline is of divers sizes some greater and other lesser, yet all of a form, like a fanne or large fanne with sundry greater branches growing on both sides of the same stemme, and they again subdivided smaller, ending in very fine and small points, yet all joyned close together, without any separation of one from another, but with sundry small or greater holes, like the meshes of a net. Some sorts have beene seene that have had no holes in them, but were whole with some spots on them like unto holes, of a very hard and woodie matter or substance, not to be cut with a knife, of a brownish red colour yet tough or hard to breake, although it may bee easily bended, and covered in many places, in some more or lesse (but peradventure all over, when it is first taken out of the Sea) before it be rubbed with handling and carryage, with a whitish jelly. This groweth in the Ocean sea, which the Seas cast over often times. Captaine *Smith* in his booke of the plants growing in the Indies, compareth it to a Vine leafe, as some others that full few it here did, and called it the Feather. It hath been brought both from the East and West Indies to us.

5. *Coralline nigra altera duplex.* Two sorts of tall blacke Scrines or Sea Fannes of *Italy*.

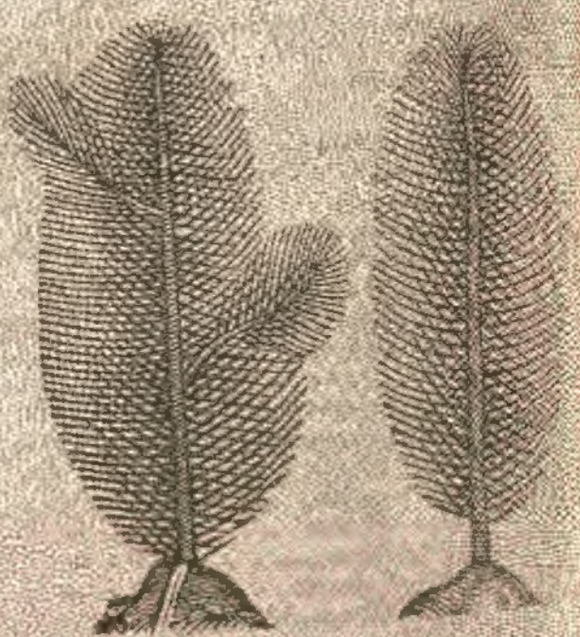
Like unto the likenesse unto the last mentioned pleasant Fanne, I thought good to adjoyne two others, each where-of growing to a meane height from the Rockes in the Sea, and gotten by them that dragge for Coralls: the one of them is branched as it were in one or two places, that is, hath a small fanne rising out from the maine stemme, and the other hath none, but the stemme thereof is rolled or wound round, like as is to be seene in the Vnicornes horne, or

1, 2. *Coralline frutticosa alba & rubra.*
The white or red shrubbed bush Coralline.

3. *Coralline grossa lignosa.* The woodie Coralline.

2. Cupressus pyramidalis sive Mas Pinnis quadrifariam positis Cortusi Clusio.
The Sebastian Sea Cypress.

Quercus Ilicis Theophrasti Cæsalpino,
Clusio Dioscoridis Oaken of Theophrastus.



1. Cupressus pyramidalis sive Sempervirens.
The Pyramidal Sea Cypress.

4. Cupressus arborescens Mas.
The Sea Cypress of Theophrastus.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

of those that hath had a With winde, or Hony suckle run up upon it, and the other not, both of them consist of a number of small and long leaves, as I may so call them, or rather blacke Hogges brissles, one row or order growing out from the middle stalke, and another from it thwarting them, so right all joyning together, in forme of a net, with the holes or spaces to be seene through them, the sides being even and the topper round.

The Place and Time.

The place of the two first are *Montpelier*, and some places in *Spaine*. The third *Clusius* saith he had from *Norway*, but not knowne whether growing there or no. The fourth and fifth are expressed in their descriptions, the sixth with all the forts is not expressed. The seventh hath beene often brought from sundry parts of *America*, both *Virginia* and other Colonies. The eight is not certainly known by *Dodon* from what place it was taken. They keepe their seasons with the rest.

The Names.

The two first are called by *Lobel Coralline alba & rubra Antipathes facie*, and by *Bauhinus Corallina fruticosa*, although herein they are *Clusius* his *Quercus marina Theophrasti*, whose figure I here also give you for the difference sake, but *Theophrastus* his description thereof *lib. 4. c. 7.* can in my opinion no way agree thereunto: for hee saith, that *Quercus marina* have a thicke long and fleshy leafe, but this is hard stone like, or Coralline on the outside, and woodey inward. *Matthiolus* calleth it *Juncus petraeus*, and *Gesner Lithophyton maeoticum*. The third is called by *Clusius Fucus marinus Crispus sive*, in his sixth Booke of Exotickes and ninth Chapter, where one by *Lobel* hath among the Corallines by the name of *Corallina ruffescens & asperata*, and among the Fuci by the name of *Fucus similis maximus*. The fourth is as is said in the title, *Clusius* his *Symphytum Peloponense Cretense*, which *Bauhinus* numbereth among the *Alcyonia maritima*, calling it *Alcyonium maritimum ramosum*, but as I there say, finding it both in substance and quality like unto Coralline, I reckon it here among them and called as *Clusius* saith by the *Italian* Fishermen *Pennachie delle Ninfe, & Palma di Nettuno*. The fifth is called by *Bauhinus* as it is in the title, and so is the sixth also of both sorts. The seventh is called by *Clusius Phucus marinus elegantissimus*, and *Plumes marina reticulata*, but I reckon them both as one, or so little differing, as they deserve not to be separated, which he thinketh commeth neare unto the *Palma marina* of *Theophrastus*, a kinde thereof, but *Theophrastus* saith, his *Palma marina* hath thornes or prickles for the leaves, which doth not agree with the eighth, if the colour were red and not blacke. *Bauhinus* calleth them *Corallina cornicornibus*. The last of both sorts is set forth in the *Italian Builder* of *Fuci*, by the name of the third and fourth sorts of *Scopules* or blacke Coralline.

The Vertues.

We have little or nothing to deliver unto you of any vertue any of these hath beene tryed to have, saving that it hath been used to helpe the bitings of any venemous creature, to heale wounds speedily, and to kill wormes, more needfull for them Coralline, but are kept as rarities to declare the wonderfull workes of God, in those deepes, which are as much to be admired as any of the Land.

Chap. LV.

Coralliums. Corall.

TO end this relation of the slimy Sea Mosses, I must also shew you the Corals (for there are a number of other Sea Excrellences, which I must passe over, being of little or no use in Physicke, and would fill up many sheetes of Papers) which are, as of sundry colours, so of formes likewise.

1. *Corallium rubrum majus.*

The greater Red Corall.

The greater red Corall groweth on the Rockes under sea like unto a small shrub with armes and branches breaking forth some into greater others into smaller sprigs, set full of knaggy eminences, of a faire whitish red colour on the outside for the most part as it is taken forth of the water, but being cleansed or filed, and polished becommeth very faire, as is usually seene, yet some will be much covered on the outside, as the first taking up, and the pith reddish within at a hearte or hard stony substance, after it is kept a while out of the water, unpleasant while it is there. There is some other sorts found which grow smaller by much, and fuller of branches, and are usually of a better colour on the outside. *Cesalpinus* maketh mention of a kinde of Corall that hath beene found red on the outside and blacke within.

2. *Corallium album majus & minus.*

The greater and the lesse white Corall.

The greater white Corall groweth like the red, but seldome found with so small branches, being thicker for the most part and although white without, is not so fine, yet somewhat darke coloured on the inside, and as rugged as the red. As there is

Palmae marinae.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

of the red, so is there of the white Corall, other sorts of smallerize even as small, and more tender and less then the red, some also of a most pure white Corall.

3. *Coralliom album alterum.* Lesse white Corall.

This white Corall groweth greater and with blacker armes and branches then the first, but lesse of substance being lesse solid and more porous or spongy then it within, and with many [illegible] the outside.

Album 3. Rubrum, Tenuicorne pori-ferum. Album stellatum.

Sundry other sorts of white Corall have been observed by some as Matth., one like an horse like a pipe, with many branches called *Coralliom album fistulosum.* Another is couched not with [illegible] pored withall, called *Coralliom album porosum ramosum.* A third hath markes like Harres, and is of two sorts both a greater and a lesser, called *Album stellatum.* A fourth hath [illegible] if they were joynts and called *Coralliom album articulatum.*

3. *Corallium nigrum leve Antipathes.* Blacke Coralls.

The blacke Corall groweth great below, where it sticketh to the Rocke, proceeding into fewer branches, but as smooth as if they were polished and shining like Jet or Pesle. There is said to be found that is yellow, else like unto the blacke.

4. *Corallium nigrum horridum.* Rough brissly blacke Corall.

This also is often found as tall as any man, and of a large size in the trunke or maine stocke, having many blacke prickes like rough brissles, or the awnes of corne standing reared about it one above another up to the toppe.

The Place and Time.

Both of these Corals are found about *Marseilles*, and the Ile of *Sardinia*, and other places in the *Mediterranean* Sea, and seldome on this side it, and never with the other.

The Names.

Coral is in Greeke and Latine *Corallium* in Latine, and so called by all that write thereof: and whereto *rubrum* or *album*, red, or white is not remembered by *Dioscorides*, *Theophrastus*, or *Pliny*, among whom only the two moderne Writers: the blacke sorts are called *Antipathes* and *Corallium nigrum*. The last is set forth in the *Italian Bible* of *Rome*, by the name of the second sort of *Antipathes*, or blacke Ivory Corall, and so called by the Fishers of *Sardinia Smadegeth*.

The Vertues.

All the sorts of Corall doe coole and binde, yet the white is thought to be of colder operation then the red and the blacke, to be as effectuall to all purposes as either of the other: but red Corall is of most use, and is commended to be very effectuall for those that spit blood, or that bleede much either at the mouth or nose, or any other flux of blood in man or woman, and being often taken in wine or other drinke doth diminish the spleene, it helpeth also the gonorrhea in men and the whites in women, it likewise helpeth them such that are troubled with the stopping of their water, or hardly make it but by droppes, and also helpeth to expell the tormenting paines of the stone in the bladder, if the powder where it is burnt be taken in drinke a dramme taken in wine, or in water if they have an ague prouoketh it as it is said: it is good to be given to those that have the falling sicknesse, or have crampes when it is burned and made into powder: it dryeth and bindeth more then before it did: it is also much commended against melancholly and sadnesse and refresheth and cheareth the fainting spirites: it stayeth the bleedings of the hemorrhoides all vertues, and of wounds, and of the menses, helpeth after an ease delivery of the birth, it also fastneth loose teeth, helpeth sore gummes and ulcers in the mouth and healeth up foule hollow ulcers in other parts: the ashes thereof being burned, mixed with other things for the eyes, helpeth the watering, heate and rednesse in them, by cooling and drying up the moisture in them: though *Galen* hath made no mention of Corall in his bookes of simple medicines, yet he appointeth it as a compound vertues sundry medicines, that are for those that have the phthisicke or cough of the lungs, tending to a consumption, and that spit blood, and that have foule running sores or ulcers, and to cleanse Impostumes.

4. *Corallium nigrum horridum.* Rough brissly blacke Corall.

Chap. LVI.

Alia marinæ plantæ. Other Sea Plants.

There yet remaine some other sorts of Sea plants, which are many of them of a stony substance, or crusted over like as if they were so, although while they are in the water, they grow like unto trees of diverse shapes and formes, and because there remaine in Physicke knowne of them, not yet for any other purpose then to behold the varriable workes of nature, or rather of the God of nature in the Sea, and to ponder the wonders of the deepe, I will be breefe in them, and but onely shew you them.

1. *Alga marina.* The Sea Fuze.

This *Alga* hath set it downe (who found it on the Sea shore of *Flanders*,) groweth upon Oyster or Muscle shells, seldome above an handfull high, very neerely resembling a low or dwarfe Fuze tree, with branches of the like, being small and brittle, composed as it were of scales, some being flat and others round compassing the small stalke. *Lobel* reporteth it to the Corallines calling it *Muscus Corallinus alter*.

2. *Cupressus marina.* The Sea Cypresse.

This also is so like unto the small Cypresse tree, as nothing can be more, having branches set round but without order and going upwards, as the leaves of the Cypresse doth, and with leaves therein the same to me and others, having before being kept in a paper booke, and set in water, will spread it selfe abroad, and shew the same as at first.

3. *Myrica & Scoparia marina.* Sea Tamariske and Sea Brush.

These shall be found growing on the like shelfe, that were likelonest unto Tamariske, and some unto Broome, of such a height and bignesse, with many branches covered over with a hoary talnesse of the Sea.

4. *Rupicola marina.* Rocke wilde Rocket of the Sea.

There is another sorte of *Sea Rocket*, and first Chapter saith, he had this at *Amsterdam*, and for the varrietie, there but before, it is a hard woodie substance, crusted over with the white saltnesse of the Sea, being not thicke bodie, but small and the lower parte, broken away, yet containing sundry branches, covered upwards with sundry small cups or vessels hanging downewards, of a whitish ash colour, not much unlike unto the seede vessels of Lupines when they are ripe, but much lesse, and so brittle that they might be rubbed to pouther betweene ones fingers.

5. *Hippuris*

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

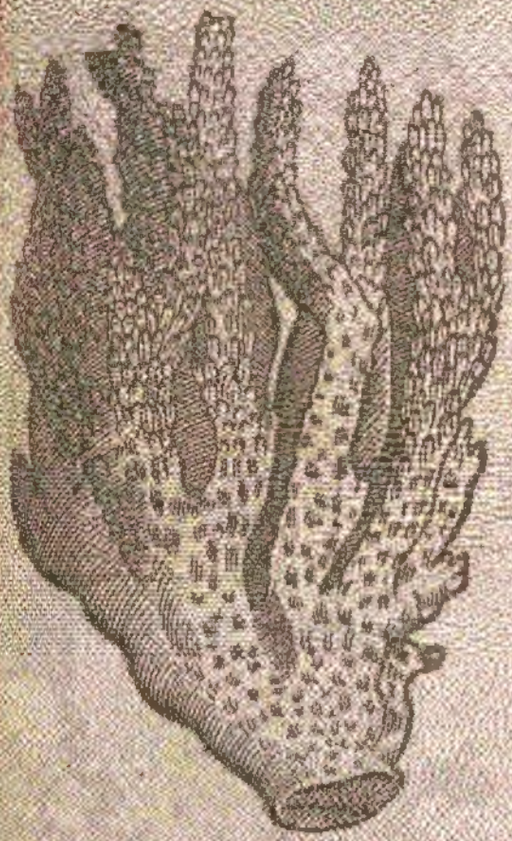
5. *Hippuris saxea.* Stony Sea Horsetaile.

This likewise seemed to grow to some stocke, a peece thereof remaining to the branch that contained sundry small sprigges leaning or bending one way, full of knots and joynes, of a browne shining colour, else all white enamelled over with a stony matter, the middle or inner part being woodly.

6. *Abrotanoides saxea seu Abrotani fœmine similis planta saxea.* Stony Lavander Cotton.

This is wholly of a stony substance, rising up a foote high spread into sundry branches, yet joyning as it were close together by the bottome of them, and they again spread into smaller sprigs, which containe five or six, or more rowes of short hollow leaves like pipes, else all like unto the leaves of Lavender Cotton, some part of the lower leaves being broken the upper part was whole, being of a purplish colour, the rest white, of a stony salt substance, shewing the originall to be the Sea.

7. *Salix marina.* The Sea Willow.



This groweth likewise upon Oyster shels or the like, rising up with sundry stalkes, of a grayish red colour, and set with narrow long leaves like Willow leaves, which lye on the water, some being smooth, and some little waved or dented about the edges, among which rise also other stalkes bearing flowers like those of the Willow with many points like the scales of the catkins, when it is ready to bloome.

8. *Androsace Matthioli, seu Corydalis marina & Umbilicus marinus.* The Sea Navell.

Least this Sea plant (if you will so call it, or what else you please) should be quite left out of this Garden, we thrust it in, in the end of this Chapter, being a Sea excellence, formed like small round fawcets, hollow in the middle like unto a Navell, and borne up by small smooth stalkes about two inches long, every one growing from some stone, or rocke, or shell in the Sea, or salt poole, being of a pale greenish ash colour, while they grow under water, but afterwards grow as white almost as Corall, or the like, and of a stony substance. This properly called *Androsace Matthioli* by divers authours, because he first set it forth being sent him from Spain by Clusius for the right, and *Lobel* seemeth to be of the same minde also, saying he can finde no other herbe that commeth so neere thereunto, calling it *Corydalis foliosa non serens & Umbilicus marinus Monspeliensium*, but Columna calling the same plant it seemeth gave it a truer name, calling it *Fungus marinus minimus*. For it can no way agree (saith he) unto the *Androsace* of *Dioscorides*, if we will believe he knew the thing he wrote of, for he saith it hath not but a husk with seede in it, and doth appropriate whereunto both husk and seede is good, but this plant hath never beene observed to beare husk or seede, for being a stony Sea excellence, as Corall and many other sorts

g. Wee

1. *Spongia communis fontis, foris nigricans, intus pallida, crassa, densa.*
Stony Lava under Colleen.

2. *Isatis marina.*
The Sea Woade.

growing upon theis stones, &c. in the Sea how should it be expected to grow any seede, yet *Lobel* and others would wrestle, curtail, and alter Theophrastus text, to make it serve their turne, but assuredly the true *Isatis*, is not yet found out and made knowne for any thing that I can understand, and therefore let *Matthiolus* still have the honour of this Sea plant.

The Vertues.

There is nothing extant of the properties of any of the former Sea plants, and but by *Lobel*, none of this who yet would assimilate some of the properties of *Dioscorides* his *Chalcefers* unto this, that is, to represse the rage, and to distill the humours gathered to the joynts, procuring ease and aches, gouty, and the like, wee know (with *Lobel*) that the herb binds the belly, to farre of it is from loosening it, as some have thought. I have known some to put this stone into the Tobacco-pipe when it is new, and called *Tabellion maritimus* yet I have found it to be a verie trifle.

3. *Lichen marinus fruticosus Corallioides minor aut Umbilicus marinus.*
The Sea Navel.

Chap. LVII.

Spongiæ & spongiosæ plantæ. Spunges and Spongious plants.

Within the Spunges themselves, which are of sundry differing formes and colours, there are also many other Sea excrescences (whether I should call them plants or no I know not well) that are of a Spongy substance, which lastly I shall bring to your view.

1. *Spongia marina usualis.* The ordinary Spunges.

Their ordinary Spunges that we have daily use of, are some bigger others lesser, some round, some flat, some of a more yellow colour, others pale yellow or almost white, some also close and hard, others more loose and soft, some of a fine thinne substance, and others of a courser and thicker. *Bauhinus* relateth that some sorts are called *Hircina*, another *Tubera*, another *Equina*, another *Equilina*, with divers other names. I will therefore onely shew you that Spunges like other excrescences are bred in the Sea, growing from some stone, Rocke, &c. or the like, and by the Seas operation in some places differing from others, brought to the forme as well as colour,

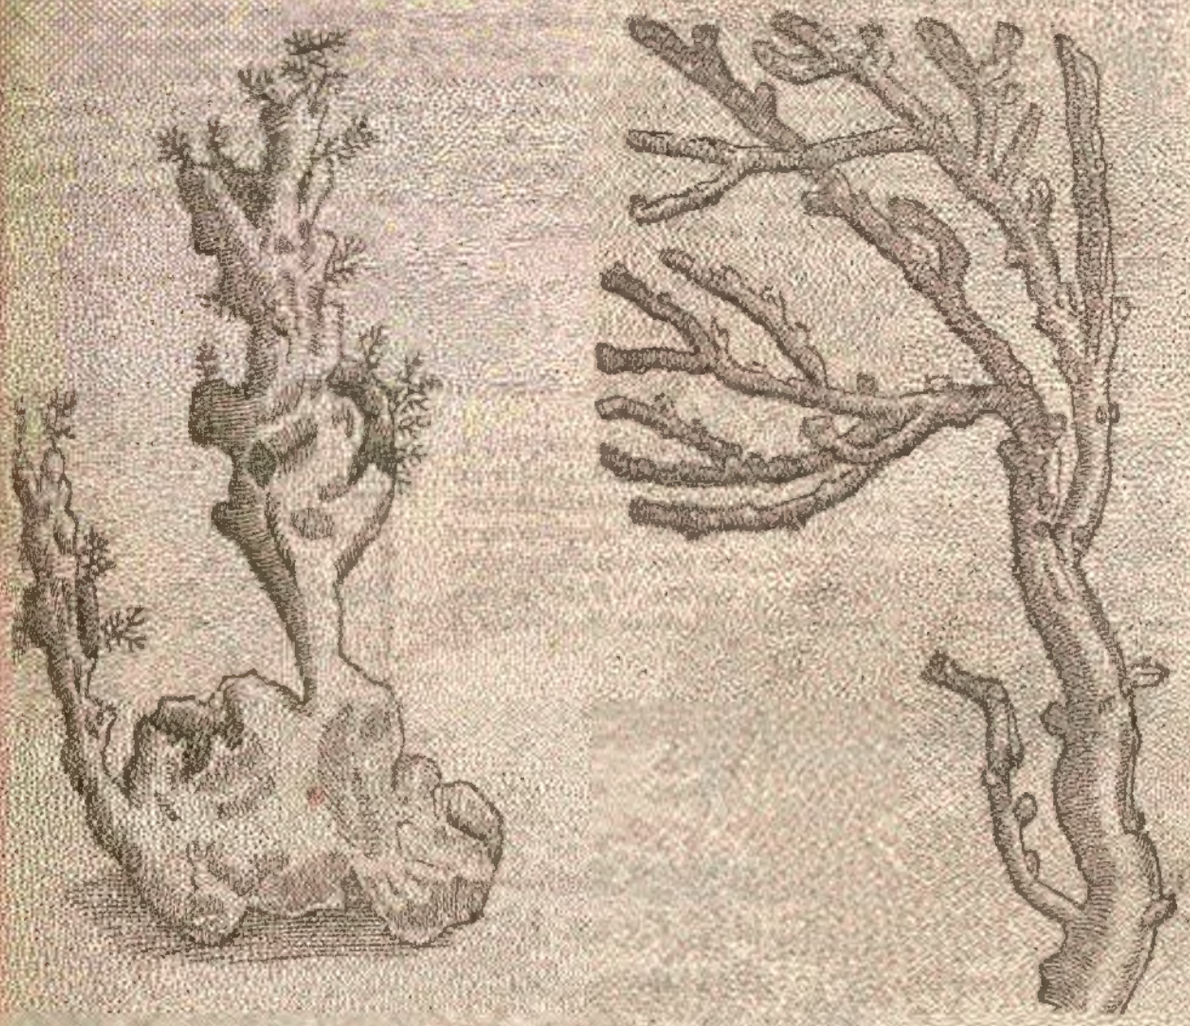
1. Spongia Ramosa tenuis.
The ordinary Sea Sponge.

2. Spongia infundibuliformis.
A Funnel like Sponge.

3. Spongia cornucopiæ formis.
The branched Angelin Sponge.

4. Spongia ramosa altera Anglica.
Another branched English Sea Sponge.

colour that it holdeth, being at all know of a fofe fubftance, neither ftony, woodily, nor herbe like: but rather like a peece of wooll or cloth to wrought together by nature, that being full of holes, it is ready to receive and hold much water and by preffing or wringing ready to yeeld it out again, for will encreafeth in the water, it gathereth into it, or elfe there is feene in the holes thereof divers fmall grany ftones, which are vfually found therein, declaring the breeding thereof, not to be farre from the ground, by the breeding of thefe ftones. *Ariftotle* in his fifth booke and 16. Chapter. *Ariftotle* *Plinie* faith that divers did thinke and fay in his time that Sponges had fence to them, for that (as they fay) they would fhrinke if any did plucke them, and were hard to be pulled up, and that they doe fo likewife, when the furges of the Sea would breake them off from their refidence. For faith *Ariftotle* in the fame place, divers did doubt of the truth of that relation, and thofe were they that dwelleat *Taranta*. I have beene bold to infert this proofe of *Ariftotle* in this place, to refute the opinion of thofe that hold Sponges, and the like to be *Zoophyta*, feminine creatures, for all though auncient in *Ariftotles* time, yet doubted of them alfo: and therefore wee that have beene better taught, and in a Schoole of farre greater knowledge, both of Divine and Humane things, may well caft of fuch fond conceits.



2. *Spongia infundibuliformis.* A Funnell like Sponge.

This Sponge *Clufius* hath fet forth to have beene cleaving to a very hard ftacke ftone of twelve pound weight, and was broad above and narrow below, where it grew to the ftone like unto a funell, or to the bowles of an helve low, where it grew to the ftone like unto a funell, or to the bowles of an helve yet not of an equall height at the brimme, which alfo were fo turned outwards that they feemed to be like leaves folded inward. One fuch Sponge I fee, member I faw while I lived at *Montpelier*, that did molt exactly reprefent forme of a very large hat.

3. *Spongia*

1. *Spongia ramosa fistulosa Venet.* The Venetian Sea hollow Sponge.

2. *Arbuscula marina spongiosa Coralloides.* A Spongie Corall like tree.

1. *Spongia ramosa Britannica.* The branched *English* Sponge.

This doth *Lobel* I found in the Ile of *Portland*, among other Sea excrements, which for substance and colour, you would say was a Sponge, but if you marke the forme of branches in it, you would say it was meere a Coralline, for it was meere a handfull and a halfe high, full of billkes, soft and easie to be bowed any way. Some would take this to be the *Ulmus Plorumos* of *Pliny*, that was like unto Corall without leaves, growing hard changing the colour to blacke, and ready to breake if it fall, which is more likely to be the *Antipathes* or blacke Corall of *Dioscorides*.

2. *Spongiosa marina Anglica planta radosa.* The *English* soft Sea ragged plant.

This soft Spongie plant hath beene found on our *Kentish* Sea shore, by Master *Johnson* and his Associates, in a late voyage to those parts, and is about the thicknesse of ones thumbe about a foote in length set with many severall knagged excrescences on all sides, like unto short branches, being very sappy, and of a soft spongie substance, and of a brownish yellow colour: it was not observed growing, but broken, and among other such like things cast upon the shore.

3. *Spongia ramosa fistulosa Venet.* The *Venetian* Sea hollow Sponge.

This Spongie kinde groweth on Rockes in the Sea like other excrescences, rising up as it were with stalkes, and dividing into all sides into sundry short branches, the substance whereof is spongy, and hollow, as soft as the crumme of bread, which may then be made into paste, and afterwards being dry, may ree made into paste.

4. *Arbuscula marina spongiosa Coralloides.* A Spongie Corall like tree.

The largest sort of *Clusius* called riseth a shrubbe or low tree, being three foote high, and seven inches ouer the ouermost branches, which although it seemed firme and solid, yet was but of a Spongie substance, and white like unto dry Ginger both the trunck or body with the many branches thereon, were set full of knobs, and knottie excrescences ending in greater, which were spongy on the inside, but without any seede in the seeming cases that were set on the outside like staues. The whole plant was covered with a thinne knobby reddish barke of colour *Cæsius* who first set it forth, doubted was not naturall, because he saw other the like which had growne of stone a little, that the fairr it selfe did not exceede it. Within a while after (*Clusius* saith) another which was a foote high or more, being wholly flat and halfe a foote broad and two inches thicke, with knobbes and knots in the like manner.

The Place, Time, and Names.

declared in their severall descriptions, so that I shall not needs further to insist thereon. The Grecians the Latines *Spongia*, and so doe both the *Italians* and *Spaniards*. The *Arabians* the French *Eponge*. The *Germanes Basschwam*.

Title

The

The Uerines.

Sponges are put to many uses, both civill and Physicall, as for fomentations or bathings, which moistned and applyed containe the warmth of the decoction, much longer and stronger then either linnen or woollen cloth: peeces of Sponges very well dryed and put into hollow ulcers, that are ready to close, before they be throughly cleansed and healed, doth open the sores againe, being to be pulled forth by the thred is fastened thereto, least it be put in: the ashes thereof mixed with a little wine or vinegar, is used to cleare the eyes when they are bloodshotten or watering: the stones in the Sponge are used by some to be given to them that are troubled with the stone, to helpe to breake it, and cause it to passe away with the urine. The *Uenerian* Sponge plaister is used to deliver the face, being washed with a decoction made thereof in honyed water, and is a remedy for them that have eaten dangerous Mushrooms to be boyled in Vinegar and taken: the poulder thereof taken in wine, purgeth like *Uenice Tartar*, and cutteth and thinneth grosse and viscous humours.

CHAP. LVIII.

Britanica Conchæ Anatifera, Barnackles or Brant Geese.

Britannicæ Conchæ anatiferæ
Barnackles or Brant Geese.

TO finish this Treatise of Sea plants, let me bring this admirable tale of mine rich to your consideration, that whatsoever hath formerly beene related concerning the breeding of these Barnackles, to be from their growing on trees, &c. is utterely erroneous, their breeding and hatching, being found out by the *Dutch* and others, in their Navigations to the Northward, as that third of the *Dutch* in *Anno* 1596. doth declare.

CHAP. LIX.

Muscus terrestris, Land Mosse.

HAving shewed you the Mosses and excrescences of the Sea, let me exhibite also to your knowledge in this place, and not put them to any other, the Mosses and Mushrooms of the Land: The varieties whereof are many, and therefore to be divided into those that grow on the ground, and those that grow on trees and other things, of each of these in their order.

1. *Muscus terrestris vulgatissimus*. Our common ground Mosse.

This common Mosse that usually groweth in our thicke woods, and the bottomes of low moggy grounds, and shadowy dirches and places, groweth very thicke together with many small single stalkes about a foote high sometimes, and often not above halfe the height, with a number of soft leaves like haires, growing thicke and close together, the toppe whereof in the hottest time of Summer will be somewhat round and whitish, the whole tuffocke is often found differing in colour, being either greene or reddish, or of a whitish yellow: it hath very short roots fastened in the earth.

2. *Muscus terrestris vulgaris alter*. Another ordinary ground Mosse.

This other Mosse that is more common in *Germany*, &c. then with us, groweth up with many branched stalkes of long winged but short greene leaves a moll like Heath, smooth, and soft, and not hard like heath, it spreadeth on the ground and riseth not above halfe a foote high.

3. *Muscus terrestris scoparius*. Besome Mosse.

The Besome Mosse taketh the name from the manner of the growing thereof, which is, from a small head below, sending up divers shining blackish purple stalkes of winged green threddlike leaves about a foote high, which spread themselves out broadest in the middle, at the top whereof breaketh forth sometimes small yellowish heads which fall quickely away without any seede following them.

2. *Muscus terrestris vulgatissimus*. Our common ground Mosse.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

3. *Muscus terrestris repens.*
Berlons Moss.

4. *Muscus clavatus sive Lycopodium.*
Club Moss, or Wolves claw Moss.

4. *Muscus clavatus sive Lycopodium.*
Club Moss, or Wolves claw Moss.

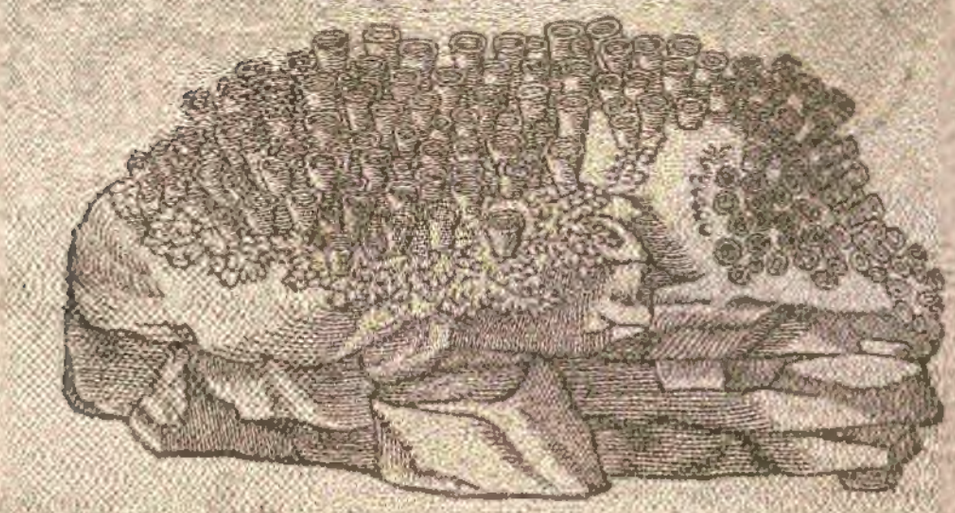
The club Moss runneth upon the ground many times length, breaking into other long small branches, shooting forth fibres into the ground as it creepeth, being made of many soft yellowish green hairy leaves: the joynts of the branches grow in several places two or three small round and long yellow hairy heads, like the catkins or bloomings of the Hazell tree, which as well the other Misses come to nothing.

5. *Muscus dentriculatus major & minor,*
The greater and the lesser dented Misse.

Both these sorts of Misses grow one like unto another, but one bigger then another: each of them somewhat like unto Firre, rooting in divers places, as it creepeth on the ground: the stalkes are as small as Rushes almost, upon which grow very small leaves thicke set together, as if they were scales. Inside close one unto another, the ends of them sticking out like teeth, but have not seene what flower or seed they have any.

6. *Muscus pennatus major & minor,*
Winged Misse small and great.

These small Misses also nestle out one departing and dividing out in the largest and greatest at branches, one from another creeping on the ground and rooting there, having stalkes and short leaves thicke set with fine yellow-green tufts like wings on both sides, and so bear the names: these grow plentifully upon Rockes and Stones.



7. *Muscus spicatus repens,*
Creeping Misse with spiked heads.

This Misse doth grow hard by, and under trees, creeping farre with slender and long branches, which send forth many

8. *Muscus arborum foliosus.* Branch Mosse.

12. *Muscus pyxidatus.* Cup-like Mosse.

many fine leaves close set together in manner of long spiked heads, one sort being greene and another sybie.

8. *Muscus ramosus crassus major,*
The greater branched Mosse.

The greater branched *Mosse* groweth thicke and close together like a turfe or tuffocke of high growth, whose stalkes are three or foure inches long, spreading into branches of two or three inches space, and those into others againe, all which are covered with very fine haires like leaves, among which shoote forth small naked stalkes of an inch long, with small yellow round heads like wheate corne. There is also a lesser hereof whose stalkes are shorter and leaves so forsed that they are scarce to be discerned.

Ibidem.

9. *Muscus parvus Hellerus.* Heath Mosse.

The small *Mosse* riseth up with divers bare stalkes of small short leaves, and at the top a many other set thicke and round in a tuffe: it groweth much on dry heathy grounds.

10. *Muscus Rotundo rostro.* Snout Mosse.

The stalkes of this small Mosse, rise scarce above an inch which have many small pale greene sharpe pointed leaves, set at the toppes of their small stalkes, in manner of a Rose, spreading forth like a little flaure, this groweth upon Rockes and stones.

11. *Muscus pyxidatus.* Cup-like Mosse.

The leaves of this Mosse that lye like Liverwort creeping upon the ground, are of a whitish yellow colour as the small hollow leaves like cups, that rise from them are of a pale greene colour. There is another sort hereof growing not on the ground as the former, but on rockes and stones whereof the cups are smaller, more in number and not so white.

Alter.

13. *Muscus cornuculatus.* Horned Mosse.

This horned Mosse which groweth on those rocky barren hills, and rocky grounds, where almost nothing else will grow, riseth out of the ground, with divers slender weake and somewhat broad stalkes three or foure inches high naked and without leaves from the bottome to the toppe, but parted into smaller branches, and they againe into lesser, which are forked at the ends like unto hornes of a dusky white colour.

13. *Muscus*

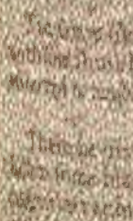
3. *Muscus minimus terrestris.* The smallest ground Mosse.

We have a small kinde of Mosse (usually growing with us not only upon many grounds that are not stirred or digged for two or three yeares together, but in flower pots of earth in Gardens oftentimes, especially some that are not stirred) which is nothing else but a number of greene thort hairs matting upon the ground, which in the Spring of Summer, and sometimes sooner will send forth small thort stalkes an inch high, with small yellowish greenish heads on them.

The Place and Time.

All these are in a manner particularly declared where they are most usually growing and are in their perfection the Summer time.

The Names.



Mosse in generall is called in Greeke βρύον and πόα, and in the Latine tongue *Sphagnum* and *Hypnum*, and *Dioscorides* in one place calleth it in Latine *Byon* and *Sphagnum*, and in another place *Sphagnos sive Hypnos*, since it is usually called *Muscus*, and properly betokeneth any herbe that is composed of haires or thredes like a weave. The first here set forth, is the *Muscus terrestris vulgaris* of *Lobel*, and *Dodonæus*, and thought by *Matthiolus* to be the *Muscus terrestris* of *Tragus*, but I suppose rather this is the last that I here set forth in this Chapter, and none other that I know growing so familiar in Gardens: The second is the *Muscus marinus* of *Dioscorides*, and *Muscus terrestris* of *Gerard*, which *Dodonæus* calleth *Muscus Pennatulæ facie*, and is very like the small *Pennatula*, but that it is softer not as it lyeth: The third is the *Muscus pyxidatus* of *Lobel* and others, and *Muscus Cladonia* of *Thalius*. The fourth is called *Muscus clavatus* by *Lobel* and *Dodonæus*, and also *Lycopodium primum*, *Tragi*, *Matthioli*, and others: *Muscus terrestris*, and is the *Selaginis species altera* of *Lobel*, *Gesner* in *Fragili manu descriptione* calleth it *Muscus arborius*, and it set forth for *Lycopodium Germanicum* by *Thalius* saith it was imposed on him by others, for *Cordus* sent the true *Lycopodium* to *Gesner* a little before his death, *Anguinum* and *Cupressinum*, by that it was of long time used in the Shops: *Muscus frondosus* for the fifth of both sorts is called *Muscus terrestris* by some, and *Muscus arborescens* by others, and *Lycopodium* by others. The sixth sorts is mentioned only by *Ruellius* in his *Index*, and *Fuchsius*, and so is the seventh also. The eighth is called by *Ruellius Muscus cornutus ex illius majoribus minor*. The ninth is called by *Lobel Muscus terrestris graveolens*, and by *Ruellius* also in the title *Muscus pumilus hellebori*. The tenth by *Ruellius* also called as it is in the title, *Muscus hellebori niger*. The eleventh is the *Muscus pyxidatus clavatus minor* by *Lobel*, the other not whereof *Ruellius* calleth *Muscus pyxidatus Cupressi*, as the leaves of *Lobel*, *Muscus terrestris*. The twelfth is called *Muscus terrestris major cornutus* by *Ruellius*, and to whom also the *Muscus pyramidalis* of *Tabernæmontanus* and *Gesner*, whereof his *Cupressus* hath put us in mind before in the place where the *Filix petræa* or *Tragi*, which is another Author doth referre it to any of the Mosses, but *Ruellius* also likewise his reference before, for as I shewed in the description thereof I struck the Fronds, that is the leaves of Ferne, and other Fearnes and Capillare herbes have, which argueth it plainly to be of that kinde: *Polytrichon*, and *Ruellius* his description of his *Muscus terrestris major*, doth plainly agree with this *Pennatularis*. These all strange best knowne to many, yet little regarded by most, and not mentioned before by any except *Tragus* and he but in part.

The Vertues.

All the Mosses are somewhat cooling and drying, and thereby stay fluxes and bleedings, their earth or ground Moss, especially the first and the fourth, are held to be singular good to breake the stone, and to expell and drive it forth by urine, being boyled in wine and drunke, the herbe bruised and boiled in water, and then applyed to any inflammations or pricking from a hot cause doth allay and ease them, and therefore may doe apply it to the Gout, or else for the paine thereof. The cup Mosse is said to help the chin-cough in children effectually, if they take the powder thereof for certaine daies together. The sixth Moss being in a veiall of wine that hath lost its vigour and vertue, so much as is convenient for the bignesse of the veiall, is said in short time to recover it again to his former strength, called *Vitis in horto*, the Wine herbe.

Chap. LX.

1. *Muscus herbæ formosæ & coralliformis.* Mosses that resemble some herbes or Coral.

There be diverse other sorts of Mosses that have some resemblance, either to some herbes or to Coral, and because I thought it best to ranke them together, I have as you see kept them out of the last Chapter, to enlarge them here into this.

2. *Muscus clavatus Cupressiformis.* Cypresse like Mosse.

This small Mosse standeth alwayes greene sending forth sundry hard branched stalkes, with very short and thicke leaves set upon them, somewhat resembling the branch of a Cypresse, being of a darke greene colour, from the top whereof sometimes come forth small and soft spiked heads standing upon small foorstalkes. Another sorte like hereunto is remembred by *Ruellius*, which he entituleth *Muscus terrestris major cornutus*, to this I ioyne this.

Alterum.

3. *Muscus Abietis facie.* Firre like Mosse.

This small Mosse groweth close upon the ground, and creeping thereon with sundry long branched stalkes, whereupon are set greene leaves, set on both sides of the middle thereof, resembling a Firre tree branch, whereof it tooke the name.

4. *Muscus Filicinus.* Ferne like Mosse.

There are diverse sorts of this Mosse, some bigger and some lesser than others, all of them rising up with sundry small stalkes, some reddish, and fine leaves set on them much like to Ferne leaves, but so some more finely cut or smaller parted than in others, on the toppes of the branches of the lesser sort hang small round rough headed heads.

5. *Muscus Polytrichodes.* Maiden haire Mosse.

There are three sorts of this Mosse, the one hath many short stalkes thicke covered with short, but somewhat

1. *Muscus abietinus Cupressiformis.*
Cypresse Mosse.

2. *Muscus pluma.*
Fethe-like Mosse.

4. *Muscus Coralloides montanus.*
Mountaine Coralline like Mosse.

5. *Muscus Coralloides saxatilis.*
Rockie Coralll like Mosse.

Matthias. hard, rough, haire like leaves, the other is lesse in each part, and the leaves not rough or hard at all: the third is the least and the leaves smoothest: the first groweth in wet wood grounds and the other upon old walls.

3. *Muscus saxatilis Ericoides*, Stone Heath Mosse.

This small Mosse hath many small hairelike leaves, neare the ground like unto the common ground Mosse among which rise rough stalkes an hand breadth high, in some places bare of leaves, and covered in the rest with many such like small leaves, as are growing on the *Erica Cerea*, the faire heath low Pine, but whitest green, on the tops of each whereof standeth a small head.

6. *Muscus terrestris coralloides incanus*, Hoary Coralll like Mosse.

This Mosse is all hoary white about a foote high, whose upright branches are thicke, solides and not hollow, divided into many branches, each whereof is like a staggs horne, and sharpe or small at the ends.

7. *Muscus terrestris coralloides rufescentibus cornibus*, Reddish Coralll like Mosse.

Among the ordinary ground Mosse doth this Mosse grow, and is a faire sight to behold the pale greene ordinary Mosse to grow on the ground, and this Mosse being all white to grow out from among it parted like Corall and many branches hard or rough in handling, but the ends or tops of them all are of a yellowish or reddish colour, like small hard or rough horns.

8. *Muscus*

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

8. *Muscus Coralloides montanus.* Mountaine Coralline like Mosse.

The Coralline like Mosse is a small low whitish dry herbe, with small hollow stalkes, not stony nor hard at all, but finely cut and divided into many parts, much resembling the true Coralline, this is often found upon dry Heath grounds.

9. *Muscus Corallioides saxatilis.* Rockye Corall like Mosse.

This groweth on the Rockie hills among other Mosses in *Naples* as *Columna* saith, whose branches are many wayes ending in a two forked like horne, somewhat like the double forked horne of a Stagge, being hollow without, and white within, but of an evill earthy scent, there is no other sort of a grayish ash colour and much lesse than the other, growing in the same place with the former. *Alterum.*

The Place and Time.

The place of most of these are expresst in their descriptions, and they keepe the Summer time for their flourishing.

The Names.

The first is called by *Dodoneus* and *Gesner in hortis Sabina sylvestris*, and by *Thalius Selaginis Plinianæ primæ species* to *Pliny* in his 24. booke and 11. Chapter (with these words, *similis herba Sabinæ & Celago appellata*, and therewithall not generally hold this to be his *Celago*, not finding any other herbe to neere to resemble it, although here of *Sabina* an herbe which is a tree, *Turner* and *Tabermontanus* call it *Chamacyparissus*, and so doth *Gerard*, but they did not observe I suppose *Gesner* doth, but a kinde of Mosse, which *Turner* nely Englished Heath cypresse; the second is remembred onely by *Bauhinus*, for that of *Clusius* is a Sea Plant, as is before shewed in his place; the third is set downe by *Tabermontanus* and *Gerard*, but the latter by *Bauhinus* onely: the fourth, fifth, and sixth, and seventh, are spoken of onely by *Bauhinus*, the eighth is called by *Tabermontanus* and *Gerard muscus coralloides sive Corallina montana*, but yet *Gerard* was much mistaken, to understand this of Stone or Sea Coralline, which is hard like Corall: the last is remembred by *Columna* in the second part of his *minus cognitarum stirpium*, and calleth it *Lichen coralloides*.

The Vertues.

There is nothing recorded in particular of any of these sorts of Mosses, to be available for any griefe or disease.

Chap. LXI.

Muscus arborum. Tree Mosses.

There are other sorts of Mosses which grow upon trees, which are next to be spoken of.

1. *Muscus arborum vulgaris & Quercinus.* Common Mosse growing on other trees as well as Oakes.

The usuall Mosse that generally groweth on all trees, is nothing else but a number of haires issuing from the bodies and branches of them, in some shorter in others longer, all for the most part hoary or of a grayish white colour, which yeeldeth neither roote nor stalke neither flower nor fruites some onely are found to be reddish, and sometime blackish, which is the worst sort of all: It groweth upon sundry trees, upon the great Cedar as *Dioscorides* saith, which is the best of all other, and is very sweete: the next in goodnesse (saith he) is that which groweth on the Poplar tree, especially if it be white and sweete: that which groweth on the Oake, saith he, is the worst. It is also found growing in severall Countries on sundry other trees, *Matthiolus* commendeth it for the best, the whitest, and the sweetest, that groweth on the Larch tree: others thinke that to be as good that is found upon the Pine, Pitch, or Firre trees. *Clusius* saith he found a kinde of ash coloured Mosse hanging downe from the armes and boughes of the Ilex, or ever greene Oake, in some places of *Spaine*.

2. *Muscus quercinus Foeniculaceus.* Fennell-like Oake Mosse.

This Mosse usually groweth upright on the bodies, and the Elder armes and branches of old Oakes and sometimes on Beeches also, tattering a small blackish roote into their barke, and from thence sendeth forth sundry slender blackish branched stalkes about two inches, with a number of most fine grayish Fennell like leaves which smell somewhat sweete, at the toppe whereof stand small round hollow vessels a little rough or hayrie about the brimmes, which quickely fall away without any seede following them.

3. *Muscus quernus fruticosus capitulis cavis.* Tree Mosse with hollow heads.

This tree Mosse hath hollow stalkes, with broad flat leaves, somewhat hayrie on both edges, the heads are hollow, with a blackish unbone in the middest of them, and sometimes compassed about with a dented verge: this hath some short branches spread divers wayes, and is wholly of a grayish ash colour.

4. *Muscus altior quernus latifolius corallioides.* Oake Mosse with broade horned leaves.

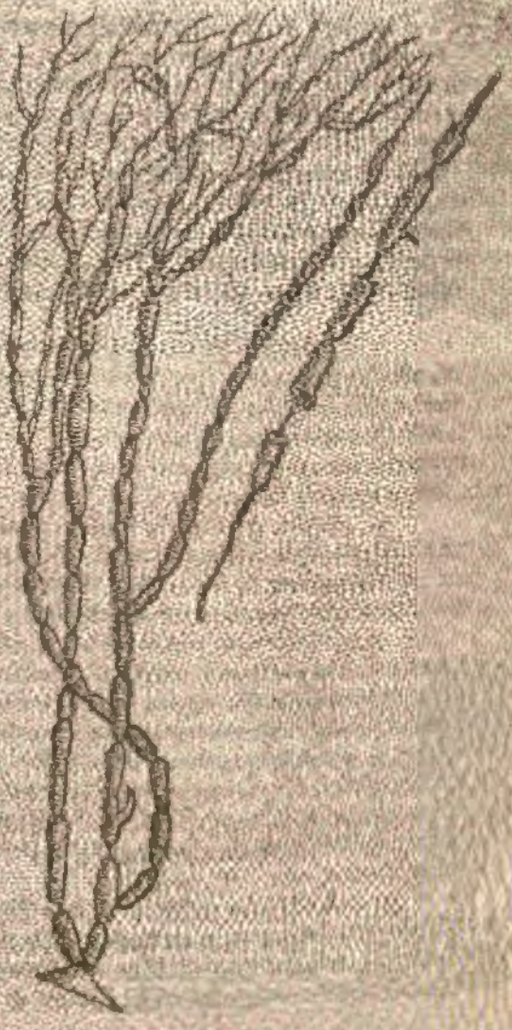
This Oake Mosse is of a whitish ash colour, branching it selfe into many thicke and broad parts, like unto the homes of a Stagge, bearing at the toppes of them certaine small vessells of the bignesse of Vetches or Tiche pease but rounder. This doth sometime grow luxurious swelling greater from the bottome to the toppe.

5. *Muscus arborum nodosus sive geniculatus.* Knobbed or kneed tree Mosse.

This grayish Mosse is very frequent in *Italy*, hanging from the trees with a large spread bush of haires, a foote and sometimes halfe a yard long, with divers small kneed joynts like beads, growing upon them towards the lower end, which are hollow and doe so grow as if they were strung together, some being lower and others shorter than the rest.

6. *Muscus pulmonarius sive Lichen arboreus.* Tree Lungewort.

This kind of Mosse that groweth on sundry sorts of trees, especially Oakes, and Beeches with broad ash coloured grayish rough leaves, diversely foulded, crumpled and gashed in on the edges, and spotted also in some places with many small spots on the upper side, it never was seene to beare any stalke or flower at any time.



7. *Muscus*

6. *Muscus Pulmonarius sive Lichen arboreus, Lung Hedgewort.*

8. *The Moss upon dead mens Scalls.*

7. *Muscus siccus crustatus.* Crustie dry Mosse or Liverwort.

This kinde also doth not much differ in forme or colour from the former, but in being dryer or more crustie of hue, growing oftentimes as well on trees as one the cleft pales, and shingles of Oaken boards, as also sometimes upon the stones and rockes on the ground, and sometimes also upon the very ordinary Mosse it selfe, as Sir *Alexander Fraser* one of his Majesties Physitians assured me, and sent me some to see which he gathered in *Windsor* Forrest.

8. *Muscus ex cranio humano.* The Mosse upon dead mens Scalles.

Let me here also adjoyne this kinde of Mosse, not having any fitter place to insert it, It is a whitish hoar kinde of Mosse somewhat like unto the Mosse of trees, and groweth upon the bare Scalpes of men and women that have lyen long, and are kept in Charnell houses in divers Countries, which hath not onely beene in former times much accounted of, because it is rare and hardly gotten, but in our times much more for by it to make the *Unguentum Sympathiticum*, which cureth wounds without locall application of salves, the composition whereof is put as a principall ingredient, but as *Crollius* hath it, it should be taken from the Scalle of those that have beene hanged or executed for offences.

The Place and Time.

The first is found in many Forrests and Woods in this Land, but the places of the second and third are *Italy*, as the knowne is also, the rest are as small to our Land as to others, but the last is often brought out of *Ireland* that hound with us, and they are to be gathered in the Summer time.

The Names.

I have shewed you before how the Greekes and Latines called the Mosses, which names indeede doe more properly belong to these true Mosses, for I cannot finde that any of the ancients made any account of the ground Mosses, or put them to any use, the *Arabians* called it *Aemec* and *Usnee*, and by the Apothecaries *Usnea*, the *Italians Muschio*, the *French Mousse*, the *Germaines Mosz*, and the *Dutch Mosch*. The first here set downe is called *Muscus arboreus* and *Muscus quercinus* by most writers: the second third and fourth are remembred by *Columna* and others generally called *Pulmonaria* by most writers of this latter age (for it is thought it was not knowne to the elder times) but without distinction almost, whereby many were misled, taking one for the other, although there are diverse and distinct matter that name, and therefore *Lobel* to distinguish it called it *Muscus pulmonarius* and others *Pulmonaria arborea*, or *Lichenis genus*, and yet some more properly *Lichen arboreus*, the seventh because it is dryer and crustie, is called as it is in the title, and as I take it is *Columna* his *Lichen Dioscoridis* and *Plinii*, and *Lichen folio-sus* one of the first because it groweth on the ground by the side of rocks *Lichen foliaceus* growing of the ground, and *Lichen adnatus* being that of the trees.

The Vertues.

The Vertues that the Ancients attributed unto Mosse, are wholly to be understood concerning these of trees, as cooling and binding, and partake of a digesting and mollifying quality withall, as *Galen* and especially that of the great Cedar, for each Mosse doth much partake of the nature of the tree, from whence it is taken, as that

of

of the Oake to be more binding than those of the Cedar, Larche, Ivie, Pittie, and Furre, to be more digesting and mollifying, it is of good use and effect to stay fluxes and laskes in man or woman, as also vomittings and bleedings, the powder thereof to be taken in wine: The decoction thereof also in wine is very good for women to be bathed with, or to sit in that are troubled with the abundance of their courses: the same also drunke doth stay the troubled stomacke, perplexed with casting or the hickocke, and doth also comfort the heart: *Avicen* saith, and as *Serapio* saith procureth deepe sleepe, some have thought it available for the Dropsie to take the powder thereof in drinke for some time together: the Oyle of Roses that hath had fresh Mosse steeped therein for a time, and after boyled and applyed to the Temples and forehead, doth marvellously ease the head ache that commeth of a hot cause, as also the distillations of hot rheume or humors to the eyes or other parts: the ancients much used it in their oynments, &c. against lassitude, and to strengthen and comfort the sinewes. The Lungwort is of great good use with many Physitions, to helpe the diseases of the lungs, and for Coughes, wheelings, and shortnesse of breath, and the sheapheards also to their Cattle doe give it for the same purpose with good successe with a little salt, it is also very profitably put into lotions, that are taken to dry the moyst humors that flow to ulcers, and hinder their healing, as also to wash all other ulcers in the secret parts of men or women.

CHAP. LXII.

Lichen sive Hepatica. Liverwort.

OF the Liverworts also there are diverse sorts, which are also other kindes of Mosses that doe either grow on the ground or on rockes and stones, yet moist withall.

1. *Lichen sive Hepatica vulgaris.* Common ground Liverwort.

The common Liverwort groweth close and spreadeth much upon the ground in moyst shadowie places, with many fat greene leaves, lying or rather as it were sticking flat one unto another, very unevenly cut in on the edges and crumpled, from among which rise small slender stalkes, an inch or two high at the most, bearing small starre like flowers at the toppes, the rootes are very fine and small wherewith it liveth.

2. *Lichen sive Hepatica minor stellata.* Small ground Liverwort.

This small Liverwort groweth in the like manner as the former, and sendeth forth such like starre flowers but is smaller for the most part in all places where it grow, for so as it groweth in the shaddow, it will come in pots as well as on the ground, if the place be not stirred or turned up. There is also another sort that bourdeth

Vbellata

1. *Lichen sive Hepatica minor umbellata.* Small ground Liverwort with round leaue.

4. *Lichen marinus filicatus & coloratus.*

3. *Lichen sive Hepatica minor stellata.* Small ground Liverwort.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

leaves, and the small stalkes have round heads not differing in any other thing from the last.

3. *Lichen petræus racemosus.* Clutter headed Liverwort.

This Liverwort that groweth upon the stones by wells and springs, hath much lesser leaves than the former, lying flat one upon another in the like manner, and of a paler greene colour and somewhat ayrie, from among which the leader naked stalkes, two inches high, bearing at their toppes small heads made like a clutter of divers graines set together of a reddish colour.

4. *Lichen petræus pileatus.* Liverwort with a hooded head.

This Liverwort groweth in the like moyst stony places, and hath such like leaves lying one up on another, of a yellowish greene colour, dashed over with an ashe colour, and pearced a little in the middle of them, the stalke groweth to be three or foure inches high, being white in such cleare or transparent, and of the thickenesse of a rush: whereon standeth a small head, somewhat like unto a hat divided underneath into many parts of a spongie substance, greene at the first, then yellow, and lastly reddish, under which are growing small seeds, which are of a darke purple colour and sappie while they are fresh: but being dry have a smokie powder within them in stead of seede: the roote is small and white.

5. *Lichen alter minor folio caleato.* Small Liverwort with skonnie heeles.

This small Liverwort hath smooth transparent leaves somewhat smaller and smaller than any of the former, growing together of a blackish purple colour, and incurving themselves one to another, as the other: from the backe where groweth forth a skinne or sheath, shaped like a shoe, whose brimmes are a little crumpled and rayed more than the rest, from whence ride up foure little darke greene shining heads, of the bignesse of the smallest Pease, which afterwards open into yellow flowers, with foure leaves a peece standing on yellowish stalkes foure inches high, with divers impalpable seeds in the middle, the roote hath fibers as small as haire.

6. *Lichen petræus minimus acaulis.* The smallest Liverwort without stalkes.

This Liverwort is the smallest of any, having leaves no bigger than the mayne of ones finger, greene and set with white spots, this hath certaine sad purplish spots on both sides of the lower part of the leafe, wherein flowers appeare, but when the leafe groweth great, it waxeth of a sad purplish colour like the skinne of a calfe with at the end, tending forth a small fruit, as big as a small Pease, skinny of the same colour with the leafe, hollow or full of whitish watery juyce, which afterwards as the fruite growes ripe, changeth yellow, and being broken hath then a yellow powder, which will colour their fingers that touch it, to the leaves cleave very fine white threds whereby it liveth.

7. *Lichen petræus purpureus Derbiensis.* Cooke or Archill.

This is growing in *Derbishire* upon the iced stones of the Mountaines a kinde of herbe, much resembling Liverwort of a sad purplish colour which the poore people there gather, and grinding it make into a moyst substance, keeping it in barrels, and therewith make a kinde of tawnie or purplish dye which although it will not hold colour in the cloth long, but will starve and change, yet it serveth the poore people for their wearing very well.

The Place and Time and Names.

This needeth no further declaration of any of these Liverworts, when hath beene specified in their descriptions, for the tell you that the third is taken from *Bauhinus*, as the fourth, fifth, and sixth from *Columna*, whose opinion he not to *Lichen caleatus*, but his description thereof the weth it rather in the leafe then stalke, and therefore have so called it. The Greekes call it λειχὴν, and so in Latine *Lichen* of Icone, *Hepatica* and *Jecoraria*, taken either by reason of the leaves of some herbes, the disease called Lichen tetters, which deforme the skinne and make it scurfie, or else the diseases of the Liver. The *Arabians* call it *Aschc* and *Alfachel*. The *Italians* call it *Epatica*, of the Liver. The *Germanes* *Stein Leber kraut*. The *Dutch* *Steene lopersckruyt*.

The Vertues.

Liverwort is a singular good herbe for all the diseases of the Liver, both to coole and cleanse it, and helpeth although any ague, and the yellow jaundice likewise. Liverwort being bruised and boyled in small Ale and drunke, helpeth the heate of the liver and kidneyes, and helpeth the gonorrhœa in men, and the whites in women: it partaketh of the qualities of cooling, cleansing and drying, but doubteth of the stanching of blood, although Matthiolus reporteth of it: it is a singular remedy to stay the spreading of tetters, ringwormes, and other spreading and running sores and scabs, &c. the name it selfe importing so much.

2. *Lichen petræus vulgaris.* Common ground Liverwort.

Having

Having thus paſſed through the fields of graſſe, and the rockes and hogges of Mullein, let us take leaſe to ramble through the woods and by places of Muſhromes, that therewith I may finiſh this Claſſis or Tribe: but leſt we ſhould goe out to great variety that for methods ſake, not to huddle them together, and the more orderly proceeding with the them, I muſt diſtinguiſh them into two primary kindes, namely into thoſe that are not dangerous, but edible, and into thoſe that are dangerous and poyſonous, unto the former ſort pertaineth *Agaricus* which I have entered in the ſecond Claſſis or Tribe of this worke, and fewes eares which ſhall be laſt of all entreated among the eſculent ones, although *Claſius* numbereth it with the perilous, and unto the other pertaineth Touchwood, with the woodie Muſhromes, and ſome other that are of a ſoft ſtony ſubſtance which I ſhall alſo adjoyne them, being for many of them, that are heere to be ſpoken of in this place. And leſt we ſpeake of thoſe that are not dangerous but eſculent, that is, may be eaten, and becauſe our Country neither produceth much variety of good or daintie ſorts of milke, our Nation alſo not being ſo addicted to the uſe of them as the *Italians* and rather neglectfull, where they grow more plentifully: I will therefore but runne them over briefly, and not inſiſt to much in them, as other things of better reſpect.

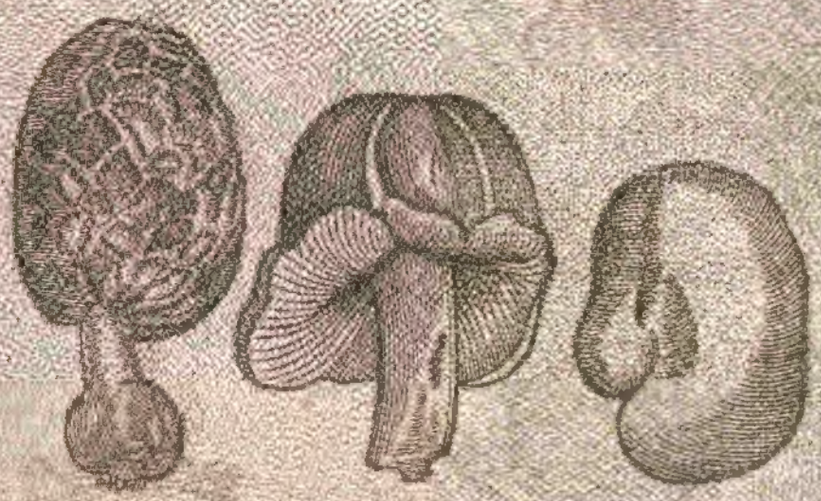
Chap. LXIII.

Fungi eſculenti. Holſome Muſhromes that may be eaten.

IN the handling of theſe Muſhromes I muſt take a differing courſe, and manner then I have obſerved formerly, or ſhall doe hereafter, for concerning *Place, Time, Names* and *Vertues* I will ſpeake of ſo many of them in their rerſpects, as ſhall be ſufficient to expreſſe whatſoever is conteined under them. The moſt uſuall ſort of Muſhromes, have ſmall ſmooth round heads, ſtanding upon thick ſhort ſtalkes, and are for the moſt part white, yet in ſome the upper skinne is browniſh or yellow, but generally in age yellow after they have ſtood long, and are decaying, moſt of them are tonguelike, red and below underneath with many lines ſumming directly from the middle to the edges round about: the ſubſtance of them generally, is ſoft and ſpongy, eaſily yeelding to be broken betweene the fingers if they be but preſſed a little hard: the taſte or reliſh of them is no doubt according to the ſoile and place where they grow, for thoſe that grow in the open champion fields and medowes, are not onely ſafer from danger, but of better reliſh then thoſe of the ſame kinde that grow in woods and under trees, I ſpeake of them that grow in our owne Land: agreeing with *Horace* his ſecond booke and Caſtin Satyre, who ſaith,

——— *pro ſenſibus optima fungus*
Natura eſt: aliis malè creditur.

But I know *Claſius* ſaith the *Hungarians, Germanes*, and others, doe moſt eſteeme of thoſe that grow in the woods, and chiefly of thoſe under the Firre trees, and next unto them, thoſe that grow under Oakes, the ordering and dreſſing them to be eaten is diverſly, as every one pleaſeth, ſome boyle them and drayne or preſſe the water out of them, and then ſlice them, and put oyle and vinegar to them, and ſome a little ſalt, or as others pleaſe ſugar, and ſome ſpice, and ſo eate them cold: others put butter, ſugar and ſpices, and ſo eate them hot: or boyle them in milke or creame, or fat broth, others againe ſlice them and ſtrow fine flower on them, and then fry them with butter, fuet, or oyle, and ſo eate them. *Claſius* ſaith that they uſe in *Germany* to hang them in ſtrings, and keepe them dry, others ſalt them and ſo keepe them untill winter, (for the beſt grow up and are gathered in the ſpring, and not in the Summer or Autumne yet it is obſerved that they grow moſt in a rainy ſeaſon, and often after thunder) and then boyle and eate them. I have beene the longer in the narration hereof, to ſave the often repetition of one and the ſame thing in the reſt, as alſo that the difference in others from this may bee the better knowne and diſcerned.



Fungi Eſculenti varij.
Divers ſorts of edible Muſhromes.

Muſhromes are called in Greeke μύκης, in Latine *Fungus*, by the *Arabians Hater* and *Feder*. The *Italians Funghi*, the *Spaniards Hongos, Cogomelos*, and *Cogumelos*, the *French Champignons, Poirions*, and *Mouſſerons*, the *Germanes* properly *Schwam*, and particularly *Herpferling*, and the *Dutch Campernoelen Peffferling*.

1. Some of this kinde grow bigger then others, and ſome more topped or ſpiring, and ſome are parted as it were all over into ſundry diviſions, making it ſeeme like unto an ilony combe, and therefore are called *Favaginoſi*, but are not dangerous as *Gerard* ſaith, for *Claſius* putteth it as one of his principall or firſt kindes of edible Muſhromes, and ſaith it ſeemeth to be that which *Dalechampius* calleth *Spongioſus*, and

a. Fungi fungosi. b. Fistulosus. c. Orbicularis.
Three of the best sorts of edible Mushrooms.

in Italy *Spongiola*, and the *French Morilles*, because the head doth well resemble a Mulberry, and *Camerarius* doth call it *Marshall* by the *Germanes*, who be much delighted with them.

2. Another kinde is more sharpe and spiring, then in any of the rest of the edible kindes, and small withall.

3. Another whose outside is of a whitish browne colour, is more simple fashioned and bigger, and is therefore called *pyramidalis*, and are as good as any of the former, being the greatest of the fourth sort of *Clusius* the edible Mushromes.

4. Another sort is round, somewhat soft and whitish, having a slit on the edges most usually, and are called *St. George* Mushromes, because they grow up chiefly about that time: this is the third kinde of edible Mushromes *apud Clusium*.

5. Another is cornered either more or lesse and some jagged about the edges, having longer and shorter stalkes, and some of them fuller or lancker then others, which are often found under Elmes, and white Popler trees, and are called *Fungi Populnei*: yet *Casalpinus* saith that at *Turin*, those that grow under the Poplar trees are nullified, which thing proveth my former assertion that the ayre and soyle betterech many of these kindes.

6. There is a kinde of Mushrome called by the Grecians in former times *μύκης* and *μύκητες*, and by *Pliny Fungus*, which may be called Cup Mushromes in *English*. For they doe grow out of the solid ground, wherein they sit ere so strongly, that hardly without breaking they can be got off, sticking to the earth by certaine small fibres, that are almost insensible and spreading low upon the ground without any stalke, into broad deepe and hollow cuplike peeces, the brimmes or edges whereof are either plane or crumpled, or cornered and containing moysture within the hollownesse, three or foure ounces of raine water, especially the greater of them, which by reason of the thicke skinny or fleshy substance thereof corrupteth not, nor the water therein reserved for a long time stinking: white on the outside and reddish within, and are found growing in the fields of *Italy* in divers places with gates made as *Columna* saith, and certainely determineth them to be the true *Fungi* of the ancients and *Pliny*. Hereof likewise he saith there is another sort, which is more crumpled or divided into fifteen folded parts, *Ibid.* more differing in substance, and are thought to be none of the pernicious sorts, because they are not brittle or easie to break in handling, and doe not rot but endure a long time, and become wholly dry. *Matthiolus* takes the Tuffe stones to be such, but erroniously.

7. Another sort is some what flat on the head, a little turned in like a Navell, and yet of an unequall forme, being brownish greenish or yellowish coated, whereof the largest is called the Prowes Mushrome, and the last of the fourth sort with *Clusius*.

8. Another like unto that throughout, but round in the body, and sometimes rotne on the edges, of a pale brownish colour, and spotted with white: this is called *tuberosus fungus*.

9. There is another called by *Cordus Bolti*, and by others *Fungi cervini*, which is almost round and white, spotted with yellowish browne markes, some of them bigger then others, those growing under Beech trees are better then others whereof some are choise in eating them, rather taking the pale then the redder.

10. Another is called *Capreolus*, differing not much from some of the last, but in being yellowish above, and white underneath, being the sweetest with *Clusius*.

11. Another sort groweth in woods about the beginning of Summer, and for their redneese above are called red Cockes, although both the stalke and the under part be not so full of stripes.

12. A sweetish kinde *Fragum* called *vulgares Amanitæ vel Boleti*, and are called the most common also by *Lobel* in his Icones.

13. Another sort being round and a little flat above, are all hairy, and of a dusky colour, and are therefore called of *Matthiolus* Swarthy *Fungi*, and some of them will be blackish also. Some also will grow two together.

14. Another is little hairy, but otherwise much like the last, whereof some are mixed with white, pale, and browne, and some are altogether without, with many blackish purple lines underneath, and are called Fitche Mushromes, because they usually grow in the Furre tree woods.

15. There is another which is called the Goates hoofe, because it is cut in on the edges into such parts, that it doth well resemble the same being browne above, and white underneath, and more some on the edges when it growes, and white it is young and new sprung up.

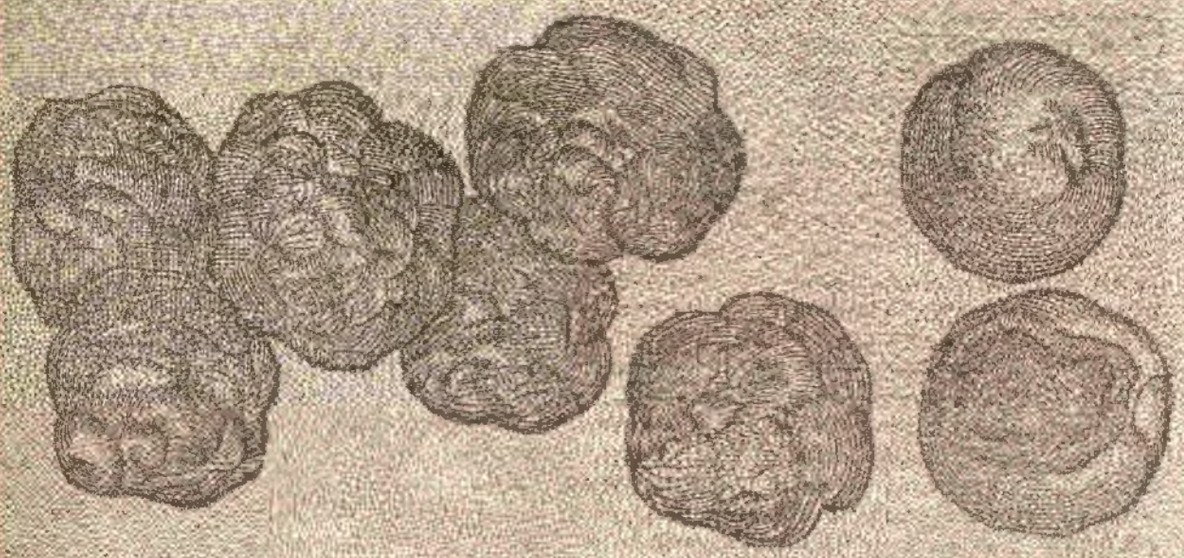
16. Another sort have the stalke sometimes bigger in the lower part, then the upper hole is, and is much discoloured with pale blew, greene, and browne, or is some yellowish, the upper part of the hole being browne, and white underneath. *Clusius* thinketh that this sort commeth nereest unto the *Amanita* of *Pauius*.

6. Fungi Pezizæ.

26. Fungus Dispersedus, Trifell Mushrome.

26. Fungus semisphæricus Pezizæ persimilis Hispanicus, Spanish Mushrome called the Cows head.

27. Fungus digitatus Clavicularis Hispanicus. Finger formed Mushrome.



17. There are two other sorts of so delicate a taste that they are eaten raw, the one is of the same grain, reddish colour, giving a sweete milke when it is broken, and is the lesse sort, *d* Fungus the outer is grey, white and round, smelling very sweete and called *Richiona*, as *Rapisfa Porta* saith, that is, the King of all, for the pleasant taste may be given to the licke without danger.

18. Then there is one which *Calsalpinus* calleth *Lingua*, growing on the bodies of the trees, which is not so red as of the true *Boletus*, and this head is somewhat red.

19. And then there is the true *Boletus* of the ancients, which is of so delicate a taste, that they that are accustomed to the feeding on Mushrooms, desire them more then any, and can never be satisfied with them: [illegible] found to his colt, being killed with them: they are as white as an egg, and at the time [illegible] they

Original from UNIVERSITY OF MICHIGAN

or *Tuberaria albida & rubra aculeata*. Round and knobbie headed, or Spunge Truffles, and rough or prickle haired Truffles.

ing up, but after two or three dayes the white skinne or coate breaketh above and thereth yellow, like the yolke of an egge, which then groweth greater, and into the forme of a Mushrome, (the white skinne falling away by little and little) being raysed somewhat higher in the middle, and of so gold a yellow colour, that it is somewhat deeper coloured then the saffron is selfe, and selfe yellow underneath. With a scaly fore skin or other skinnes, the stalke likewise is yellow and an inch thicke, when it groweth old it breaketh and there soone appeareth the fresh colour above, becomming more pale, and underneath almost white: these being dressed and served as a dish to the table where *Clusius* was, seemed unto him to be coloured with Saffron.

2. There is some that are called *Porcini* or *Scrofi*, Swines Mushromes, which are long worts, round, and of a blackish colour, spotted with white spots, and underneath with blackish lines, the upper part in shape well resembleth that hole which were called *Suilli* or *porcini* with teeth, were of a brownish yellow hore, and darkish colour underneath.

3. There are there such which the Italians call *Boccelle*, as *Ruellius Parisinus* saith, and peradventure may be those *Gesnerus* saith were called *Scarpie*, growing in meadowes, the head being broad, and the stalke very small of divers colours, this sort *Anguillara* hath eighteenth.

4. Another sort is called *Quercinus Aspleniides* by *Columna*. The head hereof is white, and like unto the ordinary sort for forme, but that the toppe is browne, and groweth to be spotted, but the chiefest matter of difference is the stalke, which hath about the middle of it, or higher, a certaine hollow dish, like as the Trufled fennell, being rough and browne, about the extremities, the lower part of the stalke is as it were knobbed, and blackish neere to the ground, with some hairy fibres thereat: it groweth among Oakes, this may be called the Fennell leaved Mushrome.

5. There is another that groweth on the Larche tree, besides the *Agaricke*, which is of an huge bigge, containing forty pound in weight as *Matthiolus* saith, and is of a gold yellow colour, somewhat borne about the edges, and is most pleasant.

6. Then is there another called *Boletus* or *Fungus*, and peradventure may be that which *Gesner* or *Dioscorides* doth name *Fungus Igneus*, being a white Mushrome, and eating sharpe and hot like pepper.

7. There is another sort which *Lobelius* saith the vulgar people called *Lycoperdi*, being very small of stalk, round and very sweete to eate.

8. Another is branched and is the nineteenth with *Clusius*, being in some yellow in others reddish, and in some very pale white, which they call the Goates beards, and adde their colour, the most compendious is that which is red and spotted with white spots. *Clusius* saith that these are like those Mushromes that *Theophrastus* writeth were brought from mount *Garganus*, like young Asparagus buds, and then breaking out into branches.

9. There are two other sorts called *Digitatus major & minor*, and *Digitalis* by the *Italians*, being of a large bigge, and are very long white fungus, one whereof will suffice a man at a meale.

10. There is a monstrous great kinde growing in *Hungary*, being of two foote in breadth, having many ouglie leaves like scales lying upon it, and fashioned like an Oaken leafe, some of them of a darke red, and some of a darke with white colour, with many blacke spots in the white, the stalke is like a foote high, and as handsome and white in thicknesse. *Clusius* thinketh this to be that mushrome which *Rampsius Portugalus* saith the Persians and Chaldeans eate, they are so large a size that it doth weigh fourteene pound, and that one will suffice a good lusty Gentleman to dinner: to these the *Fungi Leporini* of *Clusius*, which is the fourteenth. *Clusius* saith hee hath seene Fungus Tuberes of this sort that have beene so great, that one might well suffice foure men at a meale.

11. There is also one that is very small and a little long, formed like unto a tooth, and therefore called *Dens*.

12. There is yet another kinde of mushrome (for so it may most fitly be termed, and not roote, as some would have it to be) that groweth not out or above the ground, as all the former sorts doe, but within or under the ground, whereof, called in *Greeke* either ὕδνον ἢ σπόδιον, or σῦκα ἀβ ὁμοιον, in Latine *Tuber* and *Tuber terræ* (so called of diligently looking to it from *Tubez sebor*) in the *Arabian* tongue *Kamech*, *Alchamech*, *Terfez* or *Terfezi*, in *Italian Tartufi* and *Tartufole*, in *Spanish Turmas de tierra*, in *French Truffes* and *Truffer*, in the *Germane* tongue

Tuber 2

tongue *Hirta brunft*, in *English* some call them *Spanish* Fusseballs, because they are somewhat like our fusseballs which are not edible, but containe a smoaky dust or pouther in them: but I would rather call them Vnderground Mushromes, or *Spanish* Trubbes to distinguish them. *Matthiolus* saith there are three sorts of them (*Pliny* mencioneth two sorts, one whereof is grittie betweene the teeth, and are some bigger then a Quince, and some of a pound in weight, and saith, that hee knew in his time *Marinus Leontius*, *Proctor* and Iudge at *Carthage* in *Spaine*, that bowed a penny betweene his teeth that was in the bot of the *Tuber* that he did eate, whereby is manifest that the earth did gather it within it of its owne nature, being a thing not to be planted) one whole inner pulpe or substance is white, another more browne, yet it doubteth which of both is blacke and full of rifts or chaps, a third sort that groweth in the coast of *Aphrica* and *Tunis* is (saith he) the barke smooth and more browne, and lesse pleasant in taste or odour. They grow as I said under the superficies of the earth, yea not cleaving thereto, causing it sometimes to rise well, and sometimes to rift and cleave, whereby it is discerned where they grow (yet *Pliny* saith the contrary, and that they have no seede, which will presently be gainesaid) being of a blacke or browne colour on the out side, and of a fair white substance within, having as *Iohn Baptiste Porta* saith, under the outer skinne, certaine small blacke seede, like unto the seede of the Cypresse tree, whereby it not onely propagateth it selfe, where it is naturall, but as it hath beene often observed, doth leave some of them growne where the parings of them have beene cast. For the qualitie or property of them, they have none evident in them saith *Galen*: but *Actius* saith, that they have a more earthy then watery substance, breeding grosse and melancholicke humours, more then any other foode, and that they that eate much of them are subject to the Appoplexy and Palsie, and besides are hard of direction, and trouble the stomake, whether they be rosted under embers or otherwise boiled in broth, and eaten with pepper, oyle and vineger: Vnto *Empedocles* or *Diphilus*, in *Athenæus*, therefore we must not give credit herein, who saith that these *Tubera* yeeld a good iuice to the body, ease the belly by expelling the excrements, and by breeding winde, engender lust. And againe he saith that a certaine herbe groweth above, upon that ground where the *Tubera* bee, which he calleth *Asphodelus*, but what that herbe is he hath not declared.

Lugdunensis saith that *Aitzonis* sent two sorts of plants out of *Spaine*, which the *Spaniards* in *Cubile* call *Turmas terræ* (and is the *Cistus annuus*, as I shewed you before,) that is *Tubera terræ*, which peradventure may be so, for they suppose where they doe grow the *Tubera* doe breede.

31. *Tubera cervina*. The Deares underground balles or Mushromes are another sort of these *Tubera*, whereof *Matthiolus* first maketh mention in his third booke of Epistles, and the last thereof, and after him *Lobelius* in his *Dutch* Herball, growing underground, in the woods of *Bohemia*, &c. where Deare doe much haunt, especially where they couple as the former doe, and thought to grow of their sperme that falleth on the ground, and not (as the opinion of hunters and Country people, whose judgement in so secret a peece of naturall Philosophy, is not to readily to be admitted) which are like them, being alwayes round, but uneven or rugged, whose outer rinde is blackish, and the inner pulpe or substance whitish: these be not eaten in the same manner as the former, that is for meate or food, but as a medicament being cut into peeces, and dryed upon strings put through them, to be used upon occasion: while they are fresh they have a strong and evill sent, which they lose in the drying, and two drammes of the powder of them, taken with sweete wine or with such other things as provoke venery, as also to increase milke in Nourses breasts, taken in some pittane drinke, and a little long pepper added thereto: the smoake thereof when it is burned taken underneath, helpeth women troubled with the mother, and openeth the passages when they are closed: they are thought also to expell poyson, and the venome of creatures, to be taken in pure wine, and also applyed outwardly. I much mervaile that *Clusius* having seene and read so many sorts of Mushromes, remembred none of these, but I presume that if he had not hunted after overground game, he sought not for underground treasure.

Vnto these Mushromes may also be adjoyned those which are made by art, whereof *Matthiolus* maketh mention, that grow naturally among certaine stones in *Naples*, and that the stones being digged up and carryed to Rome, and other places, where they set them in their wine cellars, covering them with a little earth and sprinkling a little warme water thereon, would within foure dayes produce Mushromes fit to be eaten at what time one will. As also that Mushromes may be made to grow at the foote of the white Poplar tree, within foure dayes after warme water wherein some leaves have beene dissolved, shall be powred into the roots, which must be soft and the ground above ground.

To cause that the edible Mushromes may be lesse offensive, in that many doe too greedily devine them it is held that if they be boyled with wilde peares, they may be eaten without danger, or for want of wilde ones to take harder or harsher sort of other peares, the leaves also and barke are conducing to that purpose, and so is a Gallicke taken with Vineger.

32. And lastly there is the Iewes eare, called *Fungus Sambucinus*. (which I place among the edible sorts and not among the venemous, as *Clusius* and others doe, because although it be not eaten for the substance as others are, (and yet *Baptista Porta* nameth one *Sambucinus optimus omnium*,) yet the broth is held (as the boyling will shall shew you by and by) which groweth on the Elder trees that are planted on Cony burroughes, for their shadow and shelter, and not so frequently on them in other places, being as all know soft and tough, while they are fresh, not very thicke but transparent, and of a blackish colour, of differing formes and fashions, for some will bee twolne or puffed up, in one place more then in another, having some resemblance to a brain: some thinne on the edge, and thicke in the middle, and some two or three growing together, all of them drying and become of a blackish gray colour, and then may be kept a whole yeare or more, safe without spoyling to whatsoever you neede, for lotions for sore mouthes and throates, or when they are twolne, to be boyled in wine, or drunke in vinegar and so gargled, which is the onely use they are put unto that I know.

Cum

Chap. LXIV.

Fungi perniciosi. Dangerous Mushromes.

THe other kind of Mushromes we hold you are dangerous, if not poysonous, whereof there are many sorts which *Clusius* hath amply set down in a treatise concerning them, and *Bauhinus* after him hath added more out of other Authours, which because they are too numerous and to little purpole, either for me to write, or for you to read or know, seeing neither the one halfe of them are found growing with us, nor doe we neede caution to beware of the bad, seeing our Nation is not so enclined to the good, I shall may well spare my paines from recounting all the severall varieties that they doe, and onely mention some of the most speciall with the Touchwoods, and toad-stooles, and so end this Classis.

1. The first groweth under Plumme trees in the beginning of the yeare of differing formes, and greatnesse, for some grow many together from one roote, as it were, with very little or no stalke at all, yet some are round fashioned, others are cornered, some are larger and smaller then others, all of them being mixt with white, pale yellowish, and brownie together.

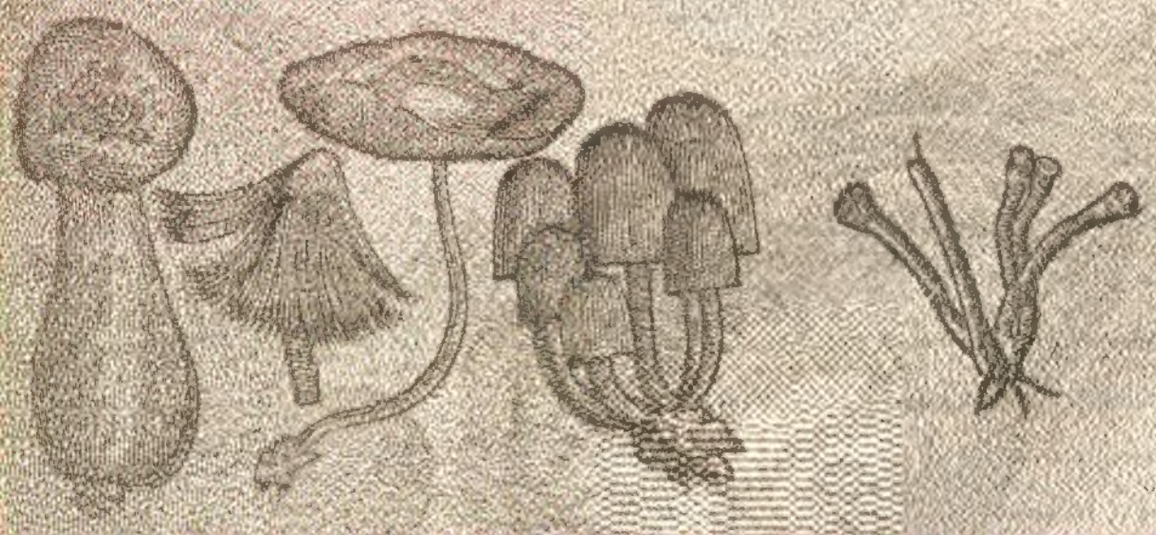
2. Another because it groweth among dung is called *Fimarius*, and is of a round flatnesse, somewhat thinne white and covered as it were with meale all over, having browne lines underneath.

3. Another groweth under Hazell nut trees, which at the first is of a whitish red, and as it were smoaked outward and somewhat broad.

4. Another of a reddish Gorsil like colour, full of round browish spots above, and pale yellow underneath, full of blackish lines found in *Wales*.

5. Another is called the Toades Mushrome, being of wan colour, and round like an helmet, or more yellowish but smoaky, or else more flat and reddish with spots.

6. Another is very small and round not exceeding the size of ones finger reddish above and very hollow underneath, this is called the Goates Mushrome.



7. Another is somewhat like the true *Boletus*, but is

8. *Fungus noxius.*
The base Mushrome.

Fungi bulbosi, &c. Deadly Mushromes, the tunicle, cord, and pith or heart of both sorts.

Mushrom perspt deathstalke.

white in and broad, spiring a little at the toppe, and being of a whitish colour, with a long stalke, of the bignesse of ones little finger: this is called the foolish or the fooles Mushrome.

8. There are two or three other sorts, that are said to kill as many flies as eat and feede on them, as well when they are raw as sodden, some of them being greater and broader then others, and some much redder, and sported with white, all of them doe grow in the woods that have beene felled.

9. Like unto these are found other sorts about *August*, one whose stalke is bigger below then above, and the head somewhat and pale whitish, but no bigger then the bottome of the stalke.

10. Another sort is much like unto our with us, and is of a blackish colour much rent or torne on the edges, and some have a small long stalke.

11. There is another kinde which is *Clusius* his mucrecorh, and is of divers sorts, which because they are so like some of the edible sorts, deceive many that gather them, and are often a speedy death to them that eate them, whereof some are reasonable small, others very large, and most of them of some beautifull aspect, either whitish

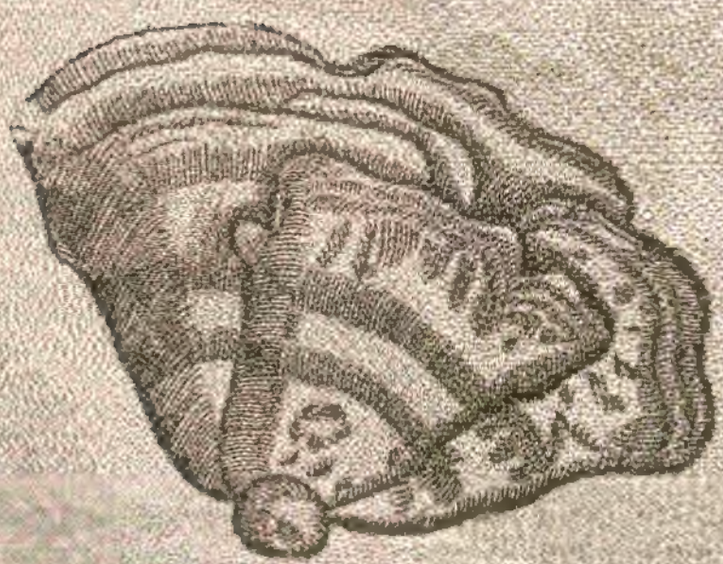
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN



whitish or reddish, or mere red and smoaked over.

12. Another sort growing under the Firre trees, that is so like unto them that grow there likewise and may be eaten, that they know no other difference but that these are hairy underneath, for which cause they are refused.

13. There was a kinde which is called *Phallus Hollandicus* by *Hadrianus Iunius*, and may bee called the *Hollanders* worke toole, which at the first rising up of it, is somewhat round, but the skinne breaking, there riseth up a stalke of the thickenesse of ones thumbe, and of a fingers length, somewhat like a doggs pricke, having a nut or cappe on the toppe an inch thicke, of a blackish greene colour at the first, and after blacker, with certaine celles or hollow places in it: the lower part or purse from whence the stalke riseth, is of an ash colour, and sometimes brownish, the stalke at the first is white, but afterwards of divers colours, and spotted, this sort stinketh at the best, but withering, it turned into a most blacke oile, colouring the very ground whereon it falleth: Flies are killed that sit and feede hereon, this is *Clusius* his description of the fifth sort, of his three and twentieth kinde, which as hee saith doth come very neere unto that which *Hadrianus Iunius* reporteth to be much found on the *Hollanders* sundry Sea shores, and although their figures be some what differing one from another, yet surely they both expresse but one thing.

14. *Fungus esculentus Indicus pediculo fistuloso.*
The Indian eatable Mushrome.

14. Another sort growing upon old Cherry trees that begin to putrefie, sometimes groweth a kinde, rising many together, laid flat one upon another, about an inch or more broad below, and spreading to bee three or foure inches above, and about halfe a foote high, being of divers colours at the toppes, the edge being of a deepe red colour, with a mealy white list about it: the lower part for an inches breadth upwards is pale whitish, up higher being yellow and red mixed together, coolish, it tasteth then yellowish, and above it red and yellow mixed againe, and the very edge, but fronted with divers slimie spots and pale or yellowish underneath. This although it be eaten of many, yet is given cattle with their fodder, dryed and made into pouther lately.

15. There is there another large round & whitish one, as full of black line from the cover to the [illegible] above and below but that those above are greater, and not straight as those below and a little [illegible] being finely dented about.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

4. Another little one hath beene found about *Hatfield*, dented in the like manner, about the edges, and of the like sad colour, but not striped above.

5. Some grow on the rotten boordes and timber that lye or are set in moyst earth, being small and like a greene lyquor lying small seed within it, which was sent unto *Clusius* to try his skill.

6. Other some are round like a Fuffe ball, being of a brownish colour above and darkered underneath, which when they are broken are of a blewish greene colour.

7. Some other are like brimlesse hats, many growing together and some broade like shields, their stemmes meeting.

8. And there is another which *Columna* calleth *Lapis crepitus*, and with *Clusius Caseolarius*, which hath a hard stone growing more differing from all others, and a round white *Fungus* at the first, which afterwards breaking open doth yeeld forth a white dust arise out thereof, which doe all joyne together, making round circles of hollow cases, or tartelles as it were, seperated one from the other, they have a very licking savour, whereof commeth the name, and is much devoured by flyes that eate it.

9. There Mushroomes likewise that grow upon the stockes or bodies of trees or their armes, or at the roote of trees that are rotting or dead, or upon dry boards are very diverse also, yet are none of them of the bigge sorte of Mushroomes, some whereof are like unto Ewer eares, either whitish or yellowish, crumpled and of a skinnie substance like them.

10. Others grow on such trees Willowes Cherry trees, divers growing one upon another of very variable colours, reddish, yellowish, which as *Clusius* saith the Country people use to keepe dry, and although it be deadly to men yet they thinke it helpeth their cattle when they are sicke, being broken small and given them with their meate in their fodder.

11. Some grow like ordinary Mushromes, very many together, on severall stalkes, differing in brownish, blackish, and redness, one from another, either on the dead rotten bodies or on the armes of trees.

12. And lastly that grow like a shrubbe with many branches, and are of so pure a whitenesse that they seeme

as if they were made of pure silver, if they were shining withall, this hath oftentimes no stalke, or but of halfe an inch long, and groweth on the rotting bodies of trees, that lye upon the ground.

25. There hath beene another sort observed growing in *Kent*, in sundry places, as at *Ripton* neere *Ashford*, on *Bromley* greene also, and at a place in *Romney* Marsh, called *Warborne*, the stalke whereof is like unto other Mushrooms, but the head is made of scales, like unto an Artichocke of a faint yellow this colour, and may be called *Fungus Cinara forma* Artichoke Mushromes.

26. The Touchwoods are likewise kindes of Mushromes which grow harder than the others, and are of a spungious or spungie substance on the inside, that may be cut or broken into fit severall pieces, having a hard or woody crust on the outside, and are of differing formes and colours, some being very great, and flat at the head, the smaller and rounder underneath, of a brown with yellow colour, and luckie they were *Cæsars* compared to *Virgils* tickes, and are once or twice boyled in lye, made with wood ashes, and being after weeds dryed, are tinder'd into peeces, serving to take fire like hot.

27. And lastly there are some of a stony substance, whereof some are of a round forme, very neere unto an ordinary Mushrome, being of a grayish blacke colour, full of white lines and scales, on the upper side, encreasing a little from the middle to the edge, and with many lines likewise underneath, but not falling above halfe way from the edge to the middle.

28. And another greater than it, whose diameter is about three inches and a halfe all whitish, and full of deepe lines, some what removed from the Center to the circumference, where it is finely dented like a saw, the underpart is also full of rough lines, but shallower, browner, and variously bending.

29. Another is some what long with the roundnesse, and hollow in the middle, the edges being cut in halfe way almost, and forming round ends like unto some flower, descending thence smaller unto the stalke.

30. Another is like unto *Agaricke* found in hollow places of the hills in *Helvetia* and called by *Gesner Agarici facies vel fungus petræus*, and by the Country people *Les Leus*, whose substance is white and brothy.

31. Another is halfe a foote long and two inches broad, channelled or guttered, and turned but rough on the upper part, and full of flakes underneath, running two wayes a crosse the whole, being in forme like unto a neates tongue.

32. The Fuzie balls or rather Foist or Fist balls, taken from the *Germane* word *Fist quod est pedum humanum*, called in Latine *Fungus ventosus*, or *Orbicularis lupi crepitus*, and *Lycoperdum fungi* of some (and taken by *Dodonæus* to be the *Pezica Pliny*, as I said before, but *Gesnerus* hath well set forth the true sort of it, whereof I gave you the figure before) but without reason, the *Lycoperdum fungi*, being the small peeces of the Weeke in Cotten, that lyeth in the Oyle in Lampes that sticking forth, trouble the burning thereof, which allusively *Virgil* meant by those *Fungi crepitantes* in the Lampes, as his verses in his first of Georgickes doe expresse and not these Fuzie balls as through *Gerard* would to inferre it, because in divers Countries of this Land they use to carry fire in them from their houses, distant a good way in sunder. They are of seven all sizes, some of the bignesse of a ball or bilbome of a childes head more or lesse, round smooth and whitish at their first rising, but growing in time to be of a russet colour, cracking in sundry places of the outside, and growing on the ground most usually in the open fields, and seldome in the moyster (which while they are young and white, as *Christ* saith, he and others of his schoole fellowes, being children, would in sport throw one at another) containing within that outer skinne certaine dust or powder, which if by the breaking or treading on should flye up into the eyes, would trouble them sore wayly, if not goe neere to blind them: yet serve to many good ules, Country Chirurgions using often to bring up the skinner of them, to serve them to stanch bleeding in wounds or otherwise, and the Country people with the powder doe dry up kibed heeles, and the fretting of the skinne in any place of the bodie, as also to hold fire as I said before, and with the smoake of them being set on fire to drive as they call it their swarmes of Bees.

Thus have I shewed you all the kindes and sorts of these Mushromes, both wholsome and dangerous, that whosoever is addicted to the delight of them may take heede in time upon this admonition, that although many may be found of a pleasant and delightfull shew in our owne Country as well as in others, yet the danger is to great yea of the best, that many upon sundry suffers by over eating of them have dyed remediles, and therefore it is not good to licke your honey from such thornes.

MISCE-

MISCELANEA.
THE VNORDERED TRIBE.
CLASSIS DECIMAQVINTA.
THE FIFTEENTH TRIBE.

CHAP. I.

IN this Tribe as in a gathering Campe I muſt take up all thoſe ſtragiers, that have either loſt their rankes, or were not placed in ſome of the foregoing orders, that ſo I may preſerve them from loſſe, and apply them to ſome convenient ſervice for the worlde.

Gramen Leucanthemum. Stichwort.

Although Stichwort is called *Gramen*, yet it much differeth in forme from them, and therefore not fit to have beene there inſerted, whereof there are two principall ſorts, a greater and a leſſer or an earlier, and later, but in each of them there are alſo ſome ſmall diverſities, as ſhall be preſently ſhewed.

1. *Gramen Leucanthemum majus.* The greater Stichwort.

The greater Stichwort hath ſundry round ſlender ſtalkes, ſtaling from the roote, fearie able to ſuſtaine themſelves, but by the helpe of the hedges or other things that grow neere it, being full of ioynts, with two ſmall long hard rough and pointed leaves at each of them, at the toppes whereof ſtand many ſmall flowers, compoſed of white leaves, ſtanding like a ſtarre, with ſome white thrumme in the middle, the roote runneth or creepeth on the ground all about, with many ſmall fibres thereat. Of this ſort there hath beene ſome variation obſerved, partly in the ſtalkes and leaves growing to bee higher or greater than others, and in the flowers likewiſe, being larger or leſſer, and in the leaves in the middle, ſome being paler or wider than others.

Gramen Leucanthemum majus.

2. *Gramen Leucanthemum minus.* The leſſer Stichwort.

This leſſer groweth like unto the former, and differeth onely in being leſſer, the leaves thinner and the flowers ſmaller, whereof each leafe diuided but were into two, ſeemeth to ſome to have

more

more leaves then the former, the seede of them both is small and somewhat like unto Linseede containing in round husky.

This also is found to have some diversity both in the stalke growing more upright, or else lying upon the ground, and also in the flowers, some having the white threads in the middle tipt with blacke, but in most all the whole flower seeme to be blacke or else with pale yellow.

The Place and Time.

The first doth growth more usually under hedges, and upon dry bankes of ditches or the like, and flowreth more earlier then the other, that is in *April*, the other is more common in the fields of Corne, and elsewhere in the more open and champion grounds, and flowreth not until *May* or *June*.

The Names.

Tragus calleth it *Bastard Orobanche*, and *Lonicerus Lutrasse major*, *Camerarius Gramen floridum*, *Matthiolus Gramen alterum Lutrasse*, *Dodonæus* and others, *Gramen Leucanthemum*. *Dodonæus* and *Lobel* call it *Melampyrum Boves*, who took it to be the *Melampyrum* of *Dioscorides*, *Dodonæus* also referreth here the *Crataegonon* of *Dioscorides*, which I thinke was also called *Melampyrum*. *Bauhinus* calleth them both *Caryophyllus arvensis glaber flore maiore & minore*, but why he should referre them to the *Caryophylli* I see little reason, I would thinke they should better agree with the Chickweedes. The *Germanes* call them *Wegen weitzraff*, and the *Dutch Ongben weedt gras*, and we in *England* Cockow wheate.

The Vertues.

It is much commended by some to cleere the eyes of dimnesse, or filmes that beginne to grow over the sight, to drop some of the juice into them. It is no lesse accounted of to helpe flitches in the sides, to drinke the powder thereof with white wine. Other properties this is said to hold, but they are onely taken from *Dioscorides* his *Melampyrum*, which whether this be it, is much doubted and therefore, the properties, whereof one is that *Dioscorides* further is charged, is not found in this herbe.

Chap. 11.

Melampyrum & Crataegonon. Blacke Wheate and Cow Wheate.

These two names although they seeme to be different, yet are the plants referred unto them, not so much differing one from another, but that I may joyne them both in one Chapter, their vertues to be explained are as followeth.

1. *Crataegonum vulgare.* The common Cow wheate.

This that is most frequent in our Land, hath an hairy square stalke, branched almost from the bot-

1. *Crataegonum vulgare.*
The common Cow Wheate.

2. *Crataegonum flore variè.*
Another party coloured Cow Wheate.

Original from UNIVERSITY OF MICHIGAN

...with a yard high or more very weake and slender, and supported of the bushes among which it groweth, having two long ...leaves set at each joyne, broadest next to the stalke, ...pointed at the end, somewhat rough all over the underside, it ...drawn downewards. The toppes of the stalkes and branches are set with ...tes of leaves and flowers together, which before ...flowers are separated, two flowers onely standing at a joynt ...with one leaves set with them, but lesser and smaller, the ...flowers are long round and hollow, gaping open at the end, and ...looking all one way, of a pale yellow colour, and white ...but grow yellower in time, yet in some of a blewish ...colour, either deeper or paler, each standing in a small ...cod like, wherein afterwards grow round cups or vessels, ...containing browish seede not much unlike to wheate, the roote ...supplied of small threds. I give you here the figure of another ...sort of this Cow Wheate, which I found among Doctor ...papers, without description, and therefore can frame none ...unto.

2. *Crateogonum flore varie.*

Another party coloured Cow Wheate.

...groweth like the former, but the stalk is more reddish, ...the leaves also, and more finely dented upwards, where ...like or tufts of flowers are of a reddish or bluish colour, ...yet if you looke open, and then shew the flowers to be yellow, ...the mouth or gaping place, and the rest purplish red.

1. *Melampyrum.* Blacke Wheate.

Lobel icon

1. *Melampyrum parvo flore.* Small bladder Wheate.

3. *Crateogonum luteum angustifolium.*

Yellow narrow leated Cow Wheate.

This differeth little from the former, but that the stalkes being red, the leaves are long and narrow, like unto *Linaria* or Tode-flaxe, without any cut or dent at the edges, the flowers are long gaping and hollow, of a pale yellow colour, standing in a long spike and looking forward.

4. *Melampyrum.*

Blacke Wheate.

This in the forme being so like the rest, shewerh that it is of the same family, but that it groweth greatest in the Corne fields, where it most delighteth, and the leaves be short and narrow,

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

tow, set on the ftalkes and branches which are many, and having other smaller leaves comming forth at the joynts likewise, the forked head of flowers opening not so much, but abiding closer, in some wholly reddish both above and below and white in the middle in others reddish below, and yellower above, or mixed with white yellow, and greene amongst, you may say it is the same, with these onely differences.

5. *Melampyrum perpusillum luteum.* Small blacke Wheate.

This small plant growing among the corne, in the fields of *Provence* in *France*, riseth not above two inches high, with slender small narrow leaves, deeply cut in on the sides, like unto Harts horne, the head being dark, and the flowers yellow, some what resembling the forme of *Alopecuros*, the Foxetaile.

6. *Melampyrum lanuginosum.* Woolly blacke Wheate.

This woolly Wheate hath a square hoary or woolly stalke a foote long, branching forth from the roote with two long and narrow woolly leaves set at every joynt, finely dented on the edges, much like unto those of the dented *Caffowers*, on the tuppes of the stalkes and branches are set long spiked heads, soft and woolly, with long flowers breaking out of them like the others, but spreading a little broader.

The place and Time.

The first set down groweth among bushes and brakes and the like, upon barren heathes as at *Hampsteed* neere *London*, and many other places of this land, but I have not heard that any of the rest have beene found with us, but in *Austria* and *Germany*, the fifth in *France*, and the last in *Spaine*, and doe flower most of the Summer, the seede ripening soone after.

The Names.

Melampyrum, *Crateogonum* is remembred by *Dioscorides*, *Plinie*, *Apuleius*, *Serapio*, *Ruellius*, *Fuchsius*, *Tragus*, *Matthiolus*, *Camerarius*, *Gesnerus*, *Lobelius*, *Dodonæus*, but *Melampyrum* is not, saving that he saith *Crateogonum* hath the like leaves as *Melampyrum* and that *Atriplex* was called also *Melampyrum*, but *Theophrastus* in the eighth Booke and fifth Chapter, mentioneth *Melampyrum* to grow among corne, and which in comparision of *Lolium* Darnell, that molesteth the braine, he calleth *res innocua*, a harmelesse thing. *Galen* hath it *primis allium succum adimo*, to grow from degenerated Wheate, and some thinke that the *Stelophurus* of *Plinie* lib. 18. c. 17. is it, and as some thinke is his *Aegilops* also, but rightly is neither, as it is likely. *Bauhinus* also thinketh it may be *Aera* of *Theophrastus*, whilst is generally taken to be *Lolium*, but it cannot be his *Aera*, because he nameth them both in one Chapter, and compareth them together. Most men now adayes call it *Triticum vaccinum* or *bovinum*. *Bauhinus* maketh all these to be *Melampyra*, not allowing any one distinctly to be called *Crateogonum*, but as others use to call them. *Clusius* in following an ancient error among the *Germanes*, whereas *Tragus* hath as it is likely remembreth it, called them *Pariteria sylvestris*, which he saith himselfe he knoweth no reason or cause why it should so be called. The first here is the *Pariteria sylvestris secunda* of *Clusius*, called *Crateogonum* by *Lobel* and others, *Lycopsis* by some both by the name of *Nauarchia inter Dolichantha* in one place, and by *Hypsiton* *Nauarchia* in another. *Tabernamontanus* calleth it *Atilium sylvaticum*, and *Thalius* and *Bauhinus* *Melampyrum*. The second is *Clusius* his third *Pariteria sylvestris*, and called *Triticum vaccinum* by *Tragus*, *Dodonæus* and *Lugdunenses*, and *Melampyrum* by *Camerarius* and others. The third is the last *Melampyrum* of *Thalius* as it is likely, and the *Crateogonum*, or *Lutea Lauro folia* of *Bauhinus*. The fourth is the *Melampyrum* of *Lobel*, and the first *Pariteria sylvestris* of *Clusius*. The fifth is called so by *Lobel* as it is in the title. And the last is called *Pariteria aurea* and *Nauarchia* by *Clusius* in his *Cura posteriores*, which *Bauhinus* calleth *Melampyrum lanuginosum Bericum*. The *French* call them *Blonde orge*, and *bled de beuf*, the *Germanes* *Kuewissen*, and *braun fleisch blumen*, the *Dutch* *Peere bloemen*, and we in *English* Cow wheate, and *Melampyrum*, like wheate generally, some authours accompt them degenerations of wheate and rye, others take them to be the faults of the Corne when as they are with them as well as with us, no other then weedes, as Cockle, Blew bottles, and Cornerose, which some where they are lowne, as well out of the Corne as in it.

The Vertues.

The Cow Wheates generally in all the places where they grow among Corne, if they be not weeded out, but suffered untill the Corne is gathered, doe make the bread blacker then that which doth it self as *Tragus* saith, and causeth the like dissigurement in the head and eyes that Darnell doth, as *Lobel* saith, yet he saith the seede is agreeable to Venery, as *Dioscorides* and *Plinie* speaketh of it before. *Galen* saith that the seede of *Crateogonum* is sharpe in taste, and is used as Millet is.

CHAP. III.

Eufragia. Eyebright.

ALthough formerly there hath beene but one sort of Eyebright knowne, yet this of late yeares have found out diverse herbes that for their likenesse thereunto they have entituled by the same name with divers vertues as shall be shewed together.

1. *Eufragia vulgaris.* Common Eyebright.

The common Eyebright is a small low herbe, rising up usually but with one blackish greene stalke, a span high, or not much more, spread from the bottome into sundry branches, whereon are set small and almost round yet pointed darke greene leaves, finely snipped about the edges, two always set together and very thicke at the joynts with the leaves from the middle upwards, come forth small white flowers stayned with purple and yellow spots and stripes, after which follow small round heads with very small seede therein, the roote is long, small and threddy at the end, this is found on some hills, to vary in the colour of the flower to be more whitish, yellow, or more purple.

2. *Eufragia minima.* Small Eyebright.

This small Eyebright groweth not much above two inches high, having narrower and smaller leaves thereon then the former, in all other things not differing from the former.

3. *Eufragia pratensis rubra major.* Great red Wooddy Eyebright.

This wooddy wilde kinde riseth up with one wooddy square browne stalke divided into sundry branches, little

Original from UNIVERSITY OF MICHIGAN

little above the ground, that it seameth a pretty bush, about halfe a yard or two foote high, set with somewhat long and narrow leaves, pointed at the ends, and somewhat endented about the edges, two alwayes set together a joynt one against another, which will in the heate of Summer turne somewhat reddish: the flowers are gaping and hooded, of colour purplish red, the roote is made of divers hard woodily strings.

4. *Euphragia pratensis minor purpurea.* Small red wooddy Eyebright.

This smaller red Eyebright hath one square reddish hairy stalke, an handfull high, sometimes without branches and usually but with two seldome more branches, compassed with a few thicke, hairy, almost round leaves, two together and deeply cut into two parts, the lower leaves which are the lesse but into three parts, the upper into five or sixe: the flowers breake forth, sometimes from betweene the leaves and the stalke, and sometimes they stand in tufts at the toppes, two standing together hooded and purplish, comming out of long greene huskes, sometimes the flowers have beene observed to be white, but very seldome: after which come long and crooked wrinkled seede in the said huskes, the roote is small wooddy and blacke.

5. *Euphragia purpurea latifolia.* Broad leaved purple Eyebright.

This is somewhat like the last, but that it hath broader leaves, and the flowers are set by spaces up to the top, of a finer purplish colour, in other things not much unlike the last.

6. *Euphragia pratensis major lutea.* Great yellow Eyebright.

This great yellow Eyebright hath a square hard reddish stalke neere two foote high, set with fewer joynts, and longer narrower darke leaves set thereby couples, and but smally dented about the edges: at the joynts of the stalke come forth branches and at the toppes of them such like hooded flowers, standing thicke or close two together, bending downewards and looking all one way, of a gallant gold yellow colour, and standing in greene huskes having in them white seede like the former: the roote is slender and wooddy, the whole plant is bitter and harsh on the tongue and astringent.

7. *Euphragia lutea minor radice squammata.* The lesser yellow Eyebright.

This lesser sort hath a smooth hollow stalke a foote high or lesse, set with branches and leaves by couples on them, which are like unto the *Coriander*, or Ivy leafed Clocke or cockle but longer pointed, the flowers are yellow, but like unto those of the common Eyebright, the seede is small blacke and round, and pointed at the ends, standing two together on a small foote stalke: the roote is white and round like a bulbe, composed of foure thicke coates or scales lying close together, the whole plant is without taste, and somewhat resembleth Lunatory, or *Columna* saith that the toothes are like the *Osmunda major* of *Matthiolus*, as the figure expresseth it.

The Place and Time.

The first and third are onely frequent in our Land, the former in many Meddowes and grassie places throughout our Country, and the other in many places of *Kent*, in the barren fields and waste grounds, both about Canterbury, and the rocke Cliffes, and in many other places: the rest some in *Italy*, and at *Naples*, or in *Spaine* and *Austria*: they all for the most part flowers not untill the end of Summer, the seede ripening with a white eare.

The Names.

It is called *Eufragia* and *Eufrasia*, and by some onely thought to be anciently called ὀφθαλμικὸν, (yet is ὀφθαλμικὸν not knowne, nor described by any of the former Greeke or Latine writers,) for it is of later invention, under the effects called *Ophthalmica* and *Oculatia*. The first is generally called *Eufragia* and *Eufragia*, of Eyebright by all Writers. The second is called by *Columna Eufragia latifolia*, although the leaves are lesse then those of Lunatory: the third is the *Eufragia altera* of *Dodonæus*, *Lobel*, and others, the *Stachys purpurea* of *Lugdunensis*, the *Odontites* of *Tabernamontanus*, the *Ericoides rubrum* of *Thalius*, and the *Orobanche Eufragia* of *Gerard*, who would needes make it a kinde of *Crateogonon*, against the saying of *Dodonæus*, from whom he hath the most that he hath, saying it cannot agree with *Crateogonon* by the defect in many parts, and yet in Correction doth so set it passe. The fourth *Lobelius* called in his *Plantarum*, *Brunella Italica*, but in his *Plantæ Euphrasiæ pratensis Italica latifolia*, and in his *Pedicularis Eufragia purpurea minor*, and is the third *Eufragia altera* of *Columna*. The fifth is the *Eufragia major sylvestris purpurea latifolia* of *Columna*. The sixth is the *Stachys purpurea latifolia* of *Lugdunensis*, *Ericoides latifolium* of *Thalius*, *Odontites flore intus* of *Tabernamontanus*, and the *Eufragia sylvestris major latifolia* of *Columna*. The last *Columna* calleth *Anonyma radice Ebuli*, and *Eufragia lutea Asphodeli radice squammata*. The *Italians* and *Spaniards* call it *Eufragia*, the *French Eufraise*, the *Germans Augentrost*, the *Dutch Oogh-troost*, and we Eyebright.

The Vertues.

The bitter taste that is herein the wetht it to be hot and dry, and is especially used for all the diseases of the eyes that cause dimnesse of the sight, for either the greene herbe or the dry, the juice or the distilled water is very effectuall for the said purpose, to be taken either inwardly in wine or in broaths, or to be dropped into the eyes, annointed for divers dayes together: some also make a conserve of the flowers to the same effect. Any of these prepared, it helpeth also a weake braine or memory, and restoreth them being decayed in a short time. *Hercules de Nevis*, in his booke of wines, much commendeth the Wine made of Eyebright, put into a vessell of new and before it worke (which because we cannot make in our land, I could wish that the Eyebright might be mixed up with our strong Beere in the same manner, which no doubt would worke the like effects: for Wine and our Beere having a like working, as we use with Wormewood, Scurvigrasse and the like for helpe of the nettle of the sight, and saith that the use thereof restored old men's sight, insomuch as they could read small letters with their spectacles before: as also did fellow their sight that were blinde for a long time before. If fine drinke be not to be made or had, the pouther of the dryed herbe mixed with oate meale, a few Anise seed and Fennell seede, and drunke or eaten in broth, or the said pouther made into a Lohoch with Sugar, doth either very good to the same effect.

Cap.

Chap. IV.

Speculum Veneris sive Viola pentagonia. The Corne Violet.

We have in our Corne fields in this Land, two sorts of Corne Violets a greater and a lesse which shall be shewed to you in this Chapter.

1. *Speculum Veneris maius.* The greater Corne Violet.

The greater of these Violets hath sundry slender weake trayling stalkes, lying on the ground, and rising from the roote, divided and subdivided from every joynt into branches so plentifully, that one plant growing in a good Garden ground, will be hardly covered with a pecke measure, thicke set without order, with small and long somewhat long leaves, slightly dented or rather waved on the edges, at every leafe from the middle upward, commeth forth a flower, of the bignesse of a two pence, so as that five hundred flowers almost, will be seene open at once, a goodly spectacle) set in a fine pointed greene huske, of a faire purplish blew colour, made of one whole leafe, pleated into five round pointed ends, white at the bottome, with a white pointell in the middle, closing up every night, and opening in the day onely, the seed is yellow, and contained in small long heads, the roote small and weedy, and annuall.

2. *Speculum Veneris minus.* The lesser Corne Violet.

The lesser sort groweth more upright like unto the little Centory, with fuller and fewer branches, more harsh or rough also in handling, the leaves are like unto the former but somewhat lesse, at each joynt almost come forth two or three flowers, standing at the ends of long ends like unto *Lysimachia filiquosa*, of the same fashion and colour as the former but so small as the eye of a little bird, never rising above the huske it standeth in, and not but in the heate of the day to be seene, which then onely layeth it selfe open, the seede is small and yellow as the former, the roote is small and annuall also.

The Place and Time.

The first groweth in the Corne fields, betweene *Greenehithe* and *Dartford* in *Kent*, as also in the Corne fields about *Lilly*, a towne in the uttermost part of *Hartfordshire*, towards *Bedford*, the other about *Hamsted*, and in sundry other places in this land, being more frequent by much, and flowreth from Midsommer untill late end of *August*, untill the seede ripening in the meane time.

The Names.

We have not understood as yet by any that the lesser sort hath beene observed by any Author beyond sea but only the former, which is called *Viola tricolor* and *Gramen viride* by *Dodonæus* and *Cyparissias* and *Cynoglossa* also *Silvestris* by *Lobel*, *Viola campestris* media by *Gesner*, and *Viola arvensis*, and *Viola pentagonia* by *Tabernæmontanus* but *Speculum Veneris* by divers, from the *Dutches Frowe spiegel*, which is *Venus* looking Glasse in *English*.

1. *Speculum Veneris maius.*
The greater Corne Violet.

2. *Speculum Veneris minus.*
The lesse Corne Violet.

but becaule it vſually groweth in Corne fields, and that ſome have called it a Violet, I have thought it fitteſt to terme it a Corne Violet, which if any liſt to alter they may at their pleaſure.

The Vertues.

We have not underſtood that any hath made triall what vertues it is endued withall, and therefore I will ſay no more thereof.

Chap. V.

Polygala. Milkewort.

Of this Milkewort beſides that there is a greater and a leſſer kinde, and each of much variety in the colour of the flowers, there are ſome other plants ſomewhat reſembling them, which could be entreated of together.

1. *Polygala major.* The greater Milkewort.

This greater kinde ſhooteth from the roote five or ſixe hard, ſlender, and flexible ſtalkes, a foote high or more, thicke ſet with ſomewhat long and narrow leaves like thoſe of Dieys wedes: the flowers grow at the toppes in a long ſpike thicke together, ſomewhat like to thoſe of Fumitory, but larger and of a fine delayed reddiſh purple colour and ſhining withall, after which follow flat poſhes, with two ſeedes in them uſually, which are long blackiſh and hairy: the roote is hard and woody, with divers fibres thereat, and ſmall long. This hath beene found to vary, the colour of the flower, eſpecially in ſhadowy and moiſt places, to be either blew or white, or mixed as the leſſer kinde is.

Varietas.

2. *Polygala minor.* The leſſer Milkewort.

The leſſer kinde groweth in all things like the former, but with lower and ſlenderer ſtalkes, yet ſomewhat hard or woody, not ſo many riſing from a roote and with fewer and ſmaller leaves on them: the flowers alſo are like but ſmaller and vary as much or rather more in their colours, ſome being of a dis-with purple, other purple and white, ſome all white, other reddiſh or of a wan colour, or overwarne red, &c. There is alſo another hereof whoſe lower leaves that ſpread on the ground are many, and rounder then in any of the former, but thoſe that grow on the ſtalkes are long like the reſt, the flowers whereof are onely blew, without any variation.

Like Varieties.

3. *Polygala Monſpeliaca.* Milkewort of *Monpelier*.

This *French* Milkewort hath upright ſtalkes a foote high, many riſing from a ſmall long white roote, with ſundry longer and narrower leaves on them ſet without order: the flowers grow one above another, in long ſpikes then in the other ſmaller, and not fully like the other, but of a reddiſh colour, the ſeede that followeth is ſmall contained in long cornered huſkes.

1. *Polygala major.*
The greater Milkewort.

2. *Polygala minor.*
The leſſer Milkewort.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

4. *Polygala repens.* Creeping Milkewort.

This small Milkewort hath a number of stalkes, full of branches lying and spreading on the ground, not above a handfull long, set thicke by couples with very small leaves like *Herniaria* Rupture wort: the flowers are of a whitish colour, standing among the leaves at the toppes in wharles compassing the stalkes one above another.

5. *Polygala affinis.* Bastard Milkewort.

This small plant spreadeth many weake slender round stalkes upon the ground a spanne long or more, set with sundry small leaves without order, in fashion somewhat like unto Myrtle leaves, but not so much pointed, the flowers are very beautifull, standing in a small spike one above another, with leaves amongst them, consisting of sixe leaves of a bright shining purple colour, the seede is small, contained in small huskes: the roote is made of small long and white fibres.

The Place and Names.

The first kinde groweth not in our Country that I can learne of but in *Galatia, Germany*, and the parts thereabouts, hitherto set by *Cordus*. The second is frequent with us, as well in carren and untilled places, heathes and the like, as in fertile and pasture grounds, yet there it will be more lush and large. The third about *Montpelier*, and so doth the fourth and fift and in other places in *France* not farre off. They all flower in the beginning or middle of May, and continue flowring a month, and perfect their seede presently.

The Names.

The name *Polygala* or *Polygalon* as *Fuchs* doth call it, is imposed on these plants, upon supposall that they are the *Polygala* of *Dioscorides*, but they doe but resemble it, and retain the name, and therefore *Lobel* calleth it *Polygala resembling*, as not judging it to be right, which *Gesner* also before him perceived by the bitter taste it hath, and therefore called it *Amarella*, yet according to the *Germane* vulgar name, he called it also *Cruce flos*. *Dodonæus*, *Cordus*, *Lobel*, and sundry others following the certain knowne name, call it *Polygala*, as not knowing a fitter to call it by, yet *Anguillara* seemeth to call it *Thesium*, and *Dodonæus* the *Chondrocalo*. *Cordus* called the first *Polygala vulgaris major*, and the second *minor*, although it be set amisse, for it is not *minor*. The third *Bauhinus* referreth to the *Chamæbuxus* of *Lugdunensis*, and calleth it himselfe *Polygala montana folijs Monspeliaca*. The fourth is generally called *Polygala repens* by *Lobel*, and all others that have written of it. The last is the *Chamæbuxus* of *Lugdunensis*, which *Bauhinus* calleth *Polygala* also as I doe. *Bauhinus* numbreth up among these *Polygala's*, one with a yellow flower, which he referreth to a plant that *Anguillara* found, and was like unto a Lentill, but had thicker and fuller leaves, a yellow flower and fruite in cods, which I have referred rather to the *Scorpioides leguminosa*, as I have there shewed. The *Italians* call them *Polygala*, the *Dutch* *Therbe inocent*, the *Germanes* *Creutz blumlin*, and *Ramel* the *Dutch Crosse bloomen*, and we the Crosse Gang-flower, Crosse-flower, or Milkewort.

The Vertues.

Although I shewed you before, by reason of the bitternesse of this herbe, having called it *Amarella*, saith that he found it to purge cholier, having made the tryall of it on himselfe, by steeping a handfull thereof all night in wine, and drinking it in the morning, and therefore is not likely to encrease milke in womens breasts, neither bitter nor purging thing working any such effect that we have known, and therefore cannot be the *Polygala* of *Dioscorides*, which worketh not that effect; other certainty hereof we have not yet learned, and therefore we forbeare to set downe ghesses or fallacies.

Chap. VI.

Antirrhinum sylvestre medium. The greater wild Snapdragon.

Cæsalpinus.

The wilde Snapdragon is of two sorts, one greater then another, the greater whereof riseth up usually but with one stalke, branching forth on all sides into some other, whereon are set long and somewhat narrow darke greene leaves, by couples: at the toppes of the stalkes and branches stand in fewe all places reddish purple gaping flowers, in shape like those of the garden or sowsed kinde, but farre lesse and without any white colour therein, after which come such like heads, but lesser, wherein is contained very small seede, like unto the other: the roote is small and perishing, every yeare regaining it selfe from the shed seede. We have another of this sort brought us out of *Spaine* by *Boot*, whom remembred before, whose flower was much like unto the other, saving of a bright carnation colour, the mouth or chappes being of a yellowish white, much like unto the garden kinde, but more lively for colour. As also another with milke white flowers, which spreadeth a little more then the former. The lesser sort groweth lower by the one halfe, yet bushing thicker with many, long narrow leaves not halfe so great, and the flowers very small also and whitish, the seede is small

Minus.
Rectum rubrum.
Alterum flore albo.
Minimum.

1. *Antirrhinum sylvestre maius.*
The greater wild Snapdragon.

Antirrhinum sylvestre minus.
The leaft Snapdragon.

Sylvestre Bauhini

ſmall and blacker then the former, and the roote periſheth alike and is ſo alſo raiſed againe. *Bauhinus* hath mention of this ſort with red flowers, whoſe leaves he ſaith are like *Serpillum*, Mother of Time.

The Place and Time.

Theſe grow wilde in *Spaine*, *Italy*, *France*, and other places, but we have them onely in Gardens, where they that once ſow them, ſhall highly have them continually, if they will ſuffer them to ſhed their ſeede themſelves, and are in flower from *July* unto the end of *Auguſt*.

The Names.

They are called *Antirrhinum ſylveſtre*, and *arvenſe maius*, and *anthora & anthirrhinum*, or *anthirrhinum* by all our moderne Writers, yet ſome call them *Orontium* or *Orontium*, and *Os lupinum*. *Hermolaus Barbarus* in his ſecond Epiſtle to *Dioſcorides*, calleth it *Lychnanthes*, and ſaith that in *Candy* the people call it *Lychnanthes*.

The Vertues.

There is a little uſe of theſe wilde kindes in Phyſicke, as of the garden kindes in our dayes, although *Dioſcorides* ſaith that the leaves, flowers, and ſeede are good for the aking of the mother, to be mixed with Roſe water and honey, and that the herbe doth cauſe the Scorpion preſently to loſe the force of his poyſon, as ſoone as he toucheth it, and that the herbe applyed to the forehead taketh away the pin and web in the eyes.

CHAP. VII.

Linum ſatiuum & ſylveſtre. Manured and wilde Flaxe.

HAving divers ſorts of wilde Flaxe to ſhew you in this Chapter, I thought it beſt to preſent them with the manured kinde, and rather ſpeake thereof together, then diſtinctly in a Chapter by it ſelfe.

1. *Linum ſatiuum.* Manured Flaxe.

The manured Flaxe hath a ſlender round plaine ſtalke three foote high, beſet with ſmall long and ſoft leaves without order, branched at the toppe into three or foure ſmall branches, that bear them bearing two or three faire blew flowers, made of five round pointed leaves, with ſome threds in the middle, after which come round buttons pointed above, wherein is contained the ſhining ſmooth browne ſeede: the roote is ſmall and threddy, periſhing every yeare.

2. *Linum ſylveſtre vulgare.* The more common wilde Flaxe.

This wilde Flaxe groweth like the former, but hath greater and higher ſtalkes, more branches at the toppes, and more ſtore of blew flowers on them, the ſeede alſo is like the former, but the ſeede veſſels will hold the ſeede therein, and not breake open with the heate of the Sunne, when it is ripe, as the manured kinde will doe, which muſt be preſently gathered and kept.

3. *Linum*

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

1. Linum sylvestre flore vulgare.
Mainard Flaxe.

3. Linum sylvestre latifolium cæruleum.
Broad leafed blew wilde Flaxe.

3. *Linum sylvestre latifolium cæruleum.*
Broad leafed blew wilde Flaxe.

The wilde Flaxe riseth sometimes but with one stalke and stem with more, a foote or sometimes more high, which are stiffe, thicke, and hairy, set with greater & broader hairy leaves, then in any of the other sorts, the stalkes branch forth towards the toppes, bearing smaller leaves then those below, and larger flowers, even as great as Mallowes, of a deeper or paler blew colour, the heads containing the seede are set in the greene huskes, that hold the flowers, which open being ripe, shewing a little flat shining seede like the rest, the roote is great and lasteth after seede time, shooting new stalkes with woolly leaves on them, and to abide all the Winter: this groweth in *Hungary* and *Austria*.

Of this sort there was observed by *Clusius* in *Vienne*, one with large broad woolly leaves like it, but the flowers were white with purple veines in the leaves.

4. *Linum sylvestre latifolium luteum.*
Broad leafed yellow flowred Flaxe.

The divers stalkes of this Flaxe are round browne, and slender, with large leaves on them, and not hairy nor hard, the flowers are many that stand at the toppes of the stalkes and large, of a faire shining yellow colour, with some specks in the middle, the seede vessels are like to the seede vessels of the other, and not shining like them, the roote is thicke and crooked, with fibres growing out, and perisheth not a twelve moneth many yeares.

We make mention of one with broad leaves, more glutinous or clammy, and the flower of a pale yellow, which grew in the hilly *Bosnia*, and about Constantinople.

4. *Linum Narbon. angustifolium cæruleum vel album flore majori.*
Narrow leafed wilde Flaxe, with either white or blew flowers.

This Flaxe hath sundry stalkes, of a foote high, and ma-

7. *Linum sylvestre angustifolium luteum.*
Narrow leafed wilde Flaxe with yellow flowers.

10. *Chamælinum Clusij flore albo, sive Linum sylvestre Catharticum.* Dwarfe wilde Flaxe with white flowers, or Mill mountaine.

ny narrow long leaves on them, the flowers are very large, and are either of a pale blew, tending to an ash colour, or else white, each leafe having a purple line running through the middle, in the rest there is little difference from the former wilde sorte, the roote abiding.

6. *Linum sylvestre angustifolium flore minore.* Narrow leafed wilde Flaxe with small flowers.

The stalkes hereof are many round and thinne, a foote long, having many narrow short leaves thereon, of a blewish greene colour: the flowers are blew and no bigger then those of the manured Flaxe, the heads, seede, and rootes are like the rest.

7. *Linum sylvestre angustifolium luteum.* Narrow leafed wilde Flaxe with yellow flowers.

This yellow wilde Flaxe hath sundry stalkes halfe a yard high, with few leaves set on them like unto the manured Flaxe, the flowers are smaller then it, but of colour yellow.

8. *Linum frutex sum semper virens.* Everliving wilde Flaxe.

This Flaxe hath divers woodily stalkes of a foote high, with a number of leaves there on, somewhat thicke and narrow, of a whitish greene colour, and abiding in the Winter on the stalkes, not falling off as the rest doe, the flowers are wholly white, and a little larger then the last, standing at the toppes of the stalkes like others.

9. *Linum arborescens Creticum luteum.* The yellow shrubbie Flaxe of Candy.

This groweth like a small shrub, covered with a blackish barke, with long leaves, thicke set on the branches somewhat like unto those of Thyme but larger, comming nearest unto large Myrtle leaves, the flowers are yellow and very bitter in taste: the seede vessels are as bigge as Ciche peaces, containing foure seedes within them very like unto Flaxe seede.

10. *Chamælinum Clusij flore albo, sive Linum sylvestre Catharticum.*
Dwarfe wilde Flaxe with white flowers, or Mill mountaine.

This Dwarfe Flaxe hath many slender stalkes, of about a spanne and a halfe long, with divers small long leaves set by couples on them, and white flowers at the toppes of the branches, lesser then those of the manured, with yellow threds in the middle, the seede is small that followeth in the small round heads: the roote is long and threddy.

Flos luteus *Lobel* setteth forth another small one, not rising above foure or five inches high, with small yellow flowers.

11. *Chamælinum stellatum.* Dwarfe wilde Flaxe with starre like flowers.

This whole plant is scarce three inches high, having but one or two very small stalkes at the most, and the small leaves ending in a very sharpe point, the flowers are few and small, made of five narrow pale green leaves, pointed at the ends, and standing forth in that manner that every flower resembleth a starre, with a round embossed middle,

The

The Place and Time.

Some of these as is before said, grow in *Spaine*, some in *France* or *Germany*, and some in our owne Land also: they all are in flower for the most part from Midsommer until *August*, and some abide longer, the seede ripening in the meane time.

The Names.

Linum in Latine, and *Λινον* in Greeke, the same with as well the herbe as it groweth, as the same prepared to be spun, and when it is made into cloath also. The first is called by all Authours *Linum sativum*, and the second *Linum agreste* by *Tragus*, who saith it is sowne in the fields of *Germany* in sundry places, because it yeeldeth more flore of Flaxe, and yet is found naturally growing among Oates. The third is *Clusius* his first *Linum sylvestre tenuifolium*. The fourth is the third *Linum sylvestre* of *Clusius*. The fifth is *Clusius* his sixt and *Linum angustifolium* which *Lobel* and others call *Linum sylvestre spicatum*. The sixth is *Clusius* his *angustifolium primum*, which *Lobel* and others call *Linum sylvestre*. The seventh is the *Linum sylvestre* of *Matthiolus*, *Dodonæus*, *Camerarius* and others, the *Linum sylvestre primum* of *Lobel* and may be the first *Linum sylvestre spicatum* of *Bauhinus in Prodromo*, and the *Linum angustifolium* of *Lobel*, for they differ little. The eighth is the *Linum sylvestre spicatum* of *Clusius*. The ninth is the *Linum sylvestre* of *Apuleius* in his booke *de plantis Scoticis*. The tenth is the *Chamælinum* of *Cæsius*, which is called Mill mountaine in many parts of this Land, by the Country people where it groweth. The last is called *Linum montanum flore cæruleo* by *Bauhinus*, who saith it is also called by some *Passerina minor saxatilis*. The Arabians call it *Bazar-chetan* or *Bezerchetan*, which is the seede thereof onely, the *Italians Lino*, the *Spanish Lenzolina*, the *French Lin*, the *Dutch Vlas*, and we Flaxe, and Line.

The Vertues.

There is neither leafe, flower, nor roote of Flaxe used in any medicine within us, that I know, neyther greene nor dryed, neither the juice, distilled water, or any other composition made thereof, but only the seede, and that more in outward Physicke in these dayes, although in former times, as *Galen* knoweth, that some people parched the seede for their food, taken with honey, and some used to put it into their bread, but saith he *primo ventriculo* it troubleth the stomacke, hardly digesteth, and giveth little nourishment to the body: but concerning the loosing of the belly downewards, saith he, I will neither praise nor dispraise it, yet it hath a small property to procure urine, which it doth best being parched, thus saith *Galen* of the manured kinde, but the wilde kindes differ more betweene themselves another property: The seede of Line made into poultice, mixed with honey and some pepper into an electuary, and thereof the quantity of a Nutmeg taken every day, doth helpe the cough as some say, the seede also boyled in water, and some honey put unto it and drunke, is said also to ease the paines of the body, as the collicke, and stitches, and all inflammations; if it be outwardly used also, with Fenugrecke and Linseed, and some Mallowes, a poultis being made thereof is of good use to mollify and dissolve any tumour or hardnes in any part of the body, or of the mother by sitting in the warme decoction of the seede, or to receive the hot fumes through a tunnel for the purposes being taken with Raisins (saith *Pliny*) it helpeth the obstructions of the Liver: the seede mixed with nitre or salt, and figge tree ashes, easeth the paines and hardnesse of the muscles, sinewes and arteries, mingled with figges, it ripeneth and digesteth, mixed with the wild Cowcumber roote, it draweth forth splinters, thornes, nailes or any other thing sticking in the flesh, and broken bones also: the decoction thereof made in wine and applyed to any fretting or running sore, dayeth it from spreading further: used with as much Cresses, it taketh away the nuggednesse of the nailes, and with Myrrhe, and Rosin, it helpeth ruptures, and the swellings of the cods: used with *Oile Rosen* and water, or Myrrhe and wine, it helpeth watering eyes, and mixed up with honey or hony water and applyed, it helpeth the hard kernels and swellings under the eares or throate. It taketh away also the spots and blemishes of the skin, Sunburning and other discolourings. The oyle of Linseede (besides that it is of much use for Painters to temper their colours, either on cloth, wood, stone, iron, or glasse, and to burne in lamps holding longer then the Oyle of Olives, although it giveth much more smoake and smoke) is of exceeding good use to mollifie the hardnes and shrinking of the sinewes, helpeth the hemorrhoides or piles, the riftes and chaps of the fundament, and the hardnesse and paines thereof, and of the mother; being bathed with Red-rose water it is good against burnings. The wilde Flaxe is of the like use in most things, and the more effectuall, by reason of the bitternesse in many others: the decoction thereof with the flowers doth resolve tumours and lenifie inflammations, the arteries also when they grow hard and stiffe, and the swellings and soares in the groines of Mid mountaine some small hath beene made among our people to move the body to the stoole.

Chap. VIII.

Caryophyllus Sylvestris minores. Small wilde Pinkes.

HAving shewed you so many Gilliflowers, Pinckes, sweete *Williams* and *Johns*, of beauty in my former Booke, let me also here shew the rest of that family, which are out of that respect, and doe rather delight in their owne naturall, then in any other forraine habitation, and they are of three sorts, growing either in the fields, on the mountaines, or among the rockes and stone. Of these severally in their order.

Caryophyllus arvensis. *Primus Ordo.* The first Rancke of wilde Pinckes of the Fields.

1. *Caryophyllus prolifer.* Childing Pinckes.

The wilde Pincke is but annuall, that is perishing after seede time, having a few pale greene grassie short blunt leaves lying on the ground for the first yeare, and are the next yeare carryed up with the stalkes, divided into some branches, and set by couples at the joynts, having a short thicke grayish greene huske at the toppes, out of which doe put by degrees one after another, seven or eight small faint red flowers, smaller than the smallest sparden Pincke by much, which scarce shew themselves above the brimmes of the huske: more flowres then one as I have not seene at a time out of the huske, or very seldome two, whereby they are long in flowring. In the outer huske

1. *Caryophyllus mollis.*
Cluding Pinckes.

2. *Caryophyllus arvensis flore pleno.*
The double white wilde French Pincke.

3. *Caryophyllus arvensis purpureus.*
The double purple wilde Pincke.

4. *Caryophyllus arvensis flore pleno.*
Wilde Pincke of Gerard.

husks is found after they have done flowering, so many as there shall spring long huskes as there did flowers shew forth, each containing within them small blackish seed, the roote is small white and hard, perishing every yeare, and raising it selfe by its owne sowing, or else must be sowne in the Spring.

Alter minor flore. Of this sort there is one that hath but one flower rising out of the huske, and of a paler reddish colour than the former.

3. *Caryophyllus pratensis multiplex major.*
The greater wild field Pincke.

We have in many places of our Land growing wild a small kinde of Pincke, as I may so call it, and especially by *Deptford* and *Redriffe*, which spreadeth much oftentimes, and rooting by the branches as it

groweth

groweth with small short greene leaves neer the ground, and by couples on the stalkes, with small reddish Pincke-like flowers on the toppes. Of this sort also there is a lesser growing in the chicke gravelly in our meadowes about *London*, towards *Tottenham Court*, whose roote is so small and thredly, that it will not abide transplanting, having very slender stalkes, and smaller, shorter, and greener leaves set thereon then in the former, the flowers also are smaller, and of a deepe red flaming colour sometimes but one of a stalke, and sometimes more especially under hedges and bushes that may defend it by the shadow. Of neither of both these have I any true figure, to exhibite here and I am loath to intermeddle for *Dodoens* figure because it doth not truely expresse it, save that it is *Lobels* figure of a small *Armeria*, which hath leaves among the flowers, which these have not.

3. *Caryophyllus arvensis glaber minimus*.

The smallest white wild *French* Pincke.

So neere like unto the former two sorts is this small one, his whole rootes are small, thred like and reddish, the stalkes slender, knot and joynted about a foot or lesse high, having small narrow greene leaves set singly thereon, and spreading at the toppe into many thredly branches, full of very small white flowers, consisting but of two leaves like threds.

4. *Caryophyllus coeruleus Hemspetiensium*.

The blew Pincke of *Hempsted*.

The leaves of this Pincke that grow next the ground, are so broad and like Cockes that they will be withered almost ere they be gathered, but of a whitish greene colour from whence rise sundry slender smooth joynted stalkes ruthy set halfe a foote high, bearing every one a flower at the toppe, set in a small huske, consisting of five blew round pointed leaves finely dented about the edges, but no bigger then those of the ordinary wilde *Century*, the whole plant of a little what hot and bitter.

5. *Caryophyllus arvensis hirsutus latifolius*.

Wilde hairy Sea Pinckes.

This Pincke groweth very like a garden Pincke, but of a grayish or hoary greene colour, and somewhat hairy: the flowers grow not like Pinkes in long huskes, but more like unto a small wilde Campion, of a reddish colour tending to murrey, and give smaller sent unlike to Pinckes, the roote abideth.

6. *Caryophyllus arvensis umbellatus*. Wilde Pinckes in tufts.

This wilde Pincke also doth much resemble a wilde Campion, having short broad leaves somewhat like unto the *Lychnis*, but lesse, and of an hoary greene colour, the stalkes have like leaves by couples on them, and at the toppe divers small flowers, rising all together from one joynt and each standing on a short foote stalke, resembling therein a kinde of umbell, and are some of a reddish, and others of a whitish colour. I give you here *Gerards* historie, more to please others then my selfe.

7. *Caryophyllus holosteus tomentosus*. Hoary Pinkes.

From a small creeping roote riseth sundry slender round joynted stalkes lying on the ground and dividing themselves into many branches a foote or two long or more, whereon are set leaves by couples, some of them broad and long, and others more round, yet all of them hoary white, like unto the leaves of the *Camphorina Americana* called here Live long, a life everlasting, bearing white flowers of five leaves a peece round pointed, this abideth long and spreadeth much upon the ground.

8. *Caryophyllus angustifolius tomentosus*. Hoary narrow leafed Pinckes.

This small low Pincke that scarce riseth with the stalkes an hand breadth high, which are woolly bearing asunder three parts, hath very narrow long and woolly greene leaves on them, some being longer then another, set by couples, bearing a white flower, made of five leaves, standing in a greene huske.

9. *Caryophyllus pumilus latifolius*. The low broad leafed Pincke.

This small low Pincke hath a short low stalke rising from the roote, presently dividing it selfe into two branches, which grow high, whose lower leaves next the ground are somewhat broad and short, but a little higher on the stalkes long, set and of a pale greene colour, set by couples at the joynts: each of the branches bearing at one side a pale purple white flower rising out of a husk at the stalke.

The Place and Time.

Some of these as I said grow in our owne Land, some in *Germany*, *France*, and *Spaine*, some also flower a fortnight

The Names.

The Germanes call the first *Armerius proliferus*, and *Thalius Caryophyllus sylvestris quartus*. The second hath likewise their titles as well beseemeth them, *Gerard* mentioning the first and last, the other the middle, called by *Dodonaus* as the title teareth. The fourth is called by *Lobel Asphylanthes Monspelienses*, and *Caryophyllus* and *Lychnis*, *Caryophyllus coeruleus Monspelliensium*. *Lobel* calleth the fifth *Caryophyllus holosteus* and *Caryophyllus* both it and the sixth *Holosteum Caryophyllum*. The seventh usually called with *Caryophyllus Holosteus* and *Holosteum* simply, *Dodonaus* as I take it, meaneth this which he calleth *Caryophyllus holosteus tomentosus*, and said he had not seene the flowers: And the eighth also *Caryophyllus holosteus tomentosus angusti-*

angustifolium. The last he also alleadgeth as it is in the title: I have *Englished* them all Finckes, not knowing how to entitle them.

Caryophylli Alpini, Secundus Ordo. The second Ranke of Mountaine wilde Finckes.

1. *Caryophyllus Alpinus latifolius*. Mountaine broad leafed Finckes.

This hath a small white fibrous creeping roote, and from thence rise some bending hairy stalkes, three or foure inches long, with two small broad and somewhat round pointed hairy darke leaves at each joynt, and from thence upwards come forth small foote-stalkes bearing each of them a large white flower of five leaves, standing in a greene huske, whereon afterwards standeth a long huske with seede therein.

2. *Caryophyllus Alpinus angustifolius purpurascens*. Narrow leafed mountaine wilde Finckes.

The roote of this is creeping like the last, and the stalke being somewhat hairy is three inches long, with paires of small long leaves thereon, pointed at the ends, with two or three purplish flowers at the toppes, laid open like a starre and the greene leaves of the huske, set betweene them.

3. *Caryophyllus Alpinus gramineus*. Mountaine Fincke with Grasse like leaves.

The leaves of this are very narrow, and about an inche long, of a darke greene colour like unto grasse, set by couples on the stalkes, as in others, which are a little hairy, the flowers are white made of five leaves, standing in small greene huske, out of which rise small heads with small seede in them: the roote is small and white.

4. *Caryophyllus montanus angustifolius albus*. White mountaine narrow leafed Finckes.

The stalke of this Fincke is small and reddish, three or foure inches long, having long and narrow smooth leaves thereon, and smaller white flowers at the topps then those of the last, here in this Ranke of Order mentioned.

1. *Caryophyllus Alpinus latifolius*
Broad leafed mountaine Finckes

5. *Caryophyllus minimus muscosus hispidus*
Our smallest Mosse like Fincke.

5. *Caryophyllus montanus Clusij*. *Clusius* his Mountaine Fincke.

The leaves of this fincke are fappy thicke and short, somewhat like to those of Thrift growing thick together from among whom rise hairy slender foote-stalkes, rather then stalkes, about an inch high, yet having joynts and leaves set by couples thereon, on the toppes whereof stand the flowers, each for the most part by it selfe, whose huskes are large and hollow greater also then the leaves, much the smallnesse of the plant, and of a purplish greene colour, ending in five poynts, out of which rise small pale reddish flowers of five leaves apeece.

6. *Caryophyllus minimus muscosus hispidus*. Our smallest Mosse like Fincke.

This small plant resembleth more like unto a Mosse, but that it hath some threadlike stalkes about two or three inches high, branching forth diversly, thicke set together and without order, with small short grosse greene leaves, that are very narrow, and more like haires then leaves, seldome exceeding halfe an inch in length, whereof though the most be plaine, yet some also will be parted on the side and forked like homes at the ends, at the toppes of the branches stand divers very small and scarce to be discerned, greenish white flowers, which once past, small cods with seede in them as small as dust: this spreadeth into many small tufts, roote-ing itself as it growes, and dyeth after seede time, and springing from the seede that shedded and abiding in the Winter, with such like small greene haire like leaves as stand by the sides of it, until that it encreaseth and groweth bigger, at the which plant is expected.

The Place and Time.

All these grow on hils and mountaines for the most part, the first and third in *Germany* and *Austria*, the second in *Spaine*, the fourth in *France* about *Montpelier*, the last no where but in mine owne Garden, wherein I found know, and doe flower in *July*, giving seede quickely after.

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

The Names.

are surely found out, the foure first whereof are recorded by *Bauhinus* in his *Pinax* and *Prodromus*, by the names they hold here in their titles, but that he addeth *Holostius* unto them. The last I say is said, not [illegible] before that I know.

Caryophylli saxatiles, tertius ordo. Rocke Pinckes, the third Ranke.

Caryophyllus saxatilis, Ericæ folijs umbellatis corymbis. Rocke Pinkes with heath like leaves.

The Rocke Pinkes, from a slender crooked and woody roote, tendeth forth divers brownish jointed stalkes, some spanne and high, having divers short and narrow leaves at their bottomes like unto Heath, and at the [illegible] very short and hard leaves: the toppes of the stalkes are furnished with tufts of white flowers, made [illegible] leaves a peece, standing close [illegible] unto an umbell.

2. Caryophyllus saxatilis Erice folius ramosus [illegible]

White or purple Rocke Pincke, or one somewhat like it.

The [illegible] of Rocke groweth like Mosse on the ground, and doth somewhat resemble the *Ocimoides* [illegible] set forth in the 78. Chapter of this Booke, but yet is not [illegible] it hath sundry long hard branches rising from a woody roote, divided into many other lesser [illegible] with little heath like leaves, and with a number of large flowe white or purple flowers standing on their toppes.

3. Caryophyllus saxatilis fissifolius.

Cauded Rocke Pincke.

This [illegible] ever greene plant is here thrust in the [illegible] Chapter, which I thinke did never please his [illegible] for [illegible] I am sure it doth not me, but [illegible] hath [illegible] like place before, let me also [illegible] the name of Rocke pincke: but it is to [illegible] [illegible] the roote, [illegible] like unto [illegible] leaves, but much [illegible], of a whitish greene colour and [illegible] sundry [illegible] stalkes, among which rise [illegible] stalkes a [illegible] long, divided into [illegible] branches, set with a few long and narrow [illegible] small white flowers of foure leaves a peece [illegible] toppes, which are followed by very slender, and [illegible] long pods containing very small reddish seed: [illegible] continueth and holdeth the lower greene [illegible] all the winter.

The Place and Time.

These grow in the rocky grounds on hills, the first in *France*, the second in *Spaine*, on the *Pyrenean* hils, and the last from among the chinkes of the Rockes in *Italy*, and flowre when the rest doe.

2. *Caryophyllus saxatilis flore albo & purpureo rotundifolius.*
White or purple Rocke Pincke, or one somewhat like it.

The Names.

The names of these are likewise mentioned by *Bauhinus*, who hath given them the same titles that they are here set downe, yet I take the second to be called by *Antonio Donati Ericæ marinæ Thymifolia.*

The Vertues.

The most of these being of late invention, are of small or no use that we can understand, they must all therefore [illegible] for this time, without being further questioned.

Chap. 11.

Satyrion & Orchis. Cullions or Stones.

Of the sorts of *Orchides* there are such a number that to avoide confusion, and to bring them into some methodicall order, I must distinguish them by severall Rankes or Orders, that is unto those that have round rootes, and into those that have handed rootes, many sorts whereof have borne [illegible] *Satyrion* by divers but erroniously, and therefore to avoide that Rocke I would bring you [illegible] the lake Haven, where you may be assured that those rootes which are properly and truely [illegible] the *Satyrion* of *Dioscorides*, are those which we usually call in these dayes *Tulipa*, as I have shewed [illegible] former Booke (although Mr. *Johnson* in his *Gerard* seemeth not to take knowledge that I had there so [illegible] set it forth, but deliver'eth it as if it were the fruite of his owne travels) whereof this age hath produced [illegible] sundry sorts for cause of flowring, and forme of being, but in the placing and distinction of these [illegible] I may say almost impossible to expresse them all. I will therefore here in the first place, [illegible] but shew you the formes and names of some of them, and referre you to my Booke to see [illegible] the round rooted kindes, some have two rootes some have three, which I would

parate into five parts, as first into *Cynosorchides sive Testiculos caninos*, Dogges stones. Secondly into *Orchides sive Testiculos mariones*, Yonder stones. Thirdly into *Tragorchides sive Testiculos hircinos vel fœtidos*, Stinking *Orchis* or Goates stones. Fourthly into *Serapiadas vel Testiculos vulpinos*, Foxe stones. And fifthly into *Triorchides aut Satyrios varios*, Sweete Cullions or stones, in which five Ranks all the sorte of *Orchides*, that have round roots, are comprehended. And then there are the handed *Orchides*, to be entreated of lastly, which are so called because their roots are like hands, with the ends of the fingers cut short of, which shall be wholly declared together, not making any devision of parts in them, and first of the *Cynosorchides* Dogs stones, after the figures of the sute *Satyrion* or *Tulipa*.

Cynosorchis Testiculus canus, Primus Ordo. Dogges Stones the first Ranke.

This kinde of *Orchis* is distinguished into two sorts, the one hath flowers resembling hoodes, with small bodies hanging out of the midst of them, the other hath flowers like unto the bodies of men, with their armes and legs cut shorte of.

1. *Cynosorchis major latifolia.* The first great Dogges stones.

The first of these greater Dogs stones hath five or sixe broad leaves on the ground, among which riseth up a fayre green stalke, halfe a yard high, bare or without leaves, or but one or two smaller standing below, at the toppe whereof standeth a spiked head of purplish flowers, set thicke and close together, made like unto open hoods, from the middle whereof hangeth downe, a small body, as it were of a Dog, or other such creature, being of a pale purple colour at first, spotted with deeper purple spots and lines, after which come somewhat long and round small huskes, containing therein rather small dust then seede it is so small: the roote is compounded of two round white bulbes, set together like the two stones of a dog, with long fibres at the heads of them, one somewhat higher sometimes then another, and alwayes one of them which is the higher, is firme full and hard, the other lanke, wrinkled and soft, which withereth away to nothing, leaving the firme roote, which shooteth out of the flower and in the Spring another springeth and encreaseth from the side of the old one, and then that beginneth to grow lanke, while the other new one encreaseth.

Primus Dod.

2. *Cynosorchis major latifolia altera.* The great purple Dogs stones.

The other greater sort hath somewhat narrower leaves then the former, the spiked head of flowers, which is not so long nor so thicke, and the flowers of a whitish purple colour, marked with some purple spots and lines more inward, formed like open hoods, and small bodies hanging forth like the former, the seede and roote is also like the former.

Secunda Dod.

3. *Cynosorchis major spica compacta.* The greater pale purple flowred Dogs stones.

The leaves of this are somewhat narrower then the last, and sometimes spotted, the stalke also is somewhat lower, with leaves upon it, and the spiked head short and close, with the like flowers for forme, thicke set together, but somewhat pale, and of a whitish purple colour, spotted also, the roote also are like the former.

Mas 2 Lob.

1. *Cynosorchis major latifolia.*
The first great Dogs stones.

2. *Cynosorchis major latifolia altera.*
The great purple Dogs stones.

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

4. *Cynosorchis latifolia minor.* The smaller pale purple Dogs stones.

The stalke riseth as high as the last, the leaves also somewhat narrow like it, and divers in like manner set upon the stalke: the flowers are not closely set but more sparsedly of a pale purple or bluish colour, spotted also, the forme sweete with open hoods and bodyes hanging forth. *Majoris altera species Lobel.*

5. *Cynosorchis angustifolia minor cæsio.* Narrow leafed Dogs stones.

The stalke hereof is not above a spanne high, having narrow long leaves below, and one or two above upon the stalke, compassing it at the bottome, of a pale greene colour: the spike whereof is furnished with a thinne long spiked head of purplish white flowers in forme as the former, representing open hoods, each flower standing in a long foote stalke. *Pseudo-*

6. *Cynosorchis militaris sive Strateumatica major,*
The greater Souldiers cullions.

The greater of these Souldiers cullions hath large leaves below, and more set on the stalke, which is halfe a yard high, the spiked head of flowers stand somewhat separate, each flower being like unto a naked little body with the armes and legs cut off, and a hood set thereon, as a legge of a Souldier with his helmet on, the hood or helmet white, and the body spotted with purple spots, the roots are great and thicke.

7. *Cynosorchis militaris rubra.*
Red flowred Souldiers cullions.

The leaves hereof are narrower, and the stalke smaller and lower then the last, scarce a foote high, the flowers also are somewhat like, the last, but of a fairer bright red colour.

8. *Cynosorchis militaris minor.*
The lesser Souldiers cullions.

This in all things like the greater of this kinde, but lesse and the flowes somewhat whiter.

9. *Cynosorchis militaris spica rubente conglomerata.*
Round headed red Souldiers cullions.

This groweth higher then the former red Souldiers cullions, and hath leaves longer, narrower and but few, the flowers grow in a round bunch together, being like them both for forme and colour, but that the lower part of the body hath foure divisions or short parts, and a very small heele behind the backside.

10. *Cynosorchis militaris latior floribus variegatis.*
Party coloured small Souldiers cullions.

This is much smaller and lower, both in stalke and flowers, then the last, the leaves are broader and shorter, and the small flowers (which make a much shorter spike) are finely parted with white and red.

11. *Cynosorchis militaris Pannonica.* *Hungarian* Souldiers cullions.

The stalke hereof is a palme high or more, with some narrow leaves thereon, the spiked head hath the small flowers like these of this kinde, the hood whereof is of a purplish colour, and the body or lippe hanging downe, cloven into foure white parts, spotted with purple, and a small spurre behinde: this hath a small weake sent. *Palma a. sesqui.*

12. *Cynosorchis militaris purpurea odorata.* Purple sweete Souldiers cullions.

This hath a stalke about a foote high, set with narrow long leaves with a long tender spiked head at the toppe: the flowers are for forme like unto these two last sorts going before this, and are differing in colour, some wholly of a fine purple colour without any spot, others are white with purple spots, and some have the hood of a deeper purple, the hollow part and the body hanging downe being white, spotted with purplish, yet all of them have a fine sweete sent. *Ubi, &c. Lond.*

13. *Cynosorchis capitulo globoso.* Round headed Orchis.

This round headed Orchis hath three or foure broad and short, smooth and pale greene shining leaves, set on the lower stalke, compassing it round at the bottome, bearing a short round head like an Ares dog at the top, and the lowermost part of the other, each flower being of a purplish red colour. *Rotundus Dalechi Lugd.*

14. *Chamæorchis Alpina flore viridi.* Dwarfe Orchis with a greene flower.

This low Orchis hath a base stalke about three inches high, above the very narrow long leaves that grow below, each side flower, the spiked head is about an inch long, with two short leaves under it, and sundry hooded green flowers thereon, the roote hath two small round bulbes. *Pseudo. 4.*

The Place and Time.

These Orchis grow in the fields of our owne Country in divers places, and many others in *Germany*, where they are better observed by *Clusius*, they flower from *May* until the middle of *June* for the most part.

The Names.

[illegible] in generall, and [illegible], this in particular, in Latine also *Orchis*, and *Cynosorchis* or *Satyrion*, I have taken some kinde or sort of these *Orchides* to be the *Satyrion* of *Dioscorides*, therein following herein *Pliny* and *Apuleius*, who made no difference betweene the *Orchis* and *Satyrion*, once forth against them, in that his *Satyrion* hath but one roote, and therefore he set forth [illegible] such as are moulded out of his owne conceit, as it is generally thought, for no such thing can [illegible] in any nature, and I have shewed you both in my former Booke, and in the preamble of this Chapter, that the right *Satyrion* of *Dioscorides*, without peradventure, both the one and the other, and that

Original from UNIVERSITY OF MICHIGAN

the seed is like dust or rather as I thinke it should be *pulvis* or *atrum*. I have given you in the margent against every one, the severall Authour (although but one or two as this time) that hath described it before. I finde that *Dragorus* was of a strange conceit about the encreate of these kinds of *Orchides*. First that they bore no seed (for he supposed that the small seede which as I said is like dust, found in the long heades of them, after the flower is past was not the seede) for he said the heads that bore after were idle, containing nothing within them: and secondly, he thought that seeing they were not procreated by their owne seede, but that they were engendred by fornication, namely of Blacke birds, and Thrushes, that in their copulation let fall some of their sperme upon the ground, and that because they are found in greatest plenty among the woods where these birds retire, and have their chiefest food. The *Arabians* call it *Chasi alkes*, and *Chasi alchele*, the *Italians Satirione*, and *Testicoli de cane*, the *Spaniards Cayon de perro*, the *French du Satyrion*, and *Couillon de chien*, the *Germanes Knaben kraut*, *Stendelwurtz*, and *Margenschen*, the *Dutch Knabenkruit*, and *Standelcruijt*, and we in *English* (of the Apothecaries yet easily taking all to us for their use) *Satyrion* and of some Dogges stones, of others Standle wort, and Standle grasse, and of some also Orchis.

The Vertues.

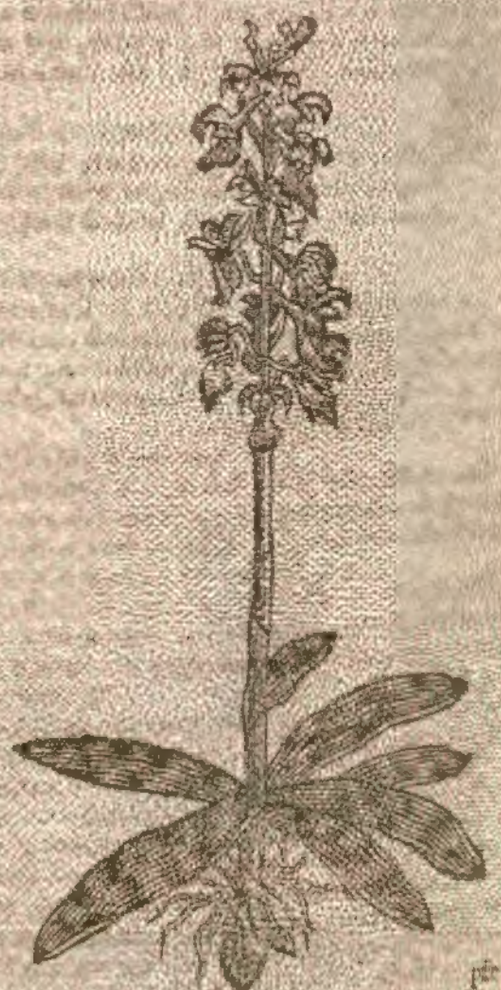
Dioscorides saith of *Cynosorchis* that the roote thereof being boyled is eaten as other sorts of bulbes are, and that if men eate the greater, they shall beget men children, and if women eate the lesser they shall bring forth women children: And that the women in *Thessaly* give the soft roote in Goates milke to procure lust, and the dry roote to restraine it, and that the vertue of the one is extinguished by the taking of the other. *Pliny* also writeth the same words out of *Dioscorides*, yet it is generally held, by almost all now adayes, that the firme roote onely is effectuall for that purpose, and the loose or soft spongy roote to be either of no force or to hinder that effect: but most of our Apothecaries doe promiscuously take, not onely both of those roottes to use, but of all sorts of Orchides in generall.

CHAP. X.

Orchis Mario. Fooles stones.

Secundus Ordo. The second Rancke.

MAny of these *Testiculi* are referred by divers Authours, unto the former Rancke of *Cynosorchides*, not to regard the posture of the flowers have different shapes from them, that is of Fooles caps, with eares at them, I have thought good to speake of them apart by themselves.



1. *Orchis mario mas folijs maculatis.* The greatest male Fooles stones.

The greater sort hath five or six broad and smooth long leaves like Lillies, spotted with blacke spots on the up-

1. *Orchis mario mas folijs maculatis.*
The greatest male Fooles stones.

2. *Orchis mario altera maculata.*
Another Fooles stones with spotted leaves.

2. Orchis Anthropophora.
The female Fooles stones.

purple, the stalke likewise hath some thereon, that compasseth it at the bottome but smaller, the spike of flowers is long and purple, each of them having an open hood or helmet like hath, with two small leaves like eares, standing upright at the sides of them, the belly that is lowest is whiter, having on the backeside a crooked heele or horne, the whole flower is sweete and very comely to behold.

3. *Orchis mas tertia altera maculata.*

Another Fooles stones with spotted leaves.

The stalke of this groweth bigger, the leaves are not altogether so large, but lying on the ground spotted in the same manner, and somewhat rounder pointed, the flowers are somewhat like the other for the forme, but of a more blew or purple colour, with a sporre behinde.

4. *Orchis mas tertia non maculosis foliis.*

Male Fooles stones unspotted.

The leaves herein are somewhat large like the last, but not spotted, the flowers are either of a deeper or paler purple colour, or somewhat dusky, or altogether white, the stalke that groweth downe, is sometimes spotted with purple spots, and sometimes it hath none, especially in those grounds that are all where.

5. *Orchis mas tertia femina.* The female Fooles stones.

This kinde hath narrower leaves, and blood-red smell like rost flowers, lying on the ground, and some standing upon the stalke: the flowers at the toppe are like those of the former, but have gaping or open hoods like the former, but of a darke blackish blood red colour, standing upright, but lye so close together that they are hardly discerned, with a heele behinde like the other flowers: this is found either of a darke violet purple colour, the middle part whiter and spotted, or else of a pale red colour, whole stalke is shorter and the leaves lesser, or else of a pale red colour, the scarlet head being thicke and short, and the flowers smaller.

5. *Orchis Anthropophora Ornithes mas.*
The male Dicapolion Fooles stones.

Testiculus morio mas Dod. Lugd.

Lob. Icon. 3. Orchis dilatata maculosis foliis.

Eluta radix fl. ochroleuca.

Testiculus mas angustifolius, Lugd.

5. Orchis

Original from UNIVERSITY OF MICHIGAN

5. *Orchis minor folijs maculatis.* Small Foole-stones with spotted leaves.

This small Orchis hath two or three small long spotted leaues vpon the lower part of the stalke, those vpon the higher being much smaller then the other, the flowers are purple spotted and striped very finely.

6. *Orchis Anthropophora Ornades mas.* The male *Neapolitane* Foole-stones.

The stalke of this is a foote high, having leaues of the length of ones hand, and an inch broad, of a pale light greene colour, waued about the edges: the toppe of the stalke hath a tuft of flowers, red before they open, and of a faire blush colour being blowne: the forme like vnto the other, before the hood or helmet open, and small leaues like eares on the sides, with thorne armes as it were hanging downe by the body, and the lower part with legs as it were cut of.

7. *Orchis Anthropophora Ornades femina.* The female *Neapolitane* Foole-stones.

This other Foole of *Naples*, hath longer leaues, but not broader then the last, spread on the ground, and some smaller on the stalke which is higher, the spike of flowers are not so great or thicke, yet in forme like the last, but of a pale colour, spotted very thicke, as small as sand, hauing the hood greenish with purple edges.

8. *Orchis Pauphora sive capitibus cum apprimis Ornades.* The apish Foole of *Naples*.

The lower leaues hereof are thicker but broader, then the last, but those on the stalke are much longer and narrower, the spiked head of flowers is greater then the last, each of them being of a reddish purple colour, seuerally expressing the forme of an Ape as can be, but that the head is greater, as it were of a monster, couered with the small white siluer like eares or leaues that are by it, and both it and the lower part which is bipartited is spotted very finely.

The Place and *Time.*

All these sorts grow much an end in fields, and by woodsides, and many in our owne land, and the three last on the hils in *Naples*; they flower in *May* as the rest doe.

The Names.

The names of all these are expressed in their titles, and the Authours are expressed in the margent, that haue written of them, as is done in the last Chapter, which may suffice for this time.

The Vertues.

The properties of these are like those in the former Chapter, and therefore whatsoeuer is said of them may be well referred to these.

Chap. XI.

Tragorchis sive Testiculus hircinus. Stinking Goates Stones.

Tertius Ordo. The third Ranke.

These *Orchides* are so named not onely because they haue a strong foule sent like a Goate, but themselues of them haue long tailes like beards hanging downe from them.

1. *Tragorchis maxima.* The greatest Goates stones.

This greater sort hath large leaues lying next the ground, somewhat like vnto Plantaine leaues: the

1. *Tragorchis maxima.* The greatest Goates stones. 2. *Tragorchis vulgaris.* The common Goates stones.

3. *Tragorchis minor & verior.*
The lesser but truer Goatestones.

4. *Tragorchis Batavica altera.*
The Hollanders Goatestones.

flower, the stalke like wise which is halfe a yard high, hath divers leaves thereon and a small spiked head of purple flowers, set in a comely row or order, having a long crooked thred or string hanging downe from each of them, and twining themselves one within another, both the hood and the taile is spotted, and have a strong sent & the bulbes are greater in these then in many other.

2. *Tragorchis vulgaris sive Testiculus leporinus.* The ordinary Goatestones or Harestones.

This other which is the more common with us, hath longer and narrower leaves, the flowers are smaller and whiter, spotted with reddish spots, and the tailes are more twining, the smell hereof is as strong as the former, but the bulbes are lesser. *Testiculus leporinus vulg. Lob.*

3. *Tragorchis minor & verior.* The lesser but truer Goatestones.

The smell hereof causeth the name of this *Orchis*, which doth neerer resemble the ranke smell of a Goate, then the former doth, but differeth in the leaves being much lesser, and the flowers being without spurres or tailes, and somewhat like unto those noisome wormes that wex all woodlice, for their proportion, the colour whereof is somewhat of a wraith. *Tragorchis minor & verior Lob.*

4. *Tragorchis Batavica altera.* The *Hollander*, Goatestones.

This stinking *Orchis* of *Holland* that was found about the *Hage*, as also about their sea coasts, and as fittest resembling this Ranke of Order, hath three or foure narrow small leaves, compassing a low stalke, about a span long; whose top is ended in a short spiked head of flowers, of a fine purplish red colour on the inside, and paler without, having a belly or lippe hanging downe, which is remained in three parts and equall parts. *Orchis Batavica.*

5. *Tragorchis altera purpurea.* Stinking Goatestones of *Austria*.

The leaves of this *Orchis* are like Lilly leaves, of a pale greene colour, with some smaller about the stalke which is long, but the spiked head of flowers is either of a wheish or pale colour, without any spots, or else purple with some purple leaves under them, each whereof is hooded and cased with a hanging belly, notched as it were with three corners at the lipping; ranke smell hereof asketh it one of this ranke, and to be numbred with them which we shall see hereof in another place. *Orchis 5. Clus.*

The Place and Time.

The former three sorts grow chiefly in clay grounds, the other two are expressed in their tables, and flower in May.

The Names.

These foure are already mentioned by *Lobel* and *Clusius*, whose names I have enrolled in the margent how to be used at large shall be sufficient.

The Vertues.

The vertues of these Orchises differ such that the roots of these Orchises, are better then any of the other, for the purple kinde, or what other good quality they chiefly partake we cannot out of any ones experience relate unto you.

Cap.

CHAP. XII.

Orchis Serapias sive Testiculus vulpinus. Foxestones.

Quartus Ordo. The fourth Ranke.

THis fourth Ranke or order must comprehend all those sorts of *Orchides* whose flowers doe represent sundry sorts of insects, flyes, or other small creatures, which for their lustfull generation were anciently dedicated to *Apis*, who was worshipped as a God at *Canope*, not farre from *Alexandria* in Egypt, and from thence tooke the name *Serapias*.

1. *Orchis Serapias bifolia latissima.* The greatest twiblade Foxestones.

This hath onely two very large leaves, not much lesse then those of the white Ellebore or Neesewort, with divers veines running through them, greene on the upper side and paler underneath, but shining withall, the stalke riseth a cubit high, five square, with a few leaves or skins thereon, closing it as it were about, the flowers grow in a spiked head like unto others, but great and large, being either purple spotted with white, or wholly white: the roote are great and somewhat long like unto small Turneps.

Chef of Thal. descripsit.

2. *Orchis Serapias latifolia altera.* Hungarian twiblade Foxestones.

This other is very like the last, but somewhat lesser, and lower, both in leaves, stalkes, and flowers, and is found also both purple and spotted, and white as the former is.

Chef of Thal. descripsit.

3. *Orchis Serapias bifolia vel trifolia minor.* The lesser twiblade or three leafed Foxestones, or white Butterfly *Orchis*.

Orchis Spheges sive apifera Lob. sive Hermaphroditica. Bellonio fœmina Lobel.

This lesser Foxestone hath two or three large leaves next the roote, yet lesser then the last, the stalke is more then halfe a foote high, with two or three peeces thereon, and a small eare or spike of white flowers at the toppe, thinly set thereon, somewhat resembling white butterflies with their wings spread, each flower having a crooked taile behind it full of a sweete liquor.

4. *Orchis Sphegodes sive fucum referens.* The greater Drone Bee flower.

The leaves of this *Orchis* are five or six, long narrow, and ribbed like Ribwort Plantaine, yet somewhat lesse, the stalke is about a span height, bearing five or six flowers at the head thereof, in fashion somewhat like a Bumble, humble or drone Bee, as it is called, having some few small whitish purple leaves like wings above, and a brownish belly or body below.

Alterc. ejusdem.

There is a lesser sort hereof, whose flower is lesser as well as leaves, and of a more whitish greene colour.

3. *Orchis Serapias bifolia vel trifolia minor.* The lesser twiblade or three leafed Foxestones, or White Butterflye Orchis.

4. *Orchis Sphegodes sive fucum referens.* The greater Drone Bee flower.

4. *Orchis Sphegodes minor.* The lesser Wasp Orchis.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

1. *Orchis Sphegodes altera.* The Waspe Orchis.

2. *Orchis vespa Sphegodes prior Tabernæmontani primum.* The greater Gnat flower.

5. *Orchis Sphegodes altera.* The Waspe *Orchis*.

The Waspe *Orchis* hath narrower leaves then the last, the flowers stand in the same manner, and of the same fashion almost, but somewhat greater and of a browne yellow colour, the wings being a little enclining to purple. *Sphegodes altera Lob.*

Thus the new *Gerard* maketh the humble Bee *Orchis*.

6. *Orchis minor calicem referens.* The lesser Gnatflower.

The lesser Gnatflower hath three leaves usually standing below the stalke, with some few short ones up higher, the flowers are many but small, much resembling a small gnat or flye, of a yellowish browne colour, whose lower part is smaller then the greater sort. *Calicem referens Trifolia Lob. Testiculus vulpinus Lob.*

7. *Orchis Sphegodes prior Tabernæmontani vulpinus primus.* The greater Gnat flower.

The stalke hereof is greater and higher, the leaves alike are larger then the two last and smaller upon the stalkes, the flowers are fewer at the toppe but larger by much, the colour doth not much differ, but is rather sadder.

8. *Orchis Melissam fere æmula.* The hony Bee flower.

The stalke hereof is seldome a span high, the leaves thereon are few, narrow and small, turning sometimes inward, some rising upon the stalke: at the toppe usually stand two or three flowers, seldome many more each where as is in shape much like an hony Bee, that many that have not seene it before, would verily believe that it were some flying or else the carkase of a dead one, but that the upper leaves which are like wings, are of a pale blewish purple colour and the head gee paler, the body tail and round below, of a darke browne colour with some spots of yellow thereon, the nectars are small. *Orchis Melissæ facie Lob.*

9. *Orchis Myodes major.* The greater or flesh flye flower.

The greater flye flower hath three or foure, sometime broad and long smooth greene leaves next the ground, the stalke riseth about a span and a handbreadth high, with a few large flowers set at the toppe, resembling a great Flesh flye made of foure leaves, the three uppermost, and a long one lowest. *Myodes altera flore grandiore Lob.*

10. *Orchis Myodes minor.* The lesser Flye flower.

The lesser Flye flower hath some what lesser leaves and more ribbed, the stalke riseth not fully so high, the flowers stand in the same manner, very like unto the last sort, but lesser, and of a little darker colour both the bottome, and about the middle part, but paler between the wings, being of a pale colour, enclining to blew. *Myodes prima Lob.*

11. *Orchis Myodes minima.* The least Flye flower.

The least Flye flower hath three leaves narrow and ribbed, growing closer to the stalke, which is smaller and lower then the last, having two or three small flowers at the toppe like the other, but smaller, and of a brownish purple colour, somewhat spotted. *Scarabæo similes Dod.*

12. *Orchis Myodes lutea Narbonensis.* The great yellow Fly flower of *Narbone*. *Orchis Myodes lutea Lob.*

The great yellow Flye hath three or foure larger leaves then the last, full of ribs, the stalke is higher, and the flowers

8. Orchis Myodes latifolia spicata.
The broad Bee flower.

10. Orchis Myodes minor.
The lesser Fly flower.

11. Orchis Myodes latifolia flore rubro.
The great broad Fly flower of Narbone.

16. *Orchis Ornithophora folio maculoso.* White or purple Birds flowers.

17. *Orchis Myodes angustifolia.* The narrow leafed flye flower.

flowers much greater, and of a yellow colour, like some flyes with us.

13. *Orchis Batrachites.* Froggie Orchis, or Frog flower.

The Frogge flower hath broad and short leaves below, and narrower and longer up higher on the stalke, at the toppe whereof grow sundry yellowish flowers, resembling the bodies of Frogs, with the head and wings spread, from whence it tooke the appellation: the rootes hereof are large, a little longer, and more pointed at the bottome then of others. *Batrachites Lob.*

14. *Orchis Arachnites.* The Spider flower.

The leaves hereof are more then in the last, narrower also and longer, the stalke is not higher, and bearing but three or foure flowers at the toppe, resembling a spider in the round belly, and the small necke or partition between it and the toppe wings. *Arachnites Lobe*

15. *Orchis Psyche dicta herbacei coloris.* The greene Butter flye.

This Butter flye hath divers large smooth greene leaves next the ground, and other smaller and longer upon the stalke: the flowers are many and great, resembling Butterflyes with their wings spread abroad, of a kinde of herby greene colour, with a spurre behinde. *Ornithophil. folio lævi Lob.*

16. *Orchis Ornithophora folio maculoso.* White or purple Birds flower.

The leaves hereof are somewhat large and spotted for the most part (for there is much diversity herein, some having broad large or pointed, others narrow lesse or rounder leaves) the flowers are large and like the last, with a spurre also behind them but some are all white, others are purple, and some betweene both, of a purplish white colour like a little flowreth with the tuft tops. *Ornithophora folosa maculosa Lob.*

17. *Orchis Myodes angustifolia.* The narrow leafed Flye flower. *Orchis angustifolia, sive rotundifolia.*

This hath fewer narrower leaves then many other, standing upon the stalke, up to the toppe, where the flowers resemble small short flyes.

18. *Orchis maculosa Calamus.* Narrow leafed Flye flower of *Naples*. *Maculosa Colum.*

The stalke of this Flye flower is three foote high, having two very long leaves at the bottome, but of an one-halfe length, those that grow next on the stalke are much longer, some being a foote and a halfe long, and very narrow: those upon the height are shorter and broader, at the top are set divers flowers in a spike to a footes length, each whereof is shaped like a reede or olle hollow pipe, having a broad and long beard thereat, of a little bluish colour, with a long spurre like a sting, hanging downe broad above and small below: this is found usually but with one round root (the other I suppose being decayed and gone) with some fibres both at the head, and from the sides which is not seene in any sort of Orchis.

The Place and Time.

All these kinds grow not in one sort of ground or ayre, for some are found in woods, some in clay grounds, some in the edges of corne fields, and many sundry soiles most of them in our owne land, yet some are strangers, and are all to be seene flowring before May be come to the end of it.

The Names.

Where done with these as I have done with the rest, and given you one Author in the steede of many that hath

written of it, with the name how he calleth it, for it were too tedious to write all the fantasticles that fantall Authours have given us their sorts of Orchides.

The Vertues.

The properties of these *Orchides* are recorded in particular by *Dioscorides* and *Galen*, to be not so effectuall for Venery, but are of force to resolve swellings, and to cleanse foule vlcers and fistulaes, that is, hollow vlcers, as the vlcers of the mouth, and inflammations also, and slayeth those that are eating it raw, it dryeth much when the roote is dryed, and slayeth the flux of the belly thereby.

Chap. XIIII.

Orchis sive Testiculus odoratus. Sweete Cullions.

Quintus Ordo. The fifth Ranke.

THis fifth and last Ranke of round rooted *Orchides* must comprehend a few small ones, that smell sweet some whereof have but one, some two round rootes, others three, and some more, as shall be found.

1. *Orchis pusilla odorata.* The sweete Munke Orchis.

Stuffe. This sweete Orchis hath vsually but three small and narrow greene leaves, the stalke is of a handbreadths height, having a long narrow spike of pale greene flowers, ending in three points, and smelling like Munke, this hath but one small round roote of the bigneſſe of a peale, above which it hath long strings growing forth, by which new plants are encreased.

2. *Triorchis alba odorata major.* The greater Sweete Lady traces.

Triorchis alba spicata Lob. The great Lady traces hath sundry very sad greene shining leaves like unto the leaves of Plantane, but smaller and narrower, which rise up in *September* after the stalke with flowers is withered which doe abide greene all Winter, and perish in *May*, the slender stalke which crooketh and windeth it selfe a little, riseth up to almost a foot and a halfe long with many small white and sweete flowers, compassing it round and hanging downe, foure stand upon it: the rootes grow sometime three, and sometimes foure together, being round and fingered like to any of the former Orchides, with divers short fibres set round about them, contrary to the order observed in all the rest.

3. *Triorchis alba odorata minor.* The lesser sweete Lady traces.

Triorchis spiralis minor Lob. The lesser traces hath much smaller leaves lying neat the ground, but of the same fashion like unto a very young Plantane, the stalke is little above an handbreadth high, with some small shew of little pearcing leaves thereon, the flowers which are white dasht over with a thinne bluish, standing in thin long spikes, compassing the stalke round about, are very sweete: the rootes grow by couples, and are small somewhat long as well as round.

4. *Orchis lutea Leodiensis.*

Lady traces of Liege.

Orchis minor Leodiensis Lob. Obs. The leaves of this are somewhat more like unto a broad leafed Plantane, yet smaller and narrower, three or foure at the bottome of the stalk which hath none on it, and hath yellowish flowers like the others at the top, one above another, the roots grow three, and sometimes foure together.

5. *Orchis Frisia littoralis.*

Frisland Orchis or Lady traces.

Frisia Lob. This hath but two small round bulbes for the roote, from whence spring up two or three small, some what long and hairy leaves, yet shaped like those of the Rubwort Plantane, the stalke is above a span high, bearing small yellowish greene flowers like unto the former, and set in the same order. In the same table with this *Orchis* you have the next *Triorchis*, as *Lobel* hath given it us, from *Cassius Gemma.*

6. *Triorchis lutea altera Gesneri folio glabro.*

Yellow Traces with smooth leaves.

Triorchis lutea altera Ger. Lob. also. This hath longer leaves and smoother than the last, and stalkes and flowers very like, yellow also and sweet, the roote is compoſed of three small round bulbes.

7. *Chamæorchis latifolia Zelandica.*

The dwarfe Orchis of *Zealand.*

Orchis latifolia Lob. apparitione 8ª tertiæ Pyrenaicarum Cl. This small Orchis hath two, and sometimes three round bulbes for the rootes, covered with withish coates or skinnes, being greenish within, and sweetish in taste, the lower of these being lanke as in others, it hath two faire but small Lilly like leaves, above two inches long rising from them, some three or foure inches high: this peradventure may be the *Pseudorchis Clusij.*

6. 7. Triorchis alba major & minor.
The greater and lesser sweete Lady Traces.

4. Orchis latifolia purpurea.
Purple broad leaved Orchis.

5. Orchis Mas Lanceolata cum maculis.
Spotted Orchis, or Adders tongue.

6. Triorchis, sive Orchis altera.
Yellow Traces with smooth leaves.

7. Orchis radice rotunda.
Small creeping or ball'd Orchis.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

8. *Orchis radice repente.* Small creeping or Ballard Orchis.

The roote of this Orchis, if it be one, are unlike all the rest, being many long and full of strings, growing thicke together, and enterlacing themselves one amongst another, yet have they at the upper part thereof neere under the leaves a *Cameratus* saith, some shew of small bulbes sometimes to be seene. the leaves that rise from them are thicke and somewhat broad like Plantane, of a darke greene colour, the stalke is slender hurnished at the toppe with divers white flowers spotted with blood red spots. Why *Gerard* should call this *Palma Christi*, I see no reason, when as it commeth neerer to an *Helleborine* then *Orchis*.

The Place and *Time.*

These kindes of Orchies grow in dry grounds, heaths, and waste untilled places, and the like, many of them in our Land, and others in other places, and doe all or for the most part not flower until *August* or *September*.

The Names.

These also as the former have their Addboure names set downe in the margent, and how they called them.

The Vertues.

It is recorded by some, that the rootes of these kindes of Orchides are marveilous effectuall above any other to incite Venery.

CHAP. XIV.

Orchis Palmata. Handed Orchis.

HAving shewed you all the kindes of bulbous Orchides in the Chapters going before, there doth yet remaine the other kinde of handed Orchies to be entreated of, which although they be many, yet I thinke it meete to comprehend them all in this one Chapter, without parting of them.

1. *Orchis palmata major mas sive Palma Christi mas.* The great male handed Orchis.

Palma Christi mas latifolia Park.

This male Orchis hath divers large broad and long smooth greene leaves lying on the ground, among which riseth up a round stalke, with some such leaves on it, but lesser up to the toppe, where grow a large head of pale purple flowers, spotted with a deeper purple colour, each flower having a heele of the same colour behind it: the rootes are flat and broad, two joyned together at the head, like unto handes, parted at the bottome into short peeces, as if the fingers were cut short off by the knuckles, with some fibres at the head thereof also, one of them being fame, and the other loose or spongy, as in the former Orchides, which rot and decay in the like manner.

2. *Orchis palmata major praecox angustifolia.* The great male handed Orchis with narrow leaves.

Dodon.

The rootes of this are double handed like the former, parted into three parts below: the leaves are long and

1. *Orchis palmata major mas sive Palma christi mas.*
The great male handed Orchis.

2. *Orchis palmata major praecox angustifolia.*
The great male handed Orchis with narrow leaves.

NARROW

3. Orchis palmata foemina sive Palma Christi foemina maculata flo. The female handed Orchis.

4. Orchis palmata grandis maxima Conopsea dicta. The greatest handed and hooded Orchis.

stalke through which the stalke riseth, as through a pipe, to be a cubit high, whereon is set a spiked head of flowers of a pale purple colour, with a spurre behinde, and a small leafe set with every flower at the bottome.

3. *Orchis palmata foemina sive Palma Christi foemina maculata folio.* The female handed Orchis.

The leaves hereof are long and narrow, spotted diversly with blacke spots, the stalke hath likewise some such flower leaves thereon, and a spiked head of hooded flowers, some reddish, either deeper or paler, or bluish, or else white, the lowest of them will be spotted, yet some will have none, the roots are handed like the other. *Palma Christi Ium. Lob.*

4. *Orchis palmata grandis maxima Conopsea dicta.* The greatest handed and hooded Orchis.

This riseth with a stalke two cubits high, having sundry long and narrow leaves set thereon, compassing it at the bottome, the flowers whereof are hooded like the last, but of a dainty pale purple colour, and sweet withall, and flower late. *Conopsea Lobelio.*

5. *Orchis palmata minor flore rubro.* Small handed Orchis with red flowers.

This small Orchis hath a slender stalke, with a few long and narrow leaves set thereon, smaller above then below, having a spiked head of shining red flowers: the roote is small and handed like the rest. *Purp. Orchis minor Lob.*

6. *Orchis palmata angustifolia minor.* The lesser handed Orchis with narrow leaves.

The roote of this sort is handed but lesse, and the lower divisions of them are longer, the leaves are very long and narrow, the stalke groweth a foote high, and the flowers thereon are of a pale purple colour, and the whole plant is smaller then others. *Orchis fo. Trag. Hist. stirpium.*

7. *Orchis palmata angustifolia minor odoratissima.* The sweete small handed Orchis.

This small sort hath roots like the rest, the leaves are much narrower and long almost as grasse, the stalke is small and slender with very small leaves up to the toppe, bearing thereon a small spike of pale purple flowers very sweet smelling, every one having a long and a lip hanging downe, divided at the bottome into foure parts with a little behinde. *Pedicu.*

8. *Orchis palmata cerei odoris.* Handed Orchis smelling like Cheese or Gilliflowers.

The roots of this sort are stone and narrow, the stalke slender with sundry short leaves thereon, the spiked head of flowers is long such resembling small flyes, and swelling as sweete as a Gilliflower, after which come great seede in small pooles, the roote is handed, but hath the lower divisions much longer, running downe into the ground. *Lob.*

9. *Orchis palmata Batrachites vel Myodes.* Handed Orchis resembling frogs or flyes.

The leaves and rootes of this stalke are somewhat short and broad compassing it at the bottome, the flowers are set in long spikes, and like wings as it were above, and a long small body hanging downe, and doth in some sort resemble a frog as well as a flye, the roote hath shorter divisions in one part, and longer in another. *Lob.*

10. *Orchis Castrata.* Gelded Orchis.

This hath many long narrow leaves set on a slender stalke, and smaller up to the toppe, where standeth a bending head of white flowers spotted, each resembling a flye the lower part of whose hanging body is more pointed: the roote is made of two long peeces like legs, ending in small points, and halfpeces or hands not fingers. *Lob.*

12. Orchis palmata palustris latifolia.
Broade Marsh handed Orchis.

13. Orchis palmata palustris angustifolia.
Another Marsh handed Orchis.

12. *Orchis palmata palustris latifolia.* Marsh handed Orchis with broad leaves. *Serapias palustris latifolia Lob.*

The large and broad smooth greene leaves hereof, are set in order upon the stalke up on the top, growing smaller and smaller upwards unto the large spike of pale bluish flowers, with every one a small greenish leafe at the setting on, the roote hath long divisions at the bottomes of the hands, this flowreth more early than the ordinary paluine kind of Dogges stones.

13. *Orchis palmata palustris altera.* Another Marsh handed Orchis. *Serapias palustris Leucophylloides Lob. Orchis palustris latifolia Ger.*

The leaves of this are not so long nor broad as the last, sometimes spotted but more usually without, the flowers are likewise set like the last, but of a violet purple colour: this flowreth after the last.

13. *Orchis palmata palustris latifolia.* Another Marsh handed Orchis. *Orchis palustris latifolia Ger. Orchis palustris Lonhoider Lob.*

This differeth little from the last, but in the leaves being without spots, and in the flowers which are more white.

14. *Orchis palmata palustris maculata.* Spotted marsh handed Orchis. *Orchis Pannonica Clusii.*

The stalke hereof is tall and strong, the leaves large and full of spots, the flowers purple with greene leaves set among them.

15. *Orchis palmata, Pannonica quarta Clusii.* Hungarie handed Orchis.

The lower leaves hereof are like unto those of the white Lilly, and of a whitish greene colour without any spots or markes, and of an ungrateful rancke, the flowres are large growing spike fashion one above another, of a whitish colour without any spot, resembling a fooles coule or hood, with eares on both sides, and a broad lip hanging downe, and with a broad blade behinde, smelling somewhat strong like Elder flowres: it hath also a small whitish roote as the beare of the flower next to the stalke: the roote is handed also.

There is another sort hereof whose flowers are purple and the small leafe set at the stalke of the flower, purplish also.

16. *Orchis palmata palustris Draconis.* The marsh Dragon handed Orchis. *Cynosorchis Draconis Lob.*

The leaves of this Orchis are like unto those of the Lilly, compassing the stalke almost round at the bottome, the spike next groweth shaue, with three red and hooded flowers like the last, and greene leaves among them.

17. *Orchis palmata flore viridi.* Small mountaine handed Orchis with greene flowers. *Peristeria.*

The leaves hereof is handed like small, the stalke is about a span high, the leaves are but a few long and narrow, the flowers greene and purple, hooded, and bellyed, parted at the bottome with a small long leafe at each of them.

18. *Orchis palmata montana maxima.* Great mountaine handed Orchis. *Serapias montana Lobelij.*

The greene are hath a stalke two cubits high, whose lower leaves are a foote long, and an inch and a halfe broad, the rest growing smaller and smaller, at the toppe standeth a spiked head of small flowers, as thicke as they can stand, of a pale greene colour, hooded and heeled, and the lower part of the lippe or belly, parted very much like hares eares, the seede of each likewise: the roote is handed like the rest with long divisions.

19. *Orchis palmata montana Lobelij.* *Lobel* his mountaine handed Orchis.

There is small difference betweene this and the foureteenth, which is the spotted marsh handed Orchis, but that

14. *Orchis palmata palustris maculata.*
Spotted marsh handed Orchis.

16. *Orchis palmata montana Pannonica.*
The mountain handed Dragon Orchis.

18. *Orchis palmata montana maculata.*
Great mountaine handed Orchis.

20. *Orchis palmata montana, radice ut antecedens.*
Spotted mountaine handed Orchis with Orchis

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

purple leaves hereof have no spots and are more broad.

Orchis palmata montana candida flore rubido, sparsa. Spotted mountaine handed white Orchis.

The leaves of this Orchis are somewhat narrow, and spotted like unto the female handed Orchis, the stalke and flowers also are like unto it, and differeth not but in the colour, which is white.

Orchis palmata angustifolia Alpina. Small mountaine handed Orchis.

This small Orchis hath very narrow leaves as small as Cresse as *Matthiolus* saith, the stalke is low and small bearing small flowers of a sad purple colour, like unto the purple flowered gendle, and of a most fragrant smell while it is fresh and greene.

The Place and Time.

Some of these Orchies grow in fields and medowes, some in moorish grounds and marshes, and others upon hils and mountaines, and flower in the moneths of *April, May*, and *June*, some earlyer and later then other.

The Names.

Every one of these hath one Authour named in the beginne that hath written of it, and how he hath called it as I have done withall the rest of this family of the Orchides.

The Vertues.

These marish stones are thought best to agree unto the *Serapiades*, and not so available to Venereous purposes, being more hearing and drying then the *Cynosorchides*, and therefore may performe the cures that the *Serapiades* doth unto, and the rest, *Camerarius* saith of this last sort that it is very profitable to stay the bloody Flixe, if the flowers be made into poulder and taken in wine, or the fresh flowers fryed with eggs into a Taste, and so eaten. The stones of all the other sorts of *Orchides* being boyled in red wine, and after they are dryed againe, made into poulder and drunke, doth stay the bloody flixe in a speedy manner.

18. *Orchis palmata tanta flore candido.* Great mountaine handed white Orchis.

Serapias candida flore montana Lob.

Dod. Camerar. descript.

Chap. XV.

Orchis abortiva five Nidus avis. Mishapen *Orchis* or Birds nest.

There are two sorts of Birds nest, the one not much differing from the other, but in the colour, the first and most anciently known, of a yellowish colour, the other of a purplish violet.

1. *Orchis abortiva rubra.* Ordinary birds nest.

The common Birds nest riseth up with upright sappy weake stalkes, having a shew of leaves on them, which are very short thin skins rather then leaves, of the same colour with the stalkes and flowers, that is of a brownish dead yellow, the flowers stand upon a spiked head, like unto that of Orchis, and of the same fashion, with huskes of dusty seede following them: the roote is composed of a number of fibres, that crosse and entangle themselves one within another very intricately.

2. *Nidus avis purpurea.* Purple birdes nest.

The purple birds nest groweth some what lower having some longer skinny leaves on the stalkes then the former with flowers on a spiked head of a very like unto the last for forme, but the whole stalke leaves, and flowers are of a violet purple colour, after which follow small seede like the other, therefore also is like the former.

The Place and Time.

Both these sorts are sometimes found in our owne Land, in Woods and low Copies, and are in flower in *May* and *June*.

The

Orchis abortiua mas. Ordinary Birds nest.

The Names.

Dodonæus calleth it *Vrtica Nigra, id est, Nidus auis*, as it is with most now adayes, it is thought also to be the *Cynosbatos terræ* of *Pliny*, *Gesner* calleth it *Orobanche*, and *Lobel Satyrium abortiuum & Orchis abortiua*. *Clusius* calleth the last *Limodoron* first, and then *Pseudolimodoron*. The *French* call it *Nid d'oiseau*, the *Germans Maulbeer dracken*, the *Dutch Vogelnest*, and we in *English* Birds nest, or Goote nest, from the platting of the roots like the sticks and strawes in a Crowes nest.

The Vertues.

There is no vse made of either of these that I have knowne in Physicke, or applyed to any other vse.

Chap. XVI.

Orobanche siue Limodoron vel Limodoron.
Kill herbe or herbe bane.

There hath bin found out of later dayes, diuers sorts of this fingerlesse of the earth (whereof there was but one sort or two as it is likely knowne to the ancients, or at least, no more expresly in their writings,) under these names, which shall be here shewed you: but because I haue already delivered you two sorts thereof, the one rising from Broome, called Broome rape, the other from the *Cistus*, called *Hypocistus*, which may fully be referred to this family, I will not further mention them here. I confesse they might have been placed neere the Mosses and Mushromes as being excellences of the earth, as they are, but because their flowers and seede doe more neerely resemble the former *Orchides*, I thought meerest to joyne these vnto them here.

1. *Orobanche major Monspeliaca.*
Great Herbe bane of *Montpelier*.

This kill herbe hath a long and round small roote without scales, and with some fibres under it, the stalke is great and thicke, with very short leaves thereon from the bottome vnto the middle thereof, where the flowers begin to grow, and with every one of them a larger and longer leafe: the flowers are long and browne-

2. *Orobanche flore maiore purpurascente.*
Great purple Herbe bane.

This from such a like roote with fibres thereat as the former, sendeth forth sundry stalkes with many thicke and short leaves on them sharpe at the ends, having sometimes branches rising therefrom, and sometimes two or three stalkes from the roote, and at the toppes are set with longer flowers then those of Broome rape on long foote-

1, 2. *Orobanche major Monspeliaca & flore maiore purpurascente.* Great Herbe bane of Montpelier, and the greater purple.

stalke.

1. Orobanche vulgo, Branched Broomerape,

4. Orobanche minor flore luteo. Matthioli major & minor. Toothwort or Lungwort, the greater and the lesser.

falling, yet standing in a husk, with a long thred as it were growing out of the flower that stretcheth up againe, in whose husk leaves and flowers are of a blewish purple colour.

2. *Orobanche ramosa.* Branched Herbe Ivane.

Although many of the former herbes are found with single and undeuided stalkes, yet some are found also that have very much branched, but then for the most part, they grow lower then others, and are of differing colours, some wholly of a yellow, some brownish yellow, and some blewish or purplish, for such are found in sundry places. Matthiolus remembreth a small sort hereof, that groweth lower, under Pine trees, Firre and Pitch trees, differing little or nothing, but in being of a darker colour, and the flowers whiter.

Hyppocist.

4. *Orobanche minor sive Matthioli major flore dentaria major Matthioli.* Great Toothwort or Lungwort.

Most properly may this herbe be joyned to these formerly set downe, for their neere affinity in many things: for as the roote is full of scales, as it may well be called, like as the stalkes or branches have, which consist likewise of blackish purple, shining thicke scales, lying somewhat closely, compact one upon another: in the beginning of the spring, there ariseth out from the toppes of these scaly branches, tender and brittle sappy stalkes, to the height of a foote, without any leaves, but bearing many whitish purple gaping flowers, and blackish inward, standing one by another, which afterwards grow up vessels with small seede in them.

Orobanche minor flore luteo minor. Small Toothwort or Lungwort.

This lesser sort differeth not a little from the greater, but in smaller stalkes, scaly, and more white, and in the roote, with a tender sappy whitish stalke, like the other manner, without leaves, and whitish purple flowers at the toppe, sometimes but two or three, sometimes many more. This varieth in some places being of a more purplish colour.

The Place and Time.

These plants grow very many times from the rootes of sundry herbes, and by their sappinesse draw with out the moisture thereof, strangling them, and sometimes among a field of Corne, Pulse, Hempe &c. sometimes also of themselves among the grasse and herbes, by the sides of hedges, and under the shadow of trees, and many times also in the middest of the same, but most commonly under trees, where they have much shadow, and the most flourishing and lively, yet some have beene found in flower in *August*.

The Names.

This plant called in Greeke, and *Orobanche* in Latine, doth much differ from that *Orobanche*, of *Theophrastus*, which with the stalkes of pulses killeth the *Orobus* that it growes withall, and therefore *Lugdunensis* taketh the name to be called *Orobanche* by *Theophrastus* his *Orobanche*, as I shewed before in the Chapter of the pulse, but it agreeth well with *Theophrastus* his *Limodoron*, as some have it, but more truely *Hemodoron*, some have it *Limodorum*, *quod herba dorcas*, or else *Limodorum faborum adfrens*: but *Orobanche* is the truest name in that *Theophrastus* saith, *quod radix eorum sit grandis & crassa tanquam cruore infecta*: for *Theophrastus* describeth his *Hemodoron* in such manner that *Dioscorides* doth his *Orobanche*, it is thought also to be *Pliny* his *Cynomorion*. Most Writers call them *Orobanches*, and some *Limodoron*. The *Dentaria* is called *Squamaria*, and *radix squamosa* by *Dodonæus Ambiatum*, by *Cæsalpinus Aruchidem*, and *Matthiolus*, and saith the people in *Germany* that keepe Vine yards, call it *Malus Hercules*; but generally, by all *Dentaria* and *major*, the lesser being called by *Clusius Dentaria epiphyos*, and *Dentaria coralloide radice* and many by others. The *Indians* as *Matthiolus* saith call *Orobanche Herba Tora*, because Kine eating thereof will

will gratefully grow on the wall, some else as he saith *Herba Lupa*, and some *Coda di leone*. Because we had no proper *English* name for the former sorts, and I thought it improper to call them Broome rapes, as they is called which groweth from the Broome, I have given them another *English* one, fitting their property as I take it: you may every one doe as they thinke meetest.

The Vertues.

Dioscorides saith of his times, that it was used to be eaten as other herbes are, either raw or boyled with pulse, which would helpe their digestion: *Galen* saith it is cold and dry in the first degree: our people doe many times use the latter sort in medicines for the Lungs, having received it as a tradition from their ancestours, and therefore called the greater Lungwort: we have no other properties of any of these herbes, to open unto you.

Chap. XVII.

Cyclamen, Sowbread.

Although I have given you in my former Booke a dozen sorts or more, of *Cyclamen* or Sowbread, for whose knowledge I must referre you thereunto, a figure of one or two being here shewed you instead of the rest, yet I have a strange plant to exhibite to your consideration, which was found and sent for a bastard kinde thereof, and withall shew you the properties of the right ours already.

Pro Cyclamino verno sparsim missa planta. A strange plant sent for a bastard Sowebread of the Spring.

It had a tuberous roote varying from the forme of the *Cyclamen* roote, being long and thicke, small at the head and broad at the bottome, with a dent in, somewhat like unto the forme of an heart, as it is pictured on the ende, or rather like those pin-pillow-purses, that poore women use to sticke their pinnes round about the brims or edges, having a hard thicke skinne of a brownish colour, with sundry hard long rough fibres underneath, and about it, from the toppe whereof rose divers somewhat round leaves a little pointed, resembling those of the ruder but smaller, some being larger and smaller then others, with three, five, or seven nerves or ribs in them, standing on a long footestalke, and of a brownish greene colour, from among which riseth up a reddish stalke, divided from the bottome into three or foure branches, with the like leaves on them; and at the head of every branch two or three small greenish yellow mossy flowers, much like unto those of the Ribes, or red Currans, with divers yellow threds in the middle.

The Place and Time.

This grew on the *Pyrenæan* hills, sent by *Venerius* to *Iohn Hoghelande*, and other his friends in the low countries, and flowring in the Spring time.

Cyclamen autumnale folio ut dicta,
The leafed Sowbread.

Pro Cyclamino verno sparsim missa planta.
A strange plant sent for a bastard Sowbread of the Spring.

The Names.

I have sent this for a dittering kind of *Cyclamen*, by the title it beareth, but as the description and figure declare, it is much differing therefrom, almost in every particular, and therefore not knowing what other denomination to give it, it must hold the first imposed for me, until I or some other can better dispose of a more certainty.

The Vertues.

The plant being rare and lately found out and known but to few, I have not yet learned that any experience hath been made thereof, whether it hath any medicinal or other property therein or not: because in my former booke, I was somewhat in declaring the vertues of the true sowbread, I think good upon so fit an occasion to expatiate them further here. Although *Mesues* doth determine the degrees hereof to be hot and dry in the beginning of the third, yet he doth not so, but saith only so, *Simplicium*, that it cutteth, cleanseth & openeth the mouths of the veines, drawes and gathereth, which is plainely seene by the particular operations thereof, for the juyce of it openeth the hemorrhoides or piles, and throughly purgeth the stoole, being put up in wooll and saith *Mesues*, it avoideth tough flegme oiled in a glister: it is also mixed with such medicines as discusse swellings, kernels, and other hard knots in any part of the body: it helpeth also the pinne and webbe in the eyes, being infused with honey, as also avoideth it out of the nostrils, which *Serapio* also affirmeth, and that by snuffing up the juice, the head and braine is purged from such humours as use to offend it, the ache also, and daily paines of it, and also the Megrome. *Galen* further saith, that if a dog be bathed with the juice, it will forcibly move it downwards, and kill the broth, or to be put up in a glister, and although the roote is weaker then the juyce, yet the roote being either drunke or applyed, provoketh urine, and is profitable for those that have the yellow jaundice, to drive it forth by sweating. If after the taking of three drams thereof in powder, in Meade or honied water, they be carefully ordered to sweate: it is said also to cleanse all the deformities or discolourings of the skin, and the freckles and spots there of: as well also, is dry applyed to the region of the spleene, it easeth the hardnesse thereof. Some also saith he gave the dryed roote to them that are purse or short winded. *Matthiolus* saith that the distilled water from the roote snuffed into the nostrils, slayeth their bleeding wonderfully: and that if six ounces of that water be drunke with an ounce of the iuyce, it will slay the blood that commeth from the braine, stomacke or liver, in a wonderfull manner, if any veine be broken in them, and this is his attestation: in hinder saith he, the ouvrance there of in purging, it is to mixe there with some Masticke, or Nutmegge, or a scruple of Rubarbe: many have been holpen of the hard-nesse and swelling of the spleene, by the use the roote, which could not be holpen by other things. Treacleth also the paine and torments in the bowels, which we call the chollicke. If saith he there be sowne here of he beaten with the meath stone kernels, and bitter Almonds, and after laid to receive in a quantity to three dayes drou or two of the scorpion creature there of dropped into the eares that are deafe or have worth in them: it helpeth them: the decoction gargared with honey or Plantane water, helpeth all maner of sores in the mouth: the roote being gargled there-with, and the toothache also. *Dioscorides* saith many of the same things, and besides that the decoction thereof healeth wounds the running sores also in the head, boney, & members out of joynte, lobes or chilblaines, and the same. *Pliny* saith the roote is good against the venome of Serpents, and that it will kill Swine, which is con-trary to the received opinion of most, that they are delighted therewith, and greedily devoure the roots, after they have rooted them up, from whence came the name *Porcopinum*, Sowbread: yet *Theslius*, saith the roote is sweet to Wolves, and Foxes then Swine, and that it is not to be inwardly taken, but by good advise and caution. *Dioscorides*, and *Pliny* from him say, that if a woman that is with child doe over a plant thereof, it will cause aborion, or to be delivered before her time; but it is certainely knowne by many experiences that some of the fresh roote it-self, but much rather, the fresh roote which *Theophrastus* also affirmeth, put into a cloth and applyed at due time to the secret parts of a woman, that is in sore hard and long travaile in child birth, hath holpen them most speedy and safe delivery: the roote beaten and applyed with honey, draweth forth splinters &c. out of the flesh.

CHAP. XVIII.

Epimedium. Barren wort.

Barren wort is a pretty shrublike plant shooting forth sundry hard wood stalkes, halfe a yard or two foote high: each stalke divided for the most part into three branches: and each of them bearing three leaves a peece, which are severally, somewhat broad and round, yet pointed at the ends, hard or dry in feeling, and a little sharpely dented about the edges of a light greene colour on the upper side and whiter underneath: from the middle of some of the stalkes of leaves, shooteth forth with them the like rising up of them, a small long foote stalke of flowers not much higher then the stalkes of leaves, di-vided into sundry branches, containing on each of them three flowers a peece, separated into foure parts, as if the flower consisted but of foure leaves, when as each part hath two leaves, one lying close upon another, the inner being yel-low and smaller then the outer, which are red, so that the red edge appeareth round about the yellow, making it seem a yellow flower of foure leaves with red edges: it hath also a few yellow threds in the middle, set with small yellow tops: the whole stalke of the flowers, being of a yellowish red colour, stripe with white lines, which being past, the small long pointed cods appeare, with flattish red seede in them: the roots are small and fibrous, hard and reddish spread-ing in the ground, and delighteth both in shaddowy, rather then sunny places: the seed of the plant is ra-ther then pleasant.

Alaternus, Americanum magis frutescens.

I have had the vigor of from some of the Northerne plantations of *America*, a certaine shrubby and woodde plant, growing forth divers thicke leaves, compassed in the same manner with the former, but such leafe was twice as great: but we never saw it beare any flower or fruits with us, nor did the plant long endure with us but by and by grew weake, and in the end utterly perished, in that I cannot determine it as I would, and we could re-cover the same kinde againe: but the *Hedera trifolia*, set forth in this Worke before, commeth somewhat neere thereunto, but hath not the same, having onely three leaves at a place upon the stalkes, and not nine, that is upon those that had.

The place and Time.

Cæsalpinus saith it groweth on the mountaines of *Liguria*, *Camerarius* neere unto *Verona* in *Italy*, *Bauhinus* on the *Tyrolian* hills, and in *Romania* in shadowy wet grounds, and flowreth from *June* unto the middle of *August*.

The Names.

The *Greeke Epimedium* of *Dioscorides*, hath beene diversly interpreted by sundry writers, some taking it to be one thing, some another: for *Columna* in his *Phytobasanos*, setteth the *Epimedium* mentioned by *Dioscorides*, to be *Lunaria* the *Satyrion* for it, but by circumstances, and also that neither the *Herba Paris trifolia*, nor that *Satyrion Serapionis*, which is the *Libanotis Theophrasti* without, which long time before became rooted in the Garden of *Padua* would seeme to make *Thalius* increase the *Cultus palustris* to be *Dioscorides* his *Epimedium*, where I cannot finde at any of *Dioscorides* his readers, that he meant to set forth any other *Epimedium* then that I here shew you. So that I hereby thinke *Gesnerus* was mistaken to cause *Thalius* to meane *Caltha*, and that *Thalius* also was mistaken in taking that herbe to which he gathered it to be such in such place of the *Hercynian* hills, and kept it in a pot of dayed earth, but had fowre round leaves a little dented about the edges, standing each upon a slender footestalke, and with a tuft of small rootes as *Epimedium Dioscoridis*, which neither had such round leaves, nor such a starke or sinewy root, *Gesnerus* it is thought first entituled the *Roman Tal* (which sort in the Low-countries called *Lunaria*) whom all others that have set it forth since, have followed, not yet some make a doubt what it may be *Dioscorides* his or no. First in that he saith, *Epimedium* hath some dry twelve leaves, when as the impoency is to compound us, that it is a wonder he should so write that, it hee meant that againe he saith it seemeth not to flower one whole moneth, when as this groweth daily, yet herewith it is answered that *Dioscorides* might mistake in this, as he did in *Dracontium*, *Peplium*, *Geranion*, etc. It is likely also that *Theophrastus* should meane this of *Dioscorides*, which in his seventh Booke and eighth Chapter, he calleth *Epimedium* and saith it is a kinde of flowers, which *Hesychius* calleth also *Epimedium*, and some *Epimedium*.

The Vertues.

We have not any sure experience proved to shew but as *Dioscorides*, *Pliny* and *Galen*, have set downe of it, to be drie, cleansing and mild and not at all for inward properes more then to keepe women from growing ever-pregnant, being made into a suppositorie with oile and applied thereto: and that the repeated use thereof would make women barren can make it unlikely, as also the leaves made into a powder and taken in Wine to the quantitie

Chap. XIX.

Viola Lunaria sive Hesperis.
The white Satin flower.

There are two sorts of this Satin flower, one that dyeth after seede time, and another that abideth, both which I have so sufficiently declared in my former Booke, that I needs not further to amplifie them: I will therefore referre you thitherunto, to be enformed of them, and only here give you the figure of it.

Chap. XX.

Aquilegia. Columbines.

HEre shewed you in my former Booke so many sorts of Columbines, and of so many colours, both single and double, that I then thought there had beene no more to be set forth, yet since that time I have attained the knowledge of some others, which I thinke meete to expresse here, especially one out of *Virginia* with a single flower, which Master *John Tradescant* brought from thence.

Aquilegia Virginiana flore rubescente præcox. The early red Columbine of *Virginia*.

The *Virginian* sort differeth little from the ordinary single sort, but in these particulars: the stalke is not so tall as those of *Aquilegia*, although *Cornutus* make it a dwarfe and reddish, the leaves are smaller and some what like unto those of the *Thalictrum*, Meadow Rue, but of a paler greene colour, the flowers are of a faire reddish colour, single from the middle of the stalke to the ends, but yellowish from thence to the bottomes, the ends of whose leaves are not blunt as in ours, but little rough, and pointed, within which horned leaves there are five other paler, and of a reddish colour also, their points bending downewards, having many small white threds in the middle, tipt with yellow, after which come five pointed or horned seede vessels, with blacke shining seede within: the roote is long with many fibres thereat. Here also give you the figure of the ordinary one, that you may see the difference.

Aquilegia flore pleno maculato diversorum colorum. Double party coloured Columbines of sundry colours.

As before said, I shewed you all the varieties of colours that I then knew, but since I have seene and have some others, as first a kinde of darke red, which we call a decoy colour, both single and double, and a double with white tips therein, as is the party coloured blew, and white: I then saw two a faire double red or crimson colour, like unto the same manner with white, another spotted as well as striped, very thickely, and of a baire colour, double and striped as the rest: and another striped and sometimes spotted, of a lived colour, or betweene blacke and blew, besides the baire or Roan Columbines party coloured purple and white, and red and white.

The Place and Time.

The first was brought out of *Virginia* by Master *Tradescant*, and floweth somewhat earlier then any of our other kindes usually by a moneth.

The Names.

I have shewed in my former Booke the sundry opinions of Writers hereon, some referring it to or a thing found by the ancients, but *Cornutus* is resolute upon the point, that it was not known. And to approve one

Aquilegia vulgaris Cordifolia.
The second sort single Columbine.

Aquilegia Virginiana flore rubescente.
The first Columbine of Virginia.

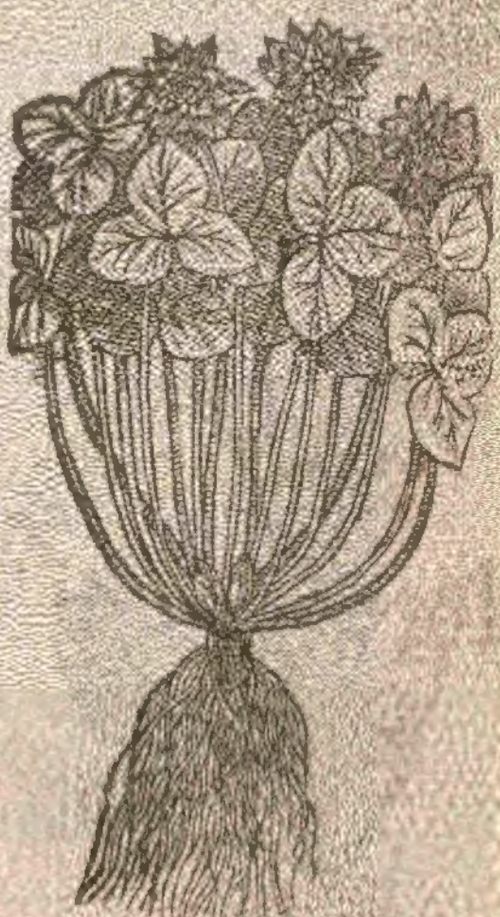
to thinke his sort that came from *Canada* (which as I take it is the same with ours of *Virginia*, howsoeuer he saith his seede rise a palme high) would by foulding the leaues, containe Water in them, and therefore would referre the name to *Aquilegia* that *Pliny* mentioneth, the pipes that conuey Water: which containeth more conceit then verity.

The Vertues.

The leaues of Columbines are commonly vsed in lotions for sore mouthes and throates, which doth best it worketh by the drying and binding quality therein. *Tragus* saith that a dramme of the seede taken in Wine with a little Saffron, doth open the obstructions of the Liuer, and is good for the yellow iaundise, and adviseth that the parties after the taking thereof should be laid to sweate well in their beds. *Cinsius* saith a Physitian in *Brussels* vsed the seede for women that were in sore trauell of childe birth, to cause a speedie delivery, being taken in Wine, and a second draught to be taken, if the first did not the effect. *Camerarius* saith that diuerse in *Spaine* did eate a peece of the roote for many daies together, to helpe those that were troubled with the Stone in the reines and kidnies. Others doe vse the decoction both of herbe and roote in Wine, putting thereto some Ambergrise, against these swoonings, that the Greekes call *Syncopia*.

CHAP. XXI.

Hepatica nobilis flore trifolio. Noble Liverwort, or *Hepatica*.



Although I shewed you in my former Booke, all the sorts of *Hepatica* that then I knew, yet since Master *Tradescant* found one other sort, as I take it growing in Virginia, and brought it home with him, which differeth some what from the other sort we formerly had, the bearing very darke greene leaues, and a small white flower, with a few white and not red threds in the middle, but because I had some of the figures by me, I thought good to reuiue them in this place.

Their *Place*, *Time*, *Names*, and *Vertues* are expressed in my former Booke, whereunto I referre you, but as I there shew you, there is little Physicall vse made of them, else I would willingly haue enlarged the properties heere: their being more for pleasure to the senses then helpes for any disease.

Hepatica nobilis flore trifolio simplex.
Single Noble Liverwort.

Hepatica nobilis flore trifolio flore pleno.
Double Hepatica or Liverwort.

Cut

Chap. XXII.

Chrysanthemum & Bupthalmum. Corne Marigolde, and Oxe eye.

THere are sundry sorts of theis Golde,or Corne Marigolds to be entreated of here,some whereof grow plentifully enough, in our Cornefields, others being Straungers, we have received from beyond Sea, and some I have set forth in my former Booke, whereof I thinke good to give you the figures, of some of them,and therewith of our garden Marigolds, and referre your to the Bookes: and for the neere affinity betweene theis and the *Bupthalmum*, I thinke it not amisse to joyne them here also.

1. *Chrysanthemum segetum nostras.* The Corne Marigold of our owne Country.

This Corne Marigold hath sundry tender pale greene herby stalkes, breaking forth into some few branches, with divers long brewish greene leaves, set without order on them, being narrow at the bottome, and broader at the end, cut in a little on both edges: the flowers grow singly at the toppe of every branch, being large, growing out of greene scaly heads, and of a shining yellow colour, both the thrumme and the border of leaves about it: each leafe being broad at the point, and cut into three or foure parts, smelling a little sweete: the roote perisheth every yeare, and riseth from it owne sowing. *Matthiolus* hath set forth one of this sort, with leaves like the Feverfew. The chiefest difference in this from the former, consisteth in the leaves, which are whole and long and round pointed like those of the Daysies. *Bright leaves*

2. *Chrysanthemum segetum Regium*, *Spanish* Corne Marigold.

The stalkes here of are harder and browner then of the former, and stand more upright, the leaves are greener also, is much divided as not in on the edges, the flowers are not of so shining a yellow colour, but somewhat more yellow, the seede is small and whitish, and is bitter as the former is, although the herbe is sweete and easie to take heede and herein consisteth the chiefest difference.

3. *Chrysanthemum tenuifolium Batticum Bauh.* *Base* like *Spanish* Marigold.

In the leaves chiefly consisteth the greatest difference betweene this and the tall, for this hath sad greene leaves, very much jagged and cut into very small and fine parts, almost as small as Camomill, the flowers are yellow, and like the rest, for the leaves, they could hardly be distinguished.

4. *Chrysanthemum Hispanicum Clusij.* *Elegant* like *Spanish* Marigold.

Clusius hath *Chrysanthemum* of *Valentia* in *Spaine*, which up usually, but with one stalke of a foote high, parted into some branches, better without order, with finer leaves then the last, but of a hoary colour, the flowers stand like the rest, and of a shining gold yellow colour, but unlike in this, that this hath no border of leaves at all about the middle head, but is bare and naked.

5. *Chrysanthemum Hispanicum primum Clusij.* The first Mountaine Corne Marigold of *Clusius*.

This hath many long leaves near the ground, resembling those of the white Wormewood, in the forme and

Chrysanthemum Creticum.
Candy Corne Marigold.

Calendula multiplex, & prolifera
Double Marigolds, and like shapes on head leaves.

Original from UNIVERSITY OF MICHIGAN

leaves, the stalke is a spanne high, set with finer set leaves, and at the toppe many yellow flowers set together, like unto those of Ragge wort, the roote hath many white fibres.

8. *Chrysanthemum montanum secundum Clusij.* *Clusius* his second Mountaine Corne Marigold.

The leaves of this sort is much more finely cut, and like unto those of Southernwood, of a pale greene colour, and of an unpleasant savour, but sweet, but bitter in taste: the stalkes are divided into some branches, bearing each of them one or two flowers, greater then Camomill flowers, and without leaf, of a yellow colour wholly, without and the border, the roote hath blackish fibres.

9. *Chrysanthemum tertium eiusdem.* His third Corne Marigold.

Differeth little from the former in the leaves, being as fine cut, but are longer, thicker and greater, and the flowers grow more together, and is later then the former, and the roote hath white fibres.

10. *Chrysanthemum Hispanicum rotundiori folio.* *Spanish* round leafed Corne Marigold.

The greatest difference in this from the others, consisteth in the leaves, which are not divided at all, but are long in shape, some what round pointed, and onely dented about the edges: the flowers are greater then grow in those of the former sorts, and stalke, of a shining yellow colour, both border and middle thrumme: the roote is woody, having many strings thereat.

11. *Chrysanthemum latifolium Breghamum.* Sweete Corne Marigold of *Bresford.*

The sweete Marigold springeth up with a stalke about halfe a yard high, somewhat rough and crested, having many leaves set thereon, of foure or five inches long, and two broad, compassing it at the bottome, and growing smaller to the end, somewhat dented about the edges, with sharpe dents, from the bottome of whom come forth some what long bowe leaves, bolstering each of them a faire yellow flower, set in a greene huske or cup, having fewer or eight leaves for a border, dented at the ends, and compassing a middle thrumme, consisting of fine threds, whereunto afterwards foeth the seede, very like unto the former *Spanish* kinde, the roote perisheth yearly in like manner, the herbe is so sweete that the Slugges and Snailes doe eate it above many other herbes in the garden.

12. *Buphthalmum Matthioli sive vulgare Millefolij folijs.* The ordinarie Oxe eye.

The more common *Buphthalmum*, with us, hath sundry faire greene leaves, divided very much into sundry narrow leaves, somewhat resembling common Yarrow, and is taken to be by divers that looke but superficially thereon, but heedfully marked differeth plainely from it, the divisions not being so thicke or small, the stalkes and branches stand not so stiffe or stringly as Yarrow, and at the toppes of them beare but single flowers, fuller then the Corne Marigold, but wholly of a deepe yellow, and not shining, the seede followeth in the thrumme, the roote is hard and perisheth yearely, or abiding the second yeare after the first sowing, which the Yarrow doth not.

13. *Buphthalmum alterum Cotulæ folio.* Camomill-like Oxe eye.

The weake soppy greene bending stalkes hereof grow two foote long sometimes, with fine Camomill like leaves set dispersedly thereon, and the branches every of which beares a flower like unto the former Oxe eye, but the leaves hereof are some what larger and fewer, and yellow, the middle thrumme being of a deeper colour, and somewhat hollow.

14. *Buphthalmum flore purpurascente.* Oxe eye with purplish flowers.

This Oxe eye with purplish flowers, differeth not much from the last, in the manner of growing, or forme of leaves and flowers, but herein chiefly, that the backe of the leaves of the flowers are either wholly purplish or else

13. *Buphthalmum alterum Cotulæ folio.*
Camomill like Oxe eye.

14. *Buphthalmum flore purpurascente.*
Oxe eye with purplish flowers.

publish

13. *Euphthalmum perigrinum Alpini.* Sinuated Oxe eye.

14. *Euphthalmum Africanum tenuifolium Raii.* Thin leafed Oxe eye of Barbary.

purplish in the middle: this stalke also which in the other is greene, is more reddish in this.

13. *Euphthalmum perigrinum Alpini.* Sinuated Oxe eye.

This strange Oxe eye riseth up with diverse streight, round, slender, darke greene stalkes, three foote high, branching forth into divers parts, whereon are many small fresh greene leaves, much divided, and somewhat like to those of Fennell, the flowers are twice as large as those of Camomill, and wholly of a shining gold yellow colour, set in greene heads or husks, wherein afterwards the small long white seede is contained: the roote is long, slender and blackish, abiding fresh and not perishing after seede time. *Alpinus* misliked this of *Matthiolus*, because the leaves were not like Fennell, nor the flowers bigger then Camomill.

14. *Euphthalmum Africanum tenuifolium Raii.* Thin leafed Oxe eye of Barbary.

Although *Alpinus* supposed that he had set forth the truest Oxe eye of *Dioscorides*, yet as you may see both by the figure and description of this I here give. This is in some things defective, and this in my opinion the nearest matching the figure, it riseth up with one slender stalke, with divers long thinne leaves diversly parted, continuing greene both winter and summer before, bearing a large yellow flower at the toppe, which it branches forth, as doe the leaves and flowers on them likewise: the roote is full of strings, and perisheth after seede time.

The Place and Time.

The Corne Marigolds grow for the most part in the Corne fields, and about the borders of them, or where Corne hath beene sowne formerly, either in our owne land or in others as by their rules are to be knowne. The Oxe eyes grow all greene in the moister ground, by water courses and the like, in other Countries, but in Gardens only with us, where they are sowne, and carefully kept, and doe flower in the end of summer.

The Names.

Xyst. Stem. in Greeke is *Chrysanthemum* in Latine *ab aureo flore colore præditum*? there is much controversie among divers in respect of the Author [illegible] *Chrysanthemum*, which he saith some called also *Euphthalmum*, because whatsoever he had said of *Chrysanthemum*, he said the same in the Chapter of *Euphthalmum*, thereby inferring the Chapter of *Chrysanthemum* to be thrust into the worke of *Dioscorides*, by some others, and they are the more induced hereunto, for that neither *Pliny*, *Galen*, nor *Aëtius*, make any mention of *Chrysanthemum*, but of *Buphthalmum* only: as though they knew no other *Chrysanthemum*: but *Matthiolus* evidently disproves the error, shewing how *Dioscorides* by these several marks, doth distinguish them, saying *buphthalmum* hath narrow like leaves, which the saith in *Chrysanthemum* are onely cut or jagged: against the stalke of *Chrysanthemum* you eate as other herbes, which he doth not say of *Euphthalmum*: and lastly the flowers of *Chrysanthemum* he saith are much shining, but he saith of *Buphthalmum*, that they are greater then of Camomill, whence the flowers of *Buphthalmum* made up with waxe, is a salve to dissolve swellings and knots: but of *Chrysanthemum* he saith they apply is difficult, that lumpe thereof that hath like fat in it. There is no lesse doubt about his *Bunias*, in that herbe knowne to us should be the right, some taking the great white Daisie and *Leucoium*, and *Eruca*, the blue weede to be the right, neither of which can be so, in that they are not all yellow as *Dioscorides* saith *Buphthalmum* flowers are *Matthiolus* therefore hath set forth one, which is most commonly received by most to be the right, although both *Lobel*, *Dodonæus* and *Dalechampius* have set forth others, which they tooke to be rightest. The not

here is called *Chrysanthemum* and *Segetum* by all Writers almost, yet some and *Bauhinus* with them call it *Bellidioides*. The second hath no Author before that expresseth it. The third is very likely to be the second sort of *Chrysanthemum Creticum* of *Clusius*, which *Bauhinus* referreth to the *Achillea montana argentea tenuifolia facie Salicis*, and the *Argemone seu lactuca* of *Lugdunensis*, but neither of them truely. But the last *Chrysanthemum Creticum* of *Clusius*, I take to be that *Chrysanthemum Creticum* that I have set forth in my former Booke, and which *Cesalpinus* calleth *Bupthalmum alterum parvum candido parvo intus flore*. But *Bellidi similis Chrysanthemum Creticum minus*. The fourth is the *Chrysanthemum Valentinum* of *Clusius*, which *Lugdunensis* setteth down for the *Buphthalmum verum Dalechampij*, but *Clusius* mistaking him, tooke that he referred his *Valentinum* to *Matthiolus* his *Chrysanthemum*, and for it is a little bitter against him, but it was *Clusius* his oversight, for he saith that of *Dalechampius* is diverse from that of *Matthiolus*. *Clusius* his *Valentinum* is also referred to the *Buphthalmum Narbonense tenuifolium* of *Lobel* in his Observations, as *Bauhinus* quoteth it, which *Cesalpinus* calleth *Chrysanthemum alterum ex Dioscoride*. The three next are *Clusius* his sorts of *Chrysanthemum Alpinum*, whereof as I said before, the second is very likely to be also this third sort here expressed, or very like it. The eighth is *Lugdunensis*, his *Chrysanthemum Asyeos*, which hee saith the *Gallicians* called *Giralda*. The ninth wee received by the same name that *Bauhinus* calleth it by in his *Prodromus*, and is of *Breyn*. The tenth is generally called *Buphthalmum minus*, by most Writers, and taken to be that of *Dioscorides*, which he saith is called *Achile* also, yet some call it also *Chrysanthemum*, as *Fuchsius*, *Cordus*, *Gesner*, and *Turner*. The eleventh is mentioned onely by *Cesalpinus* in his *Arabicolon*, and by *Bauhinus* after him. The last is called by *Lobel Buphthalmum folio & facie seminis lactuca*, both in his *Adversaria* and *Icones*, and is the same with the *tenuifolium Narbonense*, in his Observations though *Bauhinus* quoteth them as differing plants.

The Vertues.

Turner finde that any Authour hath enlarged the properties of Corne Marigold, beyond that which *Dioscorides* hath set downe of it, which is to discusse that Impethuose, that hath like fat in it, and that it will helpe them that have the yellow jaundise, to have a good colour if they drinke it for some long time, continually after bathing. And of *Buphthalmum*, the Oxe eye, that the flowers made up with a cerote, doth discusse tumours, and inflamations, and helpeth the jaundise (as he saith by heare say in both these) and to get a good colour, to drinke it and bathing by continuance.

Chap. XXIII.

Tussilago montana. Mountaine Coltsfoote.

There are two or three sorts of these Coltsfoote of the Mountaine to shew you in this Chapter.

1. *Tussilago Alpina folio glabro.* Smooth leafed Mountaine Coltsfoote.

The roote hereof creepeth under ground like the common Coltsfoote, and will almost spread as much ground, from whence spring sundry round leaves, each rising by it selfe, with a long footestalke under it, and are a little notched or waved about the edges, smooth, and of a darke greene colour on the upperside, and not shining as the other, not woolly underneath, among which riseth up some stalkes, a spanne long, with a small long leafe or two thereon, and a purplish flower at the toppe composed of threads which when the seede is ripe, that with the downe sticking to it, is carryed away with the winde.

2. *Tussilago Alpina folio canescente.* Hoary Mountaine Coltsfoote.

The other Coltsfoote differeth not in forme of leaves or flowers, being also purplish, nor in the manner of growe

1. *Tussilago Alpina folio glabro.*
Smooth leafed Mountaine Coltsfoote.

2. *Tussilago Alpina folio canescente.*
Hoary mountaine Coltsfoote.

Original from UNIVERSITY OF MICHIGAN

ing, but onely that the ſtalke is woolly, and the leaves hereof are very rough, and of a darker greene ſhining colour, on the upper ſide, and more hoary or very woolly underneath. *Clusius* giveth another figure altogether not that the one differeth from the other, but to ſhow the full open flower of the one, and the cloſed and drooping of the other.

3. Tuſſilago Alpina folio oblongo. Mountaine Coltsfoote with longer leaves.

This hath five or ſix ſomewhat long leaves, riſing from a blacke roote, of the bignes of ones little finger, with ſome fibres at it, each leafe upon a foote ſtalke of an unequall length, ſome longer then others, hard, rough, hairy, and of a darke greene colour, edged about the edges, from whence riſeth the ſtalke of a cubits height, ſet with two or three narrower leaves, branched ſometimes with a large yellow moſſie flower at the toppe, which being ripe ſcatteth with the winde.

The Place and Time.

This groweth on the *Alpes* of *Auſtria*, and *Syria*, and elſewhere in *Germany*, and on Mount *Baldus* in *Italy*, and flowers in *June* in their naturall places, but in *April* and *May*, being tranſported into Gardens.

The Names.

This being but of late invention, have no other name impoſed on them then the firſt finders gave them, which is *Tuſſilago Alpina*, for to *Cluſius* doth entitle them, the firſt being his ſecond, and my ſecond his firſt, which I have ſhewed I ſtand in the Chapter of *Acoram*, ſuſpected to be the *Aſarina* of *Matthiolus*, but altogether was miſtaken therein, for although he ſeeme to deſcribe the queſtion abſolutely to be the ſame, yet he leaveth it to every one to judge as he liſt. The latter is termed by *Bauhinus* as is ſet downe in the title.

The Vertues.

Although the formes of the leaves and flowers doe route them to be referred to the Colts foote, yet it is not knowne, or to the beſt made knowne to us, of any the like faculties, any of them are endued withall, and therefore untill they can by more for themſelves let them be held to be mutes.

CHAP. XXIV.

Arctium montanum quibuſdam. A kinde of mountaine woolly plant or Beares wort.

This plant hath diverſe faire and ſomewhat large long leaves like unto Mullein, ſomewhat greene above, and hoary or very white below, and full of veines: the ſtalke is ſmooth and covered with much woolle, bearing one great head, ſcaly on the outſide, but without any prickles, and with a yellow thrumme for the flower ſtanding within it, which when it is ripe is by peece meale carryed away in the winde, with the ſeede hanging thereat, which is like unto Cummin ſeede, the roote is thicke long white and tender.

Arctium montanum quibuſdam.
A kinde of woolly plant, or Beares wort.

Arctium vulgare Caſparo.
Caſpars houſe Burdock.

years hereafter put the figure that *Dioscorides* hath. But I looke out of a Manuscript Herball of the Emperours, and whether it be the true or no, he doth not set downe, but surely I thinke both this and all the others to be *Aconites*, or but *figmenta* [illegible], they are so artificially compoſed, although but rude-ly according to the times expreſſe, like unto many others of this name, though much ſet by by others, for the heads, are like unto horns, the reaſon that he would frame it to a kinde of *Arietes*, a Horne, which differeth much from *Aconites*.

The Place and Time.

It growth among the Rockes, on the Mountaines in *Savoy*.

The Names.

It is called by ſome to be the [illegible] of *Dioſcorides*, *Galen*, and others, which *Pliny* alſo calleth *Aconitum Neapolitanum*. *Lobelius* onely doth exhibite this to view, under the name of *Aconitum quorundam*, which *Ruellius* calleth *Lappa montana alterà Lonchitis*: falling on the ſame rocke that others before him did, to put no difference betweene *Aconitum* and *Caſtanea*, when as *Dioſcorides* hath ſo punctually deſcribed them, for aſſuredly it is another plant, and hath no fellow.

The Vertues.

If this be the true *Aconitum* of *Dioſcorides*, then he ſaith that the roote and ſeede boyled in Wine, helps the Sciatica, if the decoction be held in the mouth: the ſame decoction is good for burnes, kibes, and chilblaines the haires and beards to be bathed therewith: it is alſo drunke with Wine againſt the paines of the Hip-gout *Galen* confirmeth the ſame things, ſaying it is of hot parts, and doth moderately heat the body.

Chap. XXV.

Melanthium five Nigella. Nigella in Fennell flower.

There be ſundry ſorts of *Nigella*, ſome sowne in Gardens, others growing wilde, moſt with ſingle, and ſome with double flowers of the double ſorte, and of the Spaniſh ſingle kinde, I have ſpoken already in my former Booke, the reſt ſhall follow here.

1. *Nigella Romana ſive ſylveſtris.* The Romane or ſweete ſmelling *Nigella*.

This ſweete *Nigella* groweth up to be two foote high, with many ſlender branches, and many ſmall and divided leaves on them, almoſt as ſmall as Fennell, and very like unto thoſe of the Larger beedes, at the end of every branch ſtandeth one flower, made of five blew leaves laid abroad like a ſtar, without any greene cup under the flower as in ſome ſingles and another double blew ſort, with a greene head in the middle, compaſſed with ſome few thrids, which head groweth to be the ſeede veſſell, being a little long and round, with five ſmall horne tops like hornes, ſtanding at the toppes of the heads, in which lye in ſeverall cells, ſmall blacke, and rough ſweete ſmelling ſeede: the roote is ſmall threddy and yellow, periſhing yearely.

1. Nigella

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

2. *Nigella sterilis sive Damascena vulgaris.* Wilde Damaske *Nigella.*

This Nigella groweth very like the former, for the greene leaves, but a little smaller and shorter, the flowers are blew, and like the former, but the head with seede is larger, and the hornes longer, the seede also without blacke usually, but sometimes a little wurrish, or yellowish, and without any tent at all. There is another of this sort as I take it, that differeth onely in bearing single white flowers, and blacke seede without tent.

A new white sort.

3. *Nigella arvensis.* Field *Nigella.*

This sort is very like the last, but groweth thicker of branches and leaves, and they shorter also, the heads are smaller and longer, & the flowers are also but of a pale blew colour, the seede is blacke and without any tent. There is of this sort another, differing little from the other, but in the flowers that being single and comely like, & both greene leaves under them, and the seede being blacke is somewhat sweete.

Another with Iulips.

4. *Nigella Creetica incana semine.* *Nigella of Candy* without tent in the seede.

This *Candy Nigella* groweth with fine cut leaves like the other, but of a darker greene colour: the flowers are small, and stand singly as others doe, at the toppes of the stalkes and branches, greenish at the first, but blewish afterwards, there is of the leaves keeping a little greeneesse still in them, with many greenish threds in the middle, not much blew: the seede is blacke like others and without tent, that followeth in such like horned heads as others: the roote is like an yellow wish and annuall.

5. *Nigella Creetica latifolia odorata.* *Candy Nigella* with broad leaves, and sweete smelling seede.

This broad leafed Nigella ariseth up from the yellowish, threddy and annuall roote, with one slender weake stalke, diuided into some branches, having long and diuided leaues set thereon, but not of the forme of the other Nigella, which are fennell like or Coliander like, but much broader and parted into diuisions, some what like ones those of Groundsell but cut into lesser and finer parts, at the toppes of each of the branches standeth single white flowers, like unto the other Nigellas, and heads some what like them succeeding, containing blacke seede also, but smelling sweetely.

6. *Nigella Creetica glaucophylla rotundifolia.* Another sweete *Candy Nigella.*

The roote of this *Candy Nigella*, are said to be harder then the rest, yet annuall like them, the stalkes that rise from thence are many, upright and slender, parted into seuerall branches, with but few leaues set thereon, the leaues below being not so finely minced as the former, that are upwards, having smaller yellowish white flowers at the toppes of them, and crowned blacke seede sharpe and somewhat sweete, contained in small bitorned heads, like two small berries.

7. *Nigella Creetica minor apii folio flosculis diuersis.* A sweete *Nigella* of *Candy* with double formed flowers.

This wonderfull kinde of Nigella (for so it is called) groweth from a small horny roote, with many slender stalkes and few branches rising from them, not much above halfe a foote high, set with long winged leaues like those of Ehrve, opposite each to other, on a middle stalke, at the toppes of each whereof standeth a large yellow flower, some what like unto the flower of a Poppy, after which come five cornered heads, containing small blacke

...long leeded: but besides these at the joynting of the branches, come forth other sorts of seede clustring together like a bunch of grapes, which are whitish, nature thus providing it with a double store, least it should fayle.

β. *Nigella Cretica flore albo simplici.* Single white Nigella with yellowish seede.

We have also in our Gardens, another single sort of Nigella, that hath come among other seedes that hath come unto us from some of our friends beyond Sea, that differeth so little from the other small sorts, that it can scarcely be discerned, except it be in the lighter greenenesse of the leaves before it come to flower, which then is whiter: the third wild sort here set downe but white: the heads also are small but formed alike, having smaller seede within them, not blacke as others are, but yellowish and without seed, and herein it is somewhat like unto the double white kinde, described in my former Booke.

The Place and Time.

The first is usually sowen in Gardens even in *Italy* or elsewhere, the other sorts grow wilde and in the fields of ...*candy, Candy, Germany, &c.* they are all annuall to be sowne in the Spring, if they doe not sow themselves: they flower in *June* and *July*, giving ripe seede in *August*.

The Names.

It is called in Greeke μελάνθιον and μελάνθιον, *Melanthium* also in Latine, and *Nigella a nigro semine colore ut* ...commonly called *Gith*, divers other ballarde names have been given it, as *Salusandra* and *Papaver niger* ...from the Greeke word: all late Authours call them either *Melanthium* or *Nigella*, onely *Fuchsius* and *Cordus* ...take it to be the *Lasanum sylvestre alterum* of *Dioscorides*. The *Arabians* call it *Xanim Sunis* or *Sunis*. The ...Italians *Nigella*, the *Spaniards Alcaroel*, and *Nigrillo*, the *French Poyvrette* and *Nielle*, the *Germanes* one sort *St. ...Katherines Flowre*, that is, *St. Katherines* flower, the wilde sorts *Schwartz Kummel*, and *Schwartz Bernwurtz*, the ...*Low Dutch* sort, because they and others had a perswasion that the oyle made out of the seede was *Oleum ...Sathanæ*. We call it in *English* either Nigella after the Latine, or Fennell flower, as I doe. For the understanding of the several Authours of these: the first, second, and third, are mentioned by our later Writers, by those ...that have, or very neere them. The fourth is called by *Bauhinus Nigella Cretica* simply, and by *Clusius Mr. ...Lobels Candy*. The fifth is mentioned by *Pona* in his *Italian Booke*, the seventh by *Alpinus* in his booke of ...exotick plants. The first by *Pona* in his *Italian Balsam*. The last as I thinke is not mentioned by any Authour.

The Vertues.

The sweet smelling seedes are effectuall to many diseases, but the first kinde is onely used in medicines, the other ...two are not much worth, are in a manner refused. *Galen* saith it is hot and dry in the third degree, and of thin ...parts, and thereby it helpeth to dry up rheumes and distillations from the head, being tyed in a cloath, and smelled ...unto, being put into a cappe among other things for that purpose it doth much good: being taken inwardly ...it killeth wormes, the wormes, and wooseus courtes; it helpeth also the shortnesse of wreath, and cleanseth the ...reynes, gravell, and the slime, and provoketh urine, being taken with honey, and is a remedy against poyson, ...being drunke of the Spider *Phalangium*, and the Scorpion, and as it is said encreaseth milke in womens breasts, be-...ing boyled in Vinegar, it helpeth the tooth ache to be held in the mouth: the same used outwardly helpeth the ...scurfe, scabbes, spots, &c. in the skinne, and hard swellings also, and cleanseth the eyes: being burned, it driveth away flies, gnats, and the like, the seede was familiarly eaten in former times, being strawed on their bread, or ...kneaded as Poppy seede was. *Alpinus* saith, that the use of the first sort is very effectuall, both in tertian, and ...quotidian agues, to open obstructions especially, if the seede thereof be boyled with Vinegar and so taken, and kil-...leth wormes also.

Chap. XXVI.

Tithymalus vesicarius, The bladder bearth or spotted Peale.

Although divers have diversly thought of this plant, some referring it to the kinde of *Halicacabum*, or *Alkekengi*, Winters Cherry, others to other plants, yet finding it agreeable with none of them all, but ...to some one thing or other, in others, wanting some one thing or other. And because I could not ...finde a fitter place hereunto I might thrust it, I have kept it for this place, that some fellow may be ...found to match it with. I take therefore the description thereof thus. It riseth up and spreadeth ...much, if it have good ground to grow in having sundry slender weake stalkes, which will lie down ...upon the ground, and entangle it selfe with the claspers it hath, unlesse it be sustained with some stakes, sending ...forth many branches, and very greene leaves on all sides upon long footestalkes, being divided either into three ...parts, each whereof is much cut or cut in on the edges: at the joynts with the leaves from the middle ...of the stalkes, upwards, and at the tops of them like wise, come forth divers small whitish flowers set ...upon small footestalkes, each consisting of five small leaves apeece, which passe into small fruite, contained in ...small pouches, growing more whitish as it ripeneth, having five ridges, wherein three are the more e-...minent, and open into three parts, in each whereof lye three round hard, blackish seede, of the bignesse of a great ...Pease, marked on the side with a marke, of the forme of a white Hart, as it is usually set on the cards, or as some ...would have it the shape of one of Moonckes and Fryers. the roote is bushy or stringy, with many fibres thereat, ...perishing every yeare, at the first approach of a Winters day, whether it be ripe or no, and indeede I did never ...see it come to ripe perfection, nor but in the hottest yeare that I have sowne it.

The Place and Time.

It is brought from *Italy*, and other parts beyond Sea, but surely even they have received it from other places ...for I thinke it groweth naturally in any part of *Europe*, it flowreth as is said very late, and the seede ri-...peneth after.

The Names.

Some of late have referred it to the *Solanum pomiferum*, or *Halicacabum* of *Dioscorides*, and thereupon have ...called it *Dioscoridis peregrinum*, or *Halicacabum peregrinum*, or *peruvianum*: *Tragus*, *Fuchsius*, *Gesner*, *Matthiolus*, *Dodonæus*

and others, but *Cordus* on *Dioscorides* earnestly striveth to make it the *Doryenium* of *Dioscorides*, whereunto it seemeth he was led, not onely from the severall parts of the forme thereof, except the leaves, but also from the properties of the seede, which as hee saith, he tryed in himselfe to be dangerous in provoking sleepe, if too much should be taken, although as he saith it causeth a sweeter sleepe then *Opium*, but *Matthiolus* contesteth against him for this his opinion, but sheweth no reason for it: *Dodonæus* misliking others opinions, bringeth in one of his owne, that this is *Serapio*, his *Absyng* or *Abrugi*, mentioned in his 153. Chapter, in these words: *Absyne* It is a small graine spotted with blacke and white, and like unto the graine *Maioranæ*. *Lobel* allenteth unto such of his friends as tooke it to be *Dioscorides* his *Isopyrum*, whereunto it commeth neerer as he saith, then unto any sort of *Meadow Rue*, such as *Matthiolus* gave it for, or as *Dodonæus* in his *French* kinde hath it, *Thalictrum galliarum*: but all alike, every one wanting something or other. *Lobel* calleth it the stone or rocke Fumitorie; *Cornutum*, or *Pisum Indicum*, *Cordus* greene seede, and *Tabernamontanus Cardiospermum*. Penny also saith it was called with them *Monachi Kappuzen Kraut*, *Monnekes cruydt*, or as *Gesner* saith, *Lupus Monachi*. *Lobel* also calleth it *Pisum Cordatum*, but *Bauhinus* putting it among the Peases as a sort thereof, calleth it *Pisum scandens, siliqua ventricosa oblonga maculata*.

The Vertues.

Some *Apothecaries* would make it available for faintings and other diseases of the heart, but without experience as I thinke. *Cordus* saith as is before related, take a great proportion to sleepe, even to the danger of life, if the quantity be not proportioned: I find not any of the other Authours that hath written of it, hath set downe any property they knew or heard to be in it.

Pisum Cardiacum officinarum.
The bladder like spotted Pease.

Chap. XXVII.

Delphinium sive Consolida regalis.
Larkes spurres or heeles.

Have in my former Booke shewed you all the sorts of Larkes spurres, both tame and wilde, both single and double, both simple and severall coloured, and party coloured, that I have not any more to bring in your consideration: Yet I thinke good here to present you with some figures of them, that I had by mee, and with them a kinde of different *Nasturtium Indicum*, in the forme of the leaves, which *Lobel* had formerly for both, taken as it is likely, to the life of the viewed plant, but sithence it hath beene since misliked by many others, who since his time have not obtained the like to see againe, yet that hindereth not much the verity of the thing, no more then the relation of *Hendius* the yonger, of a white flowred of this kinde, which yet have not as yet seene neither.

Delphinium sive Consolida regalis sylvestris.
Wild Larkes spurres.

Chap.

Chap. XXVIII.

Paonia. Peony.

ALthough in my former Booke I have shewed you some sorts of Peonies, which were the male, two sorts of double, and three of the female single, yet not all that are extant, whole that wanted there shall be supplyed here, with the Vermes more largely unfolded, of the male kinde I know but one sort, which is single and not double, how soever *Matthiolus*, erroniously hath excluded many therewith, wherefore I thought it not unfit to give you the figures of both sorts, that one may be known by them.

Paonia femina Hispanica simplex. The Spanish female Peony.

The female Spanish kinde is of a darke bluish roote with many fibres or strings received thence, growing with many stalkes two cubits high, which are diversly cut into divers parts like unto Fennell, of a deepe greene on the upper side, but more whitish underneath, among which spring tender pale greene stalkes, lower then others, and at the toppes of each a smaller flowers, made of eight leaves, of a more purple colour, then the ordinary double Peony and as it were, with many white threds tipt with yellow, standing about the middle incornered knop, which growing ripe, containeth within it blackish blew seede: the roote is glandulous like other female Peonies but smaller.

Paonia femina Aquilinæ folio. Columbine leafed Peony.

The third female differeth from the rest in the leaves, which hath many long cloves hanging thereat, as other female Peonies have, parted into three divisions, each producing three rounder pointed then leaves then any other, white in on the edges, of a pale greene colour on the upperside, and wholly of more whitish underneath, resembling very exactly Columbine leaves, that it will deceive the eye unlesse it be not well well in the flowers. A worthy friend *Mr. Goodyer* from whom he received the plant, which neither had nor ever flowered before, could not determine therein, notified unto him that it was a kinde of wilde Peony: but I thinke this to proceed rather from the barrennesse of the soyle, then otherwise, contradicting that opinion.

Paonia femina variegata. The party coloured Peony.

The difference of this from the other consisteth chiefly in the flowers, which are sometimes of a pale red, and sometimes of a deepe red colour wholly, and sometimes parted with both these colours, either in the leaves, or with lines and veines.

Paonia femina Lutea stamine & Ochroleuca. The female white and pale yellow Peony.

Now for the true Peonie I must deliver you but upon trust of others fidelity, that have related them, the white

Peony bearing two withered, the one *Bellonius* in his Observations, the other *Camerarius* Duke, each of them affirming that in the Mountaine *Ida* in *Candy*, there groweth in great plenty, a white Peony, and *Rosea* or Rose, and in the whole Iland there is no other sort of Peony to be found, but yet is a *promiscuous* or doubtfull sort, and hitherto since their time we have not heard of any hath enjoyed one of such a colour, unlesse *Belloni* in some Epistles should meane it that he calleth *Paeonia mas flore albo*. But *Camerarius* saith that that which passeth under their title is not perfit white, but whitish with some reddish among it, which maketh a faint blush colour. For the pale yellow, *Camerarius* also saith, that one by such a name he had out of the *Low-Countreys* of *Belgia* his Garden, but had not as then when he wrote thereof flowred with him, neither yet to this time that I write of, can I heare of any that hath it, but words enough I heare.

γ. *Paeonia femina prompsea*. The double full female Peony.

Because the leaves of this Peony have not a resemblance to those of the male, or tanfed *Lobel* to confirm his *multiformis Natura*, saying, if you behold what growes above ground, you would say it were a male, but the roots under ground, a female, and saith that *Pony* made this the *mas*, but *Dodonaeus* refuteth it in the other terms which hath longer and smaller rootes, calling it *Paeonia altera*, whereby it is plaine that one of them was transposed that way, & as I thinke a transposition of the figures in *Lobel* for the figure in *Lobels* book that he calls *Paeonia* is the first female in *Dodonaeus*, which bee saith was most common with them, as in ours, the other being brought in afterwards, which I thinke doth neerer resemble the leaves of the male, let the judicious consider this well and gain say it if it be erroneous, for although *Dodonaeus* calleth *Dodonaeus* the former, to be the most common, yet rarely I can not finde it so with those plants that are the most common female in our Country, and so he finds by his errour of divers sorts of the male, and of divers colours, and the same like wise, among the rest, which he calleth *Paeonia mas flore albo*: but as *Dodonaeus* [illegible] doth plainly distinguish betweene the male and female Peony, not by the leaves, the one white and smooth, but like unto those of the Wallnut tree, and secondly in the rootes, that they are long and not clouded, as the female, which doth utterly confound both *Belloni* and *Dodonaeus*, opinions, for both *Lobel* and *Camerarius* also, were the same *prompsea*, all the other sorts shewing themselves to be knowne by their rootes.

δ. *Paeonia femina duplici flore & pleno, ex ruberrimo flore plenissimo nata*. Double red female Peony.

Carnation red and double female Peonyes, that spring with *Cloves* of the nature of the double red.

Cloves have (as is shewing in some yeares before) from the ordinary double red Peony (which is not unlike a Rose) sowed them, and within three yeares the had plants that bore flowers, some single and some double: of the single, one bore flowers like colour most like unto the mother, but was single, resembling onely of the leaves, the ordinary female Peony: another bore a larger flower of eight leaves, whose colour was of a deeper red, running somewhat to a Sacke colour. A third bore a double flower, as great as the mother plant or greater, and of the same colour: but he said the stalke faild, neither like the mother plant in leaves, &c. whose flowers were more white and not so thicke of leaves, the colour whereof was of a deepe red, being neere the bottome of the middle bush, having some white spots in their leaves that grew in the middle.

Paeonia femina duplici flore purpureo.
The double purple female Peony.

Paeonia femina duplici flore rubro.
The double red female Peony.

Original from UNIVERSITY OF MICHIGAN

2. *Paonia Turcica flore pleno rubro major.* A greater double Turkish Peony.

From *Canon Arembergs*, and *John Bultel*, persons worthy of credit such *Clusius*, I received intelligence, that as yet in the garden of the Lady *Tysenac*, who was the *Presidents* Widdow, they saw growing a bluish double Peony, greater then the ordinary, and as great as the ordinary double red, yet holding the same all properties of the double bluish flowes, which use to grow whiter by standing, and to hold the leaves without shedding for long time.

The Placentes Time.

The places of the most of them are declared in their titles, or descriptions, and their flowring, &c. in their severall and proper sorts.

The Names.

[illegible] in Greeke [illegible], in Latine also *Paonia*, many other names are given thereto Greeke and Latine, *Pentorobus*, (yet some have it *Pyrobolus*) *Orobalion*, *Heraclea*, *Paonion*, *Paeonium*, *Paeonium*, *Scirocopion*, *Telasis*, *Asclepias*, *Glycyside*, and some others: in Latine also *Rosa Paeonia*, *Herba Paeonia*, *Rosa sanctorum*, and *Oberga*: in *English*, from the reed graines in the Peony called *Didia* Cowbe, and *Peonie* from *Peon*, that famous Physitian in his time. And *Asclepias* from the stirring or shaking of the Feaver-sick patient, from whence in many fabulous and deceitfull illusions of the *Ethnicks* the *Asclepias*, and *Paeonia* are reported of Peony, as may be seene in the Writings of the Ancients. *Theophrastus* in his time the male Peony roots were sold for *Dactamnus albus*, but I thinke *Theophrastus* was there in error, for verily I have seene they were the same white roots which now are taken and called *Dictamnus albus*, neither are the stones of the *Peonie* male, as I shewed before in that Chapter. In the stones of the male Peony are white streaks, which ornament the more therein, because *Theophrastus* saith, the stones of that Peony which he knew to be male, had seed like an Asse, or Unicorn, and such are the *Peonie* leaves, which also *Dioscorides* resembleth unto them, in the seventh Chapter of his first Booke, with *Dictamnus Creticus*, but not so in the stone: like *Dioscorides*, unlesse it be diverse in the *Asian* part from others. And I have seene some Herbalists, that would not be ignorant, and deceivers, to sell the white roots of the garden *Ornamithe*, to be Peony roots. These two I shall not any further explication of their sorts of *Peonies*, since *Clusius* hath made mention of all sorts, and that *Dioscorides* in sorte, and *Rhasis* doe expresse, which is the fourth. The Germanicke *Peonie*, the *Italian Peonie*, the *Spanish Rosa de Leonte*, and *Rosa Alexandrina*, the *French Pivoine*, the *Peonie Roses*, *Rosa Corallina*, *Pyngwurtz*, *Konigs krones*, and *Gichtwurtz*, the *Dutch Pioenen* and *Rose Peonien*, and in *English* Peony, or Peany.

The Vertues.

The barke of the stem, parts and drying yet not very notably hot, but according to our owne Symmetry, or attemperation, or rather a little hotter, an astringent quality also, with some sweetenesse it hath, and some sharpnesse withall, and bitternesse joyned together, whereby it is effectuall to procure womens courses, if the boggs-

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

nesse of an Almond, in powder be taken in horied Wine: by the acrimony and bitternesse therein, it helpeth to open the obstructions of the liver, and kidneyes, and the yellow jaundise and stone: and by the astringent quality to stay the fluxes of the belly; but the more effectually if the decoction thereof be taken, that is made with hartshorn or red Wine: by the notable drying quality therein also saith he, I doubted not to helpe children therewith that had the falling sicknesse, by tying it about their neckes. And indeede I saw a childe freed from that disease, that had for eight whole moneths together, worne a good peece of the roote about him, and that as soone as that peece by some chance fell from about his neckes, or was taken away for tryall of the matter, he fell into the disease againe: but having a fresh one applyed to him againe, he became perfectly well: the reason whereof may be, that the spirits thereof drawne into the pores by the inward heate, and outward aire, purged the glandes, effected with the disease and cured it: for after the same manner doth the *Saxifrage* procure, that of the Liver, *Lupus*, or *Lupia*, cure the uvula, or palate of the mouth as we call it; when it is falne downe, or swollen through rheume: or as Nigella seedes being fryed, and bound in a thinne warme linnen cloath, doth dry up the chinne and troublesome distillations of rheumes, by the hot breath thereof going through the nostrils: as also if divers threeds dyed in the purple fish colour, be bound about a Viper or Scolers neckes, and it the eate through, and they afterwards bound about their owne neckes that have swellings or other diseases in their neckes and throates, doe marvailously helpe them: this be *Galens* wordes: but our age hath not only found *Galens* sayings true on children, the roote (of the male rather then the female, yea the male not the female, and that fresh, and not dry if you meane it should doe good) is to be hanged about their neckes, and that the decoction thereof is to be taken inwardly, to make it the more availeable, and that also in older persons, if the disease be not growne too old and past cure, for whom the roote of the male kinde washed cleane, stamped small when it is, and laid to infuse in a sufficient proportion of Sacke ten, twenty foure houres at the least, after strained, and given hot and fast, a good draught for sundry dayes together, before and after a full minime, untreth that notwithstanding, there be a due and orderly preparation of the body also ordained with potet drinke made of Peony, &c. as the learned Physitian can best appoint: the roote also is effectuall for women that are not sufficiently cleansed after child-birth, and for such also as are troubled with the mother, for which like wise the blacke seed being beaten to powder and given in wine, the red seedes being taken for fluxes: the blacke also taken before bed time, and in the morning also is very effectuall for such as are in their sleepe troubled with the disease called *Ephialtes*, or *Incubus*, which *Pliny* calleth *suppressio sopiens*, we usually call it the night mare, which is a suppressing both of voice and breath, and oppressing the body as it were, with some heavy burthen, striving to be eased thereof, but seeming not able nor not to call for helpe. Melancholly persons being for the most part subject to this disease: it is also good against melancholly dreames. *Matthiolus* doubteth whether our Peony, be that which *Galen* used, because many Physitians as he saith in his time failed in the tryall thereof on young children, and I am in doubt that *Tragus* his male Peony spoken of here before, was that which they used, and then no marvaile if it proved not effectuall as they expected, yet saith *Matthiolus* our Peony seedes is availeable to restore speech to those that have lost it if thirty graines be boiled be made into powder and given in Wine: it is also saith he, good against the biting of Serpents not onely to be drunke but to be laid on the bitten place, which thing *Tragus* saith of his male Peony, which as I shewed you before, is the *Ivascyamus*. The distilled water or Syrupe made of the flowers, worketh to the same effects that the roote and seede is applyed before, although more weakely. The male kinde being so rare a plant and planted but by a few, and those great lovers of rarity in this kinde, and the Female being more frequent, the one is usually put inlieu of the other.

Chap. XXIX.

Pappus sive Batatas. Potatoes.

There are divers sorts of rootes that are called Potatoes with us, serving for foode or delight, more then for medicine whereof all that are truely knowne to us, what face or forme or leaves and flowers they beare we have expressed in my former bookes: there are many more in the same quality, besides others that serve instead of bread, familiar to the Natives both of the East and West Indies, whose names or city are extant in whole Authours Works that have written of them, without any further declaration either of forme or any property, but that the rootes are eaten by them, some being of better taste then others & longer lasting, among whom as I take it the *Igname* or *Inhame* is a principall one, whereof *Scaliger* and *Clusius* afterwards have written the best information. *Clusius* saying it is also called by some *Canames*, *Ignames* and *Nuts*. All the fault of it is that some *Portugall* Ships that were taken by the *Hollanders*, had divers of these rootes in them some bigger then others: for some as he saith were as bigge as ones arme, and of a foote long or more, others lesser, and some thicke and short having some small tafts hanging out at the lower parts of them but all of them covered with an uneven and rugged barke, with many knots in them: the substance of the roote within, being white, soft, ropy, tender, and as it were kernelly, and of no unpleasant taste (that is the *Igname* for he saith he tasted it) at the first, but a little rough and sharpe afterwards: but being rosted under the embers it tasteth more tender then any Chesnut, and somewhat like a Peare, but saith he what like or least I cannot could not understand of any: onely he saith he received one that was sent him that had a sprout at the head of it which was broken off in the carriage, as the figure here expressed, it may you, but *Lobel* in his [illegible] he understand that those rootes of the *Inhame*, that were brought from *Archipelo* and *Guinea*, but without the leaves as (and differeth from those of *Spaine*, and the *Canary* Hands, which are our ordinary great [illegible] such like leaves doth *Lugdunensis* give to an *American* plant called *Hetich* whose roote is [illegible] dible. *Clusius* also speaketh of another sort of these *Inhames*, which as he saith some called *Taino* [illegible] *Portugals Inhame* as the former, which although it were like the other, yet the barke was more [illegible] as it were some knobbes thereon, with small fibres going from them, and from the head of the roote, were [illegible] hard great stringes, of a foote long, which were prickly for the most part. *Clusius* seemeth to referre [illegible] *Potatoes*, to the *Arachidna Theophrasti*, and *Lugdunensis* saith some did the *Hesiodes*, and that this *Inhame* was [illegible]

ishered to *Theophrastus* his *Arcas similis*. But *Bauhinus* the *Dracunculus*, or *Dragons*, and *Oetum* by *Pliny*, [illegible] mens conceites, especially in things ab- [illegible] unknowne, or when they doe *rapium* with- [illegible] consideration *sententiam proferre*. But *Scalig. Exercitat.* 181. 17. seemeth to know three o- [illegible] sorts, besides the ordinary, which will abide good [illegible] perishing for a whole yeare, and therefore [illegible] *Agricolæ* use to bring them to Sea with them, and [illegible] it *Peruanæ dictorum*: the other will last nothing [illegible] that whereof that which groweth in the County of [illegible], is of an excellent relish, but that of *Mexi-* [illegible] the world, and that of *Saint Thome*, which is [illegible] yellow as a Carrot, is of most extreme: the planting [illegible] faith he, is wonderful, for it is not done by pur- [illegible] the roots into the ground, but a stalke taken [illegible] cut in long peeces, and holding some barke [illegible] and so thrust into the ground, will in five [illegible] be ready to be gathered: it hath withe, a [illegible] somewhat like unto that of the Citron tree, both [illegible] and taste, but smaller and thinner: it runneth [illegible] ground that we let not it like Hoppes: the roote like [illegible] Dragon hath store of five suckers joy- [illegible] it: this manner of planting this *Solanum* in our [illegible] I suppose is best of the *Arambee* or *Turcs*, where- [illegible] the Caffares make it there be not a mistake, it is [illegible] that these roots should be so propagated.

Chap.

CHAP. XXX.

Rosa Hierosolyma. The Rose of *Hierusalem.*

THere hath beene observed two sorts of this small plant, called the Rose of *Hierusalem*, the one accounted a wilde sort, and yet the one groweth in as barren places as the other.

1. *Rosa Hierosolyma vulgaris.* The vulgar Rose of *Hierusalem.*

The Rose of *Hierusalem* is a small bushy plant growing full of woodly brittle branches, set in a round compasse, and sundry small leaves on them, farre lesser then those of the Willow, and more neere unto the Privet: the flowers stand thicke clustring together, made of foure white leaves, growing out of long huskes, wherein afterwards is contained two small seede, the roote is long and woodly. This is said to smell somewhat sweete, but I could never finde it so, and to taste somewhat sharpe.

Rosa Hierosolyma.

2. *Rosa Hierosolyma sylvestris.*
The wilde Rose of *Hierusalem.*

The wilde sort groweth in the same manner, as the former, but the woodly stalkes are thicker and harder to breake, and hath (as it is said) neither smell nor taste.

The Place and Time.

Both these sorts grow in *Syria* and *Arabia*, as *Belonius* and *Rauwolfius* have observed in their travailes.

The Names.

It is called *Rosa de Hierusalem*, and *Hierosolymitana*, and *Rosa Mariæ*, by all that have written of it, (the Monkes as *Bellonius* saith, being the first inventers of the name, and of the superstitions they added to it, which as he saith he found none thereof growing about *Hierusalem*, but only in *Arabia*, in the desart land neere the red Sea) except *Cordus* and his Father before him, who tooke it to be *Amomum*, but saith *Anthonius Musa* contrayed that opinion for divers respects, and yet hee contumaciously would uphold his Fathers error, which sheweth how necessary it is to see the face of things growing as *Camerarius* and others, who having sowne the seede, doth say it doth in some sort represent a *Thlaspi*, having but a little sharpe taste in the branches onely and roote. *Rauwolfius* saith he found the other sort in *Syria*, growing among the rubbish, and on the houses and the store called it a wilde kinde. *Cordus* to put a distinction betweene these two sorts, called the former *Amomum* and the later *Amoma*, comparing and fitting the description of *Amomum* in *Dioscorides* unto the former and parts thereof, yet how like soever he would make it, it commeth farre short of the true *Amomum*, as it is well knowne now adayes. *Gerard* on the contrary side would referre it to a Heath, which is as farre wide as the other.

The Vertues.

It is not found vsefull in physicke for any respect that I can learne: the onely property is this, that how dry soever the plant is being brought from beyond Sea, yet if it be set in water for a while, it will dilate and open it selfe abroad, that all the inward parts may be distinctly observed how it groweth, and although the leaves are all lost, yet the seede and the vessells remaine, from whence if it be fresh, the seede taken hath growne, and will start up againe after a while, that it is taken out of the water, not as the superstitious Monkes falsely fained that it did open miraculously that night that our Saviour was borne, and that it would doe so in what house soever it is, when the woman with childe abiding therein, shall be neere her time of delivery for with greyhure as I said it will open, and not without it.

ARBORES, ET FRVTICES.

TREES AND SHRVBS.

CLASSIS DECIMA SEXTA.

THE SIXTEENTH TRIBE.

CHAP. I.

Quercus. The Oke.

IN this Classis, I am to shew you all those kindes of Trees, whether they be tall and great, or lesser, usually called Shrubbes, which grow naturally in these Countries of *Asia minor*, the hether part of *Asia*, best and longest knowne to us, and *Europe*, and that have not beene distinctly already spoken of heretofore: As the infinite kindes that grow in *Asia major*, the East India, and *America*, the West India, besides that we want the knowledge of the most of them; would furnish a copious volume by themselves: and therefore in my last Classis I will onely give you a view of some, either of best use, or best knowne, and in this as I thinke is fittest, begin with the Oke.

The Trees that beare Acornes, called in Latine *Glandiferæ arbores*, doe comprehend five severall kindes, which are *Quercus*, *Ilex*, *Suber*, *Ægilops*, *Arculus glandifera*, and *Phellodrys*, and for want of the *English* names to forenamed each, we are forced to call them all Okes, and to distinguish them, give them severall epithetes, according to their qualities. The *Quercus* or Oke is parted & ranged into five sorts, all of them having divided leaves, called first, *Platyphyllos Latifolia Quercus*, *Quercus foliis Ilicis Mexicana Hernandez*, *Virgiverens* or *Robur*, *Phagus Esculus*, *Ægilops Cerrus mas vel majore glande*, and *Phellodrys Cerrus fœmina minore glande*: Of these and their severall *species* in this Chapter, and of the rest in the succeeding, every one in their order.

1. *Quercus Latifolia.* The broad leafed Oke.

The Oke, which as I take it is the most common in our Land, groweth to be a great tree, and of long continuance, especially if it growe in a fertile soyle, the trunck or body whereof is covered with a thicke rough barke, full of crags and clifts: the armes or boughes likewise are great, dispersing themselves farre abroad, and bluntly cornered about the edges, smooth, and of a shining greene colour, whereon is often found a moss (where the aire is somewhat clammie) and upon divers of them are found growing a round spongye substance, called an Oke apple, hereof I shall speake more hereafter, among the sorts of excrescences. It beareth small, yellowish mossie flowers, standing close together upon long stalkes, which wholly fall away in the beginning of the Spring. The fruit is Acornes standing up in sundry other places, upon short stalkes, two or three for the most part joyned together, whose cuppe is rude or skonne, browne being ripe and tough, the lower end being set or placed in a small round hollow cup, the nut or kernell within being hard, cleaving into two parts, and of a reasonable sweete taste. The roote is very great and spread farre and deepe, some thinking that they runne as deepe into the ground, as they grow high above it. The timber or wood is tough, strong, tough and yellowish, with a smooth great graine, yet knobbie and knotty in some places more then in others, being the most durable either above ground or under, or else in the water, beyond any other kind of timber almost, and enduring both moisture and drought above all: the sappe or liquor called the sappe, is as all know whitish and verie durable.

Some have made one or two sorts more of this kinde, one with greener, yet more hairy or woolly leaves, and a little shorter cuppes, wherein they seeme as curled thereby; another with a shorter leafe and more jagged about the edges, both of them with smaller Acornes then the former. *Clusius* also saith that he found a dwarfe kinde of this kinde, not farre from *Lisbone* not above a foote high, bearing broad leaves with sharper edges, whose Acornes were as great as those of the common Oke, but very bitter, standing in a smoother cuppe, and saith also that on the hils over the Straights or *Hercules* pillars, there are some growing that hold their green leaves all the Winter, and *Dodonæus* reporteth the same to be found on the *Apenine* hils, and those that are called

Original from UNIVERSITY OF MICHIGAN

called *Aukes*, bordering on *France*, as *Pliny* out of *Theophraſtus* ſpeaketh of one in *Thurino agro ubi Sybaris fluit* that did not ſpring till Midſommer, and kept the greene leaves in the winter.

2. *Homeri ſive Robur.* The ſtrong or Gall Oke.

The ſtrong or Gall Oke (call it which you will, for both names ſit it well, the one from the Latine word *Robur* that is ſtrength, and the other becauſe it eſpecially beareth Galles) groweth not ſo high or great as the former, but ſhorter and more crooked, yet ſpreading faire branches, ſet with long leaves like the former, but more cornered on the edges, and hoary underneath: they flower and beare Ackornes like the former, but not ſo plentifull and are greater, ſtanding on longer ſtalkes, being ſweeter alſo, beſides which Ackornes, it beareth alſo a round woodily ſubſtance which is called a Galle: the wood or timber hereof is hardly to be bored.

Of this kinde there are divers ſorts ſome growing much lower then others, ſome having their leaves leſſe cut or jagged on the edges, and ſome bearing more ſtore of Galles, others no Ackornes at all, ſome againe beare great Galles, other ſmaller, ſome knobbed or bunched, others ſmooth: ſome of one faſhion, others of another, and of colour ſome white, ſome reddiſh, others yellow and ſome ſmall and greene, which is the *Graſſa ſpecies*. *Gaza diverſe.*

3. *Phagus ſive Eſculus.* The ſweete Oke.

The ſweete Oke called in Latine *Eſculus* (*ab eſca vel ab eſu* becauſe the Ackorne is the ſweeteſt in taſte, and moſt to be eaten of any) hath a ſtoute truncke or body in compariſon of the laſt Oke, and like unto the Gall Oke, growing with thicker and more buſhing branches, full of leaves which are thicker and narrower, and with more ſparre gathes of a darke greene colour on the upper ſide, and whitiſh underneath: the Ackornes grow ſeldome two together on a ſhort thicke ſtalke ſtenderer, more pointed and ſticking faſter in the tough prickly cuppes to be ſcaled off from them, becauſe I ſaid is the ſweeteſt of any other, comparing with the Cheſnut. When it is rolled or ſod and in many places in *Spaine*, ſerve for the poore to feede on as their daily food, and the Rich for junkets at their table, as we uſe to doe with fruite of all ſorts, according to the time of the yeare, and will as much intoxicate the braine as Darnell in bread. There is another differing ſort hereof, whoſe Ackorne is greater, and will more eaſily fall out of the cuppe, by reaſon of the heavineſſe of the Ackorne. They have in *Virginia* a goodly tall Oke, whereof they call the white Oke, becauſe the barke is whiter then of others, whoſe leafe becauſe it is neerely reſembleth this ſweete Oke, I have joyned with it, the Ackorne likewiſe, is not onely ſweeter then others, but by boyling a long it giveth an oyle which they keepe to ſupple their joynts. *Alterâ glande albi ſort. Oke of Virginia.*

4. *Ægilops ſive Cerris mas.* The male bitter Oke.

The male bitter Oke is called of the extreame bitterneſſe of the Ackornes, is ſeldome groweth neere any habitable place, but moſt uſually in great woods, and riſeth up with a tall ſtraight body, ſpreading large armes and branches, whereon grow thicke long leaves, with deeper gathes therein then in any other: the Ackorne is ſmall ſhort reſembling and very bitter, almoſt wholly covered in the rough flat huske, which is ſet with ſharpe prickles, of a purple colour: the wood or timber is ſtrong if it ſtand upright, and durable being kept dry, but in that it is of a looſe ſubſtance it quickly rotteth, yet is it for fewell for coales and the fire, for it doe not require any great heate.

1. *Galla minor.*
The leſſer Gall of the Gall tree.

3. *Phagus flore & fructu caſtaneæ & Quercus alba Virginiana.*
The ſweete Oke, and a leafe of the white Oke of Virginia.

1. Quercus foemina vulgaris. The male bitter Oke.

2. Quercus mas vulgaris. The female bitter Oke.

diers through necessity eate of the Ackornes, notwithstanding the bitternesse, but they doe engender much headache: Dyers also use this to make a blacke colour, but it will hold telle then that which is made with Galls by much.

2. *Quercus foemina.* The female bitter Oke.

This other bitter Oke (which from the Greeke name, might be called) the smoke barke Oke or else from the thicknesse of the barke be reckoned a kinde of Corke tree, but that other things doe not agree: it groweth a reasonable tall thicke, but somewhat crooked body, covered with a very thicke all coloured greyish barke, having such store branches, that it seemeth as continually kept lopped and poled, the leaves are like to the male kinde, but narrower and longer, whose cuttes or gathes are not so much opened being hard, rough and of a darker greene colour. the Ackorne heere of is small, rather then in any other, except the Scarlet Holme like, but lesser set forth, and is so short that it scarce sheweth it selfe out of the sharpe and prickly cuppe like to the male kinde, and is almost as bitter: the wood or timber heereof is loose, weake, and soft, neither firme nor strong, whereby it is the more unfit and unapt for building, or any other but small worke.

There is another sort observed here in some woods, whose leaves are not so much gathed, and the Ackornes being greater, grow three or foure together, without any stalke, whose huske or cup is as sharpe and prickly as the other of these kindes.

The Place and Time.

The bitter Oke is the most generall throughout the land, growing on high or low grounds indifferently, yet doth best in a fruitefull ground: the other kindes that I can heare of, are not growing any where in our Land, though there is some variety found in the timber of ours, some being of a finer graine, and smoother, some more knotty, and whiter wood, others a courser graine, tougher, stronger and more coloured: but they are most frequent in hote Countries, and other hot climates, their fore eatkins or bloomings come forth early in the Spring, and fall away for the most part, before the leaves doe come forth, the fruite or Ackornes are not ripe untill *October*.

The Names.

The Oke is called in Greeke δρῦς, and is a generall word for all trees that beare Ackornes, as the Latine *Quercus* is, but more strictly taken, it signifieth this Oke, which is called by most in Greeke πεδουνκλάτος, in Latine *Pedunculata*, after *Gaza*. The *Italians* call it *Quercia*, the *Spaniards Quemiza*, the *French Chesne* and *Cheisne*, and *Quesne*. *Dodonæus* calleth it *Hemerh quercus quasi salva vel robusta*, and the second he calleth ἔρυς ἡ ἄγριος, or *Robur*, whose

as the

the best Authours that I read make *Hemerus* to be *Robur*, *Gaza* translateth it sometimes *Placida*, and sometimes *Tranquilla*: *Theophrastus* saith that the *Macedonians* in his time called it *Quercus Ecmodrys*, and by *Gaza Veri*; and of some *Quercus robur*, and *Cerris robur*: the *Italians* call it *Rouere*, the *Spaniards Enzina*, and some *Carualla*, the *French Rolle*, and *Roure*, in *Dutch Eycken boom*. The third is called in Greeke *Fagus Phagus Fructus*, as the Latines doe *Glans*: *Gaza* in translating this unto *Fagus*, according as had so done before him, hath beene the cause why so many have erred in taking this *Phagus* or *Phegus* for *Fagus* of the Latines, which is in *English* the Beech tree, whereas they might plainely see that *Fagus* in Greeke is as a kinde of Oke, and that beareth the sweetest Acornes, but *Fagus* the Beech tree beareth no Acorne, but a three square nut like a Chelnut. The *Italians* call it *Faggio*, the *Romanes Fiscolo*, the *Spaniards Haya*, and the Acornes *Vallotas*. The fourth is called in Greeke *Aegilops*, of the *Macedonians Agrias*, in Latine *Cerrus*, or *Cerre* as some have it, yet *Pliny* maketh mention both of *Cerrus* and *Cerrus*, some *Cerrus mas*, & *Cerrus majore glande*, in comparation of the next. *Gesner* calleth it the Holme Oke, and *Turner* letteth it to passe, when as the *Ilex Coccifera* is more fitly to be so called, because the leaves thereof are much more like unto the Holme or Holly bush, then this is: the *Italians* call it *Cerro*, they of *Cyprus Sia*, and in places in the bottome of the Straights call it *Acchomes* hereof *Gallomes*: the Wood *Aegilops* doth also make a kinde of wilde Okes, as is declared before among the Grasses. The last is called in Greeke *Balanos*, as some read it *Bunos*, in Latine also *Hairpilosa*, but of most *Cerrus femina*, and of some *Cerrus glandi*, *Gesner* translateth it *Salfarea*, thinking it tooke the name from *Sal* which is *sal*, and *Balanos* but the barke hereof is not more salt, but more thicke then others, and therefore it is derived from *Balanos*, *crassus & crassitudo*, the *Italians* call it *Farnia*.

The fruite of the Oke is called in Greeke *Balanos* & *Kalamos*, in Latine *Glans*, but both Greekes and Latines are also knowne to divers other fruites of trees, as *Balanos Basilica*, *Iouis glans* the Wall nut, and *Balanos Persica*, *Glans Persica* the Chestane, and *Balanos Aegyptia*, *Glans Thebaica*, or *Palma* the Date, and *Balanos pyrifera Balanos Myrepsica*, *Glans unguentaria* or *Nux Ben*, the oyle Nut Beh, in *Italian Ghiande*, in *Spanish Bellotas*, in *French* and in *Dutch Eycheln*, in *English* Ackorne, and Masle, which yet is said to be the fruite of the Beech, and some others. The cup or backe wherein the Ackorne standeth is called in Greeke *Pyxos*, in Latine *Calyx glandis* the Apothecaries *Cupula glandis*.

The Vertues.

The leaves and barke of the Oke and the Ackorne cups doe binde and dry very much, and are somewhat cold also but the Ackornes themselves are neither so cold nor so much binding, yea we have generall received opinion that Ackornes in poulder drunke in wine are good to helpe Witches and poisons in the tides, but they unwisely put few bay berries into them in the taking: the inner barke of the tree, and the thinne skinne that covereth the Ackornes, are most used in Physicke to stay the spitting of blood, and the bloody flix: the decoction of them and the poulder of the cups doe stay vomitings or caltings, spitting of blood, or bleeding at the mouth or other of blood in man or woman, laskes also, and the involuntary flume of naturall seede: the Ackornes in meate taken in wine, provoketh urine, and resisteth the poyson of venemous creatures, and the decoction of the barke made in milke and taken resisteth the force of poysonous herbes and medicines, as also the iuyce of *Cantharides*, when as by eating them, the bladder is exulcerated, and they piss blood. *Hippocrates* prescribed the fumes of the Oken leaves to women that were troubled with the strangling of the mother, and withall he applyed them being bruised to one that had a wound with an axe or hatchet, not having any thing else at hand, and thereby sodered up the wounds, and kept it from inflammation. The cups of the Ackornes are more binding then the Ackornes by much in any thing. The distilled water of the Oken buddes before they come into leaves, is good to be used either inwardly or outwardly in all wayes abominations, and to stay all manner of fluxes in man or woman. The same water is singular good in pestilentiall and hot burning fevers, for it withstandeth the force of the infection and slayeth the extreame heate: the same water also drunke as *Matthiolus* affirmeth the heate of the Liver, breaketh the stone in the kidneyes and bladder, womens courses: the decoction of the leaves worketh the same effects. The water that is found in the hollow places of old Okes is very effectuall against any soule or spreading sores: the *Rosarius* saith *Galen* was wont to use it in hard of digestion. Ackornes beside their taste and a kinde of gladnesse they are boyled or roasted, are very wholesome meate, and thereby they become light, ready and more pleasant, yea it is extant by the testimony of Homer and Virgil, that the elder age before it knew the use of corne and bread therewith, lived upon Ackornes which they gathered thereby, yea they held the Oke in that honour that they dedicated it to *Iupiter*, especially that of *Dodona*, because that *Iupiter* manifested his oracles and was worshipped by them, and the use of them is yet in many places, yet utterly extinguished, for as at first before, the poore people in *Spaine* in some places, use Ackornes a piece of their seruice, and the rich have them serued to their tables for an after course, as with Apples, Nuts, and such like fruites as the seasons require. There is said to be a great Antipathie betweene the Oke and the Wilow, the one not to grow neere the other, as also betweene the Oke and the Vine, as *Columella* saith in his Booke of Observations. The leaves of the sweete Oke or Acorne, as *Columella* saith in his Booke of Observations, and the leaves of the Wilde Oke, and *Nicander* tanne or thicken them as we doe hides, as our Tanners use to doe Goate skins, and Kidde skins: but the cuppes of our Ackornes would doe as much, if they would gather them, as that the Turkes in *Natolia* and other places in *Turkie*, use the leaves of *Sumach* to tanne their leather, as they of *Egypt* and *Arabia*, use the rinds of *Acacia*, the prickly binding tree, they of *Russia* use the barke of the Birch tree, and they of *Illyria*, the leaves of the Mirtle tree, that beareth Myrtles: which shewes how many things may worke that effect, seeing every Country taketh that which is

CHAP. II.

Excrescentia Quercuum. The Excrescences of these Okes.

There are great many things that breed upon sundry of these Okes, some of one fashion some of another, and so in substance likewise, soft or hard, besides the Oke Apple and the Gall, whereof I intend no speciall skill. I have given you the description of the tree in the Chapter last going before this, I will but onely shew you here the diversities of the Galles, and the good uses they are put unto by Physitions, or other purposes, and I cannot understand that any of the other former sundry kinds do yeeld Galles but those that are here set downe by the name of *Robur*, which is the second sort; for although divers a tree may have a shew of Galles, which made *Pliny* to say that all Ackorne bearing trees, bring Galles likewise, yet they are but spungy balls for the most part, and none so good and hard Galles as they.

The Galles are of two sorts, smooth, and rugged or knobbed, both of them round and hard almost as wood, and all a little hollow within, and when they are dry, are either whitish or yellowish, but while they are greene and fresh upon the tree they are somewhat soft and tender, and reddish towards the Sunne side: all of them set close to the branches, and that as without order, and sometimes one joyning close to another, without any stalke under them. There is also a blacke Gall as bigge as an apple, sometimes full of a Rosin like substance, which will flame being set on fire.

The Oke apple groweth upon sundry sorts of these trees, and not on any one alone, for although in our Country ours are for the most part round and soft, being fresh and full of watrish substance, but being dryed in the sun and ayre withered, yet in other places hence are found sticking to the backe of the leaves, and containe in them cleere water and thicke flesh in them, and are white, and as it were transparent before they be dry and grow hard.

Others are called *Capillares*, because they are all hairy, and containe within them a hairy like liquor as the Spring time, yet not put to any use.

One that put out of *Virginia* with round hard rough or prickly balls on the leaves.

Others are called *Lanuta*, for that within an hard huske or shell, they containe certaine flockes of wooll, which are fit for Lampes, but not without oyle or other unctuous matter as *Pliny* saith it will.

They that are called *Sessiles* grow under the joynts, as the setting to of the leaves close to them without any stalke, the nave being white, and a little (within) forth, and sometimes of sundry colours, and sometimes hollow and thin engrafted in the middle, being hollow within, with a pithie vacuity.

They are called *Foliacea* or *Frondosa*, that are made as it were of leafy leaves, like unto the head of the Knapweed that grow with wool rolled in the folded.

1. *Quercus cum pomis suis gerens pomiferis acetabulis.* The Oke and the Oke Apple.

Quercus Excrescentia. The Oke Excrescence.

Another thing groweth on the branches under the leaves, that is like unto the apple or husk that containeth the flower of the Pomegarnet or such like.

Sometimes there hath beene small fair stones found like unto pearles, yet not often seene.

A round thing also hath beene found, which *Theophrastus* calleth *Sycamindos*, and is somewhat like unto a Mulberry, differing only in the colour, hardnesse to be broken, and in taste also.

Another cone also like to the privy members of a man, as the yard and the stones.

There is againe another thing found growing thereon like unto the beginning, called by him [illegible] but after-ward growing hard, taketh the forme of a Swines head with a hole in it, and being broken hath like an Olive stone within it. Nitar also as *Theophrastus* saith, is made of the gum of the Oke, which *Plinie* declareth in this manner: It is reported that the gum of the burnt Oke is like unto Nitar, which *Democritus* writeth, and *Cato* translateth it also *Pix* in the same words.

The Acornes of *Ilex* the sweete Oke, and of *Cerris* sative the tame bitter Oke, have certaine small stones sometimes found in them, either at the end of the Acorne, or on the out side, and sometimes in the nut it selfe.

The Oke also beareth a *Cachrys*, which *Theophrastus* in his third Booke and seventh Chapter, expounded to be a manifold conception or gathering together of leaves, growing upon the last yeares shoote, and the young bud for the next yeare. *Cachrys* also as *Dioscorides* saith, is the weede in the Corne of Libanotis, or the seede of the white bearing Fennel, which burneth the tongue being chewed: but *Plinie* hereof erring by this double acception of the word, confoundeth them both together, and maketh them both but one thing, saying [illegible] that the Oke beareth *Cachrys*, as a small bill that hath the property of a caterpill: but *Theophrastus* saith in the place before set downe, that the Pine tree, Larch, Pitch, Line, Nut and Mast trees, doe beare a *Cachrys* after the leaves are fallen off, abiding on all the Winter.

Cocci growing on the Okes in *Cilicia* as *Dioscorides* saith in the 43. Chapter of his fourth Booke a *Cocce* or Grain, which the women there gather with their mouthes, and is like unto small Cockles or Snailes: this seede is called the same, as both he in the same Chapter calleth *Coccus Baphica*, and groweth on a small shrubbe, like unto Gilder rose tree, as hee affirmeth: but some learned Writers have taken them to be both one, namely the scarlet graine gathered from the holme Okes: but surely *Dioscorides* maketh either kind of graine, such from the dying was called *Coccus*, and may peradventure be the same that [illegible] found in the growing of the Okes of great Greece in *Bulgaria*, not farre from *Thessalonica* a Citie of Macedonia, which [illegible] there and fed, but was carefully kept in *Poland*, where it groweth also: of the which I shall intreate in the end of the 18. Chapter of the Second booke, which is like unto the graine of Okes which grow upon the Okes in the Wood by *Segni* in *Germany*, and in divers other places of *France*, and *Germany*.

There are many Mosses also growing on these Okes, some sweet and some not, whereof I have spoken already in the Booke of Mosses: as also those Mushromes mentioned among the Mushromes, whereof it is needelesse to speake further here: but these groweth at the rootes of old Okes in the spring time, and sometimes also in the beginning of Summer, a peculiar kinde of Mushrome of excellence, called *Boletus cervinus*, swelling out of the ground, growing one vpon another, of the fashion of a grape, and therefore tooke the name. The Oke hath a purplish colour on the outside, and white within like Suet, and in the end of Summer becommeth Woody.

The Dragon a monstrous serpent called *Dryinus* taking his name from the place of his breeding and chiefe abode, the roote of Okes. *Theophrastus*, *Dioscorides*, *Galen*, *Nicander*, and *Ælian*, have all made mention of the wonderous venemous quality of this Monster, and of the cure of the poyson.

There are also [illegible] found in the roots of Okes: and in those thicke called *Galbæ*, but especially in the Corcke Okes.

There is also a certaine kinde of Gumme growing on Okes, which Master *Lobel* hath described in his Icones, and sent some sorts of it to me.

There also growing vpon Okes, Auricles, Pellipody, Agarics, Mushromes of sundry formes and fashions, [illegible] and the two last figures expressed in the Table are of a differing forme from others.

There is a kinde of Honie dew, which we call in *English* a long dew, found more plentifully on the Okes leaves than on any other trees: but because they are not peculiar only to the Okes, but grow upon other trees also, and therefore do not fall into the same place of this Booke, I forbeare further to mention them here, leaving them to the places where they are to be more conveniently entreated of, to their fit places.

These Okes and Trees are sufficiently expressed in their description, and so are their *Names* also, saving that the Oke is called in Greeke δρῦς, and in Latine *Quercus*, whereof one kinde fit for medicines is called *Oxyacantha*

both

Original from UNIVERSITY OF MICHIGAN

both in Greeke and Latine, not that it is an auncient Gall, but that it hath more aterinary and thyrsty in it, then the greater and the yellower have: the Oke Apple also is called of most Writers *Pilula Querna*, Gall-nuts also and *Aceria*.

The Vertues.

The small Gall called *Omphacia* is dry in the third degree, and cold in the second as *Galen* saith, and being a sowre harsh medicine is fit to draw together and fasten faint and loose parts, as the overgrowing of the eyelids repelleth and dryeth up the humors, and such like flixe, by laying them effectually, especially those that fall upon the gummes, almonds of the throate, and other places of the mouth: the other whiter Gall doth also binde and dry, but in much lesse then the former, by how much it hath a lesser quality of sowre harshnesse in it, and is good against the dissentery or bloody Flixe: the decoction of them in water is of a meane affriction, but in Wine stronger, and in hot fiery red Wine stronger then it: if women sit in or over this decoction being warme, that are troubled with the falling downe of the mother, it will helpe them: the Galles themselves after the boyling being beaten and applyed to the fundament that is falne downe, or that hath any hot swelling or inflammation doth wonderfully helpe the same: the scales of them when they are burned and quenched hot in Wine or Vinegar, are good to be applyed to stanch bleedings in any place: they also dye the haires blacke, and with them is made coloured writing incke, and the Dyers a blacke Dye as all know: the Oke Apple is much of the nature of the Gall, yet inferiour thereunto, but may be used in the want of Galles, for rheumes, flixes, and such other like diseases, and that to good purpose. *Matthiolus* reciteth a tale of his Country *Indians*, as *Gerard* doth of our *Kentish* men much to one purpose, saying that *Matthiolus* hath it of Galles, and *Gerard* of Oke Apples, but both alike true, as are a number of such grosse doting tales of Saint *Paules* day, and Saint *Swithens* day, and the like, which have more of Paganisme then is allowable, to drive us from the confidence of Gods providence, to rely on such vaine and wicked figments, or speculations, and yet maintained lively by a great many, which is, that in the Gall of the Oke Apple saith *Gerard* there breedeth three small creatures, which will prognosticate the courses of the succeeding yeare (in every Country, for the Gall or the Oke Apple doth grow I thinke in every Country) if a Flie doth *Matthiolus* it portendeth Warre, if an Ant saith *Gerard*, plenty of graine: if a creeping Worme be found in the Gall saith *Matthiolus*, it foreshadowes scarsity of victuals: if a white worme like a magot saith *Gerard* mortality of beasts and cattell: but if a Spider by they both there will follow a pestilence or mortality: but least I grow tedious in this unnecessary pertinent to this our History of Herbes, I shall passe no further, but leave it to every man as his minde is either led unto *God* the Judge of all mens affections. The Oke grape doth binde stoppe, whether of bloudie or humours, and preferred by some, before either Gall or Oke Apple, especially in Bleedings, Which is the full that I know hath written of it. Most of the rest of these excrescences are seldome used, for those that are, have the same quality of binding that the Gall or Oke Apple hath. The red graine that is found on the Okes in *Polonia*, and other places, is altogether used by the Dyers, but not used in any medicine, by any that I have read or heard.

CHAP. III.

Viscum. Misselto.

BEcause the best Misselto groweth upon Okes sometimes but more usually on other trees, I thought good to entreate hereof next unto the Gall, and the other excrescences of the Oke; yet for that there are some varieties found herein.

1. *Viscum vulgare.* The ordinary Misselto.

Misselto springing from the branch or stemme of the tree whereon it groweth with a woodily substance, parteth it selfe into sundry branches, and they spreading againe into many other smaller twiggie, entrelacing themselves one within another, very much covered with a greyish greene leafe, having two leaves (for at every joynt one) and at the end likewise, which are somewhat long and narrow, small at the bottome, but broader toward the end: at the knees or joynts of the boughes and branches, grow small yellowish flowers, which turne into small round white transparent berries, three or foure together, full of a glutinous moisture, with a blackish seede in every of them, which wasteth yet is prone to spring being put into the ground or any where else to grow.

Varietates.

Camerarius maketh mention of one sort hereof, that had many more berries growing together in a knot, then the former, but not to differ in any thing else.

Historia stirpium.

Clusius and *Belonius* have each of them recorded in their writings, to have found Misselto growing on Chesse trees in sundry places, both in *Spaine* and in *Turkie*, that bore red berries not varying much in any other thing: it maketh the trees barren that Misselto growing on them.

2. *Viscum Indicum.* The Misselto of *India*.

The Indian tree Excrescence (which for want of a fitter name was called Misselto because it groweth on those trees) doth as it were runne or creepe up in the boughes, shooting up sundry whitish greene stalkes with knottie joynts thereon, like to those of Grasses, but without any leafe at them, saving at the very joynts, where groweth one long leafe like the Misselto leafe, but twise as great thicke and fleshy as it, with five round ribbes on either side of the middle ribbe toward the upper end: from the bottome like wise of each of those leaves riseth up a long spiked head of small leaves as it were, which abide greene all Winter long.

3. *Viscum Peruvianum.* Misselto of *Peru*.

This other strange plant also, that referred to the Misselto groweth like a bush of small rushes like twigges with broad leaves folded one over another at the bottome, as broad as ones hand, where it is fastened to the bough whereon it groweth, with small roots like those of Onions, but ending in small points, all which doe encompasse an hollow reddish striped branched stalke two or three cubits high, representing the chaffie ruffe or case of Grasse for the fashion, but *Asclepias* for the bignesse, and the silken downe with small seede therein like *Cotyledon* of a fleshy unpleasant taste like Nitre, perhaps taken from the Sea sure it feeleth.

The

1. Viscum quercinum.
Mistletoe of the Oke.

2. Viscum Peruvianum.
Mistletoe of Peru.

The Place and Time.

The first groweth very rarely on Okes with us, but upon sundry other as well trees as trunke trees, plentifully in Woods, Groves, and the like, in all the Land, but beareth many berries in Germany, &c. the other two grow in the West Indies, from whence a cion of the other was brought by a friend. Our Mistletoe floweth in the spring time, but the berries be not ripe untill October, and abide on the branches all Winter, unless the Blacke birds and other birds doe devoure them.

The Names.

It is called in Greeke Ἰξὸς by *Dioscorides*, and so is the Birdlime made thereof also called by *Theophrastus* who saith also that in *Eubœa* it is called *Stelis*, and in *Arcadia Phyxa*: yea he, lib. 5. cap. 16. of his History, he saith that *Stelis* groweth on the North side of the tree, and *Hyphear* on the South, & so they differed one from another in those things, which he hath no where expressed, as I say. *Ixion* and *Viscum* and so also the birdlime made of the berries, as are all these sorts called by all Writers, who have written either of the two last, since *Lobel*, with their several additions. The Italians call it *Vischio*, *Pesbacco* and *Pizlo*, the Italians *Visco*, the Spaniards *Liga*, the Germanes *Vogelleim*, the Germanes *Affholt*, and *Eychen mistel* and *Papeleen*, the Dutch *Vogelmaye*, and we in English Mistletoe. There are sundry controversies moved about this *Viscum*, first whether it be produced from the drowned seed of berries, or have fallen downe blacke birds eating the berryes and lying in their belly dunging on the trees the seede hath thereby beene made the fitter to grow, which I hold, and so doth *Pliny* from *Theophrastus* for it dayne *Sandis plus minus* that the blacke birds wey deth that, whereby it is brought to death, but it is found by experience, that there is no shew of seed in that dung they voyde upon trees, being wholly altered in their bellies before the voydinge. Also it groweth on trees from their owne impulsion as may seeme, for the seed to fall in *Sudat quercus*, even as Gallies doe, and Oke Apples and Galles have no seede of their owne, and to this purpose

Cuncta solet sylvis brumali frigore Viscum
Fronde virere nova, quod non in semine silvit:

Wherewith agreeth that the Mistletoe looseth the leaves in Winter if it grow on those trees that shed their leaves, but holdeth them growing on ever greene trees, the reason whereof saith he is the tenacious humidity of the one, which the other wanteth: but the experience of our times hath shewed that it keepeth the leaves fresh

fresh and greene in Winter, when the trees whereon they grow have not any of their owne leaves left on them in these parts of Europe generally. Secondly about *Ixia* and *Ixia*, whether they be both one thing, *Dodonæus* calleth both the bush and the Birdlime made thereof by one name *Ixia*, as the Latines doe *Viscum*, as you heard before, and saith further that it is also found on the rootes of other shrubs which cannot be understood of the Misseltoe to grow from other shrubs, but is meant of that kinde of Gumme or glew called *Ixia Vilcum*, that is gathered from the rootes of the white Chameleon Thistle, as is shewed before in the Chapter of the Chameleon Thistle, but *Ixia* cannot be understood to be either Misseltoe, or the Birdlime made thereof, which is called *Ixia*, as is before said, although *Dodonæus* doth much inlist upon it, because the qualities of Birdlime are dangerous to be taken inwardly, for as I shewed in that Chapter of *Chameleon*, *Ixia* is either the roote of the blacke Chameleon Thistle, which *Galen* saith is very pernicious, or another very like it as *Columna* thinketh.

The Vertues.

Misseltoe is hot and dry in the third degree, the leaves and berryes doe heate and dry, and are of subtill parts, to some acrimony is in them, which severeth the bitternesse, the Birdlime doth mollifie hard knots, tumours, and impostumes, ripeneth and discusseth them, and draweth forth thicke as well as thinne humours, from the remote places of the body, digesting and separating them: but is not of that property to heale suddainly, but after some time as *Theophrastus* doth, and being mixed with equall parts of Rosin and waxe doth mollifie the hardnesse of the spleene, and healeth old ulcers and sores: being mixed with Sandrack and Ormean, helpeth to draw out stale nailes, and if quicke lime and Wine lees be added thereunto it worketh the stronger. The Misseltoe that is of the Oke as the best, for of the Chestnut tree as *Matthiolus* saith to be as good) made into pouther, and given in drinke unto those that have the falling sicknesse, doth beale them as *Matthiolus* saith, and that he had cured and healed many effectually: but it is fit to use it forty dayes together: and with this caution, that the wood where it is broken from the tree, doe not touch the ground, which is in my minde too superstitious, as is their opinion also, that it hath power against Witchcraft, and the illusion of Sathan, and for that purpose, use to hang peeces thereof at their children necks: *Gentile Fulginas* and others have so highly esteemed of the vertues hereof, that they have called it *Lignum sanctæ crucis*, believing it to helpe the falling sicknesse, Apoplexy, and Palsy very speedily, not onely to be inwardly taken, but to be hung at their necks, and some to hang it at their necks, or weare it on their armes to help them to conceive: and saith *Matthiolus* I have knowne ignorant empericks to have given the Birdlime made into pilles to persons to swallow in stead of the wood: and further saith that he knew the Misseltoe that grew on a Peare tree, given to one that had the gowt drawne together, to doe him much good and divers doe esteeme of the Misseltoe that groweth on Hasell nuts, or Peares, as much as that on the Oke, in a roote neer the ground. For the falling sicknesse, to be taken in Wine. *Porta* saith that the fresh wood of any Misseltoe bruised, and the juyce drawne forth, and dropped into the eares that have impostumes in them, doth helpe and ease them within a few dayes: the leaves are often given to retteil saith *Plin.* to soften them and purge them first: but if they be diseased they cannot continue long. this manner of curing them lasteth for forty dayes in Summer.

Chap. IV.

Ilex. The Holme Oke.

Of these Holme Okes there are three sorts, two that are great trees, and the third a small shrubby, whose descriptions I meane to give you in this Chapter, and because there are divers peculiarities growing upon these Okes, which are not found upon any of the other: I thinke it fit to entreate of these in a Chapter by themselves, that so they may be the better understood of all, and the more easie to be discerned them.

1. *Ilex major aculeata.* The greater prickly Holme Oke.

This greater usually is but a very great tree, yet sometimes groweth not so high, covered with a blackish red barke, as are also the boughes and branches, spreading here and there like unto a meane Oke: the leaves are like unto the Oke tree, but somewhat smaller and rounder, with prickly edges especially in the youngest trees, which are whollie prickly, but in the elder doe grow smooth on the edges without prickles, greene above and grayish underneath, which do always abide greene: the yellow mossie rashnesse and at the coppes of the branches upon long footestalkes like to those of the Oke and fall away in the same manner: the fruite or Acorne groweth set where the flowers stood, but in other places on the branches, upon short stalkes inclosed in a rough coppe like common Acorns, in some places bigger then the others, and smoother also, very pleasant to some plants, that many delight much to eate them: the wood or timber is of a brownish, and colour and very hard, not easie for an Axe, but for a Saw to cut it: the roules whereof are very durable above others: the roote groweth very deepe into the ground, and spreadeth much likewise.

2. *Ilex major non aculeata.* The great smooth Holme Oke.

This other or smooth kinde doth also rise a great tree equall to the former, and like thereunto in bodie, barke, branches, flowers and fruite, onely the leaves hereof are longer and narrower, pointed at the ends, and not prickely on the edges, but finely limbe or dented onely, some what rough underneath, and greene and lively above: the timber likewise being as hard and heavy as the former.

3. *Ilex aquifolia seu Cocciglandifera.* The lesser or Scarlet Holme Oke.

The lesser Holme Oke or Scarlet Holme Oke, is a small tree in manner of a hedge tree, the bodie or body whereof at the bottome is seldome bigger then of an old Hose tree and that if it be suffered to grow without pruning: the branches are faire and many, three or foure foote high, covered with a pale reddish barke, having many small thicke and fresh greene leaves set thereon, but hard and very prickely on the edges like unto the leaves of Holly, yet farre lesse and abide alwayes greene as the former doe: it beareth yellow flowers like the other but smaller, and smaller Acornes also more bitter and pointed at the end and almost wholly covered with a very sharpe prickly huske

shake or cup, but thus it doth onely when it is neglected, and not pruned and cut low, for like as the same grow more plentifully, as shall be shewed hereafter, and which else it would not do.

The Place and Time.

The last is more plentifull in *Spaine* and *France*, than the second and the second in *Italy* where the first is scant found: they grow also in divers other Countryes, and are planted for the rarity in sundry places in this Land, and therefore may be found in the Kings privy Garden at White Hall, just against the back-gate that openeth into the High Streete over against the Tennis Court there, which tree is knowen and wondred at, as by reason of the many, who have gathered the Acornes under the tree, which I have not observed when he was better clad with leaves: the second groweth in many places as, *Spaine*, *Portugall*, *Italy* and *Provence* in *France*, in *Africa* about Tunis and *Asia*, both the greater and the lesser as *Armenia*, *Cilicia*, *Syria*, *Candia* and *Cyprus*, as *Clusius* hath recorded, and in *Virginia*, *New England* &c. likewise: they all flower also with divers not long after, in *May*, and their fruite ripe in the end of *September*. The *Smilax* grape commeth forth in the middle of *May*, and is gathered in the end of *August*, and the *Time*.

The Names.

Ilex is called in Greeke πρινος ἡμερος ἀκανθωδης φερουσα βαλανους, *Cornutus* called it in Latine *Ilex mitior*, and *Bauhine*, and *Ilex glandifera*, because the lesser is called *Ilex aculeata glandifera*. The first is called *Ilex major* [illegible] or *sativa*. The second *communis* or *aculeata*, and simply *Ilex* by *Matthiolus*, *Lugdunensis* and others, and *Ilex aculeata* by *Lobel*, all which *Bauhinus* together with the first, *Cordus* taketh it to be *Smilax Aculeata Theophrasti*, but *Theophrastus* maketh the fruites of *Smilax* to be soft and eaten to be wormeaten, but the timber of this is hard as the former. The last is called *Prinos* by *Theophrastus*, and diversely with the first, by *Dioscorides*, *Cordus*, *Lonicerus*, *Cornutus*, *Daphne*, and so he calleth also the grape, in Latine *Ilex aquifolia*, and *Ilex aculeata* or *Cocciglandifera*, and *Phyllirea quarta*, in *Spanish Carrasca*, taking the name from *Carthusium*, one of the names given unto *Kermes* therein to. The Acorne of the first is called in Greeke βαλανος, and *Aegilops* and from hence commeth the word *Aegilotes*, which *Bauhine* maketh mention in sundry places for rare Acornes, in *Spanish Bellota*, and *Italian*

The Vertues.

The greene leaves of the Holme Oke, as *Galen* saith have a greater force to coole, binde and dry, then have the leaves of any other Okes: being beaten and applyed they are good against soft swellings, and strengthen weake members: the Cankerworm dusht, the roottes hereof bruised and laid on the parts that the Serpent *Dipsas* hath made, is very good to represse the venome, and to stay the paines that come thereby. The Acornes of this *Ilex*, which are called βαλανοι, and of the first Oke, and *Phegos* of the sweete Oke, either fresh or rosted doe binde the belly, but if they be boyled they do lesse: the young roottes boyled in wine or water, till they be tender, and then made into a plaister and applyed to any place burned or scalded doth helpe it: the Acornes of these greater Okes are generally eaten in Spaine where they grow, of the rich as well as poore, in the same manner that they doe

with

withstanding Aromes of Pliny or Ilex the Sweete Oke. The Ilex or Holme Oke, as Pliny and other Authors make mention, is of no small durability or not decaying in many hundreds of yeares, he reporteth one that made almost a wall alone, divided into ten bodies or trees, and contained thirty five foote in compasse, and each of large greatnesse and of another that grew on the Vatican, that was older then the City of Rome it selfe: the Chaplet or Garland that was given to a Citizen for any worthy act in former times, was made of the branches of this tree, although afterwards it was made of Ebenus that was dedicated to Jupiter, the properties of the lesser Holme Oke, are chiefly remaining in the berries, of the juyce whereof you shall heare in the following Chapter.

Chap. V.

Ilicis nomina. The Excellences of the Holme Okes.

There are five severall Excellences growing on these Holme Okes, differing from the former, and none of them found upon any of the other Okes, which are only reserved for this place, as shall bee declared downe in order: and first of the Scarlet graine, as the most worthy.

1. *Coccus ilicis seu Coccus infectoria.* The Scarlet graine.

The graine or berry (for not the proper fruite of the lesser Holme Oke, for that is an Aroma, the others have) is a kinde of Excellence that nature thrusteth forth upon this tree, when the branches are young and not growne old or neglected and not pruned, which then grow harsh, and without moysture upon it, and a certaine skurfe along the barke at the severall joynts and foreclinkes of the leaves, bearing as a Peare of a red colour before they are ripe, but of the colour of the Holly or Asparagus berries, when they are ripe or knowne to bee, but are gathered for the most part before they be ripe, when as they will containe within them a cleare juyce of a crimson colour, as deepe as any pure cleare blood, which by the heate of the Sunne here in all hot countries, little bigger then Pease at the full, but being suffered to grow great, consume the inner substance of the berry or graine, creeping away and leaving the huske or shell empty, which empty shells are the Scarlet berries that are found in the Apothecaries and Druggists shoppes every where, and which made Matthiolus who never saw the thing growing, to thinke that they were not the true Coccus of Dioscorides, but some prickie kinde of berry, because Dioscorides saith that they are like unto lentils before their ripe, or that any worme is bred in them, they are gathered for the Apothecaries use, that make the Syrrup or Electuary called Alkermes, which is cordiall, and pretie forth the joyces, which being boyled up with a proportion of Sugar, is kept for a whole yeare after: but when they are somewhat more ripe, yet before the wormes are ready to breake the shell to runne away, they are gathered for the Dyers use to Dye the Scarlet cloaths withall, and are brought into powder in this manner. When these graines or berries are gathered in their season, they rub them on a sheete or other such thing, sprinkling them with a little White Vineger, borne up from the ground by the sides or foure corners, and set them in the hot Sunne who feeling the heate of the Sunne begin to stirre, and would creepe away, but that one that is appointed to looke to them, with a small wand or sticke by striking the sides of the sheete causeth them to fall downe into the middle againe, which worke is continued so long until they be all dead, and dryed to the heate of the Sunne, and are afterwards brought to the market and sold to the Merchants, that will buy them. Some doe rub in a large bowle, shaking them in the Sunne, or drying them in an oven. Brilonius sheweth the way that they vse in Crete, who make two sorts of Dyes of them, the one of the pulpe, the other of the bladders or shells and because the pulpe maketh the richer Dye it is sold at foure times the dearer rate.

2. There is also found upon the branches of the greater Holme Oke, scatteringly here and there, and nothing so plentifully as in the other, certaine small round graines of a darke red colour, which for the most part are neglected and lost.

3. There is likewise found a kind of grayish Mosse made like unto a small long tuft or locke consisting of grayish hoary haires but not tweete.

4. There is a gum also found bleeding to the Aroma of the great Holme Oke, which is somewhat hot in taste, but not unpleasant.

5. Theophrastus maketh mention of Hyphear, to grow as well as Mistletoe on the Ilex, and that on the Fruitfull shee tree, which cannot be but a differing thing from Mistletoe.

The Place and Time.

The place of growing of these berries, both heere set downe in the Chapter before, and they beginne to appeare in April, and are gathered in May, the best in Greece, Italy, Spaine and France, and are ordinarily found in the Summer.

The Names.

The former graines are called by Theophrastus in Greeke κόκκος βαφικὸς Coccus Phœnicius, by Dioscorides κόκκος and κόκκος βαφικὸς Coccus Baphicus in Latine of Pliny, Granum, Coccus, Quasquilium, Coccolum, Scricum and Vermiculum, in English both by him and Turnerus taken from the word Hyr, whereby as Festus saith the Tuscans signified Porcus did call it, or the later Writers, Granum infectorium in shoppes Granum Cnidium, and Chermes or Kermes, and Grana kermes after the Arabian name, by the Italians Grana di tintori, or Spagna, Spanish scarlet berries and Granen grees, in French Vermillon, and Graine de scarlate, by the Dutch Scarlaet Beer, and in English the Scarlet graine or Cherries berry. The second is called Granum Tingens. The third Myrtus Ilycina. The fourth Coccus Infectorius. And the last as is said Hyphear.

The Vertues.

The Scarlet graine boyled to heale greene wounds, and sinewes that are cut, to be mixed with vinegar or Oxymell, and is much commended and given by the later Physitians to women with child, who by abortive or other casualty are subject to miscarry with their children, by untimely travell and birth: but especially the Confection which is called Alkermes, which is made of the juyce of these berryes is effectuall for that purpose, and is a sovereigne

...against Cordiall to strengthen and revive the fainting spirits of the heart, and to drive away melancholly. This confection also is dayly commended and used with good effect, against the trembling and shaking of the heart and against swounings; it is often used likewise against Melancholly passions and sorrow proceeding of no evident cause, and to procure such as much as Physicall meanes may effect, but there hath been formerly many errours committed in the composition of this confection, (left in the *Lapis Lazuli* (left out by *Mesues* the *Arabian* against Melancholly) some condemning the use of it, and some fearing the operation thereof by forcibly purging Melancholly, have wholly left it out, and others have put it in, but without due preparation it ought to have: a second errour is in counterfeiting the like that is appointed to be put into it, some taking crimson silked dyed as our Dyers use it, which may be dangerous in that they use divers things to strike the Dye that is not safe to be used inwardly, and therefore some used to draw a tincture out of the dryed berries: the later age hath appointed a safer course, namely to steepe the raw cods of silke that hath felt no art passe upon them in the true juice of the *Oxycoccus* berries, wherewith being imbibed and sufficiently tinctured, the juyce also boyling and straining, is then fit to be used to make this confection: a third errour rose from *Ordonius*, that mistooke *Sericum*, and made it *Sera*, whose errour Doctor *Priest*, that translated him into *English* did follow, and gave occasion to *Gerard* to publish it so in his Herball: in that *Gerard* received that translation from Mr. *Morton*: a fourth errour hath risen from the Monckes that wrote Commentaries upon *Actuarius*, who affirmed that kinde of Crimson grayne that is gathered from the roots of Burnet is the *Kermes* of the *Arabians*, but *Gabelchoverius* hath confuted their opinion sufficiently: a fifth errour is in many mens mistaking *Cochenile* (a certain grayne or rather flye knowne but of late dayes, and brought from *America*.) for *Kermes* of ancient and later writers with the old *Arabian* and Greeke Writers: but now all these errours being taken away, men may safely repose confidence in the goodnesse of this confection, the faithfull preparation of the ingredients hereof, as well as other compositions, being so carefully overseene by the governors of the Apothecaries, since they were joyned in one corporation, that it may justly now compare (who were farre behinde before) with the most famous and renowned art wherever: the berries that are found on the great Holme Oke fairly *Aquifolium*, being bruised with vinegar, are good to be applyed to greene wounds and put also into those eyes that are blood shotten through: and wood: the other excrescences are not put to any use that I know.

Chap. VI.

Suber, The Corke tree.

Of the Corke tree there are three sorts observed by divers, which yet may well be reduced unto two, in that the difference is not such in my minde to make a speciall sort as you shall here.

1. *Suber latifolium.* The broad leafed Corke tree.

The broad leafed Corke tree groweth to be a great tree in many places, but not so high as the *Ilex* or Holme Oke, nor so farre spread, but with a thicker body, and fewer boughes, yet in some places it groweth much lower, for *Pliny* said it was a small tree: the leaves hereof are very like unto the leaves of the *Ilex*, but usually greater, broader and more prickely than those of the elder Holme Okes, and in most places abide alwayes greene on the trees, but in some few doe fall as doe the ordinary Okes doe, which therefore being but rather rarely found, I omit to make continuance another *species*. The flowers are like the other Okes, and the Ackornes also like those of the *Ilex*, but alwayes growing in clusters, (that is very rough and prickly cups of a brownish green colour, long and full of chives or threads hanging upon the tree, and with cloves and fall off before the Ackornes be perfected: but being sowen in due time, that is every fifth yeare, the new barke will appeare very red, as if it were painted, and if any rayne should happen in the barking time, they would wither and dye, but the Country men diversly observe a time for that purpose, and when they have taken away the barke, bring it to the house and make prime and flat, and straine it under stones untill it be thoroughly dryed, which then with pumice stone and other like they smooth and make fit for use. The timber or wood hereof is strong and fit to build withall, but dyeth very soone when it is cut down, and should longest be preserved standing.

2. *Suber angustifolium.*

The narrow leafed Corke tree.

The later Corke tree, which some take to be two sorts, growing to a great tree, spread with many armes and branches which are more pliant and fitter to be bowed, whereof we have longer, narrower and sharper pointed leaves then the former but not endented or prickly on the edges at all: in other things it is like unto the former.

The Place and Time.

The first groweth in many places of *Greece*, *Spaine*, *Portugall* (where in some places it groweth low) in *Italy* also

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

and *Pomet*, the other for Wherof that fourth the leaves in Winter, groweth in *Aquitania* neere the *Pyrenæan* hills where *Scaliger* did observe it to grow (the other about *Pau* more plentifull then any where else in France except *Montpelier* saith: although *Pliny* denyeth any *Suber* to grow in *Italy* or *France*, they flower and bear their fruite later then other Okes.

The Names.

The tree is called in Greeke ἀείφυλλος *Phellos*, in Latine *Suber* and *Ilex famina* of some as *Theophrast* saith. The first is by *Matthiolus*, *Lobel*, and others called *Ilex latifolium*, but that whole leaves fall in Winter: which *Bauhine* maketh another *species*, but he might as well make the low one of *Pliny* to be another for likewise) *Suber Hispanicum folio deciduo*. The other is called *Suber angustifolium* by the said Authors. The *Italians* call it *Sovero*, the *Spaniards Alcornoque*, and the barke *Corcha de alcornoque*, the *French Leger*, but lastly *Dodo* is not that *Turg* that *Belonius* saith the fruite is edible, the *Germans Korcheichbaum*, and *Korcheck*, the *Dutch Corck* as we doe.

The Vertues.

The Corke hath a manifest drying and binding faculty, more as it is thought then the barke of any other Oke; the ashes of the burnt Corke stancheth any fluxe of blood, whether in men or women as *Dioscorides* saith,

Quæ ungenta sint & quomodo curanda.

Being drunke in Wine or any other convenient drinke. Corke is profitably used for many purposes, as stoppe all sorts of vessels, to peise fishermens nets, and to be put into shooes and slippers to keepe out heate warme and dry.

Chap. VII.

Smilax Arcadiæ major glandifera. The great Laurell Oke.

WHo the *Smilax* of *Ilex* divers have joyned this *Smilax* for some like nesse, but differing in most things untill now we to many of our moderne Writers for they still understood the Yewe tree to be meant by this name, and another of this there are two sorts, one greater and the other lesser, both which shall be shewed in this chapter.

1. *Smilax Arcadiæ glandifera major.* The greater Laurell Oke.

This greater kinde sheth up to a reasonable height like an indifferent tall tree, covered with a grayish smooth barke, and the younger branches with an hoary soft downe, the leaves are very like unto Bay leaves, or as *Theophrastus* saith like unto the smooth *Ilex*, being greene above, and with a fine white woolline nesse underneath, without any dents or prickles on the edges: it setteth yellow flowers on long stalkes as all other Okes doe, and fall away in like manner bearing small Acornes like the great Oke.

Smilax Arcadiæ glandifera major et minor.
The greater and lesser Laurell Oke.

Smilax Arcadiæ glandifera minor.
The lesser Laurell Oke.

The lesser differeth from the greater in that it groweth lesse, but ever remaineth like a low shrubbe, hath longer leaves then the former, and narrower also, but as white and woolly underneath, in other things they are alike.

The Place and Time.

They both prosper plentifully about *Constantinople*, and in many places of *Italy* and *Greece*, the other upon the hills about the City of *Rochell*, but sometimes in *Germany*, and flower and bear fruite when the other doe.

The Names.

The old Writers, and especially the *Arcadians*, as *Theophrastus* doth called this tree *Smilax* and *Smilax Arcadia*, but they doe not live in these Countries now, doe call both the Tree and the Acorne thereof *Asplano* by corrupting the word *Agrifolium*, as it is very probable. *Bellonius* saith that the tree, which the *Greekes* call *Asplano*, they of mount *Athos*, keeping the old name doe call *Agrifolio*, keeping the leaves alwayes greene, whereby *Belonius* thought how much we are mistaken herein, for *Theophrastus lib. 3. c. 8.* doth number *Ilex*, among the evergreene trees, such as the *Ilex* first beareth *Acylanos*, but not among such as beare soure hard berries, as the Service tree doth, unto the kindred whereof *Ilex* is referred by our moderne Writers, and besides *Theophrastus* in his 4. Booke and 8. Chapter saith, *Laurus duas similes habet*, so that this *Smilax* or Laurell Oke is most likely to be that *Acylanos*, and their *Aria* also, and but the wood hereof is white and soote as *Theophrastus* describeth differing from *Ilex*, which is firme and browne, it might be accounted a *Thyon* thereof, and *Cassius* doth referre the great *Ilex* that he saw in *Spaine*, to be this *Smilax* and so doth *Dioscorides* allow the vertues of both

Original from UNIVERSITY OF MICHIGAN

sorts of *Smilax* and *Ilex* peradventure mooving some what thereunto, for *Bauhinus* doth not account this *Smilax* to be a proper species of Oke at selfe, but putteth it among the *Ilices*, calling it *Ilex folio rotundiore molli margine spinoso sive Smilax Theophrasti*: the word *Smilax* is of a large extent comprehending under it divers sorts of trees and herbes, as fruit this *Smilax* of the *Arcadians*, which we therefore call *glandifera*, to distinguish it by a speciall epithete, from *Taxus* the Yewe tree, which is also called *Smilax*, but *taxifera*, the better to be understood: then is there *Smilax aspera*, or *Ivie* among the binde weedes, and lastly *Smilax hortensis* or *Dioscoridis*, which is accounted to be *Phaseolus* the kidney Beane.

The Vertues.

The Laurell Oke is of a like binding quality with the other sorts of Okes, as *Galen* sheweth in his 6. Booke and 2. Chapter, *de compos. medic. secundum loca*, where he doth shew whole things that are fit to ule for the meane inflammations of the pallate, appointing the decoction of Mirtles and the berries to be stronger remedies then were before remembred, as also of lowre Quinces, and likewise the young and tender branches of the *Ilex*, *Arbutus*, *Smilax* and *Phagus*, which *Cornarius* in commending upon seemeth to wonder at, that *Galen* should appoint the *Smilax*, which is *Taxus* a dangerous and deadly tree as *Dioscorides* and *Pliny* doe witnesse to be used inwardly, and thereupon thinketh that the *Taxus* may be safe dangerous in one place then another, and then that to be taken, as *Matthiolus* taxeth him for that opinion, saying that if he had taken better Counsell of his *Theophrastus*, with whom he was so conversant, who sheweth a kinde of *Smilax* that is like unto *Ivie*, he would have beene of a better judgement: and *Galen*, as you heare placeth it with other Acorne bearing trees.

Cap. VIII.

The Corke Oke.

THere are five sorts of the kindes of Okes, as *Dalechampius* in *Lugdunensis* hath diligently read and recorded, although *Theophrastus* and *Dioscorides* have made mention but of one, which shall briefly be declared here.

1. *Phellodrys alba cortice. Tab.* The narrow leafed white Corke Oke.

The first white leafed Corke Oke is the greatest reasonable great, and almost as high as the Corke tree, carried with a smoother and whiter barke, then the other Okes: the leaves are somewhat long and narrow, of some green and gray colour, cornered about the edges but not very deepely, and rather hard then tough, of the very and smith like taste, as they like, but the Acornes are of a darker yellow colour. There is also a broad leaved white leaves have no deale of very low the timber or wood is not so hard as the last, and not so red as the Oke.

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

2. *Phellodrys alba latifolia.* The broader leafed white Corke Oke.

This other white leafed Corke Oke is like unto the former in growth, and differeth in the barke, leafe and acorne of the tree, the leafe is white on the underside as the former, but broader then it, and little hard, and is dented also, the barke as well of the branches as of the Acornes, are of a blackish red colour.

3. *Phellodrys media viridis folio.* The greene leafed Corke Oke.

This greene leafed Corke Oke groweth not so high as the former, the barke of whole branches be grayish, the leaves are of a meane size, of a darke greene colour, and not at all white underneath, with but few sinpt or dents, and those not deepe, and very little prickly at the edges, the Acornes are of as bright a yellow colour as the last.

4. *Phellodrys major latissimo folio.* The broadest greene leafed Corke Oke.

This differeth from the last in the leaves, being larger and broader then the last, and more deeply sinued and very prickly, but greene as it is: the cups of all these Acornes are onely rough as the ordinary Acornes, and not prickly.

5. *Phellodrys muricata folio.* The prickly Corke Oke.

The prickly Corke Oke hath a grayish barke on the body and armes, the leaves are smaller, and of a pale greene colour, deeply sinued and with sharpe prickles: the Acornes hereof are like the other, but the barke or cup is much more prickly then any of the rest.

The Place and Time.

These doe all growe on the hilles neere the *Rhodanus* in *France*, in *Italy* also by *Senon* as *Matthiolus* saith, and in many places of *Portugall* also, where these two former sorts doe beare Galles likewise, they keepe the same time with the rest.

The Names.

It is called in Greeke ἔσκος *Phellodrys*, quasi *Subere quercus* in Latine, but *Theophrastus* saith it is a meane betweene the *Ilex* and the Oke, and therefore some did call it *Ilex femina*, But because the *Suber* or Corke tree is so like unto the *Ilex*, it may as well be said to partake of the one as well as the other. The first is the *Phellodrys* of *Matthiolus*, *Lobel* and others, and is the *Phellodrys alba angustifolia* sine *ferox* of *Lugdunensis*, the rest are onely mentioned in *Lugdunensis*, and *Pauli Renealmus* from him, the Greekes doe promiscuously call these sorts, ἔσκος, and they doe scale in the last Chapter. The *Italians* call it *Cerrosugaro*, as partaking of *Cerro*, and *Sugaro*, it is not distinguished by any *French* name that I know of.

The Vertues.

There is nothing remembred of the faculties hereof, but as *Matthiolus* saith, it is of the like properties, and little if not at all differing from the other Okes.

Chap. IX.

Castanea. The Chestnut Tree.

Although the fruite of the Chestnut tree is not an Acorne, yet because some of the ancient Writers have affiliated it thereunto, and have given it the name of *Sardinia glans*, I thought it fittest to joyne it next unto them, whereof there are foure especiall sorts, yet one is not of ours, but the new world, and there-

1. *Castanea vulgaris.* The ordinary Chestnut tree.

2. *Castanea sylvestris.* The Horse Chestnut

Alia, Castanea Peruana & Castanea humilis. The Chestnut of Peru, and the dwarfe Chestnut.

but I shall give you but a bare description of the Nut, and not of the tree untill we can learne more of it.

1. *Castanea vulgaris.* The ordinary Chestnut.

The ordinary Chestnut tree groweth very great and high, equalling many times great and large spread Okes, the leaves are long great rough and wrincled dented about the edges, the bloomings or catkins are long and somewhat like the Oke, but more greenish yellow: the fruite groweth betweene the leaves and the branches, towards the end of them, inclosed within three severall huskes, the outermost whereof is the whitish urchin prickly huske, hairy and smooth on the inside, which when it is ripe openeth it selfe, and sheweth the nut being flat on the one side, and round, bunched out on the other whose shell or huske is smooth browne, and shining as if it were on the outside and hairy within, tough also and not easie to breake, within which lyeth the nut it selfe, covered with the third huske, which is a thinne reddish, bitter skinne or peeling, the kernell being of a firme substance and white, sweete and pleasant in taste, formed somewhat like unto an heart: the timber or wood hereof rough and of a brownish colour. Some have made divers sorts hereof greater and lesser wilde and tame, but I do not hold them differences, but as the climate causeth it.

2. *Castanea Equina.* The Horse Chestnut.

The Horse Chestnut groweth likewise to be a very great tree, spreading great and large armes and branches: the leaves are very beautifull, set by couples, and divided into five, but most usually into seaven divisions, every one being dented about the edges: the flowers grow at the toppes of the branches, on long stalkes consisting of many white leaves a peece, the two uppermost whereof are larger then the two undermost, and have a round purplish violet coloured spot in the middle of the leafe, with many yellow threds and gold-yellow tips rising from the middle: the fruite is contained in rounder and thicker prickely huskes, the nut within this huske is rounder then the other, and covered with a thicker and browner shell, and having a whitish marke or spot at the end, where it is joyned to the outer huske: the nut within this shell is white, without any such thin skin or peeling as the former hath.

3. *Castanea humilis.* The dwarfe Chestnut.

The dwarfe Chestnut tree doth alwayes grow low in comparison of the former, being like in leaves and fruite unto the former, but that they grow more together, and the nuts are no bigger then Hazell nuts, having alwaies more then one inclosed in every prickely huske, and is unpleasant in taste, scarse fit to be eaten.

4. *Castanea Peruana.* The Chestnut of Peru.

What manner of tree this is that beareth these Chestnuts, or what forme the leaves carry that grow thereon, is not known unto me I thinke to any in these parts, I must therefore as I proceeded in the beginning shew you of the fruite the vessell round, yet a little pointed toward the stalke, covered with a thicke barke easie to be broken, yet somewhat spongie, of a darke or brownish yellow colour, under which grow a number of prickles, sticking to the inner barke, that covereth the nut or kernell it selfe, which inner huske is tough and hard to breake, and containeth within it a nut like an Almond out of the shell, both for colour and bignesse, but of the forme of a small Chestnut, and of a reasonable sweete taste like an Almond or the common Chestnut.

5. *Castanea Americana Catharticæ.* Purging Chestnuts of *America.*

The tree both *Monardus* groweth in the Continent of *America*, great and tall, whose fruite is like unto a Chestnut but that the outer huske is smooth and not prickly, not having any rough shell, but a thin skin that both covereth the whole fruite which is almost foure square, and divideth it in the middle into two parts.

The Place and Time.

The first growth on mountaines and in woods usually both in the South and Northerne Countries, but the former Countries for the most part breede the greater nuts. The second growth in the Eastern Countries of Asia, but the Christian world hath first had the knowledge of it from *Constantinople*. The third groweth not but from the Hill of Laon in *France*, called *Vallaret* hill, and not elsewhere as is knowne. The fourth in *Peru* about the Well Townes. And the last neere the shore of *Nuncagua*, &c. And flower in *April*, after the leaves be somewhat forth, the fruite ripe in Autumne.

The Names.

It is called in Greeke [illegible] and [illegible], *Castanea* and *Castanea*, and *Castanea* in Latine; the fruite is also so called. [illegible] *Castanea & Castanea Nuces*, that is, *Sardiane glandes Ivan glandes & Lopimæ*: It hath also some other names given it, as *Eubœide or Euboica*, and *Bernicia* [illegible], yet [illegible] calleth it out of *Theophrastus Nux avellana*.

avellana Agelochus as *Athenæus* saith, called it *Mosa* and *Amota*: *Pliny* maketh divers sorts hereof, adding names he giveth them should seeme, as *Tarentina, Salerniana, Metreana, Corelliana, Balanitis*, &c. When as the climate and soyle, make this diversity as it is in our dayes that the *French* and *Spanish* great nuts, that are of a sweeter relish are called *Marrons*, which hath caused *Matthiolus, Ruellius* and others, to set down two sorts of one to be wilde, and another tame, because one is greater then another. The first is generally called by all Writers *Castanea*, and the fruite *Nux Castanea*. The second is also called *Castanea esculenta*, by all Authours that have written of it, not being knowne as it is thought, to any of the auncient Writers, unlesse as *Columella* thinketh, it may be the *Myrobalanus seu balanobotanos* of *Pliny*, *lib.* 13. *c.* 21. The *Turkes* call it *Ac* or *Adacaruch*, which both signifie as much as *Castanea aquatica*. The third is called *Castanea humilis* by *Lugdunenses*, and *Joannes à Cleue* in his *Historia mundi*. The fourth is remembred onely by *Clusius*, who had it from *Theodorus Tarchon*, who received it from *Benedictus Arias Montanus*, brought out of the West Indies. The last *Monardus* called *Castanea Chalugensis*, and *Lac Dionysij* from him, but *Castor Durazzus, Castanea purgatrix*, and *Radicina* from him. The *Arabians* call it *Sadacastan Cafal* and *Sechules*, the *Italians Castagne*, the *Spaniard Marrons*, and so doe the *French*, as is before said, and *Castagnes* also, the *Germanes Kestin*, and the *Dutch Castanieboom*.

The Vertues.

Our Chesnuts are much of the property of Acornes, being hot and dry in the first degree, with a certaine windinesse in them, which is perceived by those that are put into the fire to roast, by skipping the coat suddenly with a great cracke or noise, but will not doe so if it be a little slit by thrusting the point of a knife into them, whereby the heate may expell the windinesse. Of all the kinds of Acornes saith *Galen* the Chesnuts are the best, and doe onely of all wild fruites yeeld unto the body commendable nourishment, yet not to be overmuch eaten, in that he saith they breede thicke blood, and being windy procure headache, are hard of digestion, and binde the belly by an astringent quality, whereof they partake not a little. The inner skinne that covereth the white nut is so astringent, that if the decoction thereof in wine or water, or the pouther thereof be taken in some convenient drinke it will soone stay any super-purgation, or any flux of blood in man or woman. *Dodonæus* saith that if the meale of Chesnuts be made into an Electuary with honey, it is very profitable for those are troubled with a cough or with spitting of blood. In many places where there are great store growing, they fatten up their hogges with the nuts as we doe in *England* with Acornes, and Beech-mast. The Horse Chesnuts are given in the East Country, and so through all *Turkie*, unto Horses to cure them of the cough, shortnesse of winde and such other diseases: the low or dwarfe Chesnuts by reason of the unsavoury taste, are not used by any: and the Chesnut of *Peru*, not recorded of what quality it is more then that *Clusius* as is before said, saith the taste is like an Almond or ordinary Chesnut. The last sort *Monardus* saith purgeth gently, and choller especially, eaten when it is rosted, or boyled and drunke in Wine, but being dryed the pouther is given in broth, and if it be rosted it purgeth the lesse: but this is to be observed saith he, that the thinne skinne is to be taken away howsoever you take it, least it procure vomittings, laskes, and other daungerous symptomes.

CHAP. X.

Fagus. The Beechtree.

BEcause this tree beareth fruite somewhat like unto a Chesnut, having beene reckoned also a kinde of Acorne bearing tree, I thought it meete to place it next after the Chesnut, both because it is found growing in woods among Okes, and that the fruite serveth as Acorne mast to fatten the Swine. *Theophrastus* maketh two sorts, *mas* and *fœmina*, the former white, the other blacke, but wee can finde no such diversity in those that grow with us. Our Beech therefore groweth to be a great and tall tree, spreading the boughes and branches on every side, whereby it maketh a goodly large shadow, and if it be shred below to make it spring up higher, covered with a smooth white barke, whereon are placed many broad smooth leaves almost round yet pointed at the end, and a little finely dented about the edges, of a sad greene colour, which usually turne yellow before they fall away, and whereon are often found certaine small round hollow berries pointed at one end, greene at the first and red afterwards, wherein are found small wormes. The blowing or eatkins are small and yellow, like those of the birch tree, but lesse, and quickely falling away. The fruite is contained in a rough huske somewhat like the Chesnut, but not prickly sharpe at all, which being ripe openeth it selfe into three parts, and sheweth a small three square nut, covered with a smooth tough skin, browne: then next the nut, and under it a sweete white kernell like the Chesnut, but more astringent: the roots grow not deepe, but yet spread farre, the timber is smooth and white, but brittle, yet profitable to many uses.

The Place and Time.

This groweth through moste Woods in *England*, among the Okes and other trees, and is planted also in Parkes, Forrests, and Chases, to feede their Deere, but in other places to fatten Swine, whose fat will not be unlike theirs that are fatted with Acornes: it bloometh in the end of *Aprill* or beginning of *May* but in a moist place and the fruite is ripe in the end of *September*.

The Names.

It is called in Greeke *Fegos*, in Latine *Fagus*, *Gesner* translateth it *Scissilis quod fit in Latina scissione* [illegible] easie to be cloven: yet he also translateth the word of *Theophrastus* which he numbreth among the Okes [illegible] cus, whose ill sample *Tragus, Fuchsius, Ruellius, Matthiolus Dodonæus*, and almost all other Writers that [illegible] his time have followed as I said before in the Chapter of Okes, whose difference many yet have acknowledged, but none before *Dalechampius* have plainely detected. Another errour also hath spread among many [illegible] cedes or *Aegilops*, *Ostrys* or *Ostrya* of the Greekes, whereof *Pliny* speaketh *lib.* 13. *c.* 22. to be this *Fagus* but *Scaliger* [illegible] eth plainely in the description of *Ostrys* that the fruite or seede is like unto Barley, which they would [illegible] make it to be like the Chesnut, thus one errour begetteth another: but *Ostrys* or *Ostrya*, as shall be shewed [illegible] after is rather a kinde of Elme, yet unproperly he calleth it *Carpinus*, when as the *Carpinus* of the ancients [illegible] kinde of Maple, as shall be shewed, and *Dodonæus* to mend the matter placeth the *Ostrys* among the Maples, under the

the name of *Carpinus*: but the truth is that there are among them three severall trees, and *Carpinus* the fourth, of severall kindes, and not to be so confounded together. The Italians call it *Faggio*, the Spaniards *Haia*, the French *Fou*, *Foulliean*, and *Hestre*, yet *Belonius* in the 52. Chapter of his 9. Booke of Observations doth distinguish it from *Foulliean*, saying that the Greekes *Fagus* is The *Prunelier Haistre* & their *Orya* the *Tremble Foulliean* (of them growing wilde in the woods, upon the mountaines or hills not *Sylvestris* in Valleys) the Germans call it *Buchbaum*, the Dutch *Beuckenboom*, and we in English Beeche.

The Vertues.

The leaves of the Beeche tree are cooling and binding and are therefore applyed unto hot swellings to discusse them: the nuts are hot and dry in the 3. degree, and greatly nourish much all creatures that feed thereon. *Serapio Grecianus* writeth, that the ashes of the wood is good to make glasse. *Dioscorides* saith, that he hath proved by good and often experience, that the water that is found in the hollow places of decaying Beeches will cure both man and beast of any scurfe or scabbe, or running sores, if they be washed therewith. *Rondelet* reporteth that if a Viper or Adder be stricken with a rod of the Beech tree, and the blow onely put unto it, it hath such power as to stay the Viper from getting away while it is by it: the barke of the Beech tree is so flexible, that many Country people do double it, with a hicker thrust through both ends at the toppe, to carry Cherries, Strawberries, and many other such like things therein, which *Pliny* also noteth was used in his time.

Figur Tree.

Chap. XI.

Ulmus. The Elme.

Theophrastus, *Columella*, and many also of our moderne Authours, have made mention onely of two sorts of Elmes, *Plinie* hath made foure sorts, which notwithstanding may be reduced into the former two: we have observed in our Country three sorts, and Master *Gerarde* a fourth, besides another very like unto them, but yet notably differing, which shall therefore (as it is due) come in the Chapter following by it selfe.

1. *Ulmus vulgaris.* Our common Elme.

The Elme which is most frequent and best knowne in generall throughout the Land, groweth more upright, and not so much spreading as the rest, to be a very great tree, with a body of a very large size covered with a long rough barke, chapt or cranked in many places: but that on the branches is smoother, the blossoms that appeare before the leaves come forth are like small tufts of red threds, which falling away there come up in their place broad flat whitish skinnes, which are the seed-vessels not much unlike to the seede of the white Garden Orache, which doe fall away by degrees, some quickly, and some holding on a good while after the leaves are fully come forth. The leaves are of a sad greene colour, broad, some what round and pointed at the the ends, rough and crumpled but not very sore, and dented about the edges, one side of the leafe next to the stalke being longer then the other, and more eaten by all sorts of cattle then any of the rest, having certaine small bladders or blisters thereon, which containe small wormes in them: the wood or timber hereof is of a darke reddish yellow colour, and very tough, fit for many uses, where it may be either continually wet or dry, but not enduring both so long together.

Figur Trog prii floribus

2. *Ulmus laciniata folio.* Broad leafed Elme or Witch Hafell.

This other Elme groweth also to be as great a tree as the former, but it spreadeth the branches more and falling downe at ends, not growing so upright as the former, the bloomings and seed hereof is like the former in all things save that the leaves hereof are much larger then it. But crumpled and rough or hard, and like unto the leaves of the Hafell tree, from whence it became to be called Witch hafell, and hath such like bladders thereon as the former: the wood or timber of this is not so tough as the former, but is more short and will be more easily split.

3. *Ulmus folio glabro.* Smooth leafed Elme or Witch Elme.

The Witch Elme groweth more like to the last then the first, in the bending boughes and great body, the blossoms and seede also, like though lesse: but the leaves hereof are nothing so large as the last, but neerest in bignesse unto the first yet not rough or crumpled but smooth and plaine and without any blisters on them, as the former two have, the timber hereof is as strong and as tough as the first or rather more, and is accounted of workemen the stronger and more serviceable kinde.

3. *Vlmus minor*. The lesser Elme.

There is in some places of this land found a sort of Elme somewhat differing from those before, in that it groweth lower and lesser, and with smaller leaves that are as rough on both sides as the first, and seme to be distinguished if they be heedefully observed.

The Place and Time.

All these sorts are as is said, found in our owne Country yet the first is the most frequent, and the second in some Countries as much or rather more then the first, the third is to be seene in many woods in *Essex*: they all flourish as is said before the leaves come forth, and the seede not long after them full spreading at large.

The Names.

It is called in Greeke πτελέα in Latine *Vlmus*, *Theophrastus* and *Columella*, as I said, mention but two kindes of the *Mountaine*, or *wood Elme*, and *champion Elmes*, *Columella* both *Dony Cattes*, and *Pontedera*, which *Matthiolus*, *Dony* hath foure sorts, *Artimo*, *Italica*, *Nostras*, and *Spinosa*, which will hereon reduced into the number of his *Artimo* and *Galica*, are both one sort, as *Columella* plainely setteth downe, and is the same with *Theophrastus* his *montana*, which is *excelsissima*: *Pliny* his *nostras* and *sylvestris* are both one, like wise, and the same with *Columellas Vernacula*, which as I said is called *Italica*, and the same also with *Theophrastus* his *ampestris*, so that our third sort with smooth leaves, was known to none of these, nor yet scarce to any of our moderne Writers, unlesse they put it for the *Carpinus* as it is usually called, or for the *Ornus* as *Tragus* doth, as shall be shewed in the next Chapter: so that our first here set downe agreeth with the *Artimo* of *Pliny*, *Italica Columella*, and *Mont of Theophrastus*, and our second with the *campestris* of *Theophrastus*, *Pedemontana* of *Columella*, and *nostras* or *sylvestris* of *Pliny*, and called also *latifolia* by divers, but *Dodonæus* in his Indgement doth much confounded them, putting one for another, the seede of the Elme is called *Samara*. The *Arabians* call it *Dulaar*, *Dardar*, and *Lanach*, the *Italians Olmo*, the *Spaniards Olmo*, the *French Orme*, the *Germanes Rusta*, *Ulmbaum*, *Ilsenholtz*, and *Landolf* in *Prussia* saith, the *Dutch Olboom*, and we in *English* Elme tree.

The Vertues.

All the parts of the Elme are of much use in Physicke, both leaves, barkes, branches and roote: the leaves while they are young were wont to be boyled or stewed, and so eaten by many of the common people. *Matthiolus* saith the leaves hereof boyled with some pepper, and drunke in Malmesie doth helpe an old rotten cough to a perfect falling. Both *Dioscorides* and *Galen*, upon his owne experience say, that greene wounds are healed by applying fresh boyled leaves thereto and bound upon with the barke of the Elme or Linden tree, or with it owne barke: the leaves salted with vinegar cureth the scurfe and lepry very effectually, so doth the barke also in vinegar as *Galen*, *Dioscorides* and *Columella* do both say, that the outer bark of the Elme drunk in wine hath a property to make leane, which I know of none in our time hath tryed to confirme it: the decoction of the leaves, barke or roote being bathed, healeth broken bones: that moisture or water that is found in the bladders on the leaves, while they be fresh, is very effectually used to cleanse the skinne and make it faire, whether of the face, or of any other place. *Matthiolus* saith, he hath sufficient tryall that the water in the blisters on the leaves, if clothes often wet therein and applyed to the nipples of children will helpe them, and they after well bound with a truffe. The said water put into a glasse and set in the ground, or else in dung for 15. dayes, the mouth thereof being close stopped, and then the bottome set upon a lay of ordinary salt, that the feces may settle, and the water become very cleare, is so singular and soveraigne a balme for greene wounds, that it is a wonder to see how quickly they will be healed thereby, being used with soft rents: the decoction of the barke of the roote fomented, mollifieth hard tumours, and the shrinking of the sinewes: the rootes of the Elme boyled for a long time in water, and the fatty scume in the toppe of the water being cleane scummed off, and the place annointed therewith that is growne bald, will the haire raine away, will quickly restore them againe: the said barke ground with honie or pickle and laid on it, serveth for some of a pulcis and laid on the place pained with the gout, giveth a great deale of ease. It hath been observed that Bees will hardly thrive well where many Elmes doe grow, or at least if they upon their first going forth after Winter doe light on the bloomings or seed thereof, for it will drive them into a loosenesse that will kill them all, if they be not helped speedily.

Chap. XII.

Of a fine Elme *Theophrasti*. The Horne beame tree.

This tree which as I said before, is so like unto the Elme, but notably differing from it, sheweth up to be a reasonable great tree with a whitish rugged barke, spreading well, and bearing some what longer and narrower leaves then the ordinary Elme, and more gentle or soft in handling, resembling in some sort the Beech leaves, turning yellow before they fall. For which cause some have reckoned it a kinde of small Beech: at the end of the branches hang downe a large tuft of whitish greene coarse and long leaves, being almost three square set together, among which the small seede is contained, small yellowish seede like unto barley corne, the timber or wood hereof is also like the Beech but tougher and stronger then any Elme and more durable in any worke, growing as hard as Elme, so as some use it for *English* Elme.

The Place and Time.

Lobelius setteth forth another sort differing in the heads of seede which in *Italy* are smaller and closer, *Lobel. Icones.* in *Germany*, and with us more loose and larger.

The Place and Time.

This tree is in many Countryes in this Land, where as I said some take it for a kinde of Beech, and some for a kinde of Elme: the tuft of leaves appeareth in *June*, and is ripe in the end of *August*, or in *September*.

The Names.

This tree hath found almost as many names as there have beene Authours that have written of it, but by the description of his leafe in the 3. *booke of trees, of Theophrastus*, which he describeth so plainely in his third booke and 12. Chapter, that it is a wonder that so many learned men as have called it otherwise should not better heede the same by curiosity or conceit have rather taken it to be any other thing then what it is. *Pliny lib. 13. c. 12. de-*

ſcribeth it but maketh it like to *Fraxinus* which is an error in him, when he ſhould rather have ſet *Fagus*, for it no way reſembleth the Aſh, but very much the Beeche. *Tragus* taketh it to be *Ornus*, and ſaith he cannot agree to *Fuchſius*, who ſaid that *Ornus* was a ſpecies of *Fraxinus*; *Anguillara* calleth it *Carpino* whereas *Pliny* ſheweth that *Carpinus* is a kinde of *Acer*, yet *Dodonæus*, *Lobel*, and others, call it ſo after him. *Dodonæus* alſo in making this to be *Carpinus*, he calleth it *Coſta quæ conjungit* of *Pliny*, and *Gerard* doth the like *verbatim*, his Corrigher letting him to paſſe as if it were no fault or errour in him, when as the true *Carpinus* or *Zygia* is not knowne what tree *Pliny* meant by it; for the other Maples that are knowne, are in leaves one like another, yet *Dodonæus* in his *Dutch* Booke maketh it his third kinde of Elme, and doubteth if it be not the *Ulmus ſylveſtris* of *Pliny*. *Lugdunenſis* giveth him the figure of it for *Ulmus Aſtrina*, but *Cordus* or *Dalechampius*, as I ſaid before, as I take it, firſt tooke it to be *Oſtrya* and ſo *Geſner* after him, and *Bellonius*, *Thalius*, *Cluſius* and *Camerarius*, doe all hold it to bee the right, and ſo call it, yet *Geſner* in horto calleth it *Fagus ſylveſtris*, *Lobel Botanicus*, and *Cluſius Fagulus herbariorum*. The *Italians* call it *Capino* according to *Matthiolus*, and the *French* in a kinde to be *Carpine*, ſo it *Charme* and *Charpine*, but *Cluſius* ſaith that his Country men of *Artois* called it *Heſtre*, the *Germans Hainebuchen*, and *Hagebuchen* or *Hainbuchen*, and we in *Engliſh* Hornbeame, and Hardbeame tree.

Oſtrya ſive Ornus Theophraſti.
The Hornbeame tree.

The Vertues.

We have not learned that any Author hath knowne this tree to be applyed to any Phyſicall uſe, but as a wood for many neceſſary imployments, both for Milles and other ſmaller workes in good account for the hardneſſe, ſtrength, and durability.

CHAP. XIII.

Tilia, The Line or Linden tree.

THe Line tree is accounted to be of two ſorts, the male and the female: that which we call the female is in great requeſt both for the large growth and goodly verdure and greene ſhade that it maketh, as alſo for the ſweete ſent it yeeldeth, eſpecially in the blooming time, when as it is much pleaſure to reſt under it, beſides the Phyſicall vertues, but the male as it is more ſtrange and leſſe ſeene, ſo likewiſe of leſſe reſpect and uſe, beſides that many doe ſuſpect it not to be a *ſpecies* thereof, but rather a kinde of Elme, it is ſo differing in forme and ſubſtance.

1. *Tilia mas.* The male Line tree.

The male Line tree groweth to be a great tree, and ſpreadeth the boughes largely, yet not ſo much as the female, covered with a thicker barke, nothing ſo flexible and fit to binde things withall, becauſe it is harder and more eaſie to breake: the leaves are ſomewhat like unto Elme leaves but ſomewhat ſmaller and longer, hard in handling and on every one for the moſt part grow ſmall bladders or bliſters, full of ſmall wormes or flyes, which being ripe doe flye away, (but *Dodonæus* ſaith it to have any bladders on the leaves, and that they are deceived which ſo picture it, but he might be deceived therein, for although tranſplanted it bore none, yet naturally it uſeth) this very ſeldome beareth either flower or fruite, and therefore it is held to be barren, not bearing any fruit: yet when it doth beare, it carryeth round and flat huskes, many growing cloſe together, each whereof hangeth on a ſmall long footeſtalke by it ſelfe, with a notch or cleft at the head or end: the wood or timber hereof is harder, more knotty alſo and yellower then the female, and comming never into the Elme, whereupon many have judged it to be rather a kind of Elme. *Bauhinus* maketh another ſort hereof with longer leaves, which he thinketh to be that which *Thalius* ſaith downe in his *Hercynia ſylva*, to have found there wilde, and calleth *Tilia ſylveſtris foemininæ*, but ſurely I thinke it differeth not from *Tragus* his *Tilia ſylveſtris*, which both he and *Bauhinus* reckon a *ſpecies* of the female kinde, and therefore cannot fitly be referred to the male, becauſe he never bare fruite.

2. *Tilia foemina major.* The greater female line tree.

This greater Line tree groweth greater then the former (eſpecially if it ſtand in good ground, for I ſaw it at Hoo in Kent, a tree whoſe branches were led into two ſeveral arbours one above another, before any of the ground under the branches, which was a goodly ſpectacle, and a large ſhadow that it yeelded) covered with a darke coloured barke, the next thereunto being very obſequious, and pliant to bend and binde, having likewiſe other thin rindes within it, whereof are oftentimes made baskets, and as *Bellonius* ſaith, the Gardiners doe uſe it, which being pitched or lined with melted roſſin, ſerve to carry wine or water in boats place to place, as alſo to make cords, ropes or the like: the leaves are faire and broad, greener, ſmoother, gender and rounder then Elme leaves, but with a longer end, dented alſo about the edges and of a reaſonable good ſent: at the ends of the branches oftentimes, and from the foote of the leaves alſo, come forth long and narrow whitiſh leaves, alongſt the ſide

2. *Tilia mas.* The male Lime tree.

3. *Tilia fœmina major.* The great female Lime tree.

the tilbe whereof fucingeth out a ſlender long ſtalke, with divers white flowers thereon, ſmelling very ſweete after which follow ſmall berries wherein is contained blacke round ſeede: *Gerrard* ſaith it beareth corned large pointed eares of the bigneſſe of Hatell nuts, (but ſuch I never ſaw) and ſaith that the male kinde doth bear round pellets clulbring together like Ivy berries, wherein is blacke ſeede, wherein bee transfereth that to the male kinde, which is proper to the female: the wood is whitiſh ſmooth and light, the coates whereof is beſt to make Gunpouther withall. At the rootes and under the old trees of this Linden, *Tragus* ſaith he ſometimes obſerved to grow a certaine Excellence like unto the Oke grape, whereof he knew no uſe.

Pro Lucubrationibus ſuis.

3. *Tilia fœmina minor.* The ſmaller female Lime tree.

This taller Lime tree agreeth with the laſt in all things, ſaving that it groweth ſmaller both in body, leaves and flowers, the leaves being of a darker greene colour, and beareth no fruite after the flowers, becauſe they appeare later then the former.

The Place and *Time.*

They all grow on the hills and high grounds, yet for the moſt part in the moiſter places and are often found alſo with us, as the greater female kinde is planted in many places of our Land, chiefly for the large ſweete ſhadow it maketh, and flowreth uſually in *May*, the other are very great ſtrangers in this Land, ſcarce to be ſeene any where.

The Names.

It is called in Greeke *φιλύρα*, but not *φίλυρα* as *Pliny*, that confounderh *Diſcoridis* his *Philyrea*, with *Theophraſtus* his *Philyra*, ſo called becauſe it is brought into *tenues aſſulas ſive philyras* ſmaller then the eares of leaves, and with thoſe they uſed to write on: in Latine *Tilia*, the one is called *mas*, and the other *fœmina* by *Pliny*: but ſtrict *Varro* adioyneth unto the rule of the *mas*, *Ulmiſolia*, and further ſaith, that the figure thereof reſemble eares of the Elme then of it. *Tragus* onely and *Cæſar* in *Italy* have made mention of the laſt, as of a thing farre from the ordinary female kinde. The *Italians* call it *Tilio*, the *Spaniards Tiler*, the *French Tillet*, *Dutch Tiel*, the *Germans Linden*, and *Lindenbaum*, for the ſmoothneſſe and ſoftneſſe thereof, the *Dutch Lime*, and *Limentree*, and we thereafter the Line or Lindentree, and in ſome places, broad leafed Elme. *Pliny* in the 12. Booke and 15 Chapter, ſheweth that among the *Tabarni*, the Line trees were ſeene to beare ſundry ſorts of fruits for on one tree grew Nuts, on another Grapes, on another Peares or Figs, or Pomegarnets, and divers ſorts of Apples, for they all were knit of long continuance.

The Vertues.

The male kinde is quite without uſe for any thing that I know, nothing being extant thereof in any Authors writings. The female is of much uſe, for the decoction of the leaves is a good Lotion to waſh ſore mouths, or that have canckers in them: the leaves alſo being bruiſed after the boyling, and applyed to ſores, or ſcabs that have rumours in them by falling of humours, doth much helpe them. The inner rinde likewiſe performeth the like effect: the flowers of the Line tree, and of Lilly Convall, being diſtilled together, the water of them is much commended againſt the falling ſickeneſſe: the diſtilled water of the

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

the barke is of the same effect, and is also of very good use against the fretting humours that cause the bloody flixe or griping paines in the belly: the said inner barke being steeped in water for a while, causeth the water to become thicke or *mucilaginous*, which being applyed with clothes wet therein, will helpe any place that is burned with fire: the wood or coales of the Lime tree while they are burning hot quenched in vineger, and afterwards ground with a certaine thing or drugge, called *Oculi cancri* and drunke, is found by good experience to be wonderfully good for those that by some fall or bruise, or by blowes doe spit blood: *Turner* saith that he thinketh the flowers hereof, whereon Bees doe much delire to feede are good for them.

Chap. XIV.

Betula. The Birch tree.

The Birch tree groweth to be a goodly tall straight tree with his straight withie boughes, and other slender branches, bending downewards, the older ones being covered with a discoloured rough chopped barke, and the younger being browner by much, under which there is another rinde or barke, much used to write upon, before paper was used: the leaves at their first breaking out are crumpled, and after are somewhat like unto Beech leaves, but smaller and greener, and dented also about the edges: it beareth small and short catkins, somewhat like to those of the Hasell nut tree, which abide on the branches a long time, untill growing ripe they fall on the ground and their seede with them.

Betula. The Birch tree.

The Place and Time.

This usually groweth in woods, as well on the higher as lower and moist grounds, every where generally throughout the land, the catkins come forth in *April*, and the leaves soone after, the seede is ripe in *September*.

The Names.

It is called in Greeke σανδὶξ by *Theophrastus*, lib. 3. c. 14. yet he giveth it to be *fœmina Caryæ*, and some read ἔστι δὲ καὶ ἡ σανδὶξ καρυα but others doe thinke that it should be *fœmina Oryæ*, whereunto it ally agreeth in Latine *Betula*, and with some *Betulla fœmina quæ bituminis fructum*: all Authours call it *Betula*. The *Italians* call it *Betiola*, the *French Boulean* and *Bet*, the *Germanes Birchenbaume*, the *Dutch Berckenboom*, and wee in *English* Birch tree.

The Vertues.

The Birch is in our dayes applyed to little physicall uses, yet the juyce of the leaves while they are young, or the distilled water of them, or the water that commeth out of the tree of it owne accord, being boyled with an vrget, or distilled afterwards, any of these being drunke for some time together, is held available to breake the stone in the kidnies or bladder, and is also good to wash sore mouths: a lye made of the ashes of Birch tree barke, is likewise all for the same purposes. Many other (I will) use the birch in pastimes, as fit to decke up houses and arbours, both for the fresh greenesse and grand beauty it affords, it serveth to make hoopes to binde caskes withall; the young branches being tough, are writhed, and serve for bands unto faggots: of the young twigges are made brooms to sweepe out houses, as also rods to correct children at schoole, or at home, and was an ensuing chastisement by the Lictors or Sergeants before the Consuls in the old *Romane* times, with which, and with axes borne in the like manner, they declared the punishments for lesser, and greater offences, to their people.

Chap. XV.

Alnus. The Alder tree.

Besides this Alder, I have to shew you two or three varieties more then others have expressed, which are these following:

1. *Alnus vulgaris.* The usuall Alder tree.

The ordinary Alder tree groweth to a reasonable height, and spreadeth much, it is like unto that covered with a brownish barke, and the wood under it more red then Elme or Yew: the boughes are pliable whereof are more brittle then any other wood that groweth in or neere water: the leaves are round, full of ribs, rugged, thicke and clammy, by reason of a sticking dew that continually lyeth upon them, very finely and dented about the edges, somewhat like unto the leaves of the Hasell tree, but of a darker greene colour: it beareth short brownish agiets like the Beech or Birch, which fall not away before the seede is ripe within them, and

Alnus vulgaris. The small alder tree.

Fol. and berry of the same.

...ard they are hard and holy, a little long and round ...ewes Olive: the timber is everlasting, if it be ...ed under the water or in a watry moist place, for being ...ade into piles it is the surest and strongest to uphold ...ridges, or building thereon, but it is quickly subject ...o rot if it be kept dry. Under this Alder in sundry places ...found such a like Excrescence, as is the Oke Grape, ...ewes with these is another sort observed whose leafe ...nger then the ordinary sort, nor differing in any thing ...se.

2. *Alnus folio asperiore.* The hoary Alder.

The hoary Alder is a taller tree then the common sort, ...e barke is whiter, and leaves likewise are somewhat ...ger greener, and more pointed then it, not so greene ...d shining on the upper side, but hoary, by reason of the ...all hairs are to be seene thereon if they be well observed, ...ke the fore, but much more hoary underneath, this ...oweth to be of an ash colour, the footstalkes of them ...ewise hoary in like manner, the catkins or aglets ...ewise are shorter and not so round as the former, but ...ewhat long until it have given ripe seede.

3. *Alnus Alpina minor.*

The small Mountaine Alder.

The small Alder, groweth in each part like the com...on Alder, but lesser and lower both in leafe and other ...s, and hath not the leaves bedewed with so clammy ...ceadure.

The Place and Time.

...ese trees and Time are in a manner sufficiently ex...ressed in their descriptions, to be delighted to grow in ...ist woods and in other watery places and the last upon ...ks in the Alpes, flowering in *April* or *May*, and giving ...e seede in *September*.

The Names.

...ey are called in Greeke by *Theophrastus* ἄλνος, but not ...derstanding *Dioscorides* or *Galen*, in Latine *Alnus quasi ...ine sine vino*; *Theophrastus lib. 3. cap. 8.* saith this tree is ...ren, *Pan* from him, that it beareth neither flower nor seede, and yet in the fifth Chapter of the same booke ...e writeth among other trees, when their fruits is ripe, that the Alder, the Wallnut, and a kinde of Peares, doe ...en in Autumne, which declareth that he is contrary to himselfe, in saying it is barren: Some of the Poets fai...ed that the three sisters of *Phaeton*, after three moneths mourning for their brothers death, whom *Apollo* ...ew with thunder for ill guiding the Chariot of the Sunne, were turned into Popler trees, but *Ovid* in his second booke ...*Metamorphoses*, and *Virgil* in *Bucolicis Eclogo sexta*, in these Verses following sheweth (yet both true alike) that they were Metamorphosed into Alder trees.

Tum Phaetontiades nostra circumdata arbore sorores
Corticibus, atque solo proceres erigit Alnos,

The first is called *Alnus* and *vulgaris* by all our moderne Writers, but onely *Gesnerus*, who calleth it *Amelanchier*, as he doth the *nigra* or *lucifera Asperum*. The second is call *Alnus altera* by *Clusius*, but giveth *Lobel* his figure of the ordinary *Alnus* here in, as the new *Gerard* doth also: but *Ruellius* in his *Cynethiologie* giveth the true figure of it, set forth by himselfe as I there called it *Alnus hirsuta*. The last is remembred onely by *Ruellius* by the same name as in the title. The *Italians* call it *Alno*, and *Ontano*, the *Spaniards Aliso*, the *French Aune*, the *Germans Erlenbaum*, and *Elsenbaum*, the *Dutch Elsen*, and we in *English* Alder, and Alder tree.

The Vertues.

The leaves and barke of the Alder tree, are cooling, drying and binding: the fresh leaves laid upon tumours ...olveth them, and prayeth the inflammations: the leaves put under the hore feete of travell'rs, that are turba...d with travelling, are a great refreshing unto them: the said leaves while they have the morning dew on them, ...ed in a new earthen pot covered with fleece wooll gather them thereunto, which being quickly fall out, will kindle the ...mours or coales of the fire is made a blacke dye, for the coarser sorts of things, and with it, or the greene ...ry, and galles, is made writing incke, by adding gum and copperas to it.

Chap. XVI.

Populus. The Poplar tree.

The Poplar is by both Beeche auncients accounted, but of two sorts, blacke and white, but by *Pliny* di...ided into three sorts, the white, the blacke, and the Libian or Aspen tree, unto these I must adde ...o other sorts set *Lobel*, which are as followeth.

1. *Populus alba.* The white Poplar tree.

The white Poplar tree groweth great and reasonable high, covered with a thicke smooth barke, and ...ery plentifully shebranched, having large leaves cut into severall divisions, almost like unto a Vine leafe, but not

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

of so deepe a green on the upper side, and hoary white underneath, of a reasonable good sent, the whole forme representing the leafe of Coltsfoote: the catkins which it bringeth forth before the leaves, are long and of a faint reddish colour, which fall away like unto others bearing seldome good seede with them: the wood hereof is smooth, soft, and white, very finely waved, whereby it is much esteemed and used in many workes. Under this tree also is found sometimes the like tree or berries but are found under other trees.

Vua passa-lina.

2. *Populus alba minor Cæsij.*

The smaller leafed white Poplar tree.

This other white Poplar groweth like the former, but the branches are more knotted than the former, and the barke more rough and white: the leaves some what of the ends of the branches and springs being somewhat smaller and lesse divided on the edges, and not so much dented or cut in, but ending in a brown hairy point.

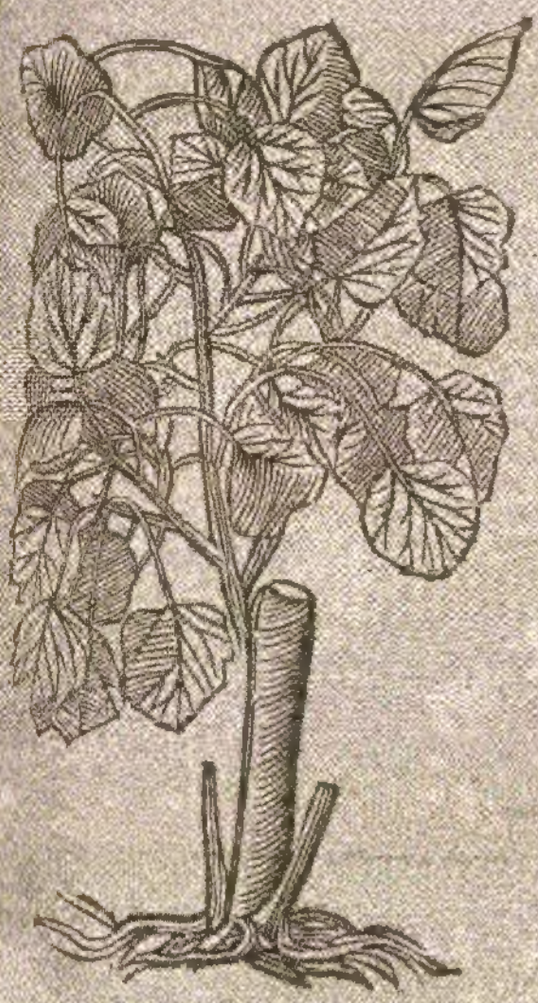
3. *Populus nigra.*

The blacke or dyers tree.

The blacke Poplar groweth rather higher, and straighter than the white, with a grayish barke, bearing broad and greene leaves, somewhat like to Sycamore leaves not cut in on the edges like the white, but wider and denter, ending in a point, and not white underneath, hanging on slender long foote stalkes, which with the wind are almost continually shaken, like as the Aspen leaves are: the catkins hereof are greater than of the white, composed of many round greene heads set together in a long

4. *Populus tremula folio.*

The smaller leafed trembling Poplar tree.



2. Populus alba. The Maior Poplar tree.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

4. *Populus Lybica.* The Aspen tree.

5. *Populus rotundifolia Americana.* The round leafed Indian Poplar tree.

cluster: wherein is much downy matter contained, which being ripe is blowne away with the wind: the eyed or clammy buds hereof, before they spread into leaves (and not of the white, as some have thought, nor yet the *Fue*, or berries that each of them have growing under them) are gathered to make the *Pugnentum Populeon*, and are of a yellowish greene colour, and smell, somewhat sweete but strong: the wood is smooth tough and white, and will quickely be cloven to make thingles or cleft pale or the like. On both these trees groweth a sweete kind of Musake, which in former times was much used to be put into sweete oyntments, and commended by *Galen* and others to be the best next unto that of the Cedar tree.

4. *Populus Lybica.* The Aspen tree.

The Aspe is somewhat like unto the blacke Poplar for the growing, but lesser then either it, or the white, and with a darker coloured barke: the leaves are also blacker, harder and rounder then those of the other, and a little unevenly dented about the edges, and in some places spotted with white spots hanging by longer and slenderer foote stalkes, which by their continuall shaking and striking one against another, make a noyse although the aire be still: the catkins or tagge are longer, and of a brownish ash colour, which continue a while and then fall away with the seede in it: the wood is white but nothing so tough. This tree saith *Pliny* hath the best Mushromes growing under it.

5. *Populus rotundifolia Americana.* The round leafed Indian Poplar tree.

The branches only of this tree were brought from the West Indies, unto Mr. *Aldergate*, who was Queene *Elizabeths* Apothecary, and by Doctor *Lobel* caused to be drawne to the life, which he exhibited in his *Adversaria* and *Dodoens Herball*, the branches were a little crooked, full of joynts, at three or foure inches distance, and at each joynt a round leafe without any dent on the edges, but where it is set on the short foote stalke, being thicke rougher and broader then the leaves of *Arbor Iudæ*: at the setting on of every which leafe commeth forth a small long catkin like a thong compassed with many small graines much resembling those of the Poplar for which cause he called it a Poplar, the taste whereof was very astringent, somewhat heating and salt.

The Place and Time.

The former two trees grow in moist woods, and by waters sides in sundry places of the land, yet the white is not so frequent as the other. The last is declared of what Country breeding it is: their time is likewise expressed for the catkins come forth before the leaves, and ripen in the end of Summer: but it should seeme that the last hath leaves that fall off altogether.

The Names.

The white Poplar is called in Greeke λεύκη, because of the whitenesse, in Latine *Populus alba*; and *Forsyrus* of the Arabians: the blacke is called αἴγειρος *Populus nigra*, but with *Tragus* it is his first *Populus alba*, the Aspe is taken by many good Authours to be ἄσπις of *Theophrastus*, because he joyneth it next unto the two former, *lib. 3. c. 14.* saying it is like unto the white Poplar, which may breede some doubt whether he meaneth the Aspe or no, which hath no such divided leaves as the white hath, *Gaza* translateth it *Alpina*, which it seemeth he doth from *Pliny*, who

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

who called it *montana*, as well as *Lybica*, the other are expressed to be of *Lobel* his declaration, not of none before him, *Homer* in his fifth *Iliad*, calleth the white Poplar *ἐρίβοιαν*, because when *Hercules* had overcome *Cerberus*, he came crowned with this Poplare branches, which he found growing by the riuer *Acheron*, in triumph of that victory, and from his example, all that with glory have conquered their enemies in fight, vse wont to weare a garland of the branches thereof; their error that *Serapion*, yellow *Abele* was the same of the blacke Poplar is so ridiculous, that but to name it is sufficient confutation, especially seeing *Matthiolus* hath done it before. The *Arabians* call the white and blacke Poplar *Haur*, and *Haurcomi*, the *Italians Populo bianco* and *nero*, the *Spaniards Alamo blanco* and *negrillo*, the *French Aubau*, and *Peuplier*, and *Tremble*, the *Germanes Pappel*, *Espenbaum* and *Seebaum* the *Dutch Abeelboom*, and *Populier* and *Espe*, and we in *English*, the white and blacke Poplar tree, and the other the Aspe or Aspen tree.

The Vertues.

The white Poplar saith *Galen*, is of a mixt temper, that is, of an hot watery, and of a thinne earthy substance and therefore it is of a cleansing property, the weight of an ounce in pouder or the barke of the white Poplar being drunke saith *Dioscorides*, is a remedy for those that are troubled with the Sciatica or the Strangury, and thereupon *Sextus* hath these Verses.

Sanat sciaticum vitia excendere morbum
Perfusa, & grossus dira lenimine nigredinis
Populus alba labit medicas de cortice potus.

The joyce of the leaues dropped warme into the eares, easeth the paines in them, the young bourgeons or buds, before they breake out into leaues, braied and a little honey put to them, is a good medicine for a dull sight. The blacke Poplar is held to be more cooling then the white, and therefore some haue with much profit applyed the leaues braied with vinegar, to the places troubled with the gout, the seede is held good against the falling sickenesse to be drunke in vinegar: the water that droppeth from the hollow places of the blacke Poplars, doth take away warts, pushes, wheales, and other the like breakings out in the body: the young blacke Poplar buds with *Antlers*, are much vsed by women to beautifie their haire, braiding them with fresh butter and brayning them after they haue beene for some time kept in the Sunne: the ointment called *Populeon* which is made of this Poplar is singular good for any heate or inflammation in any part of the body, and doth allay temper the heate of wounds: it is much vsed to dry up the milke in women breasts after their deliuery, or when they haue weaned their children. The Aspen leaues are in the like manner cooling, and are vsed for the same purposes that the blacke is, but are in all things farre weaker. Trueley it seemeth *Pena* the blacke Poplars in stead of the white, and the Aspen in stead of the blacke, as his descriptions and figures declare.

CHAP. XVII.

Taxus. The Yew tree.

THe Yew tree groweth with us in many places to be a reasonable great tree (spreading many large braunches, which make a goodly shadow couered with a reddish rugged barke, the body, and elder boughes being more grayish, and the youngest redder, whereon grow many winged leaues, that is many long and narrow darke greene leaues somewhat soft in handling, and not hard as the Firre tree leaues are, whereunto they are compared by many set on both sides of a middle stalke, alwayes abiding greene and not falling away in Winter: the flowers are small and yellow, growing along vnder the branches, whereof afterwards the berries come forth, of the bignesse and colour of the Holly, or Asparagus berries, fweete with a little bitternesse, and procuring no harme to them that eate them, for any thing that I haue heard: the wood hereof is reddish rough and heauy.

The Place and Time.

This groweth in many places of this Land, but planted in all whether at home or abroad: it flowreth vsually in the end of *May*, and the berries be ripe in *September*, and *October*.

The Names.

It is called in Greeke *σὶσὺς* and *σὶσὰφ*, but of *Dioscorides* and *Galen* also *Smilax*, yet as *Dioscorides* saith, some called it in his time *Thymalum*, in Latine *Taxus*, and so all Latine Authours call it, except *Cordus* on *Dioscorides* that calleth it *Vlex*, and others *Smilax*, because it was generally taken to be either deadly or dangerous to eate thereof, or rather to sleepe vnder it also, which in our land is found contrary by many men & children eating of the berries without hurme, it is thought that all poysons became to be called *Taxica*, and by time called *Toxica*, from hence the *Italians* cal it *Tasso*, the *French If*, the *Germans Eibenbaum*, the *Dutch Ibenboom*, and *Segenboom*, and we in *English* Yew.

Taxus. The Yew tree.

The

The Berries.

opinion of Matthiolus that this tree worketh, or rather procureth some accidentall harme by distemperature, viz. by the climate wherein it is found, or of the persons that take it but rarely, and that there is nothing of any good property recorded, by any ancient or moderne Writer hereof, but shall find by most to be deadly to beasts, and dangerous to men, and therefore *Matthiolus* calleth the matter into question, whether it be hot or cold: for *Dioscorides* and those that follow him, say it is cold, appoint divers remedies for it: that they appoint for Henbane, and to drink much wine: but *Matthiolus* consulteth there against, in that the berries are sweete with some sourenesse, neither of which qualities portend any coldnesse to be in them, and that birds that feede thereon become fat like, besides the ever greenenesse of the tree, as Pines, Firres, &c. all which shew a temperate heate to be in them, and the more, because as he saith, men that have beene drawne only by the sweetenesse of the berries to eate of them, have beene driven into fevers, and fluxes, by inflaming the spirits and blood, which effects come not of any cold quality. Of this tree formerly long bowes were wont to be made, which were of great account, as well with us, as with other nations long agoe, for *Virgil Georg.* 2. saith, *Ingens Taxi accedunt ad proelia arcus*.

Chap. XVIII.

Nux Iuglans. The Walnut.

Next to the Wallnut that we have usually growing in our Land, I must adde some others fought out, both neere home and farre abroad, as out of *Virginia*, two sorts, one white and another blacke.

1. *Nux Iuglans vulgaris.* Our ordinary Wallnut.

This Wallnut groweth to be a very high, and great tree, spreading large armes and boughes, so that they make a goodly shadow, but by reason of the strong sent that the leaves send forth, few are delighted to rest thereunder, the barke of the body and greater armes is of a darke greenish ash-colour, rieht or chapped in many places, that on the younger branches being more greene: the leaves are large and great, consisting of five or seven leaves, set one against another, with an odde one at the end somewhat reddish, and very slender while they are young, and of a weake sweete sent, but when they grow old and more hard are of a stronger sent and somewhat unpleasant: at the joynts with the leaves come forth small and long yellow catkins, which become small flowers, and falling away the round nuts come in their places, two or three usually set together, which are covered with a double husk, the outermost, thicke, soft, and green, the inner shell hard, wherein is a white sweete kernell contained, covered with a thin yellowish bitter peeling, which easily parteth from it white it is fresh, but will not peele readily: the wood or timber hereof is hard and stoke, of a blackish browne colour, with divers waved veines therein, which maketh much used in joyners workes, &c. being very durable, being kept dry, but is soone rotted in the weather.

Nux Iuglans vulgaris fructu rotundiore.
The ordinary Wallnut, and a Nutte of Virginia.

Because I said in my former Booke that the many differences of Wallnuts did arise in my opinion from the climate and soyle wherein they grow, let once shew you their varieties somewhat more largely here, without any further description of the tree, for therein is little variety, which if any be it shall be shewed.

2. *Nux Iuglans oblonga.*
The greatest Wallnut.

We usually call these *French* Wallnuts, and are the greatest of any, within whose shell are sometimes put a paire of fine gloves neatly knitted up together, that the shell may be sent, being used together, and carried whether one will, and of the outer rinde whereof

3. *Nux Iuglans tenuissimè fragilis.*
The thin shelled Wallnut.

The difference in this consisteth chiefly in the shell to be thinner that it may easily be broken betweene ones fingers, and the nut is very sweete.

4. *Nux Iuglans folio serrato.*
The sawe Wallnut.

Called as I said, but for the difference of the Wallnuts are longer, though not

Barrels Each

much greater than the ordinary sort, and the shell much tenderer and brittle which being planted grew, and more leaves like unto it, but much tenderer and notched about the edges.

5. *Nux Indica bifera.* The double bearing Walnut.

The twice bearing in a yeare of this Walnut maketh the onely difference from the common sort, for thereof there is no further mention made.

6. *Nux Indica fructu pyriformi.* Or *Indica Avellana.* The Indian Walnut, or the fair nut of Avellino.

This Walnut shooteth not forth any leaves until the Midsommer, or Saint *Iohns* day, as it is said, so that the tree seemeth as dead, others having had greene leaves thereon long before: the leaves and fruite differ nothing from others but that the nuts open not untill *October*. And then are fresh when others are past and dry, the shell of this is softer and the kernell sticking closer thereto, for it is more hardly taken out, they raise not to sweet as the ordinary sort, but more Willowish.

7. *Nux Indica alba Virginiana.* The white Walnut of *Virginia*.

The tree hereof groweth more upright and spreadeth lesse, the leaves are alike, and the nut is rounder, somewhat, much thicker and whiter in the outer hard shell then any of the former sort, and the kernell within more lesse also, but white and sweete.

8. *Nux Indica nigra Virginensis.* The blacke Walnut of *Virginia*.

The blacke Walnut differeth little in the tree from the white, but the nut is blacke and round, very uneven or chapped on the outside, and so hard and thicke a shell that it can very hardly be broken with great stones, or hammers, having a very small kernell within it.

The Place and Time.

It is thought that the Walnut will come out of *Persia*, for it is not knowne to grow naturally any where, but that it was first planted of the Nuts put into the ground (for I have not heard that they can be produced by any other meanes) wheresoever they grow, except only the *Virginia* kinds, they blossome early, before the leaves come forth, and the fruite is ripe in September, or the late ripe, which is usually in October.

The Names.

By the name *Iuglans* it seemeth the ancient Greeke understood all sorts of fruites, whose outer shell is covering with a thicke [illegible] *Nux Iuglans*, *Nux Sylvana*, *Ballanus*, *Nux Persica*, *Avellana*, *Nux Indica*, *Nux myrepsica*, *Nux Graeca*, and [illegible] were brought unto them by Kings, they therefore called them *Regia*, *Nux Regia*, but now-a-dayes it is onely called *Nux Iuglans*, *Iuglans glans*, and to the Latines from *Iovis glans*, by contracting the word, and inducting the first letter, it is called *Iuglans*, other names are found in *Pliny* whereby the varieties of them were called, as *Perfica*, *Tarentina*, and *Maiuscula* for those with thinne shels, and *Calabrenses*, and *Nux ovata* or *Ovarenses*, for those that come late, then [illegible] declare both how, and that generally unto all authors of late it is *Nux Iuglans*, or *Nux Regia*, the outer green shell or husk is called in Latine *Galena*, and by *Pedro Cubeleo*: the inner skinne that covereth the kernell is called *Nux Cortex*, the kernell is called *Iuglans*, *Lacs*, and *Grassi*, which is properly but *Nux*, as *Glans* land, *Glans Ilicensis*, the Holme Nut, the *Greeke Nuts*, and *Barry* the *Spaniards Nueces*, the *Germanes Welsch nuss*, and *Nuss baum*, the *Dutch Noot*, and *Notenboom*, and we in *English* Walnut.

The Nature.

Dioscorides is of opinion that the fresh nuts are cold and moist, but *Galen* saith they are drying in the first degree, and warming in the second: the barke of the tree doth binde and dry very much, and the leaves in some measure, but the nuts when they are olde are heating and drying in the second degree and of thin parts, and more hardly of digestion then when they are fresh, which by reason of their unctuous and oily substance are more nourishing, and better digesting in the stomache and taken with greene wine, they move the belly downewards, but being old they grieve the stomache, and cause in hot bodies choller to abound, and be hurtfull to the liver, and are very unfit for those that have any ague: but they are fitter for such as have colder stomaches, and are troubled with wormes in the stomake or belly. Drunke or eaten with Onions, salt and honey, they kill the poyson of a mad dogge, as also the biting of any venomous serpent or infectious poyson. Pliny writeth that in the time of a mad dogge, as also the biting of any venomous serpent or infectious poyson. Pliny writeth that in the time of *Mithridates* King of *Pontus*, when he was [illegible] a medicine against any poyson or infection (yet *Galen* writeth to the contrary) and [illegible] of *Mithridate* his writing, which is this, two dry Walnuts, two dry Figges, and twenty leaves of Rue or Herbegrace, bruised and beaten together with two or three cornes of salt, which taken every morning preserveth from danger of poyson or infection that day it is taken: the juyce of the outer greene husks up with honey, is an excellent gargle for sore throates, the heate and inflammations of the throate: the kernels when they grow old are more oily, and therefore are not so fit to be eaten, but they are good to heale wounds of the sinewes, gangrene, and carbuncles: the sayd kernels being burned are also very stringent, and with stay lasches, and the fumes received through a reed: Wine, and stay the falling of the haire, and make it faire, being annointed with oyle and wine, be it [illegible] of the greene husks also, used in the same manner: the kernels beaten with Rue, and Wine, bound upon the Quinsie, and bruised with some honey, and applied to the eares, easeth the paines and inflammations of them: if they be eaten after Onyons, they take away the strong smell and sharpnesse of them, a purse of the greene husks put into an hollow tooth, easeth the paines and [illegible] in the marrow (the worme is there) kill it: within it the cath in the root taken before they rise, the wood burned and given a dramme weight in powder with white wine, doth wonderfully help those women that are troubled with the colicke of the mother: some use the greene husks dryed and made into powder instead of pepper to season their meates, but I think dryed sage in pouches be put unto it, it will give a like taste: the same manner do some use the greene nuts or leaves before they grow greater, and find it a soothing thing to the [illegible] of moore taken: the oyle drawne out of the kernells (besides that it is sure help for the paines) is good to illustrate a white colour then [illegible] oyle which deadeth it, and is of singular good use to be laid upon guilded Workes, or on those workes of wood that are made by turning, such as are deske Walkes [illegible] have workes on them or the like, to preserve the colour of the gold, or of the other worke for a long time without decay,) is very profitably taken inwardly like oyle of Almonds, to helpe the cholicke and to expell wormes very effectually, taking an ounce or two at a time. The young greene nuts before they be halfe [illegible] preserved whole

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

whole in sugar, are not onely a dainty junket among other of the like nature, but are of good use for those that have weake stomacks and defluctions thereon. The distilled water of the greene husks before they are halfe ripe is of excellent use both to coole the heate of agues, to be drunke an ounce or two at a time, as also to resist the infection of the Plague, if some thereof also be applyed to the sores thereof, the same likewise cooleth the heate of greene wounds and old ulcers, and to heale them being bathed therewith. the distilled water likewise of the greene husks being ripe, when they are shaled from the nuts, is of very good use, to be drunke with a little vinegar, for those that are infected with the plague, so as before the taking thereof a veine be opened, this is often experienced: the said water is very good against the Quinsie to be gargled and bathed therewith, and wonderfully helpeth deafenesse, the noise and other paines in the eares, the distilled water of the young greene leaves in the end of *May*, performeth a singular cure on foule running ulcers and sores, to be bathed with wet clothes or sponges applyed so them evening and morning: there reseth on the leaves of this tree a kinde of red thicke dew in the hottest time of Summer more then on any other tree in and about it, which will be rather dry then bedewed all, which honey dew being taken doth raise the thirst wonderfully: it is averred by some, that if the ripe nuts, husks and all be put into honey, they will then be of so good efficacy for sores and sore mouthes, that thereof may onely be made gargles and lotions, either inward or outward.

Chap. XIX.

Nux Avellana, The Hasell nut.

Of these small nuts there is both tame and wilde, those that are manured and planted in Orchards, are called Fillberds and the other growing wild, Wood nuts or Hasell nuts usually, unto which I must adjoyne some other sorts brought from other farre countries.

1. *Nux Avellana sativa rotunda alba*, The round white Fillberd.

The manured Hasell or Fillberd tree (of this kinde, as of the other tame sorts) groweth up into a taller and bigger body then the wild Hasell, or wood nut tree doth, but never to any great stake or bie, and with fewer lashers or limmes from the roote, and spread into sundry branches, covered with a brown rith speckled thin barke, and greene underneath, bearing large wrinckled or crumpled leaves, somewhat like unto the Alder leaves, cut in on the edges into some deeper dents, but not so deeply divided, of a sad greene colour above, and grayish underneath: the catkins come forth on the Winter buds before any leaves appeare, being then firme and close, of reddish yellow colour, and after towards opening themselves, become more yellow, falling away when the leaves begin to appeare.

1. *Nux Avellana sativa & silvestris.* The Fillberd, and the wood Hasell Nut.

4. *Nux Avellana Mas incisa sive hirsuta.* Fillberds of Macedonia or Constantinople.

Greece 2 the

the nuts breake forth as other places of the ſtalkes, three or foure or more together, each enclosed in a rough browne huske, which reacheth beyond the nut, and is parted at the end into ſundry jagges, the nut within is large and round, more then the long ſort, with a white thinne ſhell on the outſide, and a white peeling covering the kernell within which is very ſweete, the wood hereof is ſmooth, white, and ſomewhat tough or hard.

2. *Nux Avellana ſativa alba maxima fructu.* The great white Filbeard.

This differeth in no other thing from the former, but in growing higher and bigger, and the nuts larger by the halfe, but round and white like it.

3. *Nux Avellana ſativa fructu longo.* The long Filbeard.

This Filberd differeth not in the bulh or tree, in the leaves or catkins, in the nut or the bearded huskes from the former, the onely difference conſiſteth in the nut it ſelfe, which is long and round, and hath a browner ſhell, which is diſtinguiſhed into two ſorts, the one hath the more thinne skinne or peeling that covereth the kernell, red, and the other white, and each of them of a ſweeter taſte then the former, and the red of this ſort, better alſo then the white.

4. *Nux Avellana Macedonica ſive Byzantina.* Filberds of *Macedonia* or *Conſtantinople*.

Although *Cordus*, and *Geſner* gave the firſt knowledge of this Nut to the Chriſtian world, and that but by a ſhort relation, yet ſince them *Cluſius* hath enlarged the deſcription thereof by the often obſervations thereof, it groweth up ſtraight and tall like a tree, as *Cordus* ſaith it was obſerved in *Macedonia* and *Thracia*, (but as *Cluſius* ſaith, it was reported to him that it grew very low) covered with a whiter and more rugged barke, having ſuch like large crumpled leaves, but ſomewhat longer, the catkins are like the others, but the nuts grow many together in a cluſter, whoſe hard skin or rough huske is much more jagged at the head then the others, and ſomewhat likewiſe at the bottome, the kernell is round like our wood nut with a hard ſhell, the kernell within being very ſweete and pleaſant like the Filberd; ſince which time *Cluſius* hath obſerved it to grow ſomewhat otherwiſe.

5. *Corylus ſive Nux Avellana ſylueſtris.* The Wood nut or Haſell nut.

The Wood nut groweth with more ſtemmes or ſuckers from the roote then the manured kinde, yet have of a reaſonable bigneſſe, branching to th diverſly, covered with a like diſcoloured barke to the former, the leaves are leſſer and rounder, yet not leſſe crumpled greene above and gray underneath, the catkins and nuts come forth in the ſame manner, but the Nuts are ſmaller and rounder whoſe huske is ſhorter and whiter, and never wholy covereth the nut, but ſtanderh therein like unto an Acorne in the cup, and herein conſiſteth the chiefeſt difference for the manner of growing.

6. *Corylus Virginenſis. Virginian* Haſell Nuts.

The manner of the growing of theſe Nuts, we have not had ſufficient inſtruction of all, though wee have ſeene and had the Nuts of a long time which are as ſmall or rather ſmaller, and browner then our Wood nut, ſharper pointed and with a tougher ſhell not ſo hard or eaſie to breake: the kernell is ſomewhat ſweete and white but not ſo pleaſant as ours.

The Place and Time.

Filberds are planted in Orchards, and the wilde nuts, grow in woods and thickets, that are moiſt rather then dry delighting moſt to grow in ſuch a ſoile, the catkins as is ſaid appeare before the Spring, and the fruite is ripe in *Auguſt* or *September* at the furtheſt.

The Names.

It is called in Greeke *Καρυα Νυξ Ποντικη, and Ευρωπαϊκη Νυξ*, in two ſeuerall ſorts, in Latine *Corylus* or *Nux Abellana*, from the Country which afterwards altered and tearmed *Avellana*, as alſo *Nux Prænestina*, and *Herculanea*, the ſeverall titles that they beare, deciphered out ſufficiently, as wee and others have and ſhall ſhew by. The *Arabians* call it *Aſelene* and *Bendiki*, the *Italians Nocciuole, Nocciole*, and *Avellane*, the *Spaniards Avellanas*, the *French Noiſettes, Noiſettes* and *Aſelines*, the *Germanes Haſelnuſſe*, the *Dutch Haſelnoten*, and we in *English* Filberd, for the manured kinde, and Haſell nut, Wood nut, or ſmall nut, for the wilde kinde.

The Vertues.

Theſe ſmall Nuts while they are freſh are ſweete, and much pleaſing to the palate, but the multitude of them breed headache and windineſſe in the ſtomacke, eſpecially when they grow older but if they be a little roaſted or parched by the fire, the oylineſſe doth become leſſe offenſive, the parched Nuts made into an electuary, or the milke drawne from the kernels with ſome mede or honyed water, is very good to helpe an old cough, the nuts parched and a little pepper put to them and drunke, it doth digeſt the deſtillation of rheume from the head, wee doe hold that theſe Nuts, and not Walnuts, with figs and Rue, was *Mithridates* medicine, effectually againſt poyſons, the oyle of the nuts is eſteemed for the ſame purpoſes. The dryed huskes and heels to the weight of two drammes, taken in red Wine ſtayeth the laſhes and womens courſes, and to doth the red skinne that covereth the kernels, or is more effectuall to ſtay theſe rennes: if a Snake be ſtroke with an Haſell wand, it doth ſooner know it, then with any other ſticke, becauſe it is ſo pliant, that it will winde cloſer about it, by that being deprived of their motion, they muſt needs dye with paine and want, and it is no hard matter in like manner (ſaith *Pliny*) to kill a mad dog that ſhall be ſtroke with an Haſell ſticke, ſuch as men uſe to walke or ride withall.

Chap. XX.

Nux Piſtacia. The Piſticke Nut.

The Piſticke Nut groweth to be a tree of a reaſonable large ſize in the warme Countries, but very ſlenderly in ours diſperſed into ſundry branches, whoſe barke is of a darke reſſet colour, the leaves are winged three, five, or ſeven on a ſtalke, each whereof is broader and larger then thoſe of the Aſh, not ſharpe but blunt pointed with us, ſmooth, almoſt ſhining, with divers veines therein, and of a pale yellowiſh greene colour. I never ſaw it beare either flowre or fruite with us in our Land, the climate being too cold for it, but elſe where it beareth white flowers, as I am given to underſtand many ſet together, on a long cluſter, after which come the fruite many together in the ſame manner

number which are somewhat long and round nuts, bigger then Filberds, pointed at the ends, with a rough outer shell somewhat like an Alexandria outer shell but tough and hard to breake, yet cleaving in two parts, and smooth and white on the inside thereof, having a full greene nut or kernell within, filling the whole shell, whose inside or pecling is thicker and red, the kernell is very sweete and pleasant in taste, without any effective quality thereunto: this in the warmer countries beareth also a long crooked stalke like as the true Turpentine doth.

Nux Pistacia. The Pistacia nut.

The Place and Time.

It is native all to *Barbary*, and other thole parts neere to the East Indies, and from thence brought to *Syria* and *Egypt*, and from them unto our *Europe*, where at *Naples* and other warme Countries *at hand*, they thrive and prosper, and beare fruite in the end of the yeare, but not in any of these colder climates.

The Names.

It is called in Greeke [illegible] *Pistacia*, of *Nicander*, and *Pistakes*, and in *Theophrastus* [illegible] by *Galenus* [illegible], in Latine *Pistacia* and *Pistaciæ*, and of some *Nux Pistacia*. *Theophrastus* called it *Terebinthus Indica*, for his description thereof agreeth so exactly hereunto, that the same no doubt made of it. The *Arabians* call it *Fustuc* or *Fosthe*, the *Italians Pistache*, the *Spaniards Alfonsigos*, and *Pinones*, the *French Pistaches*, the *Germanes Pistacien nussen*, and by that name they likewise call the bladder nut, not putting any difference betweene them, the most judicious in former times did, the *Dutch Pistachen boom*, and we in *English Pistackes*, and *Pistacke nuts* or tree.

The Vertues.

The Pistacke kernells be little inferior in goodnesse and taste to the kernels for they are very friendly to the stomacke, whether they be eaten or drunke, they are good against the stingings or bitings of serpents and other venemous creatures, by reason of the thin substance, and a little bitter and sweet substance is in them: and therefore they open the obstructions of the Liver, and are good also for the cheft and lungs, there is also a little astringent quality in them, whereby they strengthen both the liver and the stomacke so be put either in meates or medicines; they are also good to cleanse the backe and the reines of the gravell and stone breeding therein: they nourish more then any other nuts and helpe to increase lecherie and Venery.

Chap. XXI.

Nux Vesicaria. The bladder Nut.

Next adiacent to the Pistacke I must place the Bladder nut, whose growth is not much unlike thereunto, running up sometimes into a small shrubby tree, in other places creeping forth sundry suckers, whereby it doth soone increase and spread both it selfe and [illegible], the barke whereof is of a whitish greene colour, the leaves are five to the most placed together on a stalke, each a little dented about the edges, and pointed at the ends, of a pale greene colour: the flowers grow on a long stalke many set together, hanging downwards being all white, the small round cuppe in the middle, making them seeme like pure white Daffodils: after them come two or three russetish greene skinny bladders, with one or two round nuts, like unto Filbert nuts, with a rough hard shell to breake, and a greenish kernell within to the taste somewhat sweete, but otherwise of a loathsome and ready to make one cast, yet it is eaten by some people: the whole fruit makes are more easily provoked: the wood is white, hard and brittle. Mr. *Tradescant* hath brought it first from *Virginia*, having divers nuts in the bladder.

Nux Vesicaria Virginiana.

The Place and Time.

It groweth in many places of this land both as a hedge bush and a standard tree at *Hilton* in *Kent*, and at *Hillingdon* in *Middlesex* from *Cambridge*, and flowereth in *May*, the fruite is ripe in *August* or *September*.

The Names.

There is not any mention here of among the ancient Authours, either Greeke or Latine, except it be taken for *Pistacia Sylvestris*, whereof some doe in some part doubt, because he saith the nuts grow in *fulgore*, but these nuts have no bladders, but the rest agreeing to his description thereof, causeth others to thinke his *fulgore* nuts or bladders to be the bladder nuts: the *Germanes* as I said call it by the same name they call the Pistacke, and *Matthiolus* calleth it *Pistacia Germanica*. *Matthiolus* in his Epistles taketh it to be the *Coriander*, and *Lobelius* calleth it *Coriandrum Germanicum*. *Matthiolus* in his Epistles taketh it to be the *Coriander*, and *Lobelius* calleth it *Coriandrum Germanicum*, of the bignesse of both nuts and such this is not, as is not greatly respect for the Pistacke take among them: it is usually from the forme it carryeth now adayes, called *Nux vesicaria*, and in some places *Nux sylvestris*, and is *Scaliger* taketh it to be a *species* of it. *Gesner* saith, that some make it

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

Rome called it *Semburcus vulgo*, and *Anguillara* (with the *Italians* in other places call it *Albero del cuculo*, and *Pillachia salvatica*, the *French Noix coupee*, the *Germanes Pimpernuſſlin*, as they doe the former, the *Dutch Pimpernoten*, and we Bladder nut.

The Vertues.

The Nuts are as is before ſaid loathſome and overturning their ſtomacks that eate them, although *Scaliger* commendeth them to be of the like taſte and quality with Piſtackes, but we will give him leave to pleaſe his palate, and Gomarike with them, and will not envy the good he ſhall get by them, neverthleſſe yet could learne that they were accepted among our people, except with ſome ſtrong clownish ſtomacke, which can almoſt digeſt an horſe ſhoe. They have no uſe in Phyſicke, with any iudicious that I know, but ſome Emperickes, that dare venture to give any medicine, be it never ſo dangerous have boaſted of the helpe they have given to thoſe that were troubled with the ſtone, and others to procure Venery.

Nux vesicaria, the Bladder nut.

Chap. XXII.

Fraxinus. The Aſh tree.

The Aſh according to *Theophraſtus* and other of the later Writers, is diſtinguiſhed into a taller and a lower ſort, or as within into the ſtone and the white ſort, which ſhall be here declared.

1. *Fraxinus vulgaris.* The common great Aſh.

The common Aſh groweth both quickely, and in time becommeth to have a reaſonable big trunke or body, covered with a ſmooth grayiſh barke, under which there is a downer white bewty (except it were a whole) will give a blew with rubbing, ſpreadeth reaſonable well and beareth winged leaves of many, let on both ſides of a middle ſtalke, and one at the end, each being long and ſomewhat narrow, pointed, of a pale green colour, and dented about the edges, at ſundry ſeaſons with the leaves commeth forth a bunche of flowers and after them a thicke tuft of many chaine ſtrawie hukes hanging downe wards, and upon a very ſmall ſhort footſtalke, within which growth a ſmall blackiſh brown long flat ſeed very like unto a birds tongue, taſting ſomewhat ſtrong and hot in the mouth: It beareth alſo ſometimes, and in ſome places certaine ſmall round galles called apples, conſiſting of a downy moſſe gathered into a clumpe with a hard kirne in the middle, the wood is white being tough fit for many uſes, for by the toughneſſe, not being apt to cleave or rend, it is much employed about Coaches Carts, &c. and for handles for tooles and inſtruments of husbandry. *Homer* chaunts the praiſes thereof in *Achilles* ſpeare, made of Aſh, which holdeth good in all the ſeaſons, pikes &c. uſed in warre ever ſince.

2. *Ornus ſive Fraxinus ſylueſtris.* The wild Aſh or Quickentree.

The Quickentree groweth ſeldome to any great height, with ſundry ſpread brandches, covered with more rugged and darker barke then the Aſh, the leaves are winged like unto them, but are leſſer and in every particular one by it ſelfe, not ſo cloſely ſet together, dented about the edges, and of a deepe greene ſhining colour: at the end of the branches come forth white flowers in a reaſonable great tuft or tuſſell, ſmelling pretty and ſweete, after which follow ſmall round berries, greene at the firſt, and darke red, when they are through ripe of unpleaſant taſte, ready to provoke caſting, if one eate many of them, the wood is more white and tough, then of a browner colour then Aſh.

The Place and Time.

The Aſh delighteth moſt to grow in the woods rather then in the open grounds and by Medow ſides the better groweth in ſundry places of the Land, in woods chiefly, and thoſe by *Hedgegate* in ſundry places. The keyes or apples of the Aſh come forth in the end of Winter, and then they are to be ſeene, but the ſeede and kernell them both is not ripe untill *September*.

The Names.

The Aſh is called in Greeke [illegible] and in Latine *Fraxinus*; the ſeede is called *lingua avis*, but the tree ſmall is ſo called rather then the whole hooke; the other is likely to be the [illegible], *Fraxinus montana*? Dioſcorides, which

1. *Fraxinus vulgaris.*
The common great Ash.

2. *Ornus seu Fraxinus sylvestris.*
The Quicken tree, or wild Ash.

which *Pliny* calleth in Latine *Ornus*, of some *Ornoptlasum*, and *Columella Fraxinus sylvestris*. *Tragus* calleth it *Fraxinus altera*, *Dodonæus Fraxinus tubuli*, and *Gesner Fraxinus aucuparia*. *Kentius Turner*, *Dodonæus*, and others call it *Ornus*, but *Matthiolus*, *Cordus*, *Lobel*, and others call it *Sorbus sylvestris*, *Bellonius*, *Clusius*, and *Tabern.* *Sorbus aucuparia*, because that boyes, and fowlers, use the berries as baites to catch blacke birds, Thrushes, &c. and *Lugdunenses Sorbus torminalis*, without any reason or reason, but they that referre it to *Sorbus* the service tree, are in my opinion more in many things, as they that referre it to *Fraxinus*, the Ash resembling both of them in the leafe, which causeth the variation. The *Italians* call the Ash *Frassino*, the *Spaniards Fresno*, the *French Frene*, the *Germanes Eschenbaum*, the *Dutch Esschen*, and we in *English* the Ash tree, and the seeded

CHAP. XXIII.

Sorbus, The Service tree.

BEcauſe the true Service tree is ſo like unto the ſame and the wild Aſh in the leaves, and that the wild Aſh is called a Service by divers, I thinke it meete to joyne it next unto them, and with it ſome other ſorts that have obtained the name of Service, although differing much in forme from it.

1. *Sorbus legitima.* The true ſervice tree.

The true Service tree groweth in time to be a great and a tall tree, ſpreading ſundry great branches, covered with a rough grayiſh barke, whereon grow large winged leaves, greater and longer then thoſe of Aſh, and each of them broader, more blewiſh greene, and harder, and more grayiſh greene underneath, and more dented alſo about the edges: the flowers grow in tuffes at ſeverall places on the branches with the leaves conſiſting of foure white leaves a peece, after which follow the fruite as big as Wallnuts ſhaled out of the greene huſkes, ſtaind greyiſh yellow when they are ripe with broad browne kernels within them in ſome round, which are accounted the beſt, in ſome ovall that is long and round, and in ſome almoſt Peare faſhion, which like unto Services are hard and harſh to eate when they are ripe, and muſt be hung up on ſtrings in a warme roome, or laid covered with ſtraw, chaffe or lome cloathes to make them mellow fit to be eaten, which then will be more pleaſant than mellow Medlars, the wood is very hard and cloſe, and yellower then the Aſh.

2. *Sorbus Tormenalis ſive vulgaris.* Our common ſervice tree.

Our common Service tree riſeth up to a reaſonable height and bigneſſe, ſpreading largely with a whitiſh colored rough barke, the leaves grow ſingly by themſelves which are not winged but broad and cut into ſundry deviſions and broad at the bottome next to the ſtalke, of a ſad greene colour, the flowers grow in tuffes of a whitiſh colour at the end of the branches for the moſt part, which are ſucceeded with ſmaller round berries when they are ripe of a browner alſo, containing within them ſmall blackiſh hard Kernelles theſe muſt likewiſe be mellowed before eaten, or elſe lying on the branches untill the froſts mellow them on the trees, unleſſe the birds devoure them being neglected: the wood hereof is of a more dull yellow colour and hard.

3. *Sorbus ſylveſtris fructu rotundo.* Red Cheſſe apples, or the *Engliſh* wild ſervice.

This tree which we call the Service, groweth on the hilly cliffe of the greene hanke, groweth not high uſually but ro-

1. *Sorbus legitima.*
The true Service tree.

2. *Sorbus Tormenalis vulgaris.*
Our common Service tree.

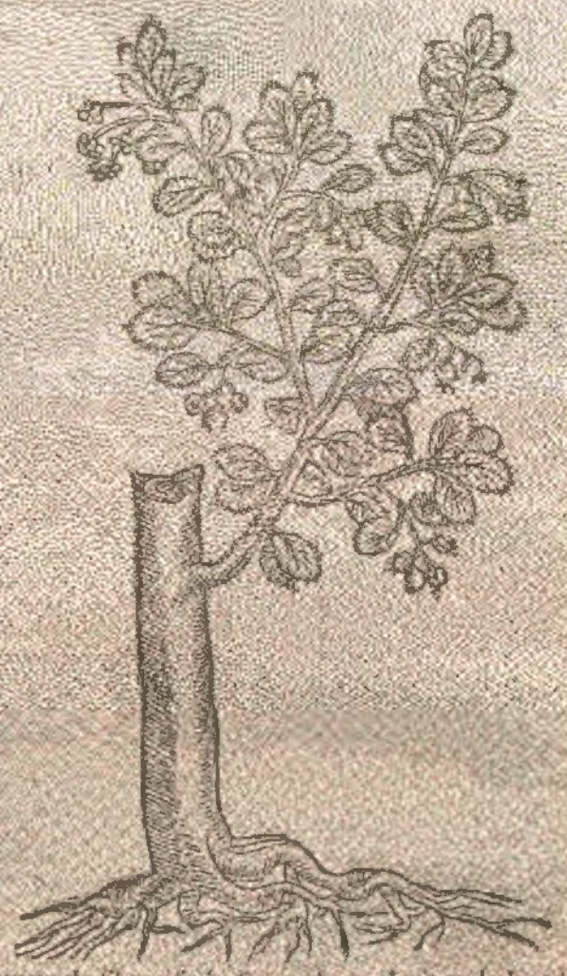
Original from UNIVERSITY OF MICHIGAN

are as a hedge bush, whose stemme and branches are couered with an hoary or grayish barke, the leaues are broad, somewhat like unto *Viburnum* the Gelder tree, (which *Gerard* calleth the Wayfaring tree) not cut in nor dented at all about the edges, the vnderside of an ouer worne mossie colour, after which followeth fruite, of the bignesse of an hedge berry, and reddish on the outside, of an harsh taste like vnto ripe or hard Seruices, yet the Country people doe often eate of them, being ripe from the tree, for lack of better fruite, but after they haue been gathered and laid by a while to mellow, become more pleasant.

4. Sorbus sylvestris Aria Theophrasti dicta.
The wild Seruice called Aria.



The wild Seruice tree groweth to be a very great tall and fatre spreading tree, with many boughes and branches whereon are set large crumpled hard leaues of a deepe greene colour on the vpper side, and gray mossy vnderneath, with diuers veines running almost vpright therein, and dented about the edges, the flowers set of a white mossie colour, thicke cluttered together, made of foure leaues a peece, which turne into browne russet red berries, with a small cuft at the top, containing within them small blackish kernels, and are of harsh taste like to the rest, yet very pleasant, moreouer any of the rest, after they are mellowed the one is very hard, and fitme or clote, and wholly withall.

The Place and Time.

The last is seene with vs but in a few places, and that onely planted for their rarity. The second is found in many places of *England*. The third in *Lancashire*, on a hill that respecteth the Sea eight miles from *Lancaster* called *Ranelor flacks*, but more plentifully in *Warberflacke* Parke, as I am informed: The last groweth likewise in some places here and there throughout *England*, as in the pasts not farre from *Croydon*, and one tree also groweth on *Hampsted* Heath alone by it selfe, without any other neere it on the left hand of the high way, as you goe on forward to *Hendon*, they do all flower before the end of *May*, and the fruite is ripe in *October*.

The Names.

It is called in Greeke ἀρία and ἄρεια, *Oxa* and *Oxe*. In Latine *Sorbus*: the first is the *Sorbus legitima* of *Clusius*, *Sorbus domestica* of *Camerarius*, *Sorbus domestica fructu* of *Matthiolus* and *Lobel*, who also thought it might be *Ostrya Theophrasti*, but erroniously, as by the description thereof given before may be seene, all other authors call it *Sorbus sativa*: the second is the fourth *Sorbus* of *Fuchs* which hee calleth *Terminalis*, as *Cordus*, *Tragus* and *Matthiolus* doe, although *Lugdunensis* misliketh of it saying that the leaues are nothing like the *Platanus*, whereunto *Fuchs* compareth them: he therefore calleth that *Sorbus torminalis*, which is called *Ormus* or *Frexinus silvestris*, as I haue shewed you before, because he would call it *Crataegus Theophrasti*, as *Anguillara* did before him, which is not worth the reading, nothing binding but that it may as well be *Crataegus Theophrasti*, as *Sorbus quartum genus Plinii*, and *Sorbus Torminalis*, both the descriptions agreeing truly hereunto, *Clusius* and *Lobel*, and diuers others: and *Gesner* doth also call it *Sorbus torminalis*, who yet thinketh it might be a species of *Mespilus Avenia*, and peradventure of *Theophrastus* his *Anthedonides*, which *Gaza* calleth *Galliea*. *Ruellius* placeth it as one of the Medlars, as doth also our Herbarist, which in his eighth number he referreth to the *Oxyacantha Pyrastri fructu* of *Dioscorides*, and yet in his ninth number maketh that *Oxyacantha Dioscoridis*, to be *Pyracantha* of *Lobel* and *Gesner*, which hath no such diuided leafe as the Haw thorne hath, and yet both of them beare berries like Seruices, and with Apples like Medlars, some also tooke it to be the *Hippomelis* of *Palladius*. The third hath not been discouered to growing by any before me, and therefore that Latine name may stand vntill a better may be found, the Inhabitants there call them not Cheese apples, and Sea Oakers. The last is taken by all our Moderne Herbarists to be the *Aria* of *Theophrastus*, although *Bellonius* saith as is shewed before, that that kind of *Ilex* or Oke that is called *Aesculus* in Country doth hold the name of *Aria* in Mount *Athos*, as is shewed before. *Lobel* calleth it *Aria Theophrasti*, *Clusius Sorbus folio cygnominato*, *Gesner* in horto *Sorbus Alpina vel pinsa*, *Bellonius* calleth it *Aesculus Theophrasti*, and *Aesculus* and *Lagunensis* doe also, and *Theophrastus*, as *Camerarius* doth, who doth call it *Sorbus aucuparia*. The Seruice is called by the *Italians Sorbe*, by the *Spaniards Serues*, by the *Frenchmen* and *Dutch*, and the tree *Cormier* and *Sorbier*, by the *Germanes Speyerboum* the tree, and *Sporbirbeere* the fruite, the *Dutch Sorbes*, and *Sorbenboom* and we in *English* the Seruice tree or fruite: the last is called by the *Italians Mispole*, and by the *French Alisier*, and *Cormier* by some.

4. *Sorbus sylvestris Aria Theophrasti dicta.*
The wild Seruice tree called Aria.

The Vertues.

Seruices not mellowed are very harsh, able to draw ones mouth awry almost to be eaten, or else to choke one, but when the mellow they are more pleasant, and fit to be taken of most to stay fluxes, scowrings, and callings, yet not like Medlars, although many doe eate them that needs not for any such purpose: if they be dryed before they be mellow and kept all the yeare, they may be vsed in decoctions for the said purpose, either to drinke or

to

to bathe the parts requiring it, and is profitably used in that manner to stay the bleeding of wounds, and at the mouth or nose to be applyed to the forehead and nape of the necke.

CHAP. XXIV.

Mespilus. The Medlar.

THere are observed sundry sorts of Medlars whereof three were knowne to the auncient Writers: the rest are of later invention.

1. *Mespilus maxima folio.* The great mayned Medlar.

The great Medlar groweth neere to the bignesse of the Quince, but never so great as an Apple tree that ever I saw, spreading branches, reasonable largely, with longer and narrower leaves then either Apple or Quince, and not dented at all about the edges, at the end of the sprigges stand the flowers made of five white great broad pointed leaves, nicked in the middle with some white threds also; after which commeth the fruite, being round and halfe flat, of a brownish greene colour being ripe, bearing a crowne as it were on the topp; which were the five greene leaves, as also like where in the flowe. stood before, which crowne of leaves being rubbed off or falne away, the head of the fruite is seene to be some what hollow, the fruite is very harsh before it be mellowed as is had of the services before, and hath usually five hard kernells within it.

2. *Mespilus vulgaris sive minor.* The ordinary or small Medlar.

The ordinary Medlar differeth in nothing from the former, but that it hath some thorns on it, in severall places, which the other hath not, and that the fruite is small and not altogether so pleasant.

3. *Mespilus minor folio serrato.* The common *Italian* Medlar.

This also differeth in nothing from the last that hath thornes, but that the leaves are dented about the edges, which as the other is not.

4. *Mespilus fructu albo magno.* The great white Medlar.

This differeth not from the first sort but in the fruite, which will be as great as it, and more white then it when ripe on the tree, and will not be so brownе when it is mellowed, the kernele also within them are not so many or hard.

5. *Mespilus Avonia sive Neapolitana.* The Medlar of *Naples*.

The Medlar of *Naples* riseth to be a reasonable great and faire spread tree, bearing broad leaves, as it were divided on the sides into three all parts, but not to the middle ribbe some what resembling the Hawthorne leaves, with thornes set sometimes on the branches and sometimes without, the flowers grow in tufts like unto the Service

1. *Mespilus maxima folio.*
The great mayned Medlar.

2. *Mespilus vulgaris.*
The ordinary Medlar.

...ke greenish colour, which turne into fruite, many clustering together and hanging downe, smaller then one inch long, and with a little crowne of leaves, and hollowneſſe in the top when it, reddish or yellowish when they are ripe, having only three stones or kernells within it, and more sweet and pleasant also.

The Place and Time.

These of theſe sorts grow with us here in our Land, the wilde in many places, and the tame with some few lovers in Gardens, the other two have not as yet been seene here to flower in *May* for the most part, and beare ripe fruite in *October* and *November*.

The Names.

...ppelled in Greeke ... in Latine *Mespilus* ... fruite *Arbor Mespilum*. The wilde sort may ... *Mespilus Dioscoridis* or *Theophrasti* and *Plinij*, and to be ... the *Mespilus arbor* of *Dioscorides*, which he some ... called *Spinalis*, *Tragus* although he call it *Mespilus*, yet saith it to be *Crataegus* of *Theophrastus*, which it cannot be, for that *Theophrastus* saith *Crataegus* hath the leafe of ... *Malus*, which hath a divided leafe, for the deſcribe to be *Mespilus*, and is the same with *Dioscorides* his *Melanocarpos*, as you shall prelently heare. It is also that which some call *Domestica*, *Cordus* ... and *Lonicerus* ... *Germanis vulgaribus vulgaris Frutibus*, *Tragus Mespilus ... Germanica*, and *Dodonaus Mespilus Oxyacanthi folio*, ... *Germanis* ... *mitis folio*. The second is named *Olivaeformis* by *Bauhinus*, as well as *Lauri folio*, and *Germanica*, being the more ordinary both with them and us. The third is set out by *Matthiolus* and *Lugdunenſes*, but these have so not expreſſe the leaves to be denied as they should be. The fourth is spoken of by *Scaliger* and *Lugdunenſes*. The first the *Mespilus*, called *Arbor of Dioscorides*, the *Mespilus* ... of *Theophrastus* and *Pliny*, and is the first *Mespilus* of *Matthiolus*, and generally called *Mespilus* ... with all other Writers, only *Bauhine*, and *Gesner* in part, with it *Pyracantha Africana*, and *Carolus Mespilus* ... and perchance be the *Mespilus Gallica* of *Lonicerus* ... The *Arabians* call it *Zarur* or *Zaur*, and *Alazar*, the *Italians Mespola* (but they call the last which we call *Nespole Azarole*, derived as it likely from the *Arabians Zarur*) the *French Neflier*, *Meſplier*, and *Nefle*, and the fruite *Nefle* and *Meſple*, the *Germans Nespelbaum*, and the fruite *Nespel*, the *Spaniards Nespero*, the *Dutch Nespelboom*, and we in *English* the Medlar tree and fruite.

The Vertues.

Medlars have the like properties that Services have, but are more effectuall in operation to binde and stay any flixe of blood or humours in man or woman, the leaves also have the same qualities, but ... these effects the ... fruite is often boyled among other sorts of fruites to the table, and eaten with ... by ... have a smacke of pleaſure, but ... it ... when with ... Sider, both to pleaſe the taſte ... and ... the ... ſtomach, and ... as also very effectuall for them that are ... and ... their time ... deliverance ... the ... ready, and make them joyfull mothers: that of *Medlar* is the more delicate, & it also ... the more effectuall for the ... purpoſes: the decoction of them is ... to gargle and with the mouth ... water, and ... there ... any deflexion of blood to ... ſore ... which ... paines and ... the ... deſluxions and ... the ... the same also is a good ... for women to ſit in ... the ... Piles ... downe too abundantly, or for the piles when they bleede too much: the same ... ſtrengthen ... and ... the ... marke ... that is given to caſting, to loath or not to hold ... deſire ... and ... it, but if a ſpoone or platter be made with dryed Medlars, beaten and mixed ... Rose ... ſome ... a few Cloves and Nutmegs may be added, and a little red Coral also, ... to the ... it will work the more effectually: the dryed leaves in powder ſtrawed on bleeding ... ſtay the blood, and healeth up the wound quickely: both leaves and fruite are of ſingu... ... and ... ſtrengthen any whatſoever hath need of theſe qualities. The Medlar stones made into ... or ... with ... the ſmall ... roots have ... infuſed all night, or a little boyled, doe breake ... and ... paſſage ... paſſe them.

Chap. XXV.

Of the ... Wilde Medlars and other ſuch like ſmall fruites.

THere are ſome other ſmall fruites to be ſpoken of, that are fitteſt to be referred to Medlars and Services, though ... to Quinces and Apples, by their Authours, and becauſe they were not to be put into the former Chapters, I thought to entreate of them now unto them, in a Chapter peculiar to themſelves.

A Chapter

1. *Chamæmespilus.* The dwarfe Medlar.

This dwarfe Medlar which *Gesner* is called for some likenesse it had in the fruite, with the ordinary Medlar, although but a little, is a small woodily shrub, covered with a reddish ashe coloured backe, having small leaves growing thereon, every one by it selfe, somewhat like unto Saffron leaves *Gesner*, but gray or hoary underneath, the blossomes are small and greenish, standing either singly or by couples on slender fuorestalkes, after which follow small reddish round berries, with a small crowne of leaves at the head like unto the Medlar, without any iuice or iuyce therein, of very little, and having two or three small seedes like grape kernells within each: the leaves fall every yeare, and the roote sheeth shooting up some wiggy stalkes.

2. *Spinosa Gesneri.* The small bullard Medlar.

This differeth from the former in that is riseth with longer stemmes or stalkes, whole leaves are greene above and grey underneath, somewhat like vnto the former, but somewhat larger, the flowers thereof come forth upon a pretty long footestalke one above another, very like unto the blossomes of *Arbutus* the Strawberry tree, that is, like a little round bottle with small brimmes and not as the Medlar, laid open into five leaves, which flowers are of a pale bluish colour, and turne into small berries, of a yellow with red colour, with a little head or crowne like the other, but lesser, not so bigge as Hawthorne berries, but as dry and tasteles, with three or foure hard white seedes within them, of a little dry but no great harsh taste: the leaves hereof likewise fall away in Autumne, and rise againe in the Spring.

3. *Cotonaster Gesneri.*
Gesner his bullard Iowy Quince.

This little shrub, *Gesner* sheweth to differ from his dwarfe Medlar, least any should suppose them to be both one, hath larger and longer leaves, a little dented about the edges, yet hoary white, as the Quince tree leaves are, and hath berries not so round nor so red as it, but tending somewhat to yellow, with foure three square seedes in each berry.

The Place and Time.

Both the former and the later, grow in sundry places of *Germany*, and of *France* also, and so doth the other also, and their berries ripen in *August*.

3. *Cotonaster Gesneri.*
Gesner his bullard Iowy Quince.

2. *Spinosa Gesneri.*
Small bullard Medlar.

The Names.

Matthias Lobel to name the firſt *Chamæmeſpilum*, whom almoſt all ſince have followed, and called ſo in like manner: onely *Lobelius* calleth it *Epimelis*, and maketh it the *Mespilus* of *Dioscorides*, which he ſaith ſome call *Lonicer*, and ſome *Scorbum*, when as himſelfe ſaith in his Chapter of Medlars, that *Dioscorides* his *Mespilus* is our common Medlar, whoſe fruite as well as tree is farre greater then is this. The ſecond is the *Lonicer of Italie*, where of he maketh mention *lib. 6. simpl. medic.* and differeth from the Medlar to call, whereof he ſpeaketh in another place; for he ſaith that the fruite thereof is towre, and hurtfull to the ſtomacke, and that ſome Country people of *Italy* did call it *Vmela*, (which is probable they did ſo, becauſe the bloſſomes are very like thoſe of the *Aronia* which is alſo called *Vmela*) *Lobelius* calleth it *Epimelis altera*, but is not *Cluſius* nor I ſure what, as he thinketh, which hath blacke berries, but this hath red as he deſcribeth it, and therefore therein was deceived, yet thinketh it to be the *Coronaſter* of *Gesner*, which *Cluſius* contradicteth. The third ſort is the *Coronaſter* of *Gesner*, which *Cluſius* alſo mentioneth in his hiſtory of plants, with his *Chamæmeſpilus* and *Five Ideis*. *Bauhinus* maketh a doubt whether it be not the *Agrimonia* of *Bellonius*. *Bauhinus* ſeemeth to make two ſeverall plants thereof, as may be ſeene in his *Pinax*. Theſe plants have gotten ſundry *Germane* names of the *Germane* inhabitants and others, as by theſe diverſe names in Latine derived for the *Germane* may be eaſily underſtood, and becauſe we wanted names to call them by, I have given it them as neere as I can, either from the fruite or their proper effects, and thus much may ſuffice untill we further be informed of them.

The Vertues.

There can be little ſaid of any of theſe plants, ſeeing as little hath beene ſaid by thoſe moderne Authours, that have wrote of them: for ſome of them being dry berries, are wholly neglected, and the other that have ſome little reliſh or ſweete taſte, are onely eaten by the Mountainers and their children, and not applied as medicines for any griefe.

Chap. XXVI.

Acer, The Maple tree.

There are onely foure ſorts of Maple trees knowne to us, that I am to ſhew you, but *Bauhinus* doth diſtinguiſh them into foure thus, *Splendanicus* is that Maple that is white and full of veines, *Zygis* is yellow and crilpe, *Clinarachon* is yellow and not crilpe, *Glinon* is white with few veines, but we muſt give them you by other termes.

1. *Acer magnæ latifoliæ Sycamorus dictum.* The great broad leafed Maple or Sycomore tree.

The great Maple (which hath beene with many falſely called the Sycomore tree) growth quickly to be a great

1. *Acer magnæ latifoliæ Sycamorus, ſive Platanus.*
The great broad leafed Maple or Sycomore tree.

2. *Acer minus vel montanum*
Our common lower Maple, and the mountaine kinde.

and a tall tree, spreading many faire branches, which make a goodly shadow, covered with a reasonable smooth barke, having many very faire large leaves thereon, set upon reddish foote stalkes, cut some what deeply into five some what long parts or divisions, all dented about the edges, greene above and grayish underneath, the flowers are of a whitish yellow greene colour, standing on a long stalke, with some few threds with them at each flower yeelding two winged husks, parted at the stalke, which are thinne skinnes at the ends, and bunched out where the seede lyeth within, and are very like unto the common or wood Maple, but much larger and rising more standing together: the wood is whitish and smooth, but not so white, smooth, and close as the wood hereof is.

2. *Acer minus sive vulgare.*

Our common or wood Maple tree.

The common Maple tree groweth lower & slower then the former, sometimes in hedges, no higher then those other hedge bushes, or else much higher covered with a more rugged barke, spreading neither so far nor so great branches, the leaves are much smaller, thinner and not so deepely cut in, but yet divided into five parts, and some what broad, at the setting on of the stalke, of a deepe and shining green colour on the upperside, and paler underneath: the flowers and seede are very like the former, but fewer set on the stalkes and lesser also in bulke or bignesse; the wood hereof is very white, very smooth, and very close grained.

1. *Acer montanum.*

The mountaine Maple tree.

This Maple differeth little from the last, that groweth well and great, differing chiefly in three points, which is not that next unto the stalke, and is some what deeplier cut into more divisions.

4. *Acer Creticum trifolium,*

The three leafed Maple of *Candy*.

This Maple groweth to be a tree of a meane size, spreading branches reasonable well, the barke whereof is of a darke reddish colour, having broad greene leaves full of veines, divided into three parts, standing equally distant one from another, with a long slender foote stalke under them, the flowers stand onely a couple together on the stalke, as the seede that followeth doth also, winged some what like the last but smaller.

The Place and Time.

The last is no where found wilde or naturall in our Land that I can learne, but onely planted in Orchards or walkes for the shadowes sake, but groweth in sundry places in *Germany*, &c. The second and third are found both on high and low grounds, in Woods, and Groves, Parkes, Chases, and the like through most Countries of this Kingdome, the one in the mother grounds, where the wood will be loose, and the other in the dryer grounds, firmer and closer; but the last is also a stranger to us growing about *Montpelier* and *Candy*, they all flower about the middle of *April*, and the seed is ripe in the end of *September*.

The Names.

It is certaine that the Greeke *Acer*, or *Sphendamnos*, in Latine *Acer*. The hill or that which *Clusius* called *Lotifolium*, because it hath the greatest and broadest leaves of any, and therefore *Tragus* calleth it *Platanus*, thinking as divers did, that it was the same *Platanus*, and therefore the *French* did call it *Plane*, before the true one was discovered and knowne. *Ruellius* and after him many others called it *Sycomorus* the Sycomore tree, which in divers Countries doth still continue, and with us also being called usually the Sycomore tree: but beside the name of *Sycomorus* the Sycomore tree, divers Writers have called divers trees, as first the true Sycomore or Mulberry bigge called of divers *Ficus Pharaonis*, *Ficus Aegyptia*, *Morus Aegyptia*, and *Ficus Aegyptia*. *Matthiolus* and others say that the *Italians* call the Acer also by the name of *Syromorus*. And *Petrus Crescentius* calleth the *Vitis lanigera*, by the name of *Sycomorus*. And lastly *Ruellius* and others say that this *Acer latifolium*, is called *Sycomorus*, for *Clusius* saith that the *French* call the hiller or wood sort so. The second is that which is most frequent in our Land, and called *Acer vulgatius*, by *Cordus* in *Historia*, *Acer minor* by *Dodonaeus*, *Clusius*, and *Camerarius*, *Opulus* by the *Romanes*, *Opulus* by *Gesnerus* here, and *Cordus*, and *Opulus campestris* by *Lugdunensis*, who also affirmeth it to be *Carpinus*, but not rightly. The third is the *Acer alterum Species, quae forte Zygia Theophrasti* of *Lobel*, by *Dodonaeus*, *Acer montanum, flavum & crispum*. and *Sphendamnos* by the Country men of *Candy*, by *Lugdunenses*, *Opulus montana*, and can be no other then the *Zygia* of *Theophrastus*, which *Gaza* calleth *Carpinus*, which differeth much from the *Ostrya*, which some as is before said call *Carpinus*. And the last the *Olmus*, which the *Italians* call it *Piedco*, and *Olmo-negundo*, the *French Ormeau* the *Germans Ulmbaum*, *Dutch* common sort, and *Acer* the greatest, the *Dutch Esschenhout*, and we in *English* Maple, and some, but falsly as the *French* or any other, the Plane tree.

The Vertues.

Neither *Dioscorides* nor *Galen*, in his censure of Maples, make any mention of this tree, neither [illegible] in the medicines for the Liver, written by *Asclepias*, he appointeth a dramme of the roote to be taken in pouther, and given in water, but *Cornarius* doubteth that the word is mistaken, because none of the Greeke Writers have made any mention thereof, or that it should be used in any disease. And none but *Tragus* recommended any of these Maples, but saith that the roote of the Maple being bruised, is applyed with very great profit into those that have obstructions, or any other paines of the Liver, or Splene, which *Serenus* delivereth in these Verses following:

Si latus immersum morbo tentetur acuto,
Arcessunt ægræ fontibus undæ,
Hinc bibe tene aceris, pariter ramalia, & una
Cum vino cocta, pro pretio medicamen habetur.

The wounded side if sharp disease invade,
In hissing water quench an heated stone,
This drink: Or Maple roots in powder made
Take eft in Wine, a present medicine known.

it is used to many joyners works, especially the finest wrought grained wood, which *Pliny* peradventure meant lib. 16. c. 16. by that which he there calleth *Bruscum*, and *Mollusca*, the more excellent both of them as he saith, is *ex aceris*, the knotty part of the tree, or of the roote thereof, which is held to be fuller of diverlified veines then the other of which saith *Pliny*, if they were large enough to make a table, would excell the Cedar, as some say it is, but others thinke it should be *Citrus* the Citron.

Chap. XXVII.

1. *Platanus orientalis verus.* The true Planetree of the East Countries.

Because in the last Chapter it is shewed that the *French* and others were utterly mistaken in calling the Maple the Plane tree: I thought it meetest to shew you which is the true kinde next thereunto, and to joyne thereunto another sort, brought by Mr *Tradescant*, out of *Virginia*. It riseth up to be a very great tree in time, spreading very largely, the barke whereof is rugged, the leaves are very large, of five divisions, and each of them deeply pashed on the edges, greene above and whitish underneath hanging by a slender reddish stalke, the flowers are of a pale white colour, many set together on a long stalke, after which follow sundry round rough balls of the bignesse of Wallnuts, made as it were a bur, but not sticking, wherein is small seede, the wood is firme, hard, and yellowish browne.

2. *Platanus Occidentalis aut Virginensis.* The Plane tree of the West parts or *Virginia*.

This Plane tree likewise groweth great, and spreadeth fairely, whose leaves being broad and large, have not so deepe divisions in them, and the balls or burres are, although somewhat rough with the roundnesse, not so large as the former, which being set hereby is utterly spoyled in the cutting, they grow also many hanging downe from the ends of the branches, as the others.

1. *Platanus Orientalis vera.*
The true Plane tree of the East Country.

2. *Platanus Occidentalis aut Virginensis.*
The Plane tree of the West parts of Virginia.

Original from UNIVERSITY OF MICHIGAN

The Place and Time.

The former groweth not naturally in any Country of *Europe*, but in *Asia*, *Syria*, *Egypt*, and *Arabia* many, and they are planted also by the way sides, and in market places. for the shadowe: take onely: it is found wilde very few in our Christian world, and those onely great lovers of plantes, being very tender, not enduring without extraordinary care and keeping, the cold of our climates, the other is but lately brought from *Virginia* by M. *Treasurer*.

The Names.

It is called *Κέδρος* in Greeke, and *Platanus* in Latine, *ab latè diffundo, quòd umbram late fundit*: and by this name all Authors have called it that have written of it. The *Arabians* call it *Dulb*, the *Italians Platano*, the *French Platane*, that it may differe from the *Plane*, whereby as is said they call the Maple. the *Germanes* know it not, and therefore they and the *Dutch* have no peculiar name, but as they take it from the *French Plane*, even so we doe also, calling it the Plane tree: *Dioscorides* calleth the fruite or burres *κροκύδας*, and *Pliny Pilulas*, *Virgil* seemeth being so like the other can have no other name.

The Vertues.

Galen saith that the: lanc is of a moist and cold nature, but not farre from a temperate, and therefore the green leaves bruised and laid on inflammations and hot swellings doe helpe them, but the barke and the leaves are more drying, which being boyled in vinegar, is good to gargle the mouth for the paine of the teethe. the burres stamped with fat is good against burnings, the burnt barke mixed with water doth clense the skin of any scurfe, leprie, or other deformities of the skin, and doth dry up much also old moist and running ulcers, stinging them for ancient writings. there is saith *Galen* and *Dioscorides*, a kinde of dust upon the leaves, which every one must be carefull to avoid, that it fall not into their eyes or eares, least it put them to much paine, the burres drunke in wine, stilleth the venome of the Scorpion, and other venemous creatures, the young render leaves boyled in wine, and the eyes bathed therewith that have eaten rednesse or cheumes falne into them helpeth them.

Chap. XXVIII.

Apeus. The Boxe tree.

THe Boxe tree, hath two or three diversities observed therein, which shall be shewed here and with them another, which divers doe referre hereunto.

1. *Buxus arbor vulgaris.* Our common Boxe tree.

The Boxe tree groweth slowly, and seldome groweth to any great body, or any great height, but when it is suffered, after a long time riseth unto twelve a mans height, and of the bignesse of a mans thigh, with a grayish barke, but in many places very low, spread verie much with branches, whereon are set many thicke small, fourewhat long and round pointed leaves, alwaies greene, larger, thicker and greener then any ordinary Mirtle leaves, greater or lesser, as the bushes be in greatnesse, at the foote of the leaves come forth small greenish flowers, which turne into whitish round berries, with foure points at the toppes, with reddish seede within them: the wood is very solid and hole, of a whitish yellow colour, and so heavy that it sinketh being put into water.

2. *Buxus aurea.* Guilded Boxe.

This guilded Boxe groweth in like manner as the former, in some places taller and greater then in others, the leaves are altogether like it, but that most of the upper leaves in the Summer time will have a yellow list or guard about the edge, and in nothing else differing from the other.

3. *Chamæbuxus minor.* Small low Boxe.

This small Boxe groweth never high or great, and although neglected or suffered yet still it hath many slender twiggie things from the roote, and every branch apte to take roote, whereby it may quickely be propagated and encreased, the leaves are much long'er and finer then in the former, and of a deeper greene colour, which never bore flower or seede that I could observe or learne.

4. *Pseudo chamæbuxus.* The baſtard low Boxe.

This small low plant lyeth moſt on the ground, with the ſlender ruſhlike greene branches, rooting as it ſpreadeth, and not riſing a foote high having divers thicke hard leaves ſet thereon without order, ſome what like unto Boxe leaves, or rather Mirtle leaves, being for the moſt part pointed at the ends, ever abiding greene: at the ends of the branches among the leaves come forth foure or five flowers of the faſhion of Peaſe, of a comly bluſh colour, the uppermoſt part whereof is whitiſh and yellowiſh in the middle, but purpliſh flowers, and in ſome purpliſh above, and yellow below, after which come ſmall flat cods like unto the broad *Trifolie*, containing within them blackiſh gray round ſeeds like Vetches: the roote ſpreadeth long ſlender branches as the ground, and abideth long.

The Place and Time.

The firſt is found with us in many woods and wooded grounds among other ſorts of trees, it is alſo planted in divers Orchards, or houſe backe ſides, where it never groweth high, but ſtretcheth as a buſh to any Lumen or ſo. The ſecond hath beene likewiſe found in ſundry places of this land, but onely neere unto that here it. The third groweth alſo in gardens being planted either as a border to keepe in the ſeeds, or as a hedge like unto the other. The laſt *Cluſius* found in ſundry places of *Italie*, and *Hiſpania*, and *Corduba* on the hills in *Europe*.

The Names.

Boxe is called *πύξος* in Greeke *ἀπὸ τοῦ πυκνὸν εἶναι καὶ ἀπύκτους ἔχειν τὰς ἴνας*, and *Buxus* in Latine, and therefore came *pyxides* the ſmall veſſels or boxes to hold and keepe ſuch things in them. *Theophraſtus* and *Diſcorides* here but one ſort, but *Pliny* hath three, the firſt he called *Gallicus*, becauſe it was made to grow into ſome ſhape or fare, into a great height. The ſecond *Creticus*, that as *Dalechampius* on *Pliny* noteth, there is an errour in the tranſlating of the Word, in ſome Greeke copy that he followed, and for *ἀγριόκαρπος*, *ſecundum quoſdam ſilueſtris eſſe*, he tooke it to be *ἀγριόκαρδος*, *Oleaſter eſſe*, it is wholly wild, and not profitable for any thing as it ſeemeth, being of a ſmall loathſome ſent, not fit to ſet againſt the houſe ſides, as the third is. Another error he hath, that he ſaith the ſeed of ſeede is called *Crataegus*, which he doth confound out of *Theophraſtus*, the ſeventh of *Crataegus* next after *Buxus*, *lib. 3. c. 15.* and a third erroor herein is, that he ſaith the Boxe beareth berries of

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

1. *Buxus arbor vulgaris*, The Common Tree Box.

2. *Buxus humilis*. The Dwarfish Box-tree.

the North side, and *Hyphear* on the South, which *Theophrastus* saith of the *Ilex* to doe so. The first is generally called *Buxus & arbor*, or *arborescens* by all. The second hath not beene mentioned by any Writer before me. The third is called *Chamæpyxos* by *Tragus*, and *Tabermontanus*, and *Buxus humilis* by *Dodonæus*. The last is the *Amomum sive Colutea* of *Clusius*, the *Anonymus Ferrariæ folio* of *Camerarius in horto*: and *Rhus Myrtifolius Plinij* in *Gesners* also. *Gesner* in *Cardanus Riphæus* calleth it *Chamebuxus*, and *Besler* directes out the great *buxus Eystettensis*, *Pluribambuxus* as I doe. *Thalius* calleth that small plant *Myrtus tenuifolius*, that *Cordus* calleth in *Sylva hercynia* plica, *Fraxinella exigua folijs myrtinis*, which is the very plant. Box is called *Buxelay* by the *Irelanders*, and *Box* by the *Spaniards*, *Buys* by the *French*, *Buxbaum* by the *Germanes*, and *Palmboom* by the *Dutch*.

The Vertues.

The leaves of Box are hot and dry, and altringent withall, as the taste declareth, and therefore alluredly doth dry and binde, yet is it not much used in Physicke by any now adayes that I know, although to my doe trumpet out the praise of it to be good for thirses, and the *French* disease, as much as *Guaiacum*. *Fernelius* onely doth number the leaves hereof among those things that doe purge, but the practise thereof is worne out of use, yet I remember that *Doctor Smith*, that was one of *Queene Elizabeth* Physitions, appointed the decoction of an ounce of the leaves of Box for a purging medicine, to be boyled in whey, and a dramme of the powder in broth. But *Matthiolus* contradicteth against such as tooke it, and the *Spaniards* to be both ignorant of the leaves and the dust of the wood boyled in lye, will make hoares of an Aborine (or *Abraham*) colour, the dwarfe Box is hot as is said to borders for beds of a Garden, &c. and either they or the leaves of the other dryed and given to horses, cureth them of the Staggers or Wormes: the wood is used for many small workes among the Turners, and the divertised boxe that hath veines therein, serveth for inlaying of Joyners: there is no use known of the fall as yet.

One medicine that I learned of a friend, who had tryed it effectuall, I will here set downe unto you, to cure the sting of a mad dogge, to take the leaves and roots of Cowslips, of the leaves of Boxe and Penny-royall, of each a like quantity, stamp them small and put them into hot broth, and let it be so taken three dayes together, and applied thereto, to the bitten place, with lope and hogges lues melted together.

Cap. XXIX.

Salix. The Willow.

The Willowes are to be divided into sundry parts, for some grow high, some low, some with broad leaves, some with narrow and long, and that both high and low, some also onely growing in the mountaines, others delighting to grow by water sides, and ditches, yet will also grow on the land. I will therefore distribute them into foure peculiar sorts or orders, that is to say into those that grow high

Original from UNIVERSITY OF MICHIGAN

1. Salix arborea angustifolia alba vulgaris.
The ordinary great white Willow tree.

3. Salix rosea. The Rose Willow.

and beare narrow leaves, into those that grow high, and beare broad leaves, into the lower sort with broad leaves, and into the tower with narrow leaves, and so I shall comprehend the whole number of them; and yet I must seperate the *Sprigs* of *Osiers* and the *Vines* or *Agnus castus* into two chapters by themselves.

1. *Salix arborea angustifolia alba vulgaris.*

The ordinary great white Willow tree.

Our ordinary white Willow groweth quickely to be a great and tall tree, if it be not lopped as it is usuall in most places, with a smooth white barke on the body and bigger branches, the younger springes, being some what greene with the whitenesse, the leaves are long and narrow, pale greene on the upper side, and of a shining silver white colour underneath, without any dent on the edges, the flowers come forth before the leaves appeare, and are small long and round, yellow mossie heads, smelling sweete for the most part, divers standing one above another, on a long stalke, which in time turne unto downe, that is blowne away with the winde, and the seede with it if it have any: the wood is soft and white, and with the brambles hereof cut into long sticks are made stakes for hedges, or to uphold Vines, &c.

2. *Salix angustifolia purpurea seu nigra.*

The ordinary blacke Willow.

The blacke Willow differeth from the former white not growing so great or high, and that the barke is more rough and of a darke reddish colour, the branches lithy and easie to bend, as whereof hopes are made to binde caskes, the leaves likewise are narrower and blacker, and wood not so white.

5. Salix Pomalis nigra. The blacke Wicke.

5. Salix

3. *Salix Rosea.* The Rose Willow.

The Willow that beareth a tuft of small greenish white leaves, on the reddish branches, set in order together almost like a Rose, is in growth like unto the last, the barke as rough and darke, the leaves not so long, nor the branches fully so lithy and pliant, yet reasonably.

4. *Salix fragilis.* The hard blacke Willow.

This differeth from the second, in that the branches are hard and blacke, strong, and not pliant as the former, &c.

5. *Salix viminalis nigra.* The blacke Withy.

This Withy hath more slender branches, and more fit to be wouen, of a darke red colour: the leaves are long and narrow, dented about the edges, of a darke greene, and a little white underneath, having two small round leaves, at the setting on of every the long leaves, which sheweth the kinde thereof.

6. *Salix Gallica nigra.* The *French* blacke Withy.

This differeth from the last in this, that the twigges are more yellowish browne, the leaves lesse dented and hath no small round leaves at the bottome of the longer.

The Place and Time.

Many of these sorts are found in our owne land in low grounds neere water courses and ditches, and the Rose Willow in sundry places of *Essex* and *Cambridge* shire: the blossomes come forth before any leaves appeare, and are in their fullest greatnesse usually before *Easter*, divers gathering them to decke up their houses on Palme sunday.

The Names.

It is called in Greeke τριανδρος ὁ ἑτερος, quod citò in altum excrescat, and *Salix a saliendo* in Latine, because it groweth with that speed that it seemeth to leape. The first is common both with us and with other nations, and is that which *Theophrastus* and *Pliny* call *Salix alba*, and *Salix perticalis* by *Matthiolus*, *Camerarius*, *Lugdunensis* and others, because the branches thereof being strong are used as stakes to hold up any thing, or to be bound thereunto. The second is taken to be the true *Salix Amygdalina nigra & rubens* of *Pliny*, and of *Columella Salix Amerina & Salina*, which *Matthiolus* calleth *Graca*, and *Dodonæus Gallica*, and by *Thalius Sabina*, and *Amerina*. The third is not mentioned by any forraigne Author that I know of, *Gerard* having given the first knowledge thereof to the world. The fourth is called by *Bauhinus Salix fragilis*, as it is in the Title. The fifth is called by *Lugdunensis Salix nigra*, i.e. *cortice nigro* of *Theophrastus*, and the *purpurea* of *Pliny*. The last is the first *Salix* of *Tragus*, the *Salix Gallica* of *Cordus* on *Dioscorides*, and by *Lugdunensis Salix Phœnicea*. The *Arabians* call the Willow *Bulif Bladin*, and *Saffsaf* also, and *Chalif*, which names *Alpinus* and *Rauwolfius* give to their particular kindes, the *Italian Salice*, the *Spaniards Salce*, and *Salgueiro*, the *French Saulx*, and *Saule*, the *Germanes Weyden* and *Felbinger*, the *Dutch Milghebooms*.

The Vertues.

The Vertues of all the sorts of these Willowes, as of the rest are set downe together at the latter end of them, except such as are mentioned in particular.

Chap. XXX.

Salix arborea latifolia, The Sallow tree.

Of this kinde there are divers sorts that plainely differe both from the former and among themselves.

1. *Salix latifolia rotunda.* The round leafed Sallow.

This Sallow groweth to a reasonable greatnesse with a grayish white rugged barke outermost, and another tender inward, the outermost being pliant and tough, fit to binde things withall: the leaves hereof are broad and almost round, indented about the edges, darke greene above and gray underneath with two small round leaves joyned to the foote of them: the flowers or catkins are not such whole tufts or tailes as the former kinde, but consist of many small heads, thicke set together, which are blowne away with the blackish seede in them as the others are: the wood hereof is more loose and spongy then the other, and hardly bearing the head be writhed round or downeward, as is seene at the Christmas time in many Noble and Gentlemens houses set at their gates by their Porters.

2. *Salix latifolia oblongior.* The longer leafed Sallow.

This other differeth from the former onely in the leaves, which are not so round, but broad and long withall, dented about the edges, and in all things else alike: on the leaves of both these sorts are found sometimes certaine bladders or blisters, and upon the branches little rough balles.

3. *Salix latifolia minor.* The lesser broad Willow.

There is another kinde hereof that groweth not so high as the former, the leaves being of a meane size, betweene them two that is not so round nor so long, but of a darker greene colour, and gray underneath like unto them.

4. *Salix folio rotundo argentato folio.* The silver leafed Sallow.

This silver leafed Sallow groweth low like the last having a brownish barke to cover the body, but especially the branches, the leaves are more long then broad, and shining silver-like underneath, somewhat lesser then the last, the leaves and the barke being the chiefest differences in this from the last.

The Place and Time.

These sorts although they are sometimes found by waters sides, yet are they also found in the moister grounds, as hedge crookes, ditches, and in the upland grounds as well: their time of flowring is with the former.

The Names.

This kinde is called *Salix arborea latifolia* to distinguish it from all the other kindes: the two first sorts are mentioned by *Tragus*, as his fourth kinde, and called *Latifolia* or *platyphyllos* by *Gesnerus*, *Camerarius*, *Thalius*, *Lobel*, and *Lugdunensis*, which *Fabermontanus* and *Gerarde* call *Salix capræa rotundifolia*, and thought it to be it by some, and called *Salix latifolia aquatica* by others. The third is mentioned by *Thalius* onely, and

1. *Salix latifolia rotunda.* The round leafed Sallow.

2. *Salix latifolia oblongior.* The long leafed Sallow.

and by *Tabernæmontanus* from him. The laſt by *Tabernæmontanus* onely, who calleth it *Salix ſubrotunda argenteo folio*, as it were the title.

CHAP. XXXI.

Salix pumila latifolia. The low broad leafed Willow.

THere are likewiſe three or foure ſorts of this low kinde to ſhew you, which are as followeth.

1. *Salix humilis latifolia erecta.* The upright low broad Willow.

The branches of this low Willow are ſhort not above a cubit long and ſtraked, or as it were crefted all along: the leaves are ſomewhat long with the rounder ſide and pointed at the ends, a little wrinkled above, and ſoft and woolly underneathe: this creepeth not as the next, which diſtinguiſheth it.

2. *Salix latifolia repens.* Creeping broad leafed Willow.

The ſtalkes with the ſundry branches of this low Willow, having a rugged barke, doe for the moſt part ſpread on the ground, and take roote againe as they lie, the leaves are ſmall, yet ſomewhat broad and long, pointed at the ends, greene above and gray underneath and ſhining, the catkins hereof are thicker and ſhorter then in any other of theſe lower ſorts, the motes hereof ſpread much in the ground.

3. *Salix latifolia Alpina repens.* Creeping mountaine broad leafed Willow.

This other ſort differeth little from the laſt, having a little ſmoother barke, a few rounder leaves, and ſmaller catkins, which abide untill *Auguſt*, and then ſhew their ſmall blacke ſeede within them, and great rootes ſtreight ſpread.

4. *Salix foliis rotundis.* The leaſt red or ſtone Willow.

The ſtocke hereof is thicke as the ſtone, but ſhort, ſending forth two or three ſlender ſhort branches lying on the ground, having long and ſomewhat round darke greene leaves thereon, with many veines, the rest at the end whereof ſtandeth a ſmall round head made of many ſmall graines as it were ſet together, which when they are ripe open themſelves and ſheweth forth a ſhort ſoft white downe, out of a three ſquare huſke, which is carried away with the winde.

5. *Salix pumila abortiva.* The leaſt Willow without fruite.

This Willow groweth not much higher then ones hand with ſuch ſmall round leaves thereon, white on both ſides, that they exceede not the bigneſſe of a penny, ſtanding cloſe together, without either flower or ſeede, that it can ſcarſe be taken for a Willow.

6. *Salix Ægyptiaca & Syriaca.* The *Egyptian* Willow or of *Syria*.

This Willow that groweth familiarly both in *Egypt* and *Syria*, is neerer a ſhrub then a tree, ſpreading into many ſlender flexible and yellowiſh branches and ſtemmes alſo from the roote, whereon are ſet faire broad and large leaves

leaves on both sides, yet but one at a place usually, especially on the younger stemmes and branches, but grow smaller on the elder, with some lesser with-in either greene on the upper side, and grayish underneath: at every joynt with the leafe usually commeth forth a whitish ball of rufe, of a soft flocky substance, which by time is dispersed into the ayre, without bearing any seede for ought that hath been observed, yet may be in this flocky matter, as is usuall in many other plants that have flocky heads: but because the flowers are very plentifull, and sweete withall, the Natives distill a water from them, wherof they make a great account, calling it *Lachedre*, using it as an especiall helpe for all forraine agues, but especially in pestilentiall and putride fevers, as also the infusion or decoction of the flowers and for paines in the head and faintings of the heart, and the comforting and strengthening thereof.

7. *Salix Arabica humilis folijs Ariphios.*

The *Arabian* dwarfe Willow.

This *Arabian* likewise groweth low, with many pale yellow with branches, but thicker, more solid and strong then the last, beset on all sides with leaves, that are of an inch and a halfe long, and two inches broad, somewhat gagged on the edges like unto a wild Arcs-ile, whose flowers or fruits as yet, was not observed, but of the nature of this sort of Willow, they make their best Cordiall.

The Place and Time.

Some of these sorts are found in many places of this Land, as upon Bromfield Heath, Barnes Marshes and the Low grounds in Kent, Lincolnshire, and Barbican, howbeit counted them to grow in Germany, Hungary and Italy, &c. The two last according to their nature.

7. *Salix Arabica humilis folijs Ariphios.* The Arabian dwarfe willow.

The

The Names.

Bauhinus calleth the firſt by the name in the title, as he doth the fourth alſo. The ſecond and third *Cluſius* calleth *Salix pumila latifolia*, the third here hanging his firſt, and his ſecond, the ſecond here. The fifth *Lugdunenſis* calleth *Abortiua*, as it is in the title. The firſt is remembred by *Alpinus* among his *Egyptian* plants, calling it *Calef ſive Bar*, and *Proſper Alpinus* ſaith the *Egyptians* and *Syrians* call it *Calech* alſo, *Rauwolfius* ſaith the *Syrians* called it *Sapſaf*. The laſt *Rauwolfius*, alſo ſaith is called *Gark* by the *Arabians*, and *Garrab* by the Moores.

Chap. XXXII.

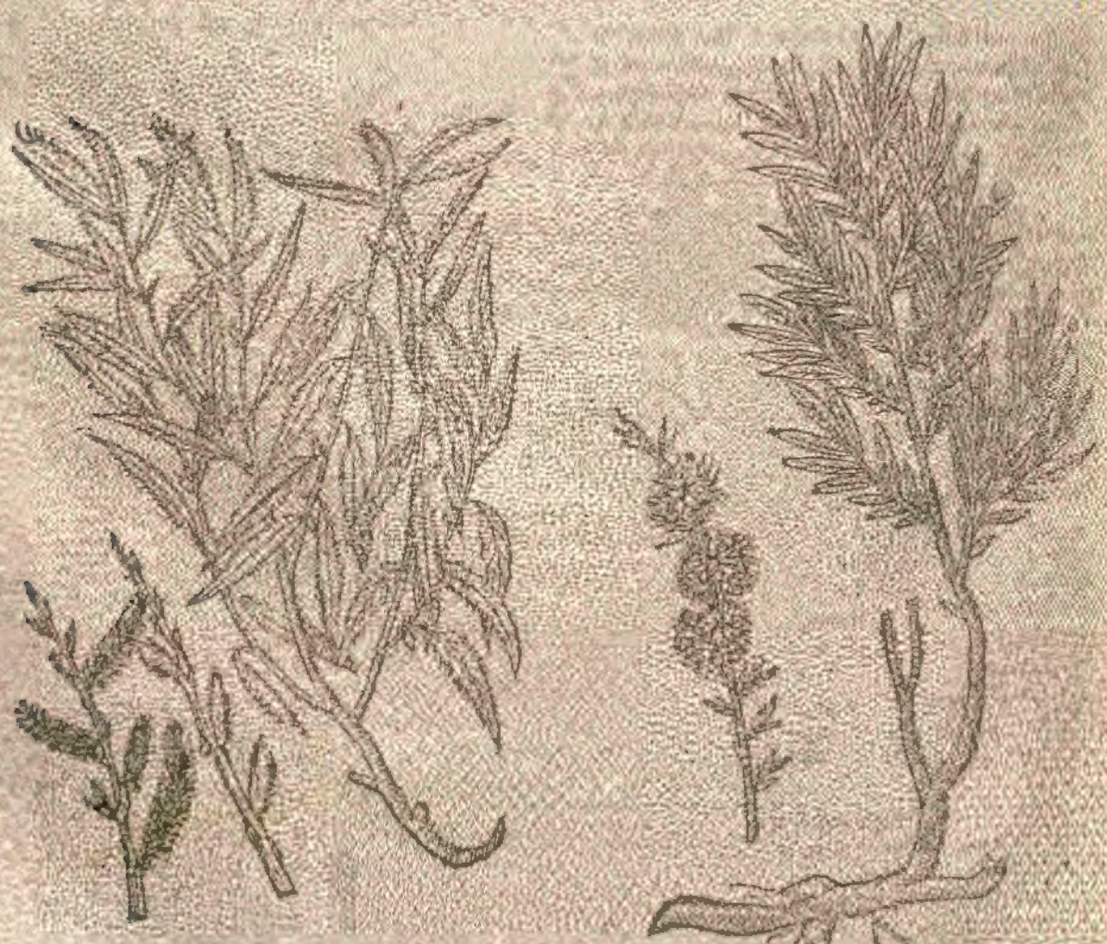
Salix pumila anguſtifolia. Low narrow leafed Willowes.

HEreof there are diuers kindes which grow diuerſly ſome in more wet places then others, and firſt will ſpeake of the *Oſier*, becauſe although it grow with longer twigges or roddes, then many of the reſt, yet it beareth narrow long leaues.

1. *Salix aquatica humilis.* The Oſier.

The Oſier hath a ſtumpe or ſtocke of a tree, as bigge as ones arme at the moſt, and not aboue a foote high, but with an head as bigge as a childes head, being kept thus low or ſo pale, becauſe the ſhootes or wands that are cut of it, are cut every yeare for uſe, the barke whereof in ſome is yellowiſh or whitiſh, in others browniſh, the leaues are long and narrow, yet broader then any of the reſt for the moſt part the faſhion, dented about the edges, darke greene on the vpper ſide, and whitiſh underneath: this hath not been obſerued to beare any flowers, becauſe all the ſhootes are yearely lopped off cloſe to the head, but the rods ſtuck into the ground will ſpring to be young trees, to be dreſſed in like manner, and ſo will any branch of the former greater ſorts.

2. *Salix pumila anguſtifolia rectior.* The ſtraight dwarfe Willow with narrow leaues.



The ſtemmes of this Willow are ſlender yet vpright, not aboue a foote long, couered with a yellowiſh barke: the leaues are narrow and long like vnto thoſe of Line or Flax: greene aboue and gray below, the young ones being wholly gray and hoary: the bloomings or catkins are ſoft and yellow, like the greater kindes, and come forth before the leaues, and paſſe into downe being ripe, that is blowne away with the winde, the roote is blacke of a fingers bigneſſe with fibres thereat, growing a ſlope.

3. *Salix humilis anguſtifolia repens.* Creeping low Willow with narrow leaues.

The branches of this low Willow grow to be a foote or more long, but ſlender and leaning, and lying vpon the ground, where it will ſhoote forth roots againe, set with ſhorter and narrow leaues, diuers comming forth together, greene aboue and gray below, in other things not vnlike the former.

1. *Salix aquatica humilis.* The Oſier.

2. *Salix pumila angustifolia rectior.* The ſtraight dwarfe Willow with narrow leaues.

Original from UNIVERSITY OF MICHIGAN

3. Salix humilis angustifolia repens.
Creeping low Willow with narrow leaves.

4. Salix alnonys latifolia.
The blacke low Willow.

4. Salix longo incana acuto folio.
The blacke low Willow.

The stemme hereof is covered with a darke red barke, parted into sundry short branches with narrow long and sharpe pointed darke greene leaves upon them, and hoary underneath, the rest agreeth with the former.

5. Salix Helice Theophrasti.
Hungarian low Willow.

5. Salix Helice Theophrasti.
Hungarian low Willow.

The branches of this Willow are very slender and pliant, though the body bee somewhat great, covered with a pale yellowish barke, the leaves grow by couples, being long narrow and sharpe pointed, greene with a certaine bealish above and gray underneath, with some small leaves at the bottomes of them, and with small reddish bals or blisters sometimes on them also, the flowers, &c. agree with the former, but this is proper hereunto to have scaly heads of leaves at the ends of the branches.

6. Salix Alpina Pyrenea.
Low Willow of the Pyrenean hills.

This small Willow riseth unto scarce halfe a cubits height, with slender stiffe branches, full of small long leaves, hairy all upon the edges, and as soft as Velvet, the stalke with the ending thereof are an inch long, being soft and slender, but like to the rest.

7. Salix alpina rotundo virgulti folio non incana.
The greene creeping Willow.

The branches hereof, although some of them rise above the flowers, yet take their roote below, having somewhat broad and long leaves on them, wholly greene, so that but that the flowers doe appeare like unto the rest, none would take it to be a Willow.

8. Salix angustissimo & longissimo folio.
The longest leafed Willow.

This low Willow hath yellowish rods, with the longest narrowest leaves of any of the rest, white on both sides, but

some

somewhat knobby underneath, this hath also scaly heads of leaves, at the ends of the branches as the rose.

The Place and Time.

The first is always planted in the low grounds that are often overflowen, where it onely will thrive: the other sorts, some are found growing with the last sort, or by them in sundry the said and the like places with us, and to *Huswifes, Basketmakers*, &c. *Clusius* and *Bauhinus* have set it downe.

The Names.

The first is called *Salix Viminalis* by *Cæsalpinus* on *Dioscorides*, and by *Dodonæus*, and is the third *Salix* of *Trago*, and *Cæsalpinus, Gerard* calleth it *Lanceus*, as the next name to distinguish it from the rest, and so doe I: it is also called *Vetus & vimalis*. *Lugdunensis* maintaineth it to be the *Salix Amerina* of *Pliny*, against *Ruellius* and *Matthiolus*, he should have said this. What would make the *Vitex* or *Agnus castus* to be the *Salix Amerina* of the Latines, because that among the bastard sorts in *Dioscorides*, it is there to set downe, but they differ much, as you shall here more in the next Chapter. For *Lugdunensis* saith that they of *Lyons*, and the *Montaines* in *Savoy* do call it yet to this day *les Amerines*, which they of *Paris* call *Osiers*, and they of *Normandy* & *Angiers*. Some also, as *Lugdunensis* saith in the Chapter of *Trassularia* and *Salix*, would make the tree of *Theophrastus* to be *Amerina*, but *Theophrastus* giveth *Vinum* as he saith, whose liquor he calleth *Acetum*, not unlike to thicke darkish Wine, but exchanging more to purple. The second is the tall *pomifera* or *fructifera* of *Clusius*. The third is the second, and the *Salix humilis* or *Capræa* of *Lobel*. The fourth is so called by *Bauhinus* as it is in the title. The fifth is taken by *Lugdunensis* to be the *Salix Helice* of *Theophrastus*, and by *Bauhinus*, *Salix humilis capitulis squammosis*. The last and least three are mentioned onely by *Bauhinus*, and the last by *Lugdunensis*, and is his sixth sort. Then *English* names are fitted to every of these, as I thinke is fittest for them.

The Vertues.

I thought it to shew you what particular property is in each of these Willowes altogether, and not to make many places of repetitions. All of these in generall are cooling, drying, thickning and binding: both the leaves and the barke, and the seede especially, are used for any of those effects, as to stanch bleeding of wounds, and the mouth or nose, and spitting of blood, as also of other fluxes of blood in man or woman, and likewise to stay calling, and the reins thereunto, if the decoction of them in Wine be drunke: it helpeth also to stay thinne hot and sharpe, salt, distillations from the head upon the lunges, causing a consumption: the leaves bruised with some pepper and drunke in wine, doe much helpe the winde chollicke, the leaves bruised and boiled in wine being drunke, doth much stay the fleare of lust, and wholly extinguish it, if it be long used both in man and woman, the seede also of the same effect. The water that is gathered from the Willow while it flowreth, the barke being slit, and a vessell apt to receive it, being fitted to it, is very good for rednesse, and dimme eye-sight, and filmes that begin to grow over them, and stay the rheumes that fall into them. to provoke urine being stopped, if it be drunke, and to cleare the face and skinne, of any spots or discolourings: the flowers saith *Galen* have a stronger vertue to dry up any flixe or humour, being a medicine without any sharpenesse, and the barke much more, as all barkes doe, but if the barke be burnt and used, it doth yet dry more forcibly, and being washt well cleane. It easeth away warts, and corns, and other the like hills that groweth on the hands or feete, or other parts: the decoction of the leaves and barke in wine, is good to bathe the sinewes, as also the place pained with the gout, and to cleanse the head or other parts of scurfe. the juyce of the leaves and greene barke, mingled with rose Rose water, and heated in the rinde of a Pomegarnet is singular good to helpe deafenesse to be dropped into the eares: the seede of the blacke Willow mixed with litharge of silver in equall quantity, made into ointment and used on any place where the haire groweth that you would take away, after it hath been bathed well before, or else in too boiles or blowe doth cause it to fall away. Of the twigges or rods are made many sorts of workes, both for fine and course baskets, chaires, cradles, and many other the like: bands also both greene and dryed, to binde up Vines, Trees, Hedges and many other things. hoopes also, and the small twiggs, to binde the hoopes stakes also, and poles both high and low: to hold up or fasten hedges, baskets, &c. mats and many more the like things. *Tragus* remembreth a merry pained controversie betweene the Beare and the Willow, written in the Germane tongue, whether of them were of the better use in the common wealth, or might best be spared. Of the Sallow especially, but of the other Willow trees in generall, the best coles are made to make Gunpowder withall, as is well knowne, and with the coles like wise, the booth painters draw their fine draughts: the *Castor* or Beaver delighteth chiefely to make his residence among the Willowes, and Osiers, in the Waters sides.

Chap. XXXIII.

Spurious Theophrasti Cluſij. Clusius his spiked Willow of *Theophrastus*.

THis strange Willow (for so it is most like) groweth to be a small low bush of three or more foote high spreading forth slender branches covered with a reddish barke, whereon are set without order, many long and narrow leaves most like unto the Willow, of a pale greene colour on the upperside, and browne underneath, finely dented about the edges, of a drying taste, with some bitternesse: at the ends of the branches come forth their nothing fairer or clusters of bluish coloured flowers, consisting of five leaves a peece, with some threds in the middle, of the same colour, without any sent, which turne into thrift five square heads with very small seeds like dust within them, of a yellowish colour.

The Place and Time.

This was sent out of *Siberia* to *Vienna* to *Clusius* by *Sibilius*, the Duke of *Brica*, his learned Apothecary, where it is most likely it grew, and flowred in *May* with *Clusius*, and the seede was ripe in *August*.

The Names.

Clusius saith he that sent it tooke it to be a *species* of *Syringa*, and questioned *Clusius* whether it should not be referred

ented thereunto, but hee seriously considering thereof, could not finde it like to any plant that he knew, and therefore judged it most neerely to represent the [illegible] or as some reade it [illegible] of *Theophrastus*, which hee putteth among those trees that beare Spikes, as *Sparus, Erica, Agnus*, and some others *lib. 3. c. 13.* and withall *Clusius* saith that he doth most fully agree to his *Spirea*, then the *Viburnum Matthioli*, as some would have it.

The Vertues.

There are no property mentioned of this plant, whereunto we might bee serviceable in Physick or otherwise, and therefore let this suffice.

Spirea Theophrasti flore albo.
Clusius his Spiked White or Theophrastus.

Chap. XXXIV.

Vitex sive Agnus Castus. The Chaste tree.

The Chaste tree is of two sorts, one with narrower, and another with broader leaves the one dented and the other not, the one with whitish, and the other with purplish flowers.

1. *Vitex folio angusto.* Narrow leafed Chaste tree.

This riseth up taller then a shrub, unto the height of a low tree, with divers branches covered with a darke coloured barke, and are lithy rather to bend, with sundry large leaves cut or divided like unto Hempe leaves, five into five or seven parts or leaves, each of them being long and narrow like Willow leaves but smaller, and not dented at all about the edges: at the ends of the branches come forth long spikes of flowers, somewhat like unto Lavender spikes, stored with bluish white flowers at several spaces up to the toppes, after which come small round seede, of the bignesse and likenesse almost of pepper, whereupon some have called it *Piper agreste*, but nearer unto Coriander seede, but of a blackish grey colour, and tasting somewhat hot and strong.

Vitex folio angusto.
The Chaste tree.

2. *Vitex folio latiore.* The broader leafed Chaste tree.

This groweth lower and taller then the former, having the like leaves divided as it, but each somewhat broader, and dented about the edges, more white and woolly also then they, the flowers grow up and down after the same manner, of a blewish purple colour, the seed that followeth is also like the other.

The Place and Time.

They grow in the further part of *France*, in *Italy*, and *Spaine*, notwithstanding and in the milder grounds, the colder Countries do only nurse them up in Gardens for their rarity and use: they flower in July, and the seede is ripe in *August* in the open ayre, but will hardly flower with us.
